Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 5.7-38 shows an example of triangle-wave PWM mode 2 operation, and **Figure 5.7-39** shows an example setting for triangle-wave PWM mode 2.

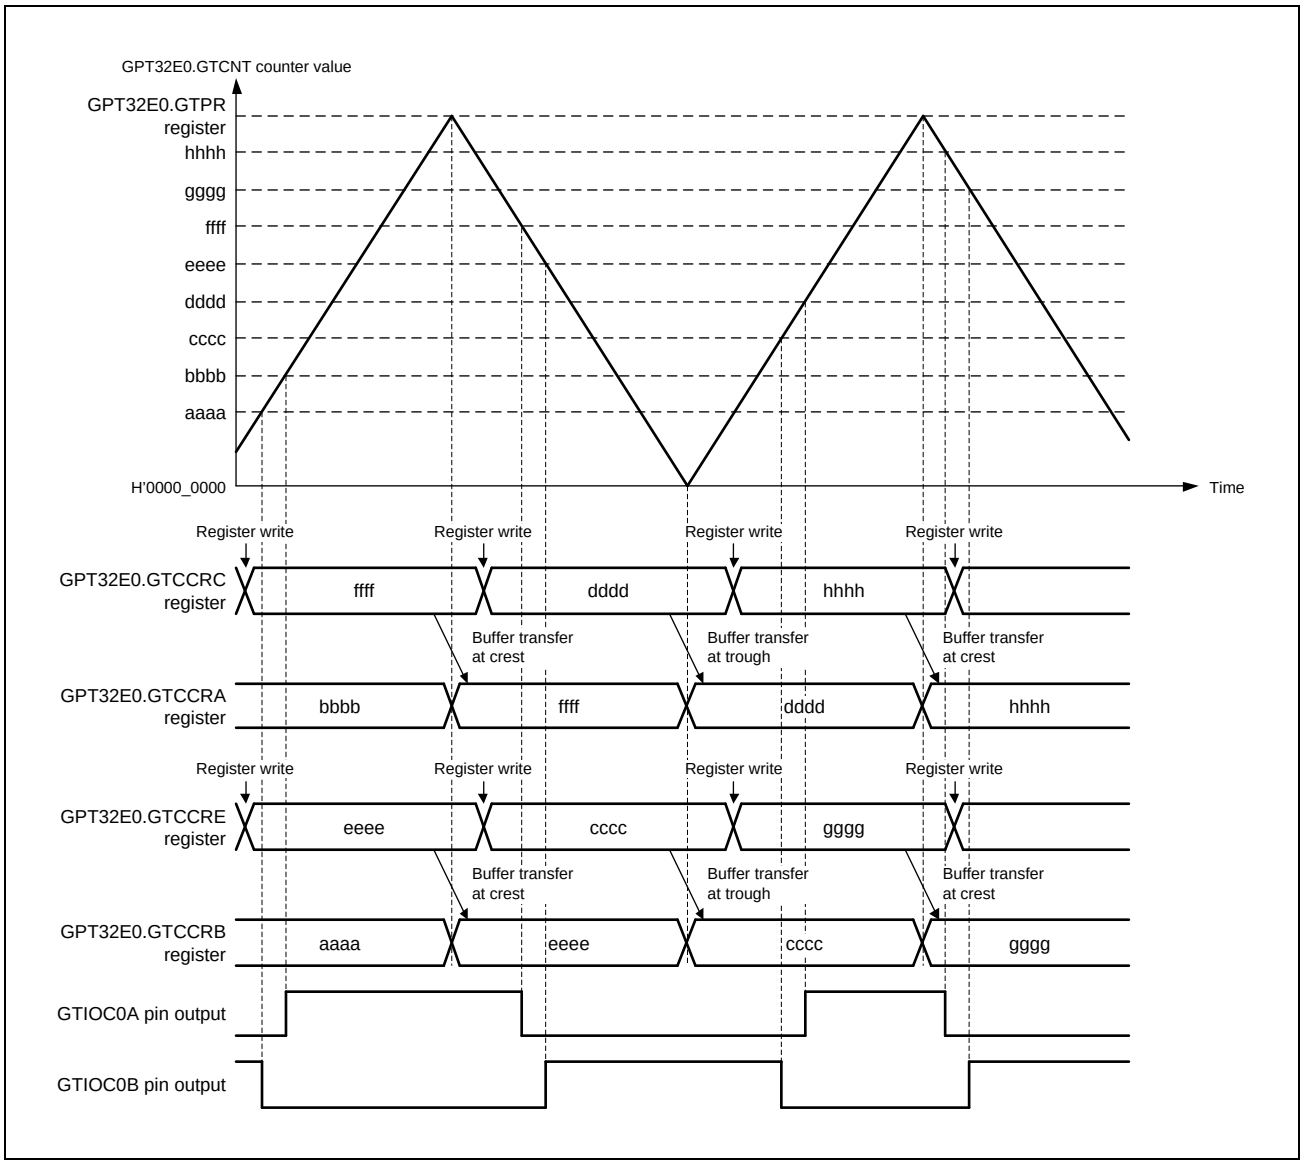

Figure 5.7-38 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

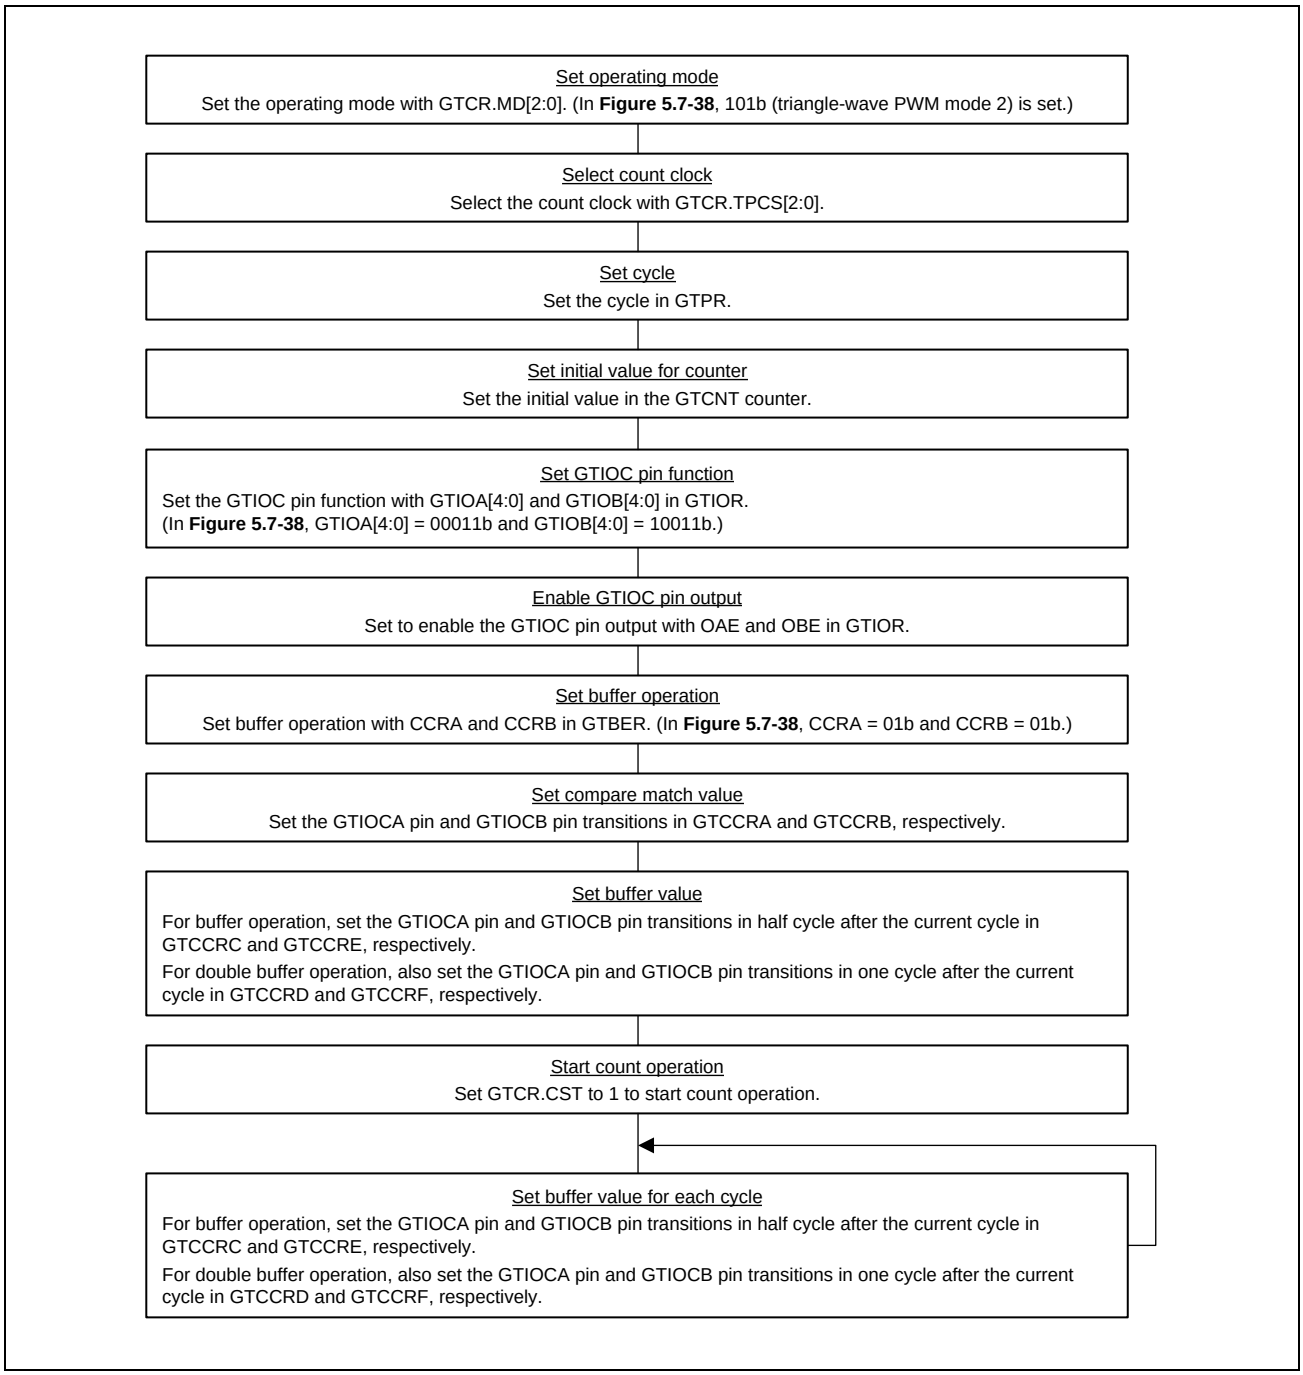

Figure 5.7-39 Example setting for triangle-wave PWM mode 2

5.7.3.3.5 Triangle-Wave PWM Mode 3 (64-bit transfer at trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 5.7-40 shows an example of triangle-wave PWM mode 3 operation, and **Figure 5.7-41** shows an example setting for triangle-wave PWM mode 3.

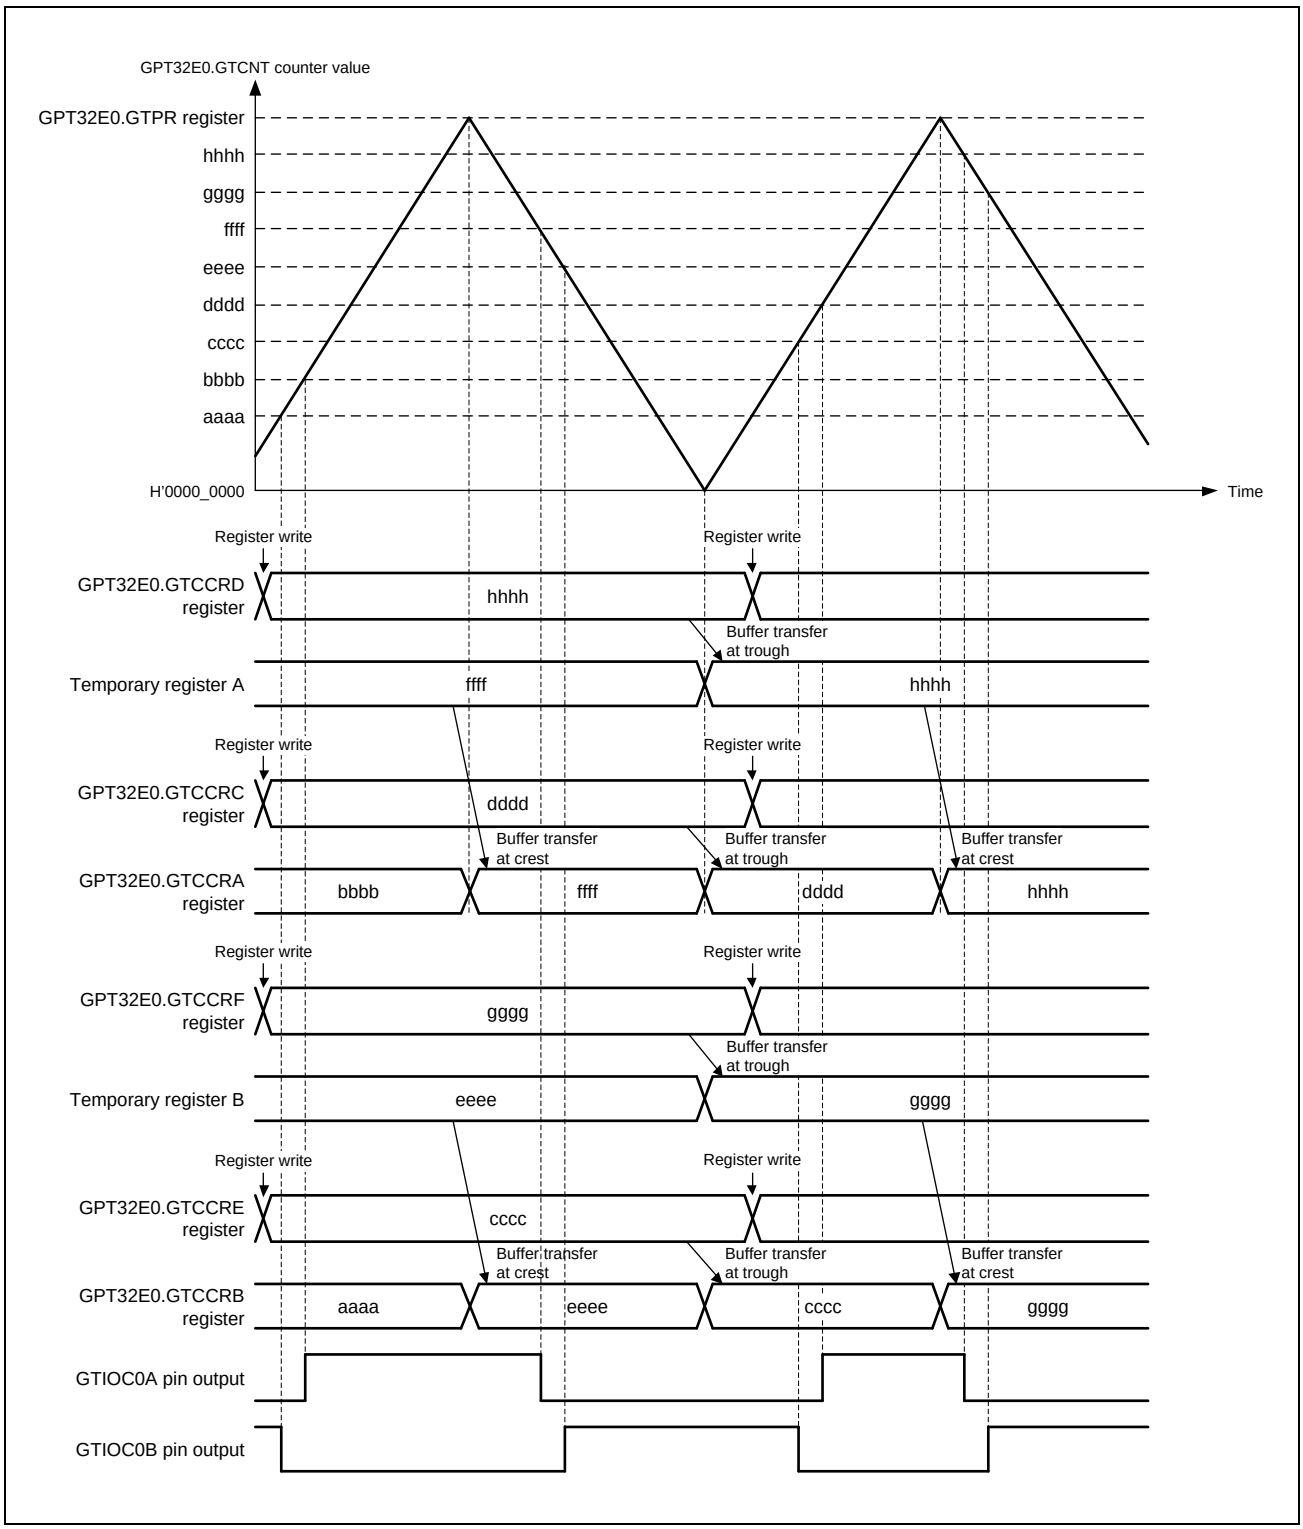

Figure 5.7-40 Example of triangle-wave PWM mode 3 operation with low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

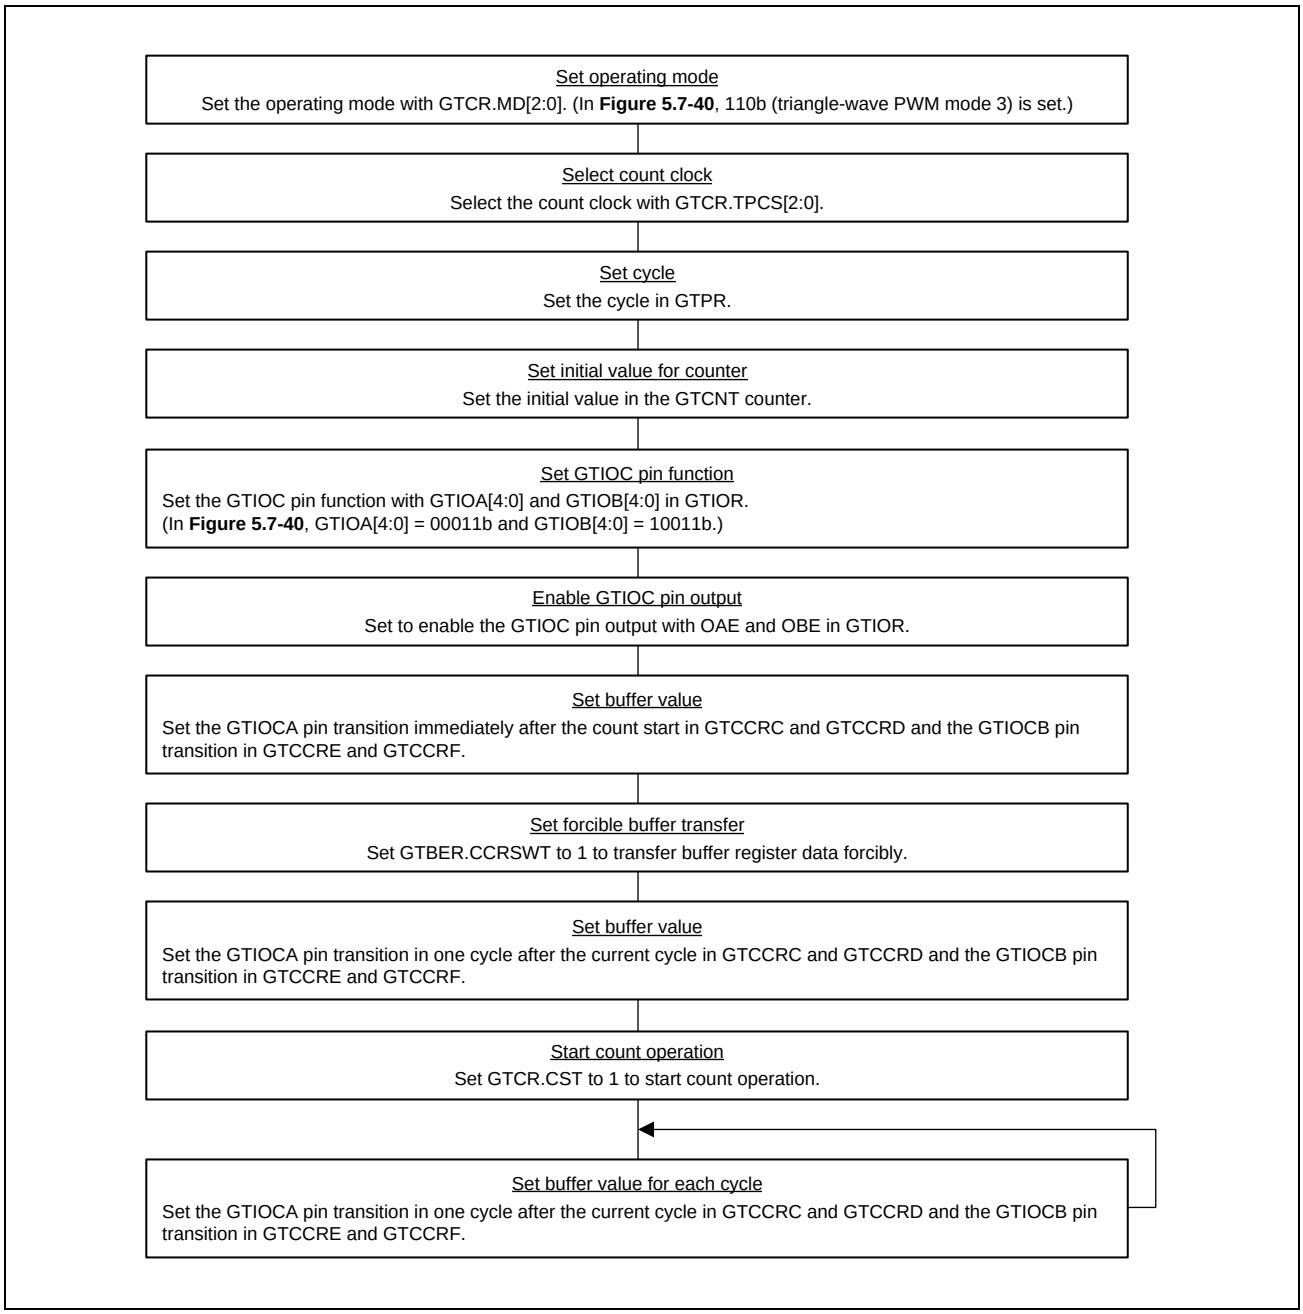

Figure 5.7-41 Example setting for triangle-wave PWM mode 3

5.7.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time values (GTDVU and GTDVD values) can automatically be set to GTCCRB. The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time can be separately set for the first half and second half of a waveform. Dead time for the transition in the first half of a negative waveform is set in GTDVU and that in the second half is set in GTDVD. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.

GTDBU can be used as a buffer register of GTDVU, and GTDBD can be used as a buffer register of GTDVD.

In the saw-wave mode, buffer transfer is performed when the GTCND counter overflows (up-counting), underflows (down-counting), or is cleared. In the triangle-wave mode, transfer proceeds at troughs.

The change point of the negative phase waveform with the automatic dead time setting can be confirmed by reading the GTCCRB register value.

Writing to the GTCCRB register is prohibited when using the automatic dead time setting function. It is prohibited to set dead time such that the change point of the waveform exceeds the count cycle.

If there is an error condition on the dead time setting, be able to generate waveforms that secured dead time by correcting the transition points of the positive and negative phase waveforms, as shown in **Table 5.7-6**.

The transition point of the corrected negative-phase waveform is automatically set in the GTCCRB register. Since the internal signal is used to judge the transition point of the positive phase waveform, the GTCCRA register is not updated with the corrected value.

By correcting the waveform transition point due to a dead time error on the saw-wave one-shot pulse mode, if the order of waveform transition points is disturbed or it exceeds the count cycle period after correction, the complementary relationship between the positive-phase waveform and the negative-phase waveform is not guaranteed.

By setting the GTCCRA equal 0 or greater than or equal to the GTPR of the GTCCRA register in the triangle-wave PWM mode, if the dead time setting exceeds the count cycle period, output transition is suppressed by the output protection function. When GTCCRA ≥ GTPR + GTDVn, GTPR - 1 is set as the upper limit value in the GTCCRB register (Refer to **5.7.7.4 Output Protection Function for GTIOC Pin Output**).

When GTCCRA ≥ GTPR + GTDVn, GTPR - 1 is set as the upper limit value in the GTCCRB register.

Table 5.7-6 Correction of waveform transition point at dead time error occurrence

Wave mode	Count direction	Interval	Dead time error condition	Positive-Phase waveform transition point with corrected	Negative-phase waveform transition point with corrected
saw-wave one-shot pulse mode	Up counting	first half	GTCCRA-GTDVU < 0	GTDVU	0
		second half	GTCCRA+GTDVD > GTPR	GTPR-GTDVD	GTPR
	Down counting	first half	GTCCRA+GTDVU > GTPR	GTPR-GTDVU	GTPR
		second half	GTCCRA-GTDVD < 0	GTDVD	0
triangle PWM mode 1/2/3	Up counting	(first half)	GTCCRA-GTDVU ≤ 0	GTDVU+1	1
	Down counting	(second half)	GTCCRA-GTDVD < 0	GTDVD	0

Values for automatic dead time setting can be read from GTCCRB. The automatic dead time value setting to GTCCRB is performed at the next count clock cycle when registers that are used for calculating the automatic dead time value are updated.

The method of writing a new value to a GTDVn register depends on whether buffer operation is enabled or disabled. When GTDVn buffer operation is enabled: The GTDBn register can be written at any time. The value in the GTDBn register is transferred to the GTDVn register at the cycle end.

When GTDVn buffer operation is disabled: Set the GTCR.CST bit to stop the GPT before changing the value of the GTDVn register.

Figure 5.7-42 to **Figure 5.7-45** show examples of automatic dead time setting function operation. **Figure 5.7-46** and **Figure 5.7-47** show the setting examples.

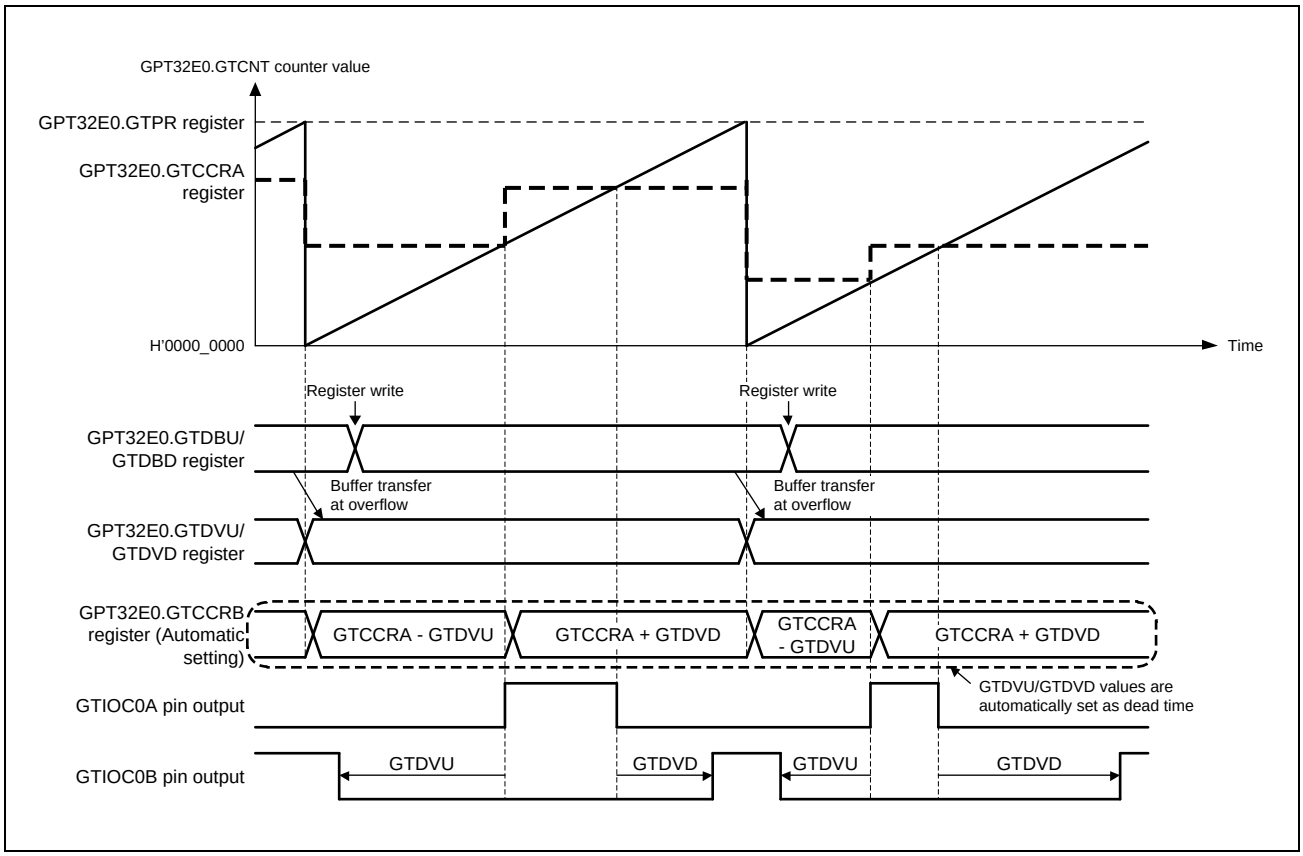

Figure 5.7-42 Example of automatic dead time setting function operation with saw-wave one-shot pulse mode, up-counting, GTDVU and GTDVD set to buffer operation, and active-high

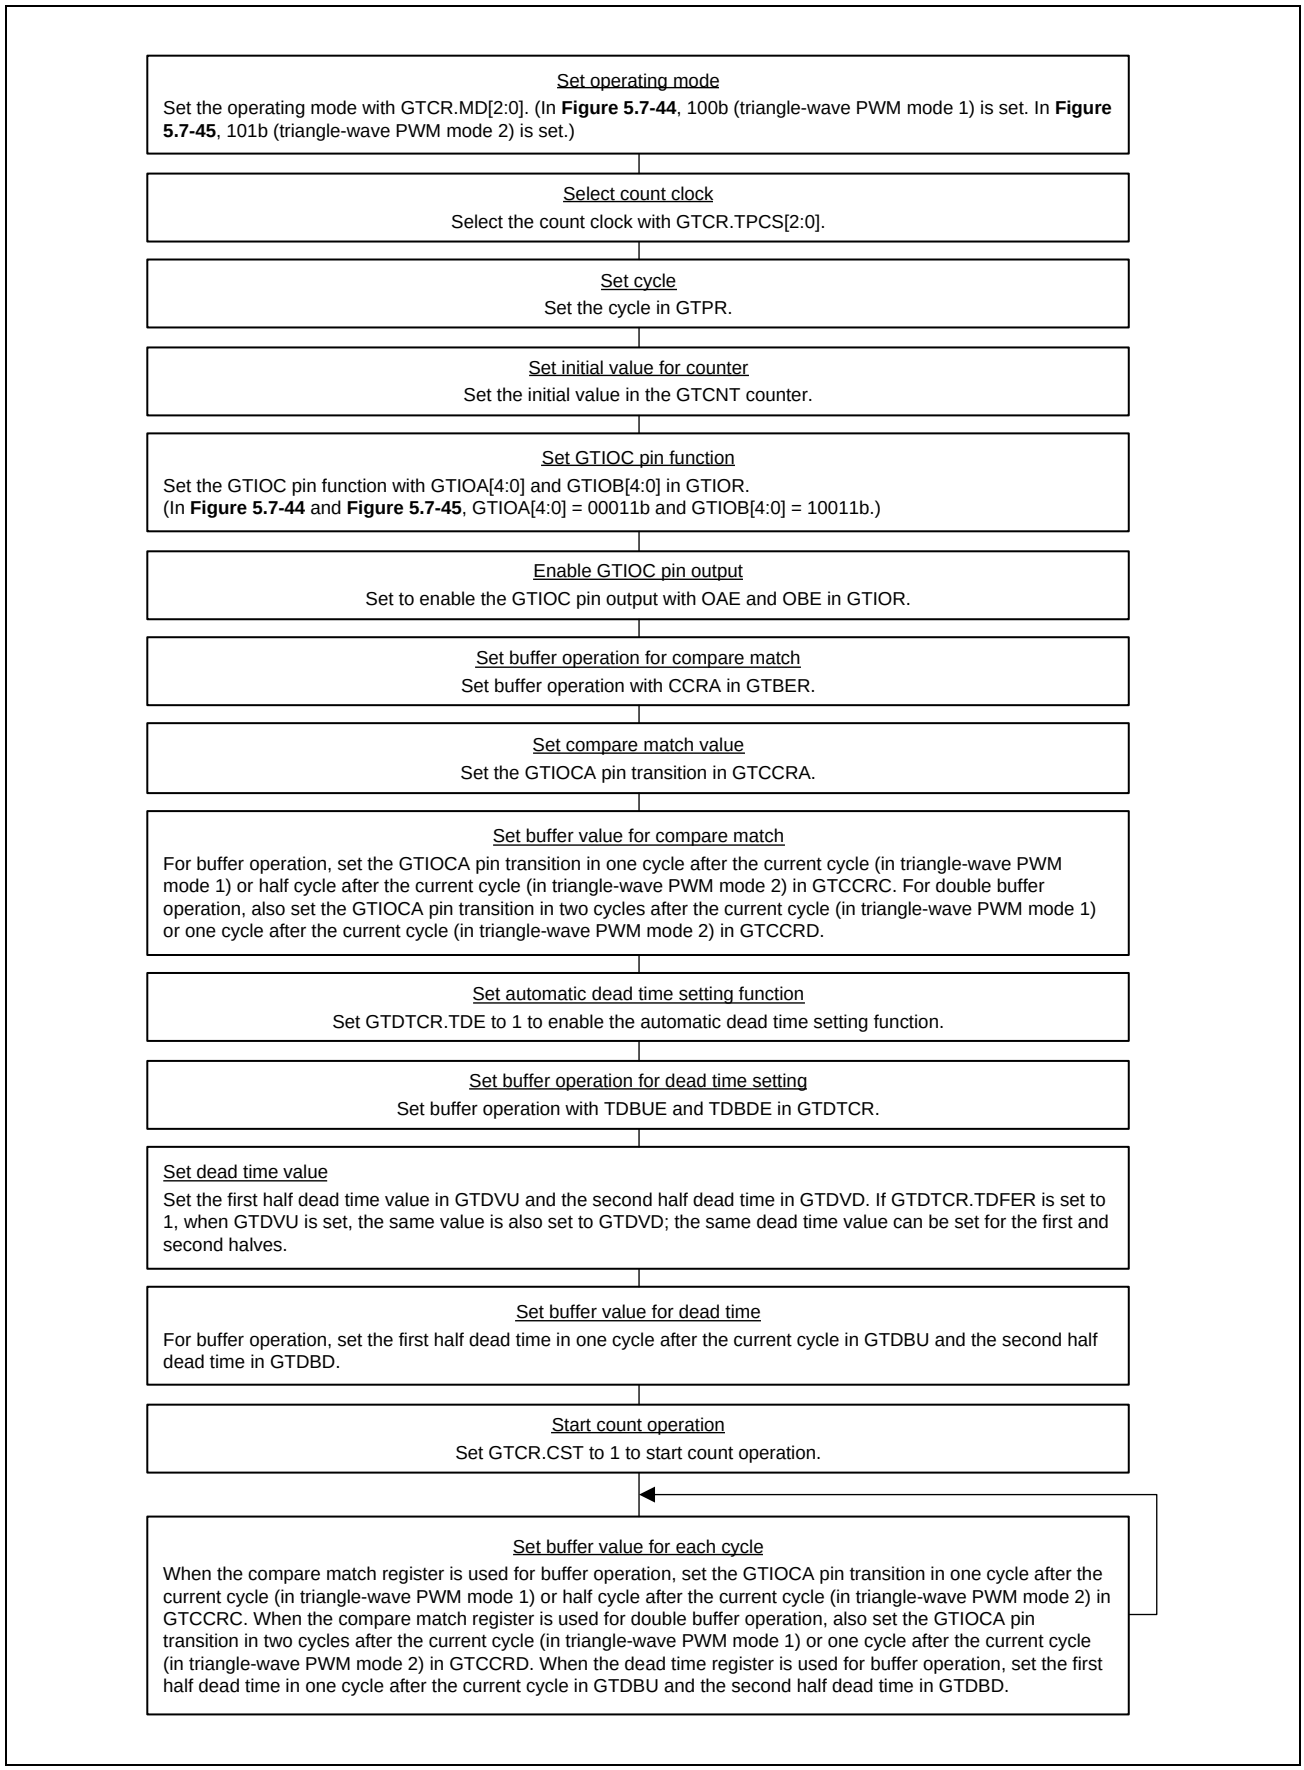

Figure 5.7-47 Example setting for automatic dead time setting function with triangle-wave PWM mode 1 or 2

5.7.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected to the count cycle during up-counting and the GTPR value before the start of down-counting is reflected during down-counting.

Figure 5.7-48 shows an example of count direction changing function operation.

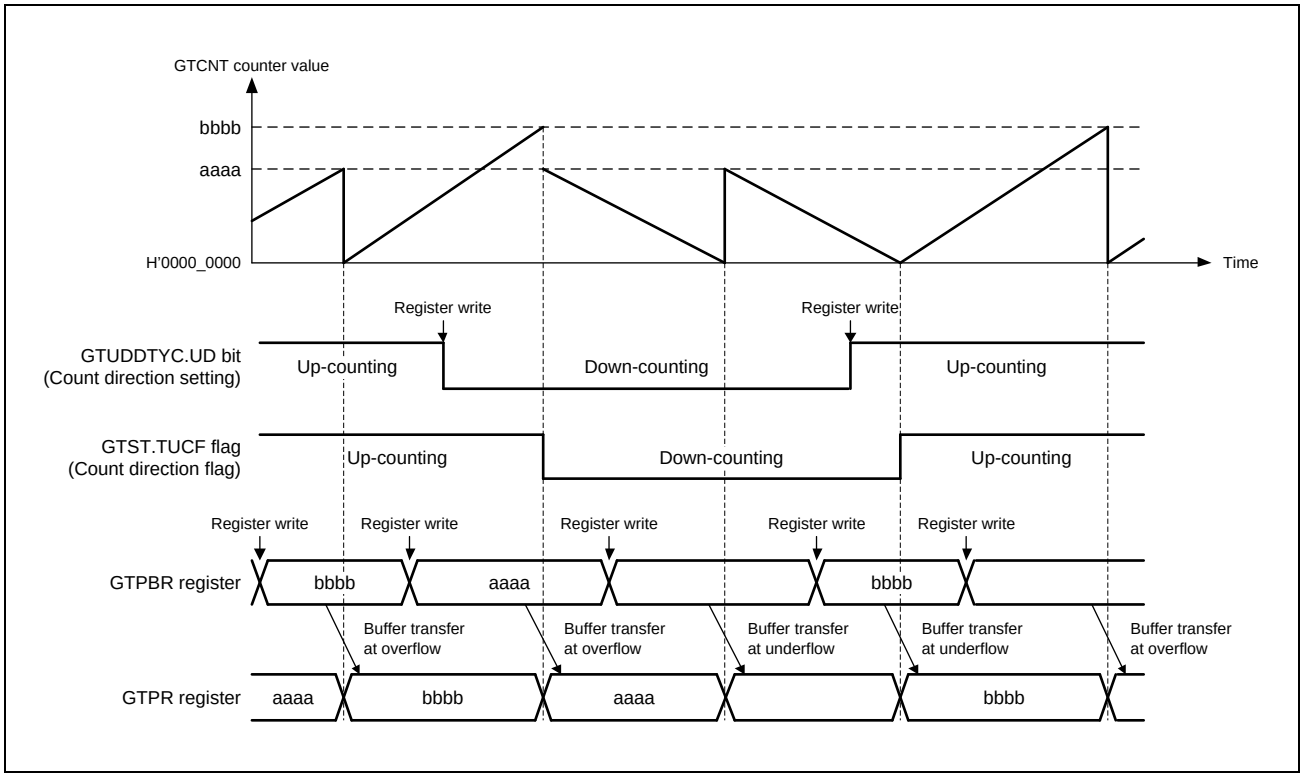

Figure 5.7-48 Example of count direction changing function operation during buffer operation

5.7.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCA pin and the GTIOCB pin are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is set to 1 while the count operation stops, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

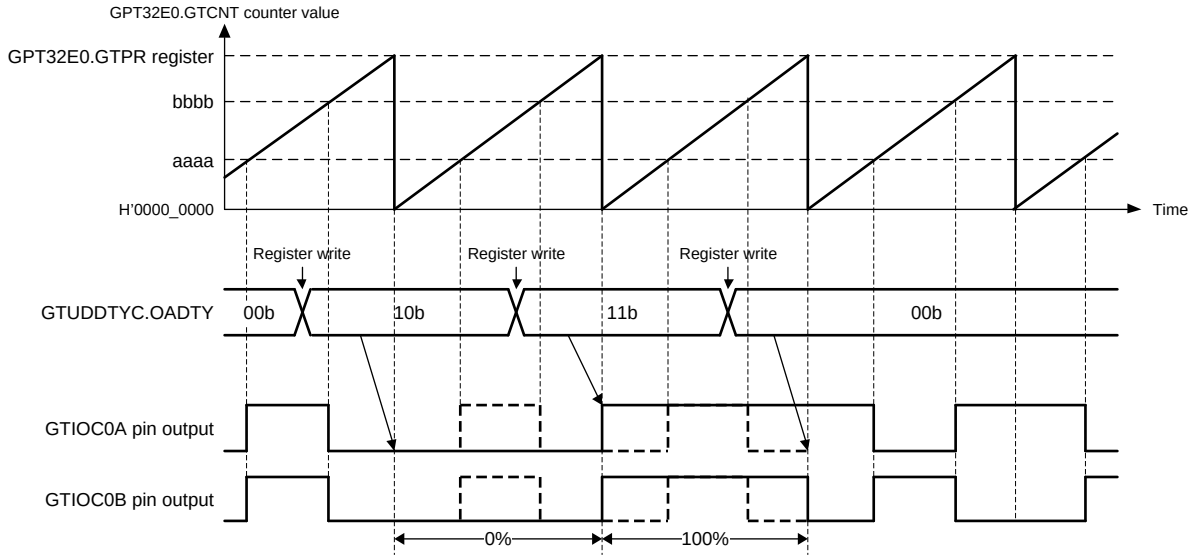
In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0%/100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.



When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). **Table 5.7-7** shows the values of GTIOCA/GTIOCB pin output at cycle end.

Table 5.7-7 Output values after releasing 0% or 100% duty setting (m = A, B)

GTIOR.GTIOm[3:2]	Compare match value at cycle end masked by 0% or 100% duty setting	GTUDDTYC.OmDTYR in duty 0% setting		GTUDDTYC.OmDTYR in duty 100% setting	
		0	1	0	1
00 (Output retained at cycle end)	0	0	0	1	0
	1	0	1	1	1
01 (low output at cycle end)	—	0	0	0	0
10 (high output at cycle end)	—	1	1	1	1
11 (Output toggled at cycle end)	0	1	1	0	1
	1	1	0	0	0

Figure 5.7-49 shows the example of output duty 0% and 100% functions.

[Setting examples]

GPT32E0.GTIOR.GTIOA[4:0] bits: 00011b
Initial output of low, output toggled at compare match, output retained at cycle end

GPT32E0.GTUDDTYC.OADTYR bit: 0
Applied the value of duty 0%/100% output to GTIOA[3:2] bits function after 0%/100% duty setting is released.

GPT32E0.GTIOR.GTIOB[4:0] bits: 00011b
Initial output of low, output toggled at compare match, output retained at cycle end

GPT32E0.GTUDDTYC.OBDTYR bit: 1
Applied the value of masked compare match output to GTIOB[3:2] bits function after 0%/100% duty setting is released

Figure 5.7-49 Example of output duty 0% and 100% functions

5.7.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- GTIOCA/GTIOCB pin input.

5.7.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 5.7-50 shows an example of a count start operation by a hardware source. **Figure 5.7-51** shows the setting example.

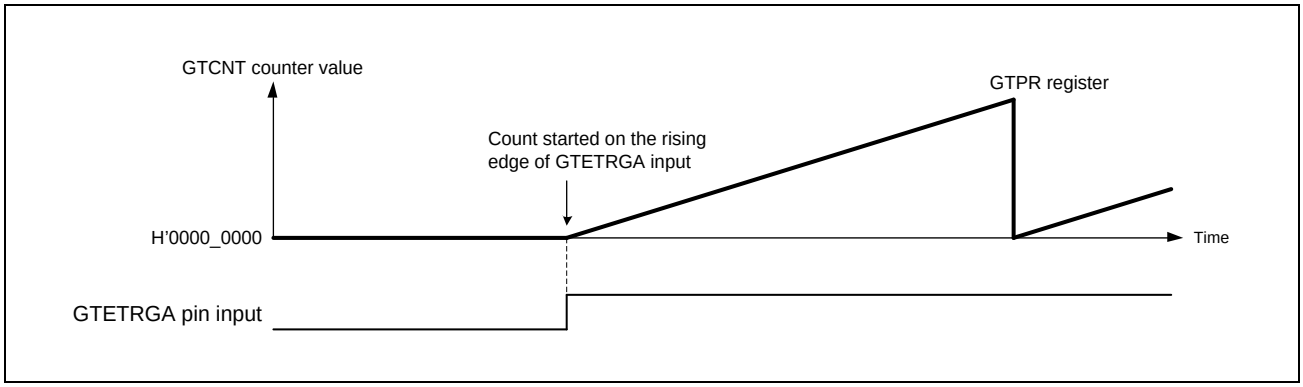


Figure 5.7-50 Example of count start operation by hardware source, started on the rising edge of GTETRGA pin input

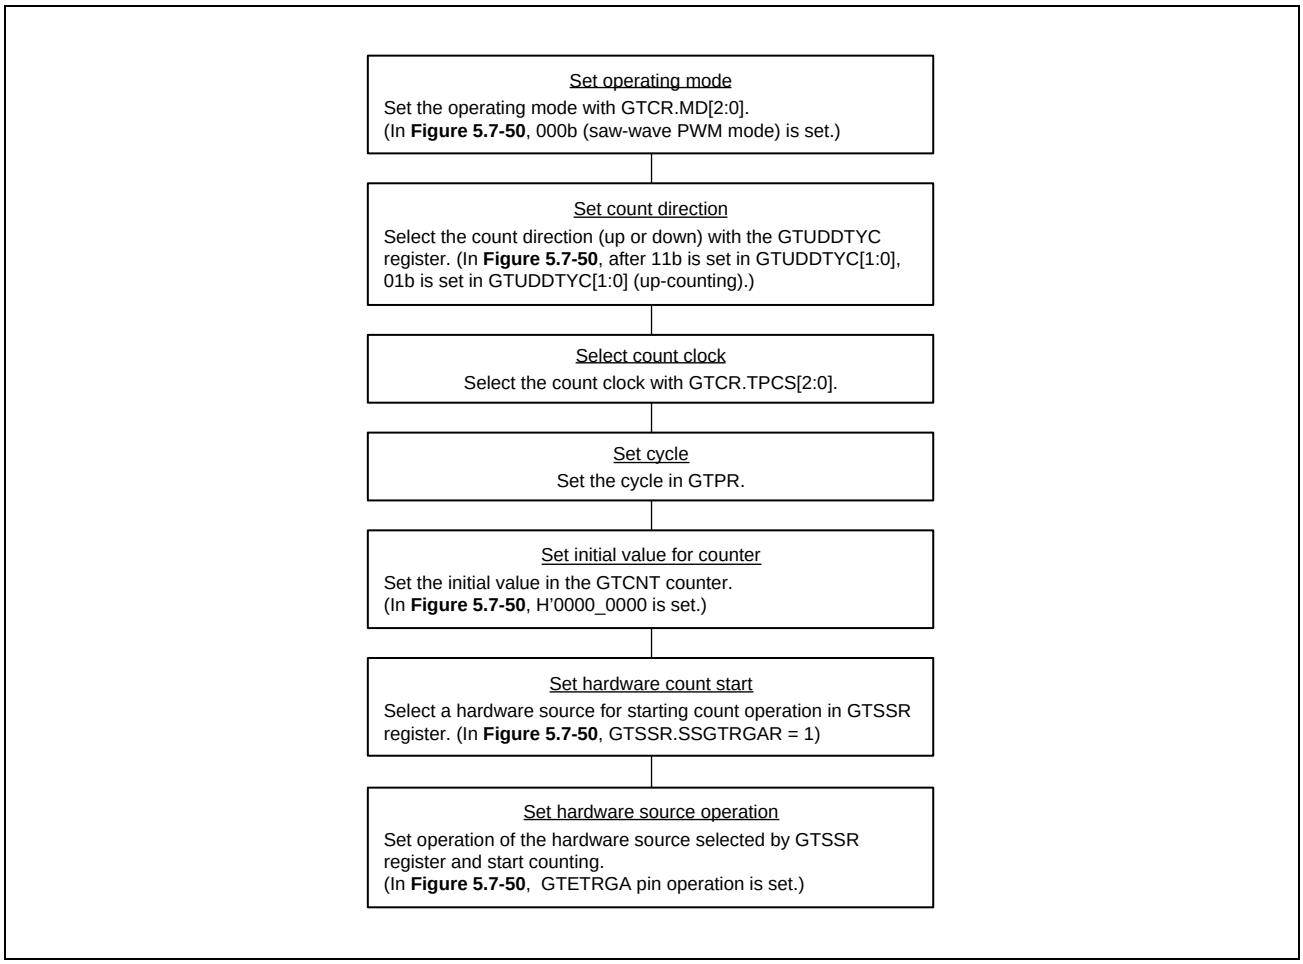

Figure 5.7-51 Example setting for count start operation by hardware source

5.7.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR. **Figure 5.7-52** shows an example of a count stop operation by a hardware source. **Figure 5.7-53** shows the setting example. In this example, the count operation stops at the rising edge of GTETRGA pin input and restarts at the rising edge of GTETRGB pin input.

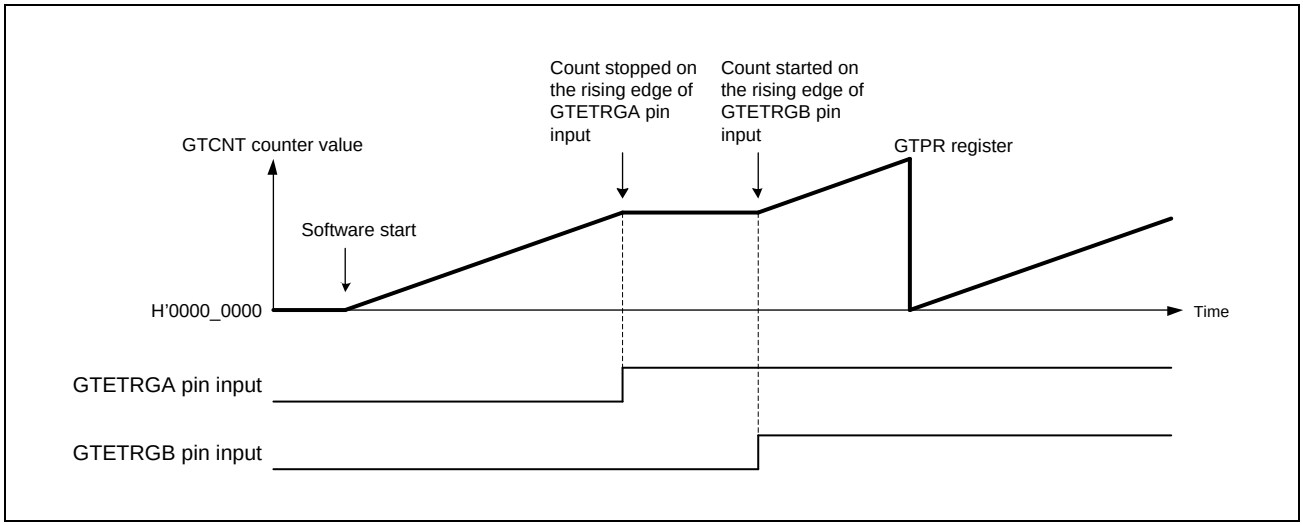

Figure 5.7-52 Example of count start operation by hardware source, started by software, stopped on the rising edge of GTETRGA pin input, and restarted on the rising edge of GTETRGB pin input

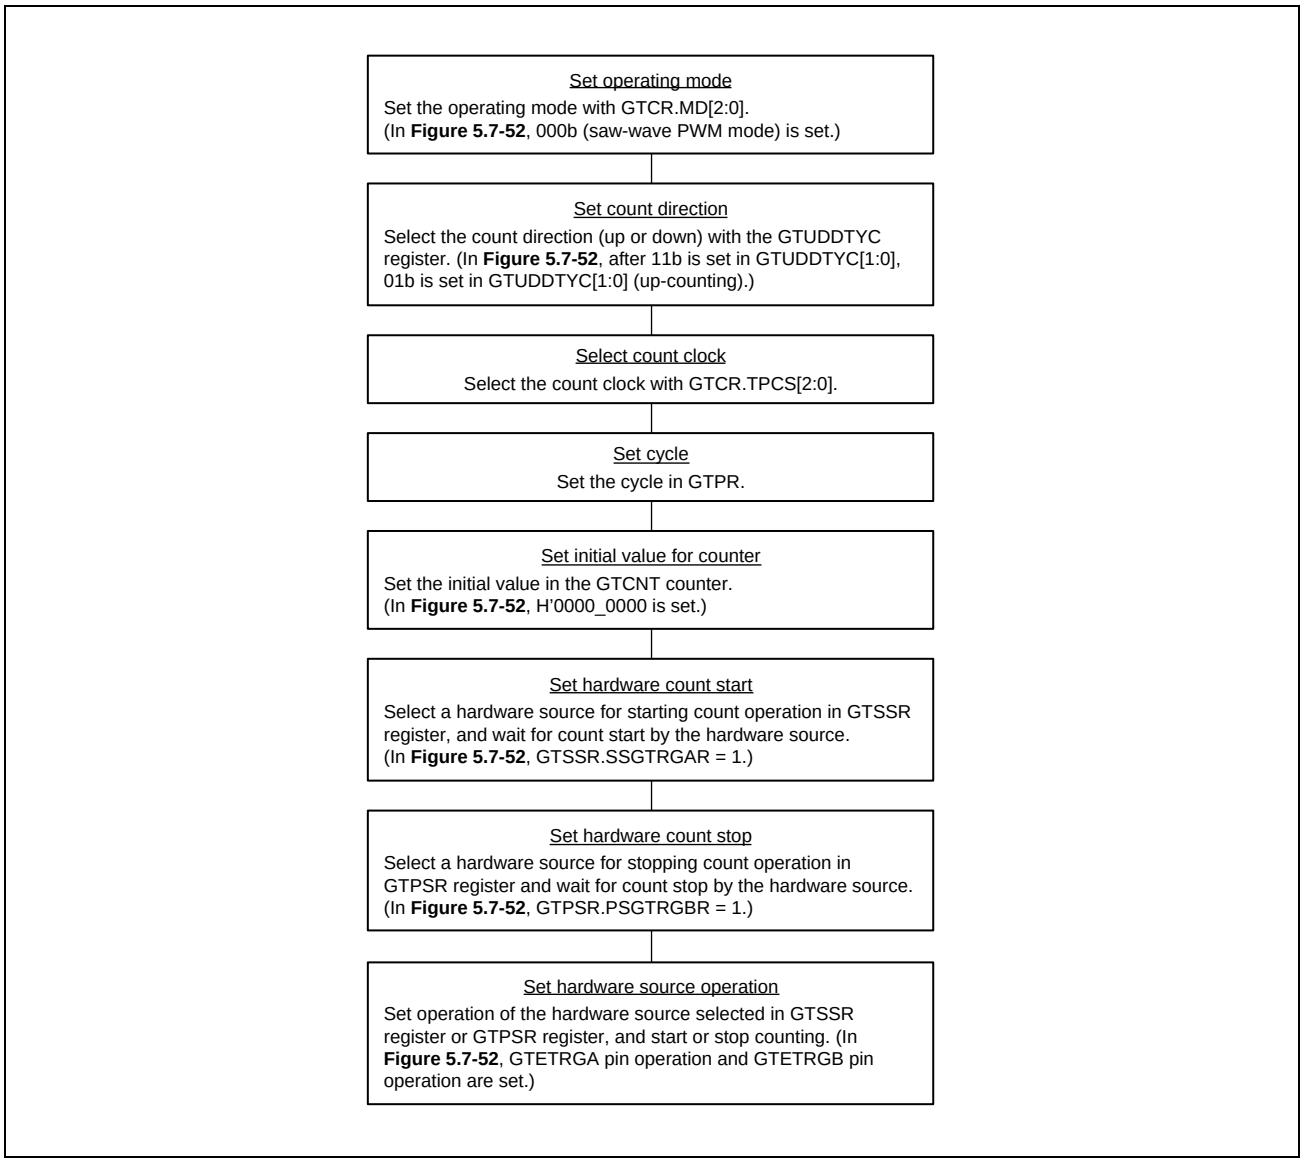

Figure 5.7-53 Example setting for count stop operation by hardware source

Figure 5.7-54 shows an example of a count start/stop operation by a hardware source. **Figure 5.7-55** shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

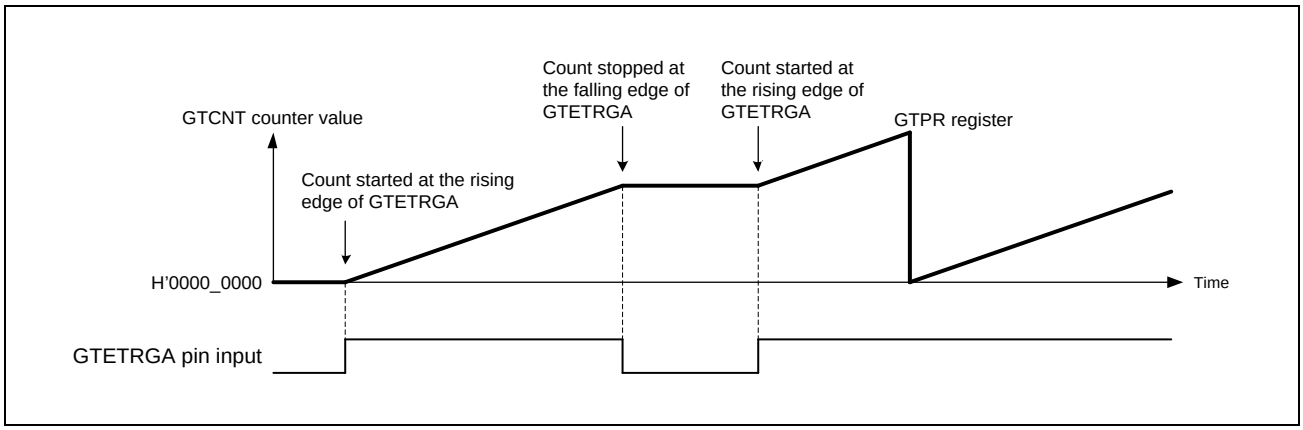

Figure 5.7-54 Example of count start/stop operation by hardware source, started on the rising edge of the GTETRGA pin input and stopped on the falling edge of the GTETRGA pin input

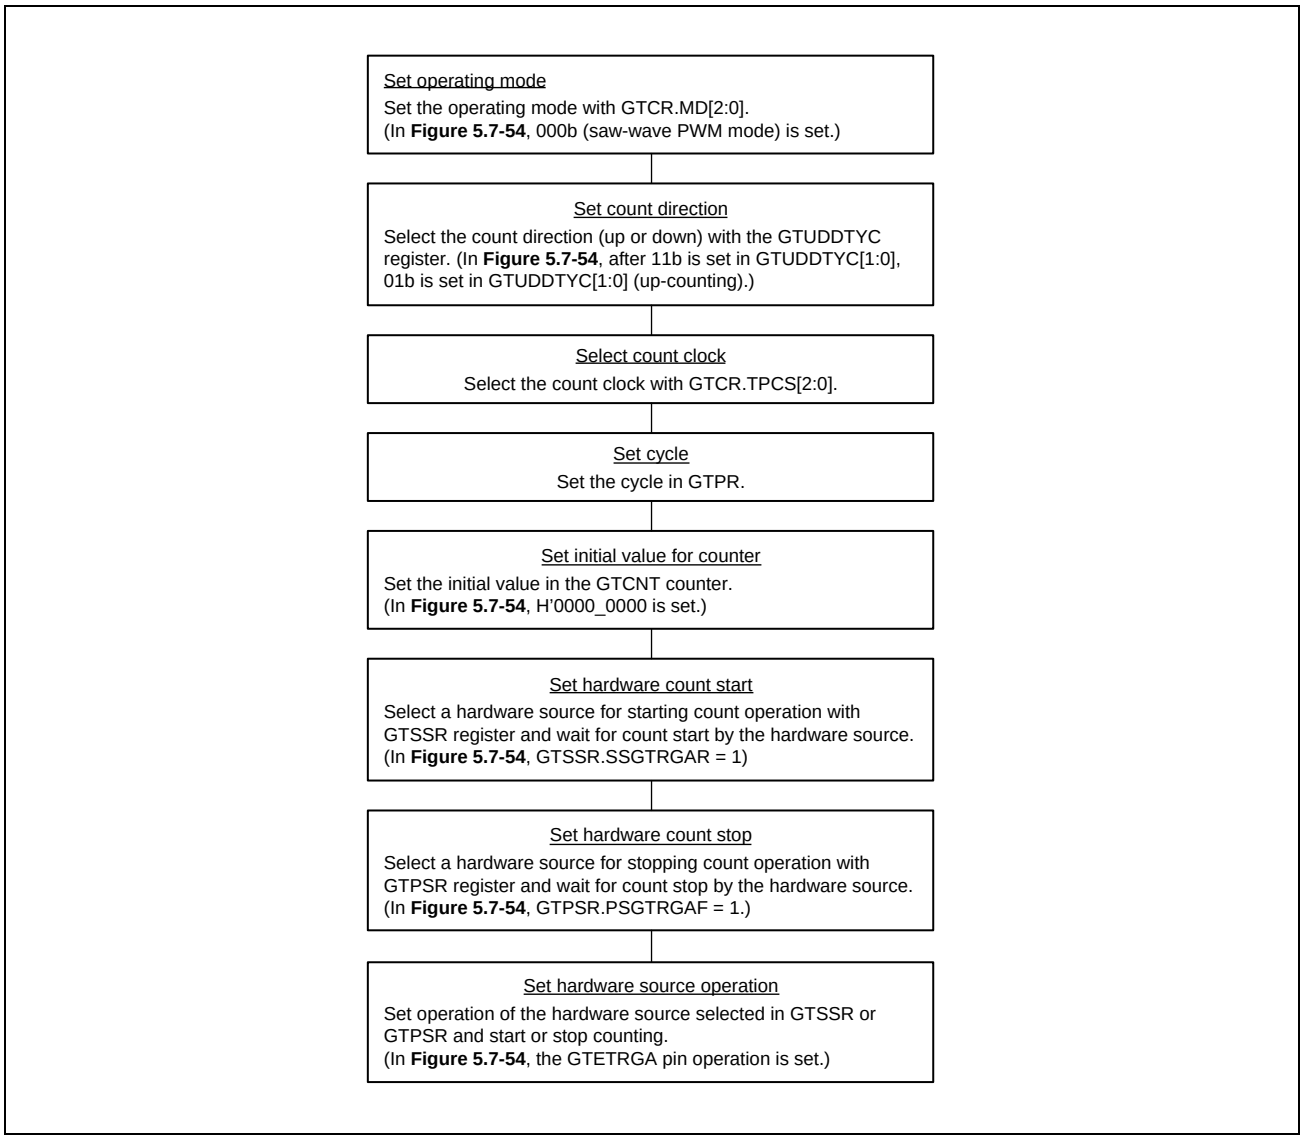

Figure 5.7-55 Example setting for count start/stop operation by hardware source

5.7.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The OVFn/UNFn (n=0 to 7) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 5.7-56 and **Figure 5.7-57** show examples of the GTCNT counter clearing operation by a hardware source. **Figure 5.7-58** shows the setting example. In this example, the GTCNT counter starts at the rising edge of GTETRGA pin input, and the counter stops/clears at the falling edge of GTETRGA pin input.

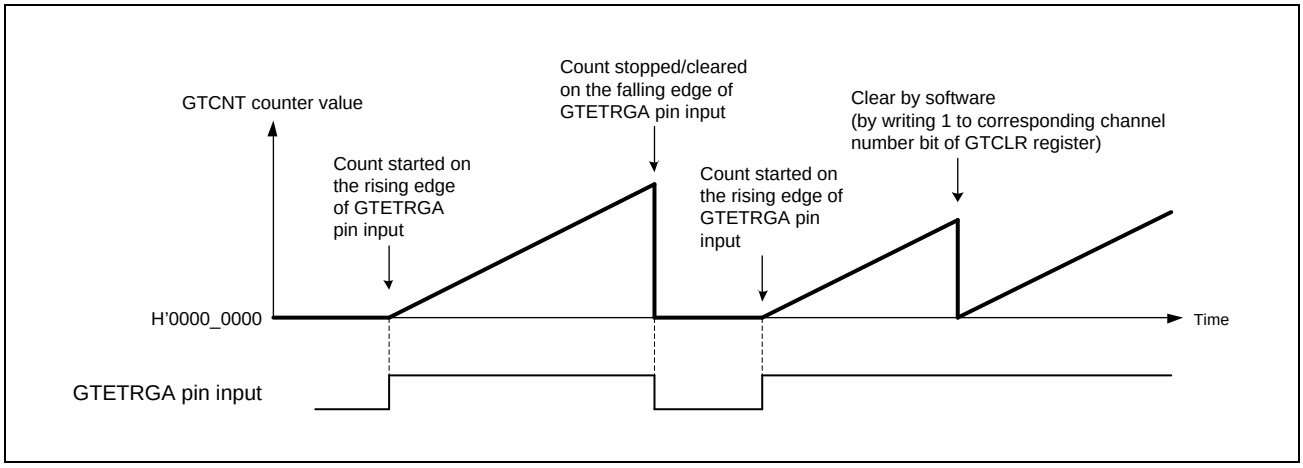

Figure 5.7-56 Example of count clearing operation by hardware source with saw wave up-counting, started on the rising edge of GTETRGA pin input, and stopped/cleared on the falling edge of GTETRGA pin input

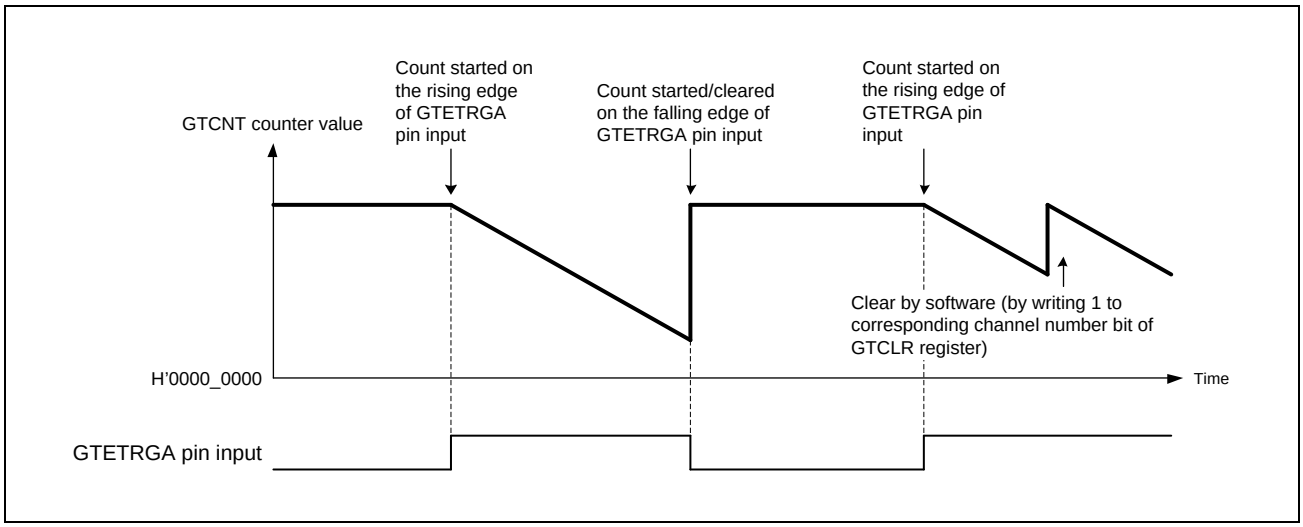

Figure 5.7-57 Examples of count clearing operation by hardware source with saw wave down-counting, started at event input A, and stopped/cleared at event input B

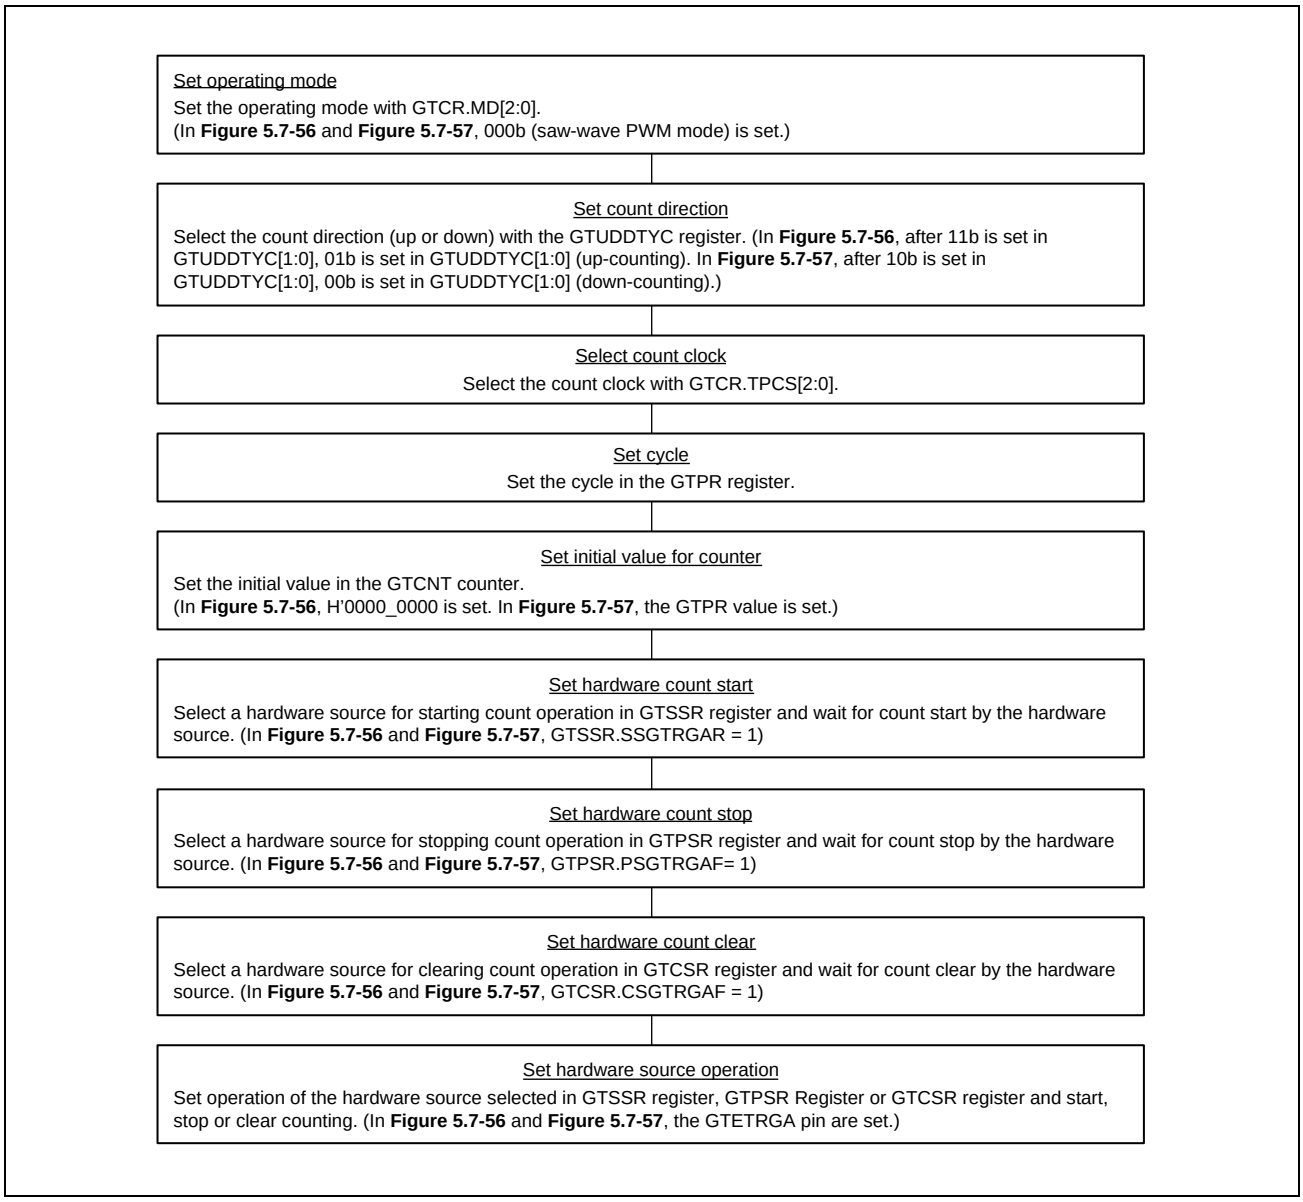

Figure 5.7-58 Example setting for count clearing operation by hardware source

The OVFn/UNFn (n=0 to 7) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 5.7-59 shows the relationship between the counter clearing by a hardware source and the OVFn (n=0 to 7) interrupt.

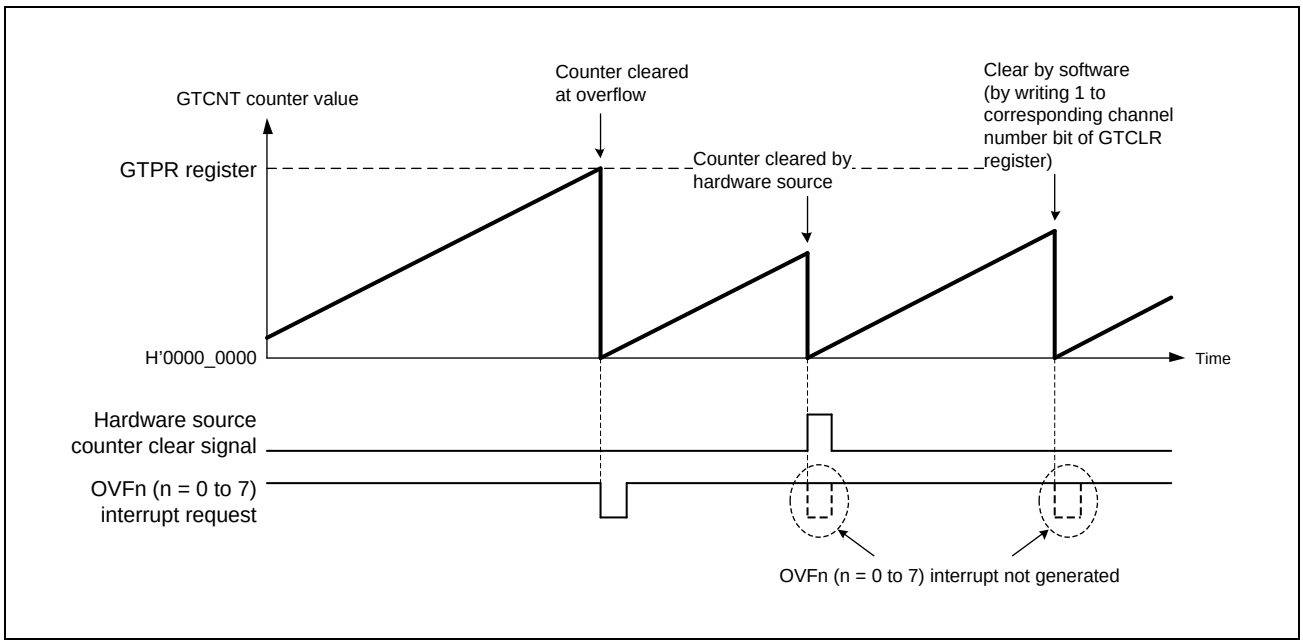

Figure 5.7-59 Relationship between counter clearing by hardware source and OVFn (n = 0 to 7) interrupt

5.7.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop and clear operation can be performed.

5.7.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

Figure 5.7-60 shows an example of a simultaneous start, stop and clear by software. **Figure 5.7-61** shows an example of phase start operation by software.

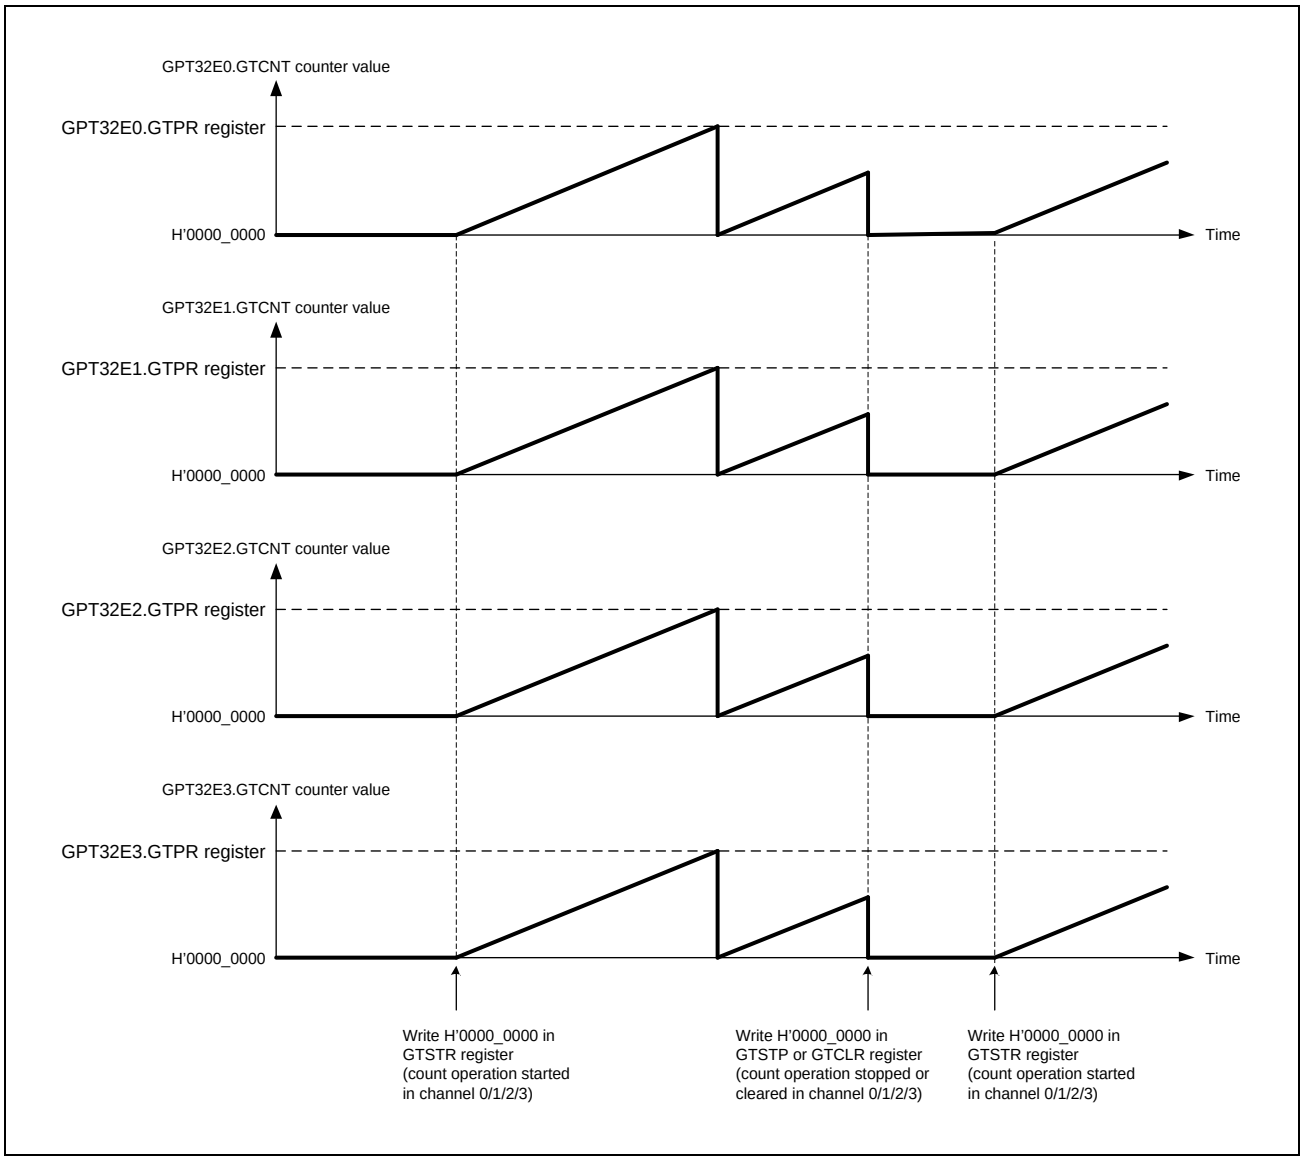

Figure 5.7-60 Example of a simultaneous start, stop, and clear by software, with the same count cycle (GTPR register value)

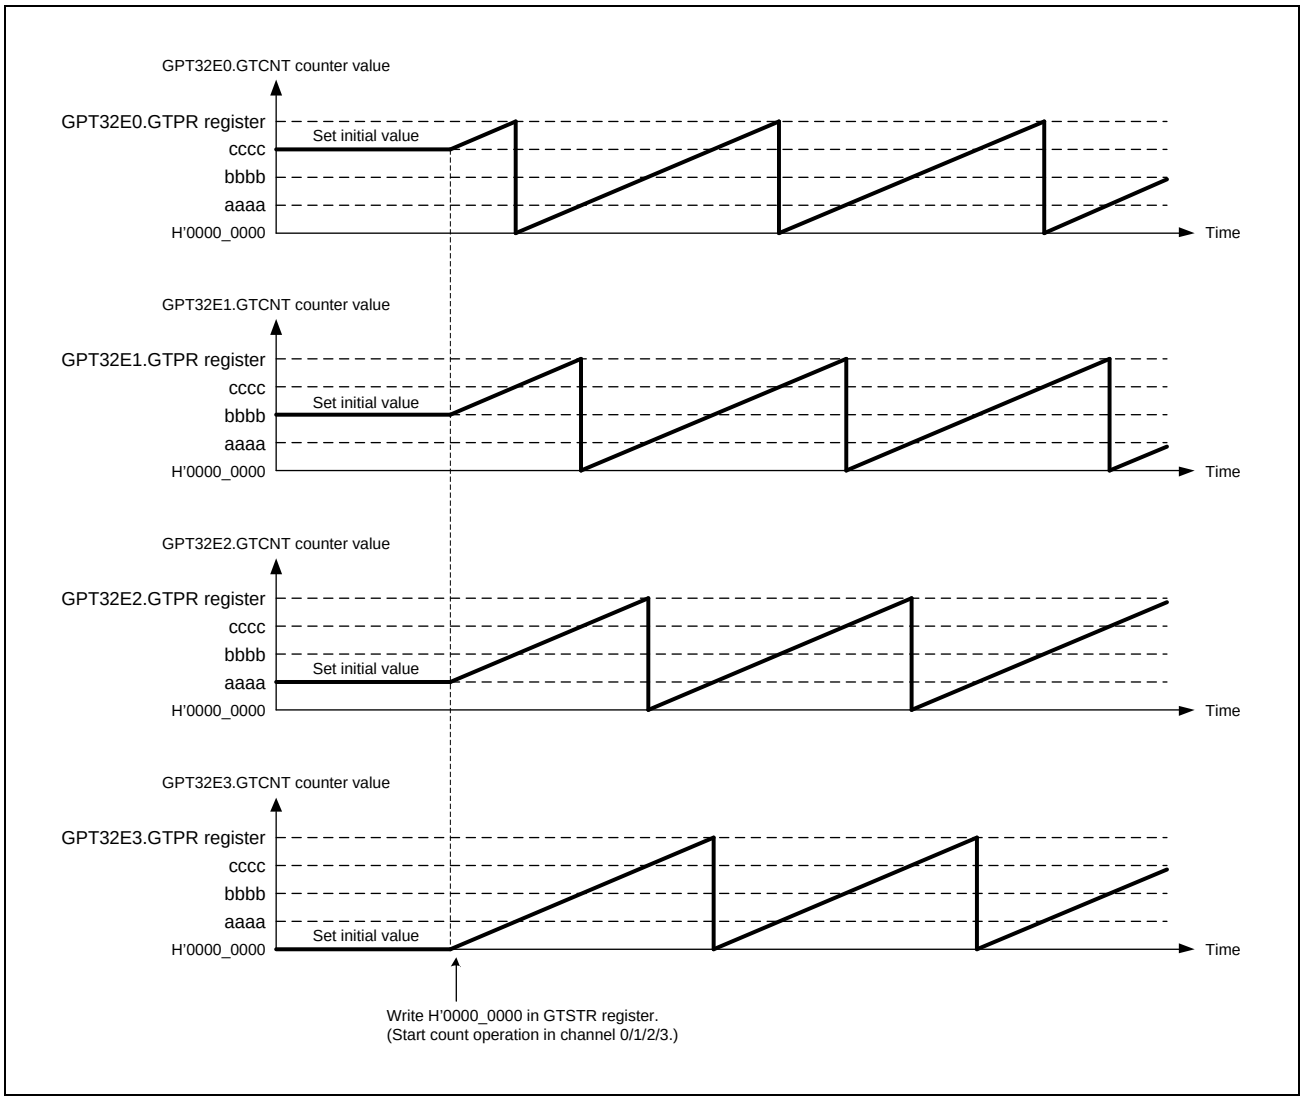

Figure 5.7-61 Example of software phase start with the same count cycle (GTPR register value)

5.7.3.8.2 Synchronized Operation by Hardware

The GTCNT counters can be started simultaneously by the following hardware sources:

- External trigger input

Figure 5.7-62 shows an example of a simultaneous start, stop and clear operation by a hardware source. **Figure 5.7-63** shows the setting example.

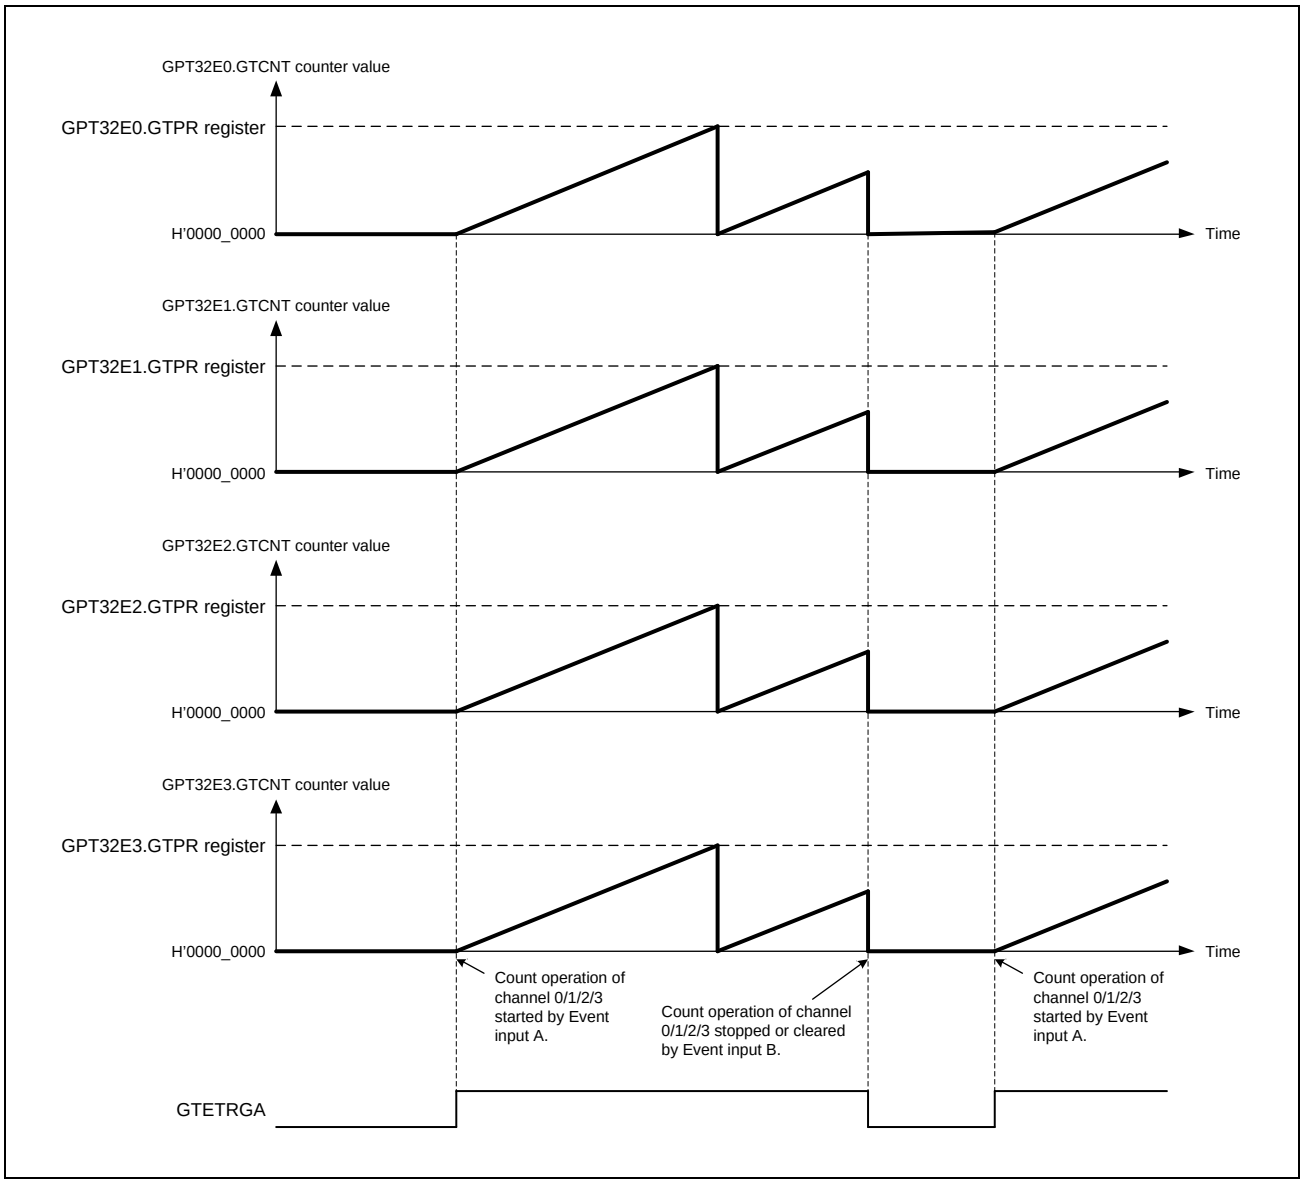

Figure 5.7-62 Example of a simultaneous start, stop, and clear by the hardware sources, with the same count cycle (GTPR register value)

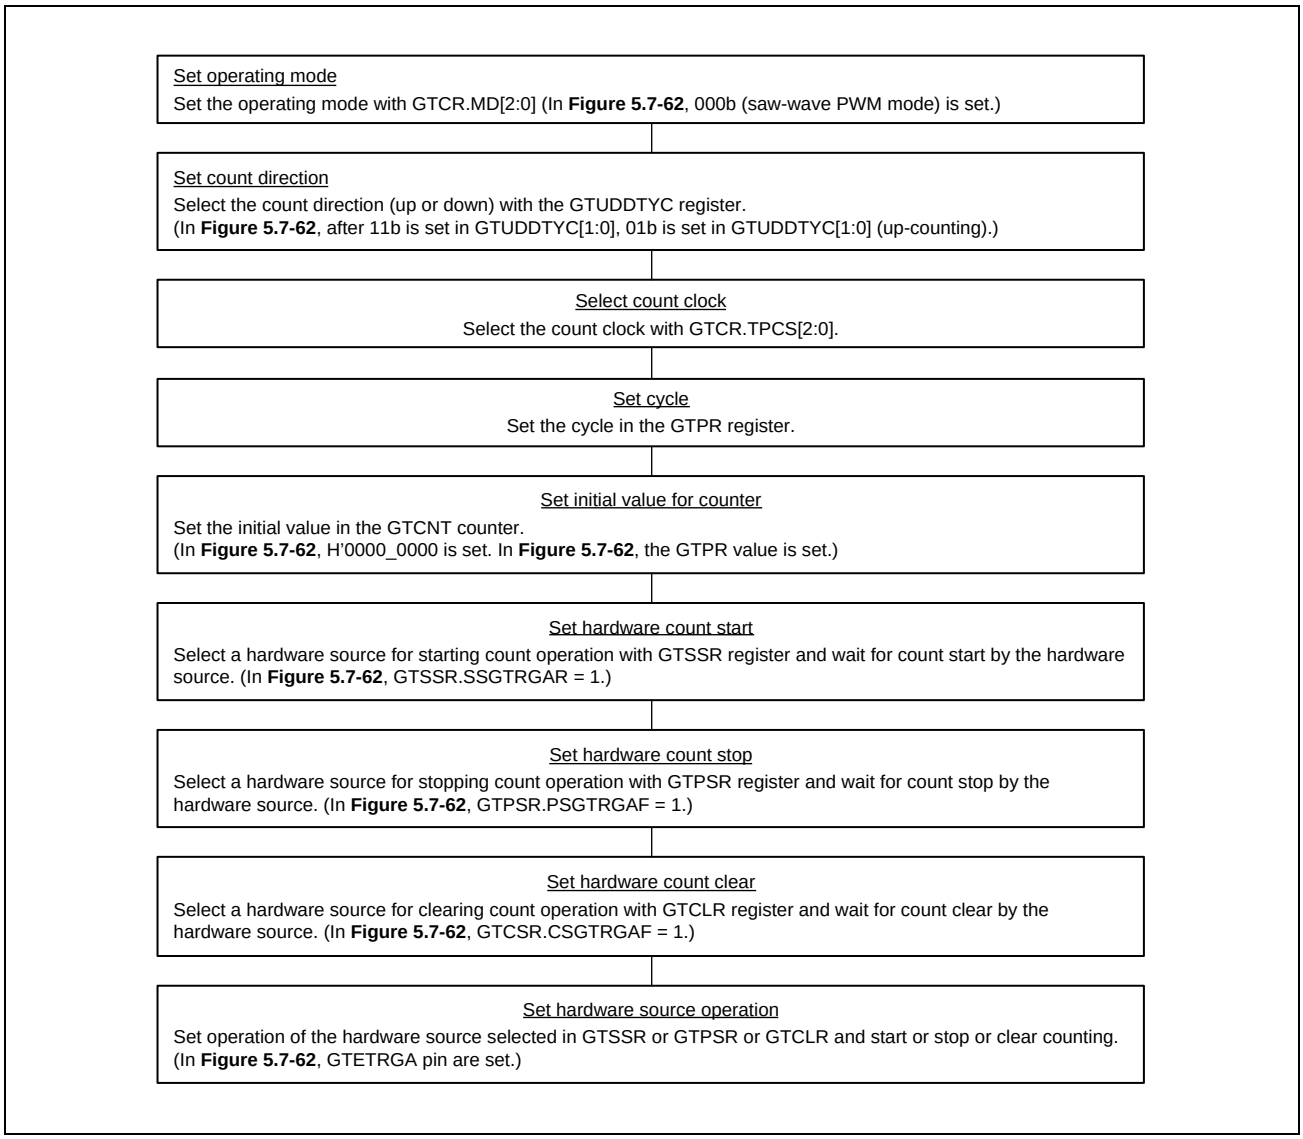

Figure 5.7-63 Example setting for simultaneous start by hardware source

5.7.3.9 PWM Output Operation Examples

5.7.3.9.1 Synchronized PWM Output

The GPT output 16 phases of linked PWM waveforms for a maximum of 8 channels by synchronizing operation on channels.

Figure 5.7-64 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

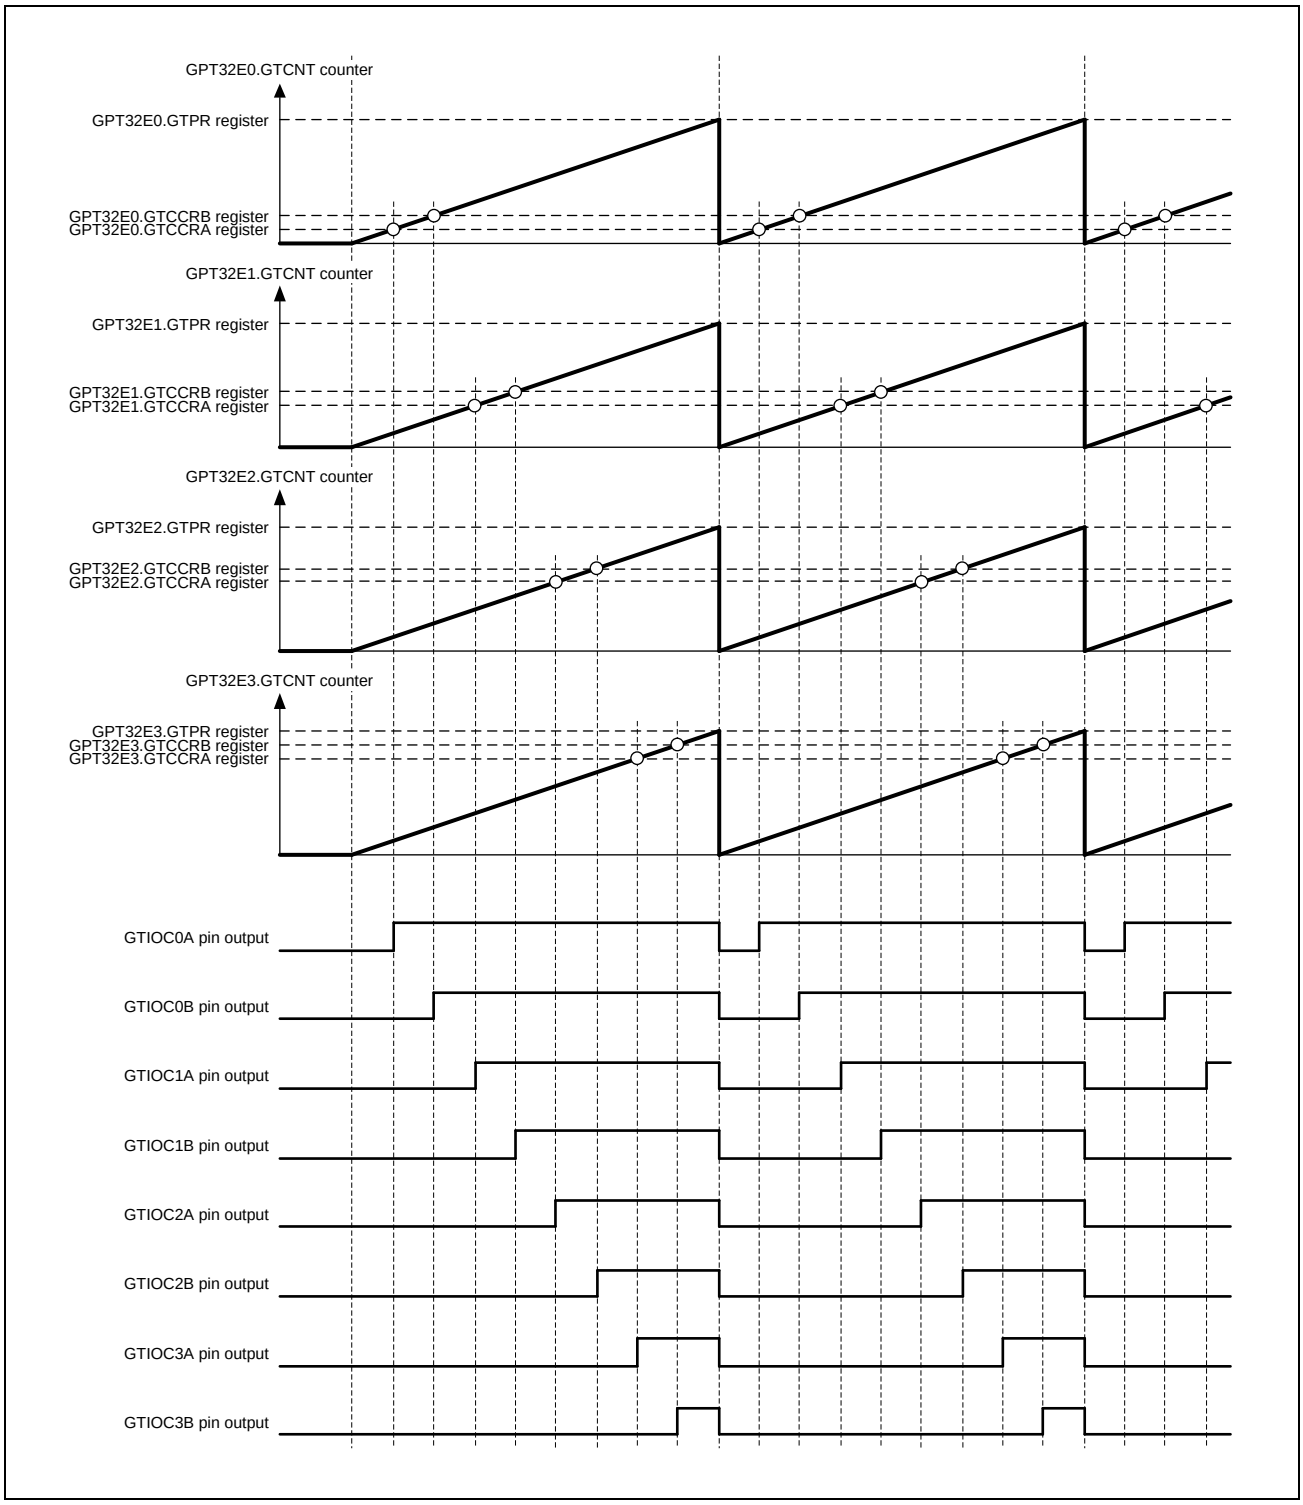

Figure 5.7-64 Example of synchronized PWM output

5.7.3.9.2 Three-Phase Saw-Wave Complementary PWM Output

Figure 5.7-65 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

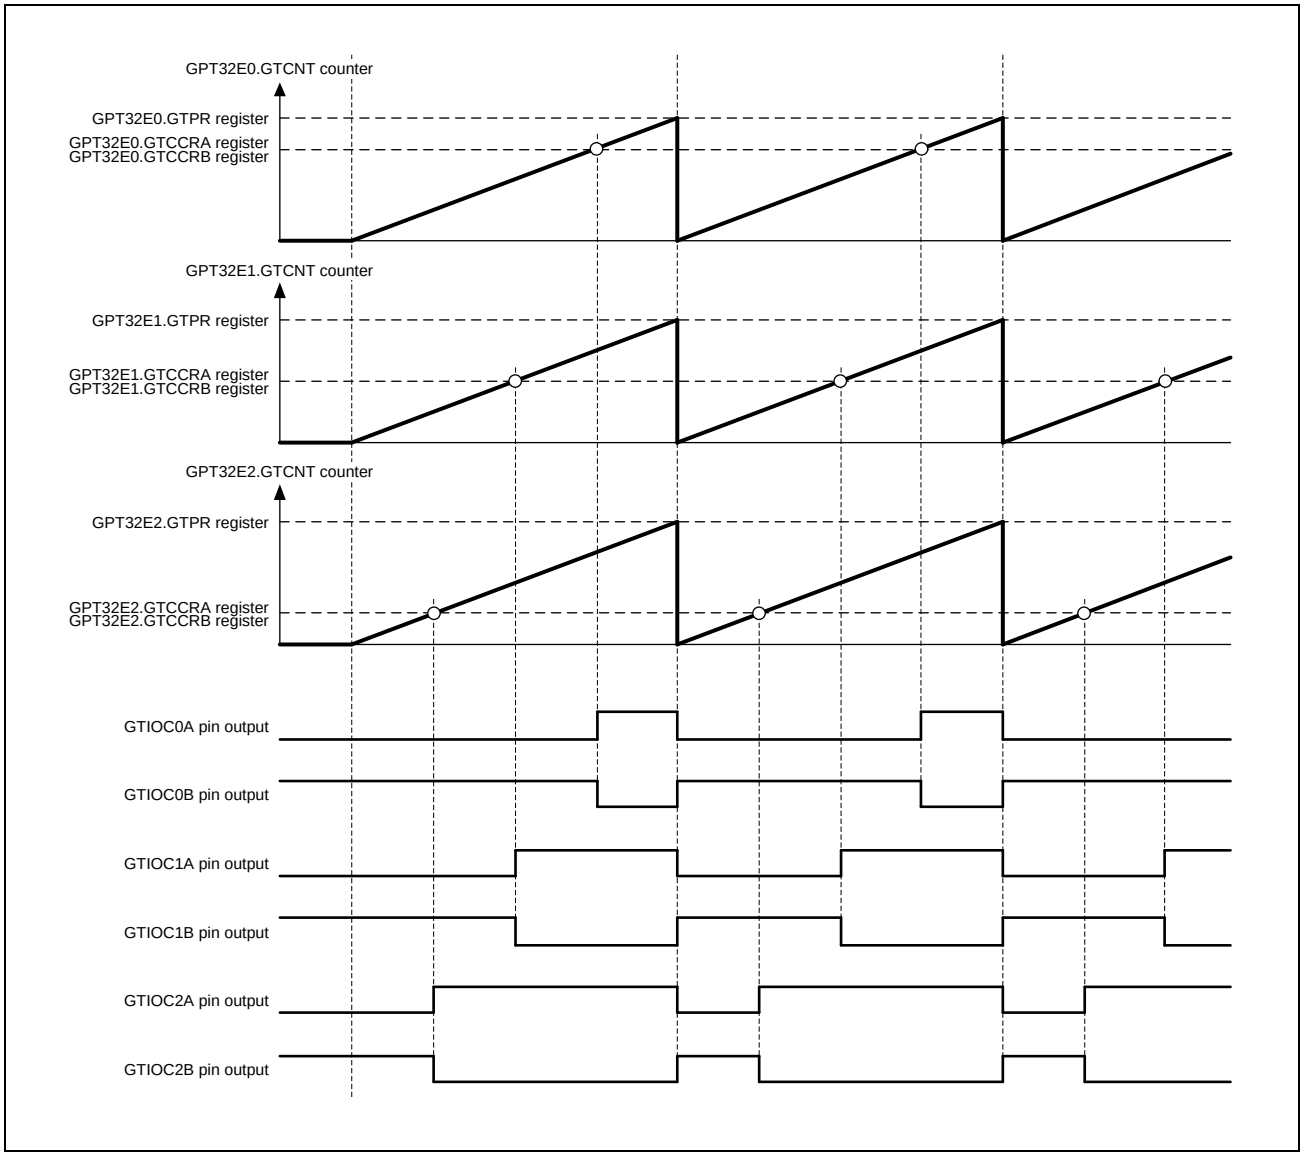

Figure 5.7-65 Example of 3-phase saw-wave complementary PWM output

5.7.3.9.3 3-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 5.7-66 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggle the output at a GTCCRA compare match, and retain the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggle the output at a GTCCRB compare match, and retain the output at the cycle end.

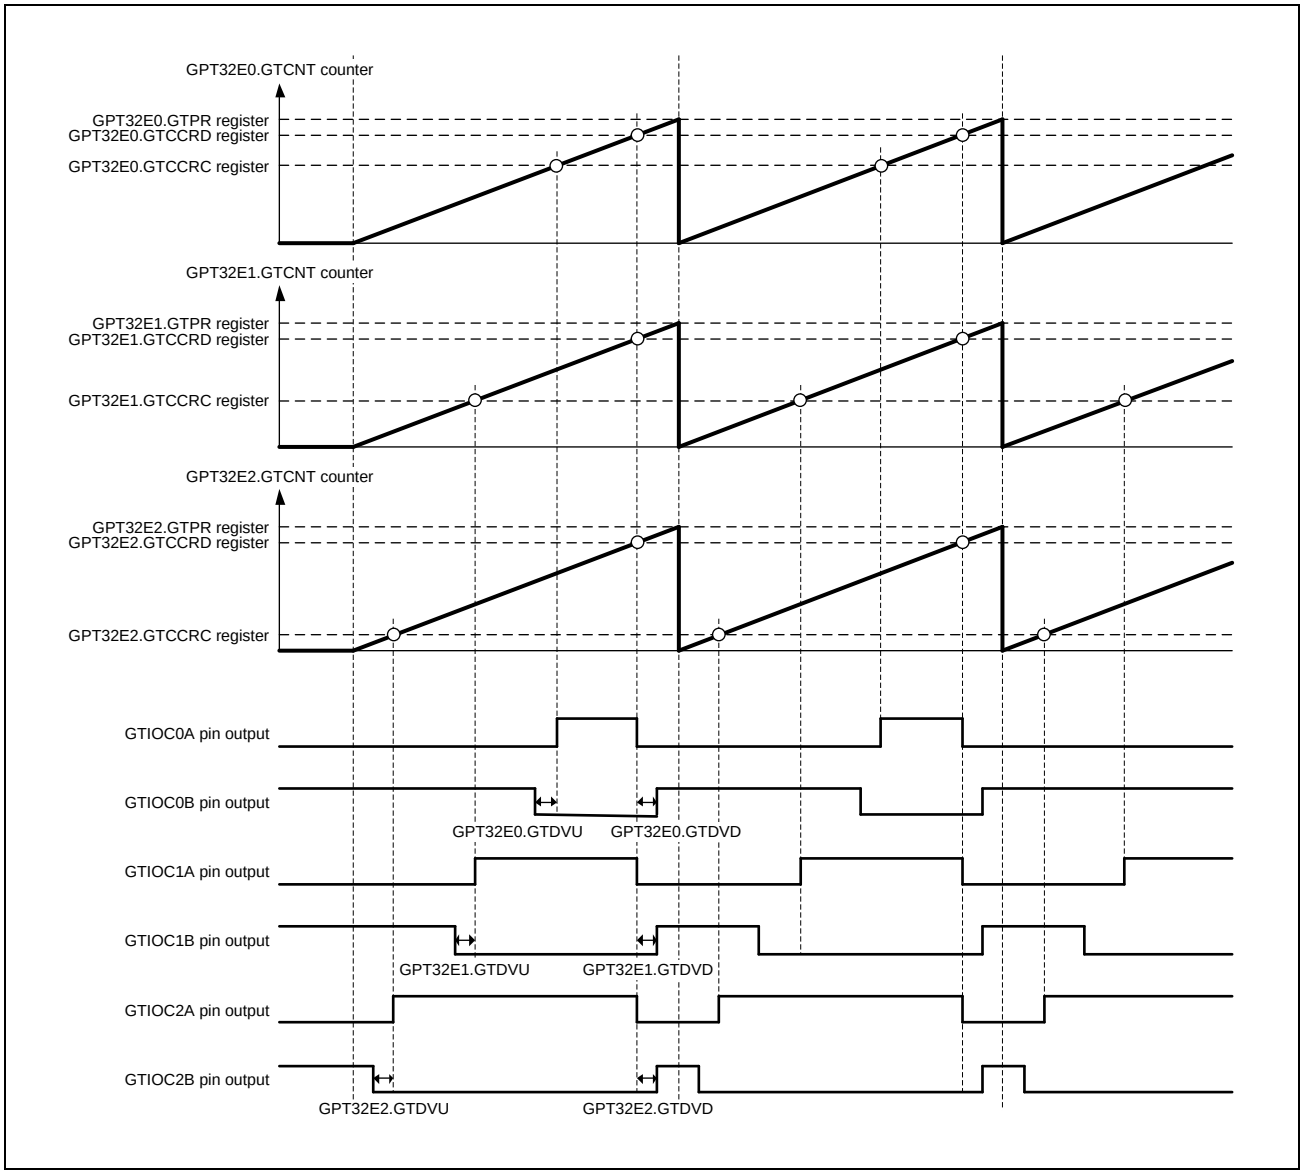

Figure 5.7-66 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

5.7.3.9.4 3-Phase Triangle-Wave Complementary PWM Output

Figure 5.7-67 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

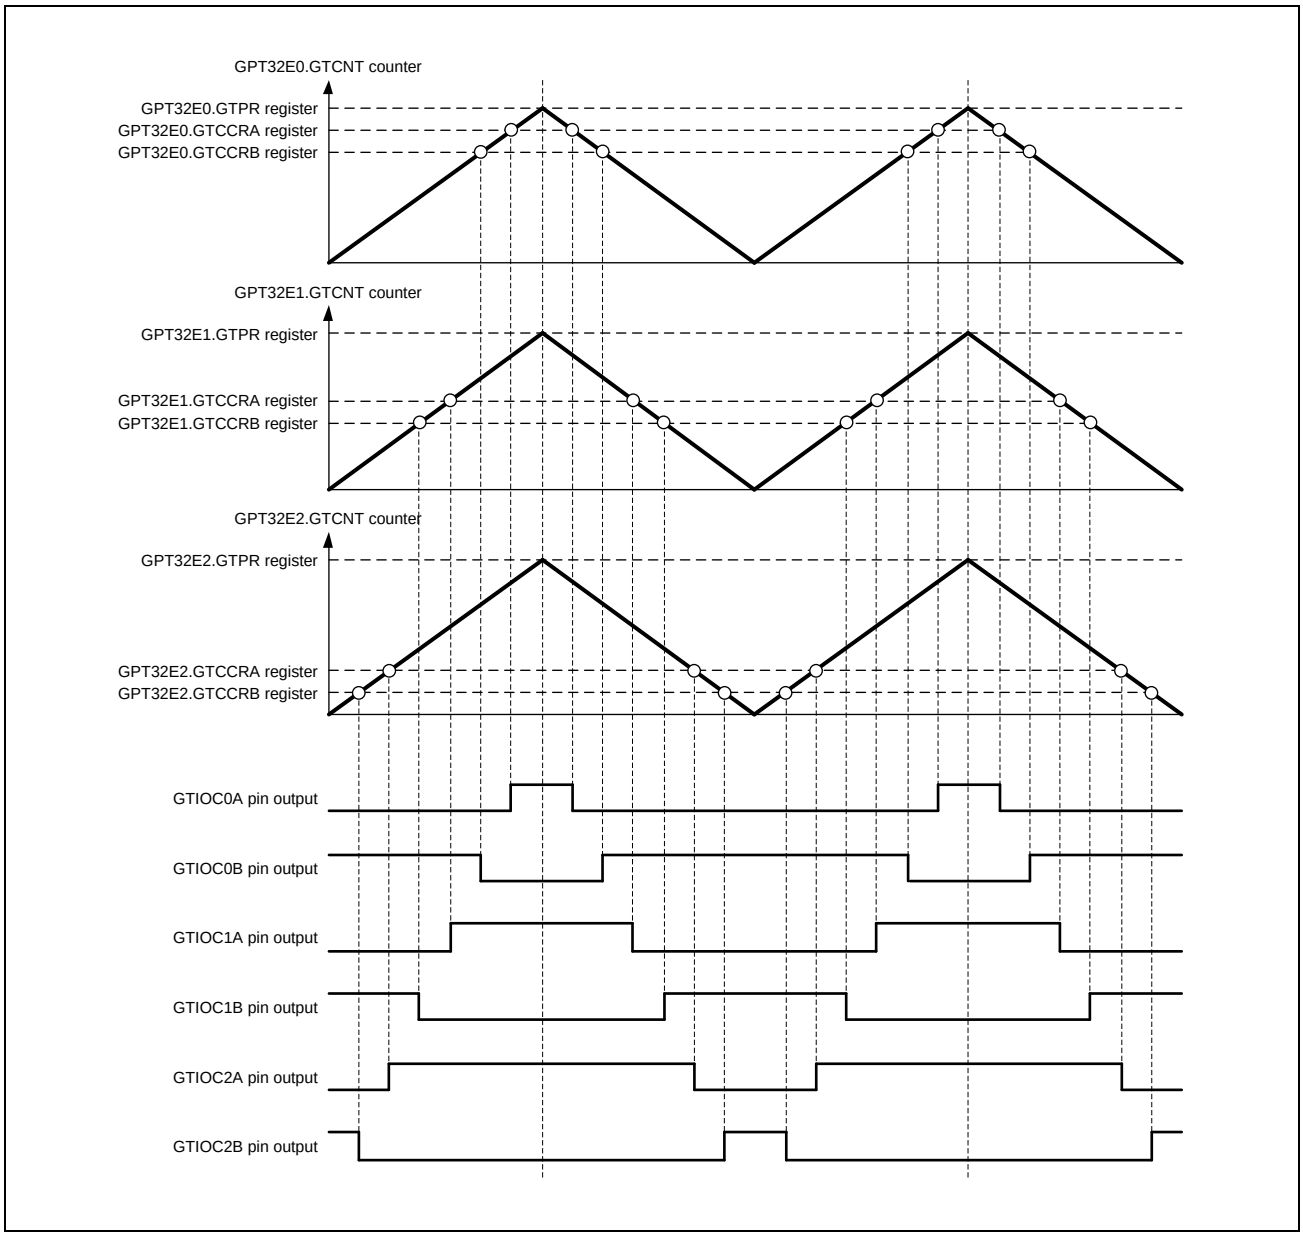

Figure 5.7-67 Example of 3-phase triangle-wave complementary PWM output

5.7.3.9.5 3-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 5.7-68 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

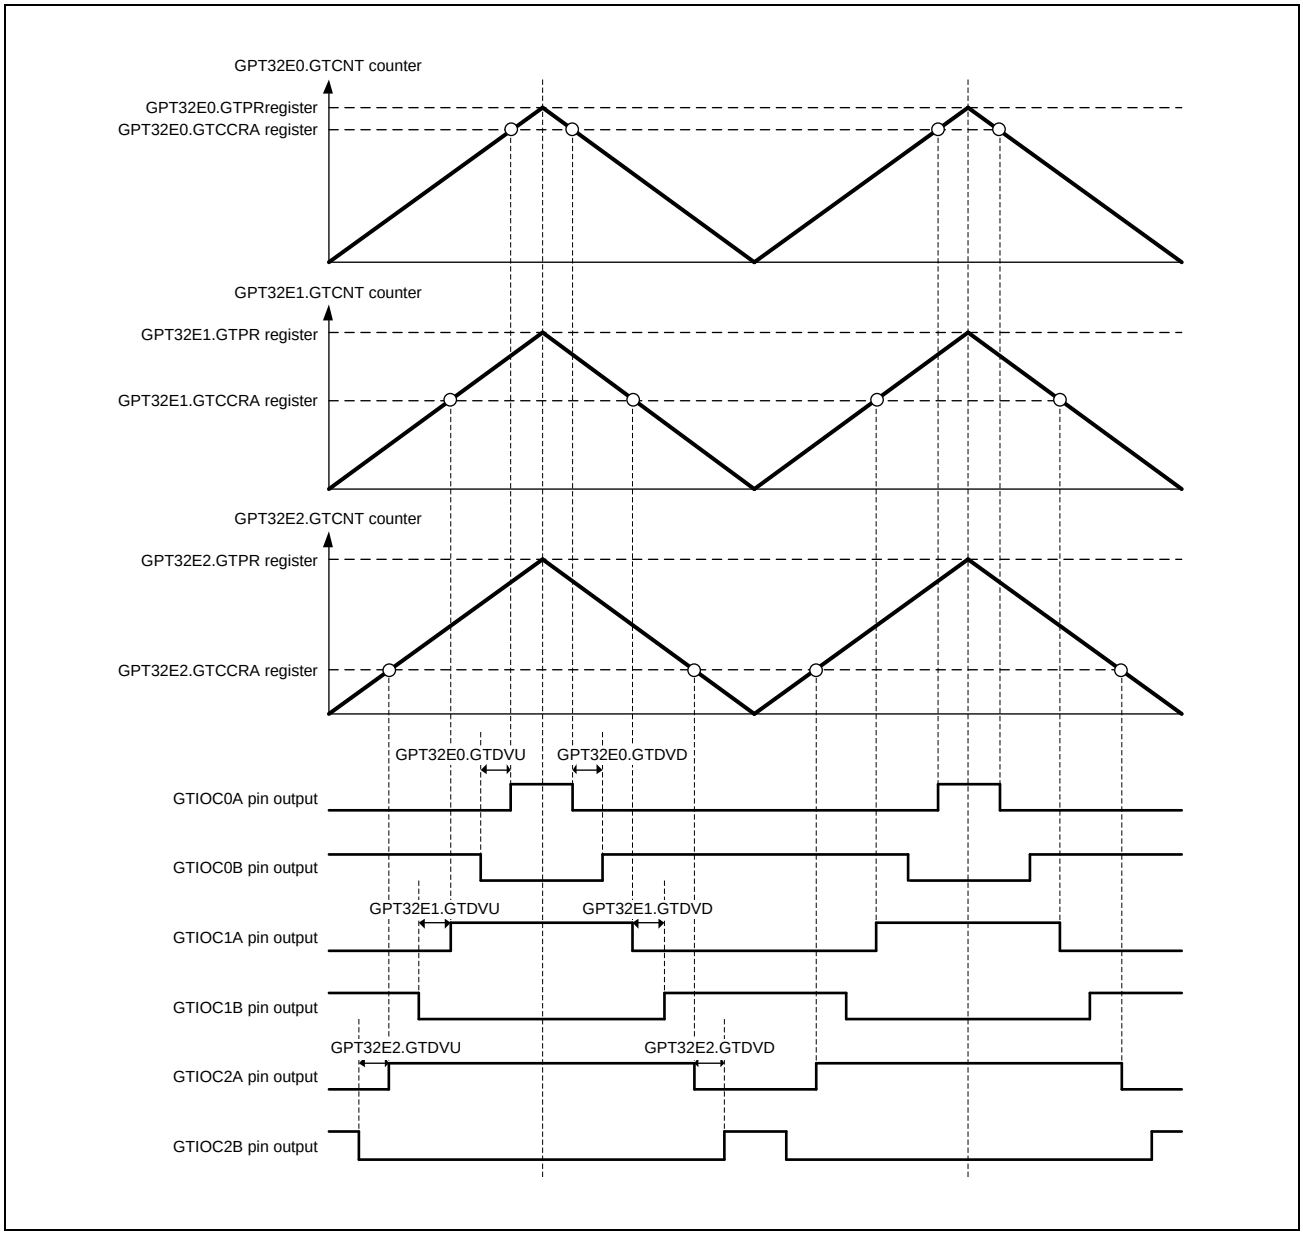

Figure 5.7-68 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

5.7.3.9.6 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 5.7-69 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

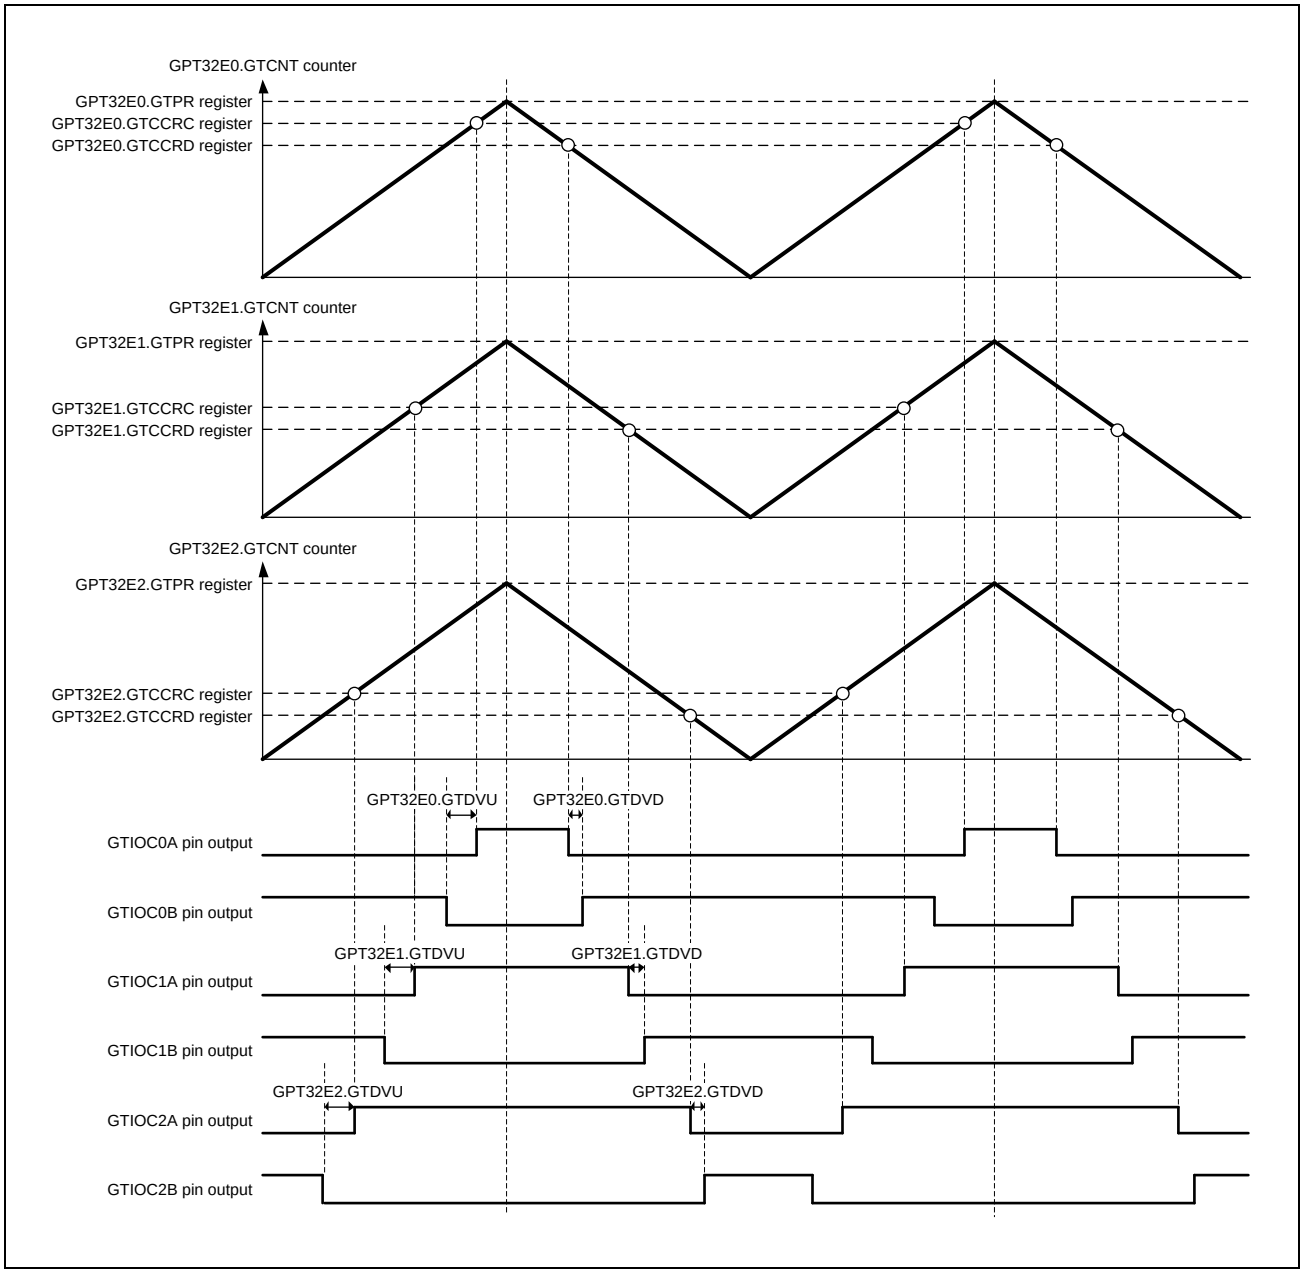

Figure 5.7-69 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

5.7.3.10 Phase Counting Function

The phase difference between the GTIOCA pin input and GTIOCB pin input is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCA pin and GTIOCB pin input being set in the GTUPSR and GTDNSR registers. For details on count operation, see **Section 5.7.3.1.1, Counter Operation**.

Figure 5.7-70 to **Figure 5.7-79** show phase counting modes 1 to 5. **Table 5.7-8** to **Table 5.7-17** show conditions of up- counting or down-counting and lists settings for the GTUPSR and GTDNSR registers.

5.7.4 Interrupt Sources

5.7.4.1 Interrupt Sources and Priorities

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTADTR compare match
- GTCNT counter overflow (GTPR compare match)/underflow.

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear happen at the same time, flag clear takes priority over flag set. These flags are automatically updated by internal state. Relative channel priorities can be changed by the Interrupt Controller. However the priority within a channel is fixed. For details, see **4.6 Interrupt Controller**. **Table 5.7-18** lists the GPT interrupt sources.

Table 5.7-18 Interrupt sources (1/3)

Channel	Name	Interrupt source	Interrupt flag	DMAC activation
0	CCMPA0	GPT32E0.GTCCRA input capture/compare match	TCFA	Possible
	CCMPB0	GPT32E0.GTCCRB input capture/compare match	TCFB	Possible

	UNF7	GPT32E7.GTCNT underflow	TCFPU	Possible

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

(1) ADTRGAn interrupt (n = 0 to 7)

When the GTCNT counter value matches with the GTADTRA register, an interrupt request is generated under the following condition:

- In up-counting, the interrupt enable bit (ADTRAUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRADEN) in the GTINTAD register is 1.

In event count operation performing, this interrupt request is not generated.

(2) ADTRGBn interrupt (n = 0 to 7)

When the GTCNT counter value matches with the GTADTRB register, an interrupt request is generated under the following condition:

- In up-counting, the interrupt enable bit (ADTRBUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRBDEN) in the GTINTAD register is 1.

In event count operation performing, this interrupt request is not generated.

(3) CCMPAn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register.
- When the GTCCRA register functions as an input capture register, the GTCNT counter value is transferred to the GTCCRA register by an input capture signal.

(4) CCMPBn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register.
- When the GTCCRB register functions as an input capture register, the GTCNT counter value is transferred to the GTCCRB register by an input capture signal.

(5) CMPCn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and an interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

(6) CMPDn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

(7) CMPEn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition.

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and an interrupt is not requested under the following conditions.

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register)

(8) CMPFn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

(9) OVFn interrupt (n = 0 to 7)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (GTCNT changes from GTPR to GTPR-1)
- In counting by hardware sources, overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

(10) UNFn interrupt (n = 0 to 7)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting).
- In triangle-wave mode, interrupt requests are enabled at troughs (GTCNT changes from 0 to 1).
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

Table 5.7-19 Interrupt signals, interrupt permission bits, and interrupt status flags

Interrupt signal	Interrupt permission bit	Interrupt status flag
UNFn	GTINTAD[7:6] (GTINTPR[1:0])	GTST[7] (TCFPU)
OVFn		GTST[6] (TCFPO)
ADTRGBn	GTINTAD[19] (ADTRBDEN) GTINTAD[18] (ADTRBUEN)	GTST[19] (ADTRBDF) GTST[18] (ADTRBUF)
ADTRGAn	GTINTAD[17] (ADTRADEN) GTINTAD[16] (ADTRAUEN)	GTST[17] (ADTRADF) GTST[16] (ADTRAUF)
CMPFn	GTINTAD[5] (GTINTF)	GTST[5] (TCFF)
CMPEn	GTINTAD[4] (GTINTE)	GTST[4] (TCFE)
CMPDn	GTINTAD[3] (GTINTD)	GTST[3] (TCFD)
CMPCn	GTINTAD[2] (GTINTC)	GTST[2] (TCFC)
CCMPBn	GTINTAD[1] (GTINTB)	GTST[1] (TCFB)
CCMPAn	GTINTAD[0] (GTINTA)	GTST[0] (TCFA)

5.7.4.2 DMAC Activation

The DMAC can be activated by the interrupt in each channel. For details, see **4.7 Direct Memory Access Controller**.

5.7.4.3 Interrupt and A/D Conversion Request Skipping Function

By setting the GTITC register, the GTCNT counter overflow (GTPR compare match) interrupt (OVFn) and underflow interrupt (UNFn) can be skipped. Other interrupts and A/D converter start request signals can be skipped in coordination with the OVFn/UNFn skipping function.

The interrupt request skipping function only depends on the setting of GTITC register and is independent of the setting of interrupt permission bits in the GTINTAD register.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, OVFn/UNFn interrupt requests cannot be generated at troughs only or at crests only depending on the skipping counter start timing. To count both troughs and crests and generate the OVFn/UNFn interrupts at troughs only or crests only in triangle-wave mode, you must set an even number of skips.

Similarly, in saw-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, OVFn interrupt requests cannot be generated on either overflows or underflows only. To count both overflows and underflows with the count direction changed and generate the OVFn/UNFn interrupts on either overflows or underflows only in saw wave mode, first check the skipping state carefully.

Before changing the skipping count, you must release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 5.7-80 to **Figure 5.7-85** show examples of skipping function operation.

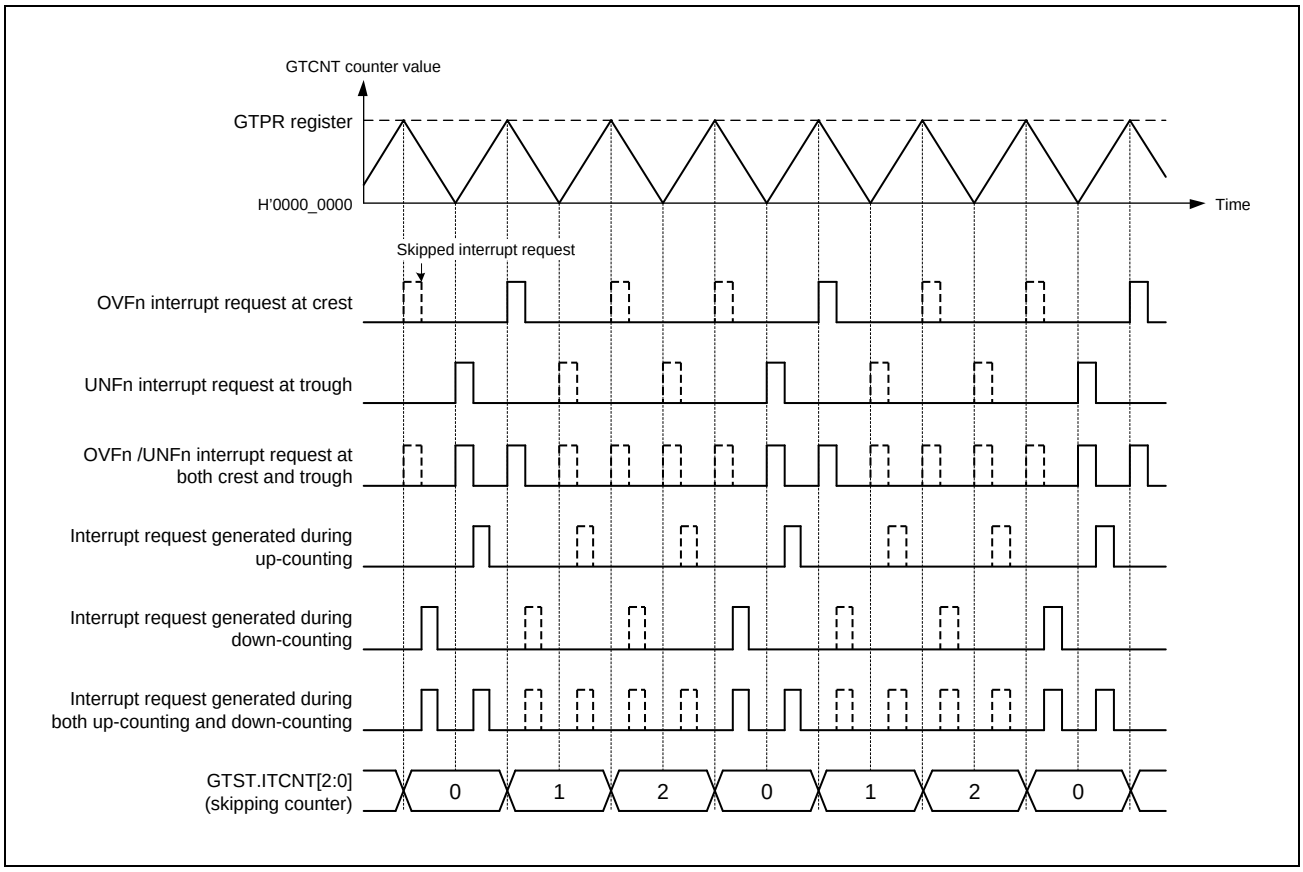

Figure 5.7-80 Example of interrupt skipping function operation with triangle waves, counting and skipping crests, and skipping count = 2

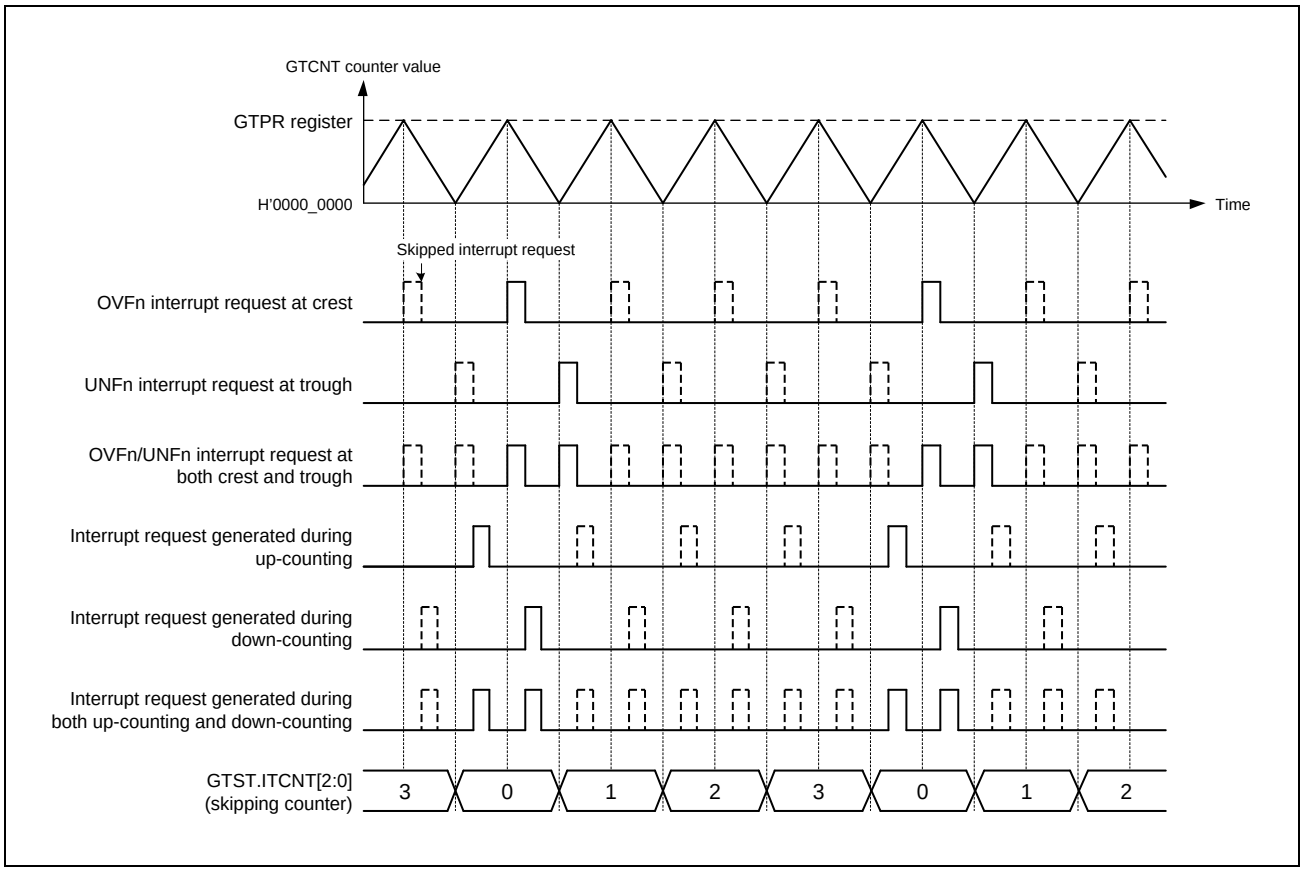

Figure 5.7-81 Example of interrupt skipping function operation with triangle waves, counting and skipping troughs, and skipping count = 3

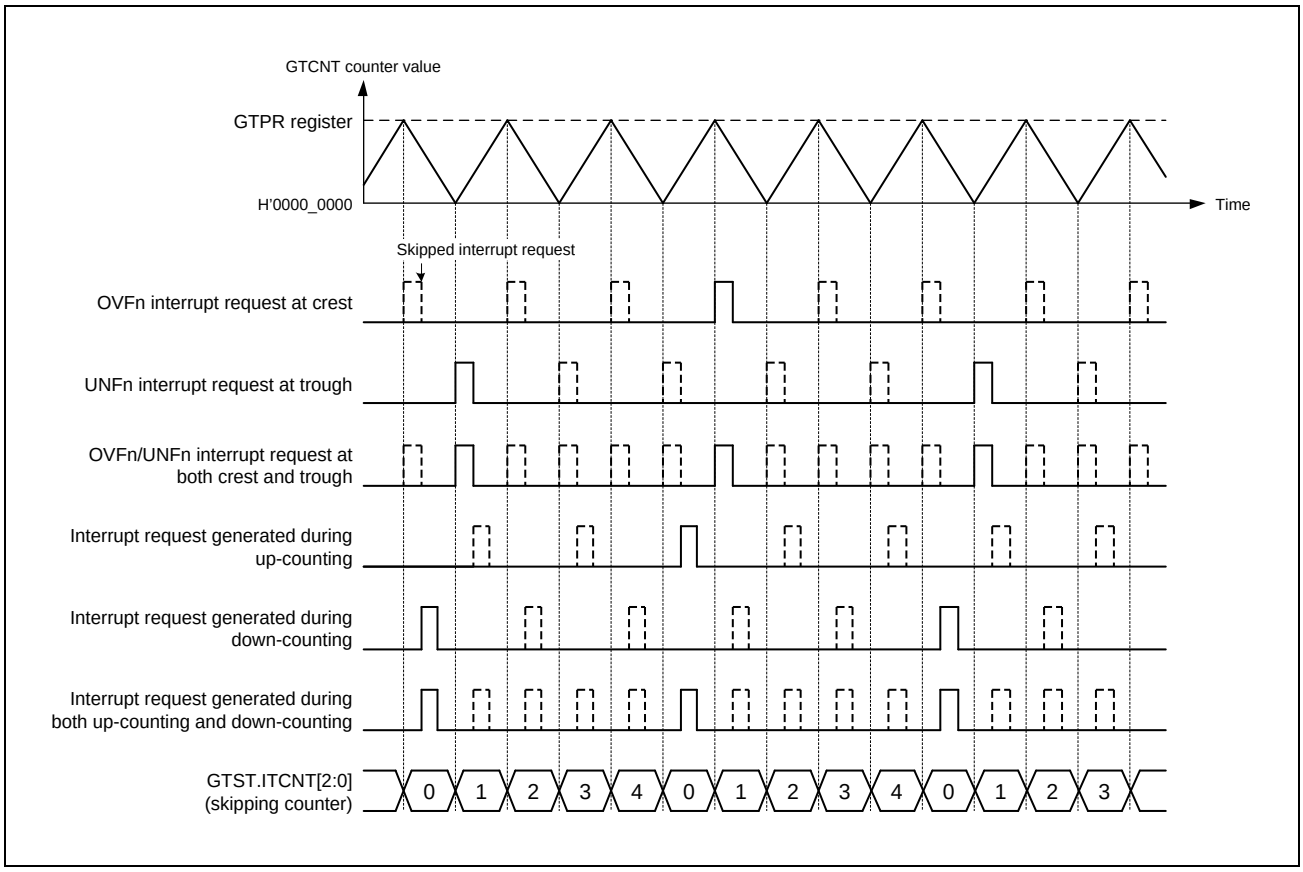

Figure 5.7-82 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, and skipping count = 4

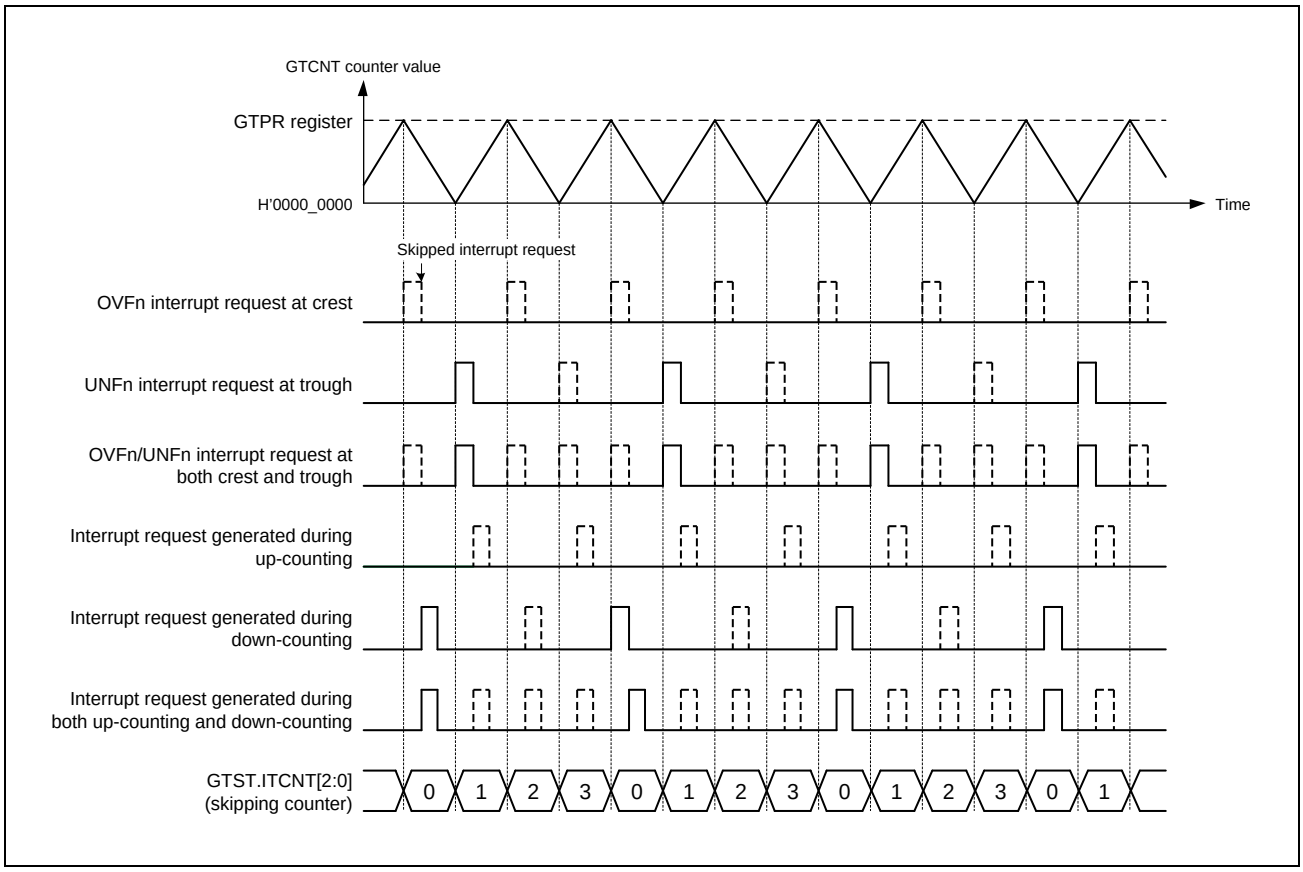

Figure 5.7-83 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at up-counting

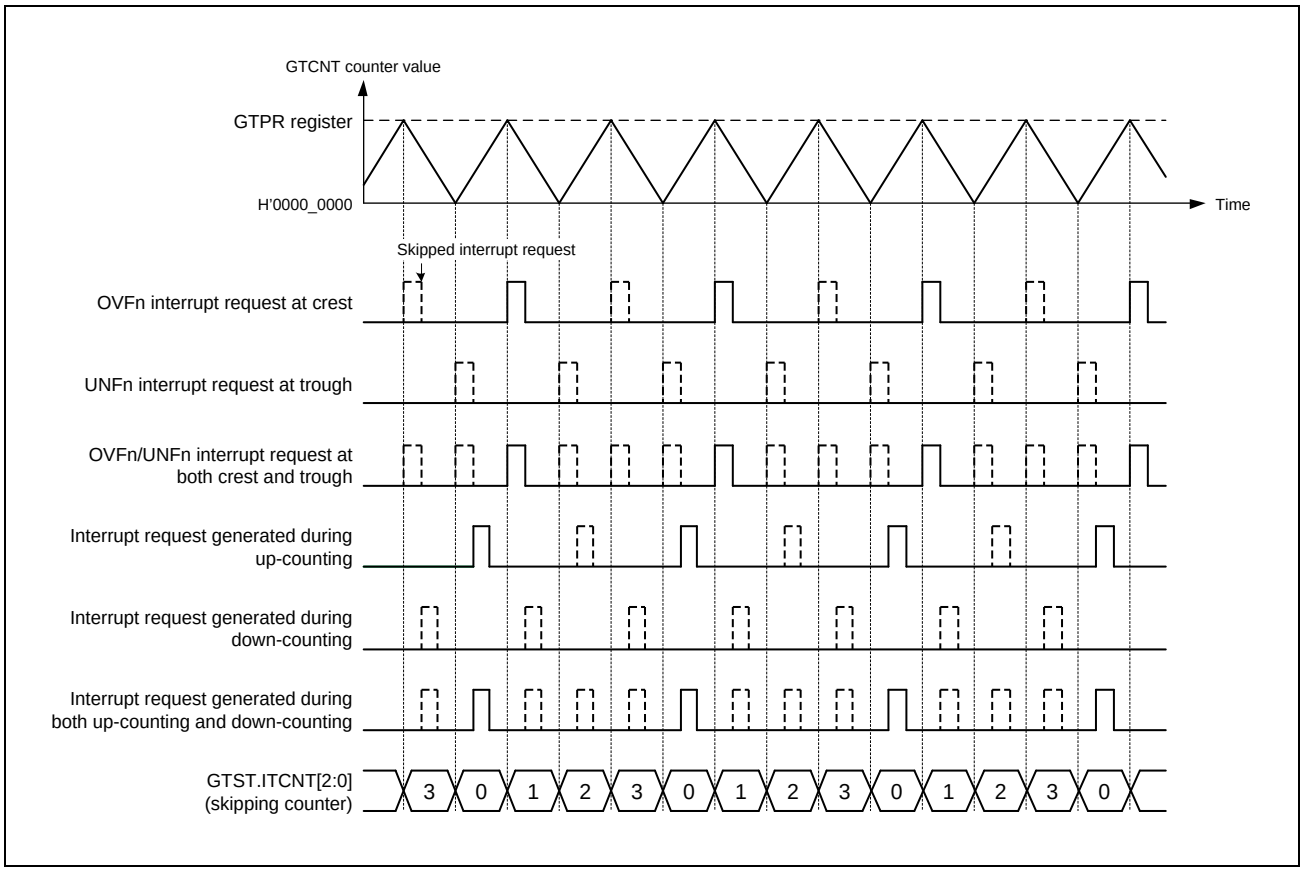

Figure 5.7-84 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at down-counting

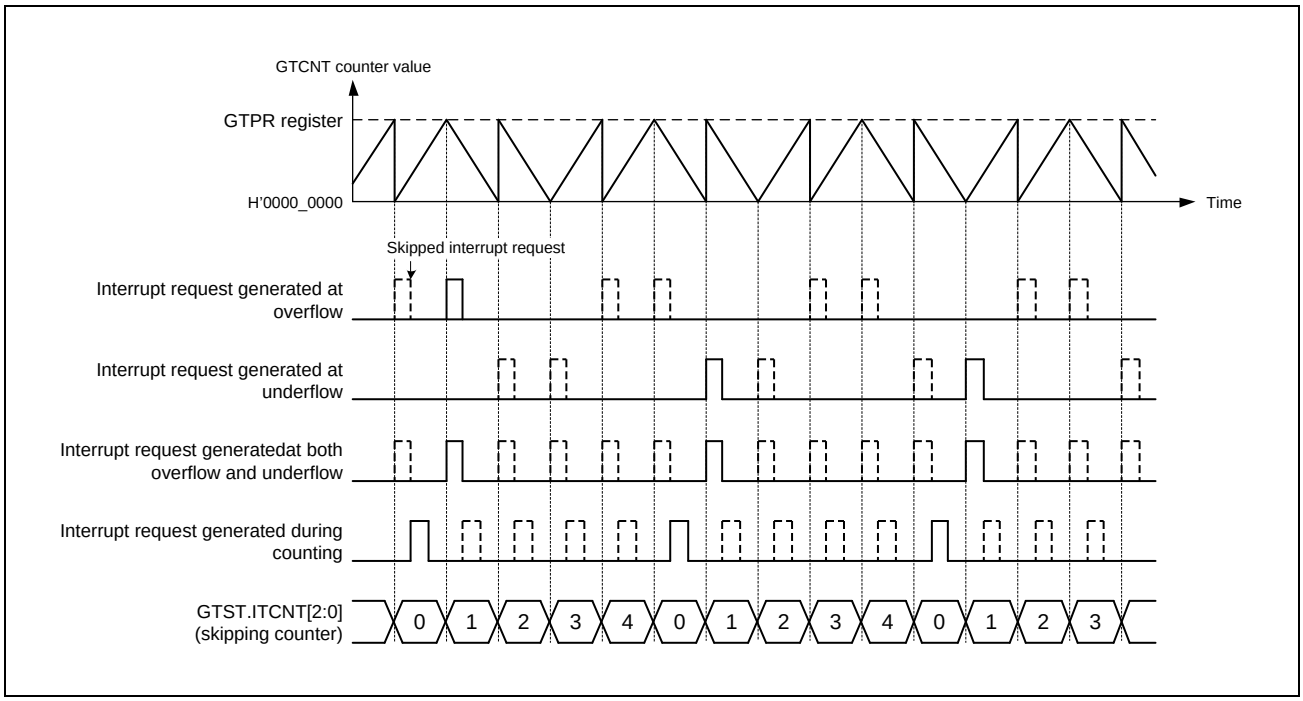

Figure 5.7-85 Example of interrupt skipping function operation with saw waves, operation with count direction changed, counting and skipping both overflows and underflows, and skipping count = 4

5.7.5 A/D Converter Start Request

An A/D converter start request can be issued at a compare match between the GTCNT counter and GTADTRA or GTADTRB, and up-counting only, down-counting only, or both up-counting and down-counting can be specified. In event count operation performing, A/D converter start requests interrupt cannot be generated.

GTADTRA and GTADTRB each has two buffer registers. Buffer operation with GTADTRA combined with GTADTBRA and GTADTDBRA, and buffer operation with GTADTRB combined with GTADTBRB and GTADTDBRB can be performed.

Figure 5.7-86 shows an example of A/D converter start request operation, and **Figure 5.7-87** shows an example setting for A/D converter start request operation.

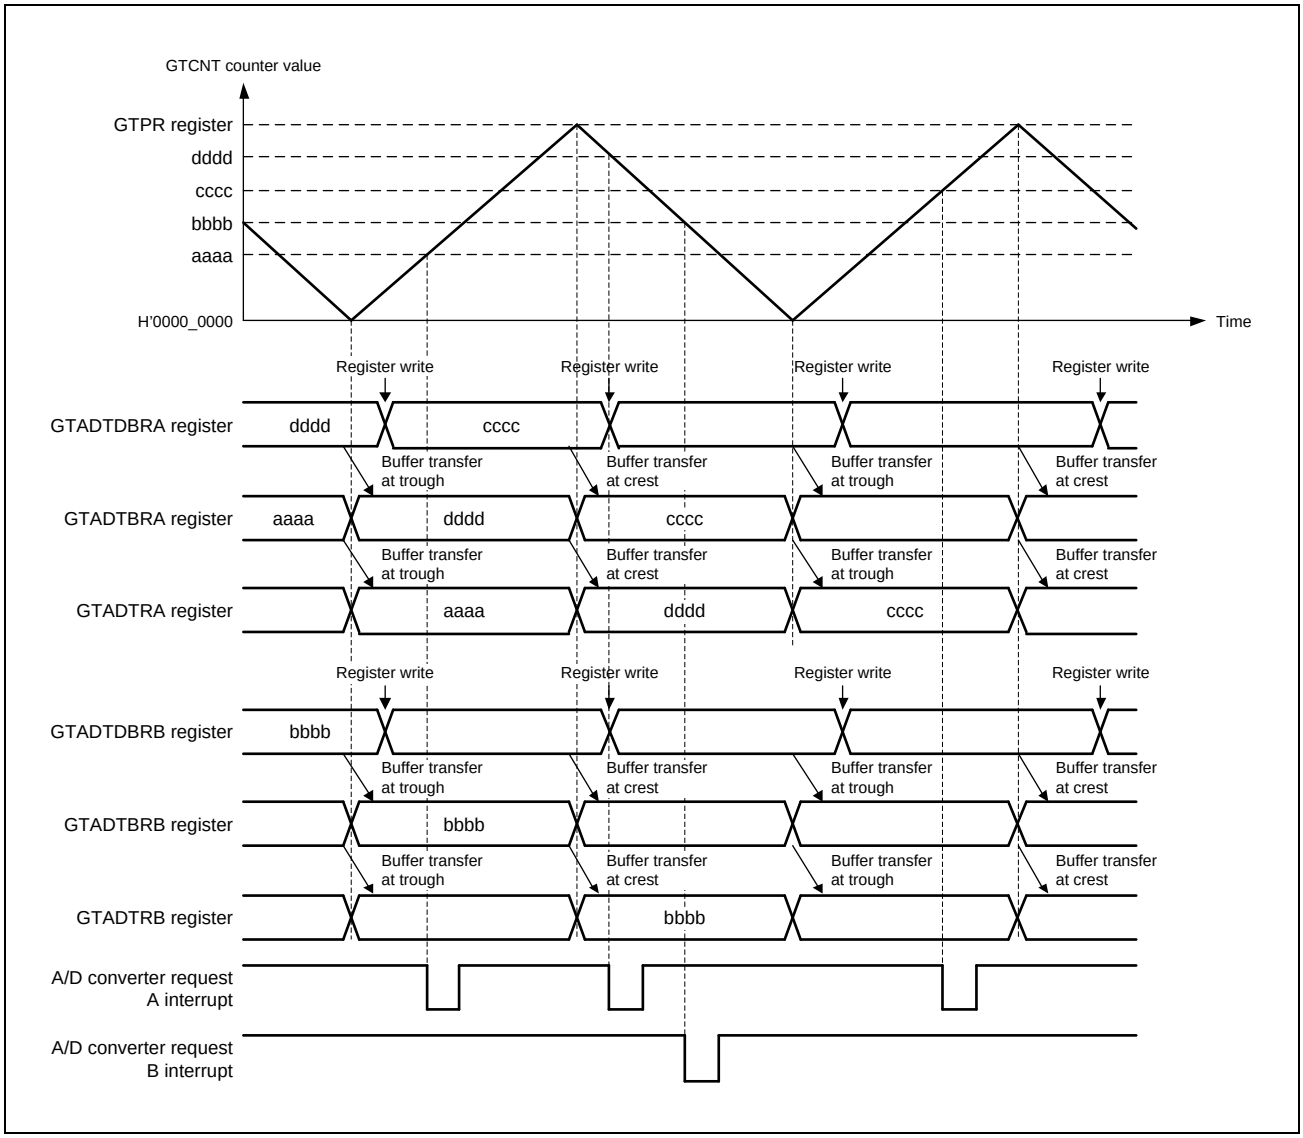

Figure 5.7-86 Example of A/D converter start request timing operation with triangle waves, double buffer operation, buffer transfer at both troughs and crests, A/D converter start request interrupt by GTADTRA at both up-counting and down-counting, and A/D converter start request interrupt by GTADTRB at down-counting

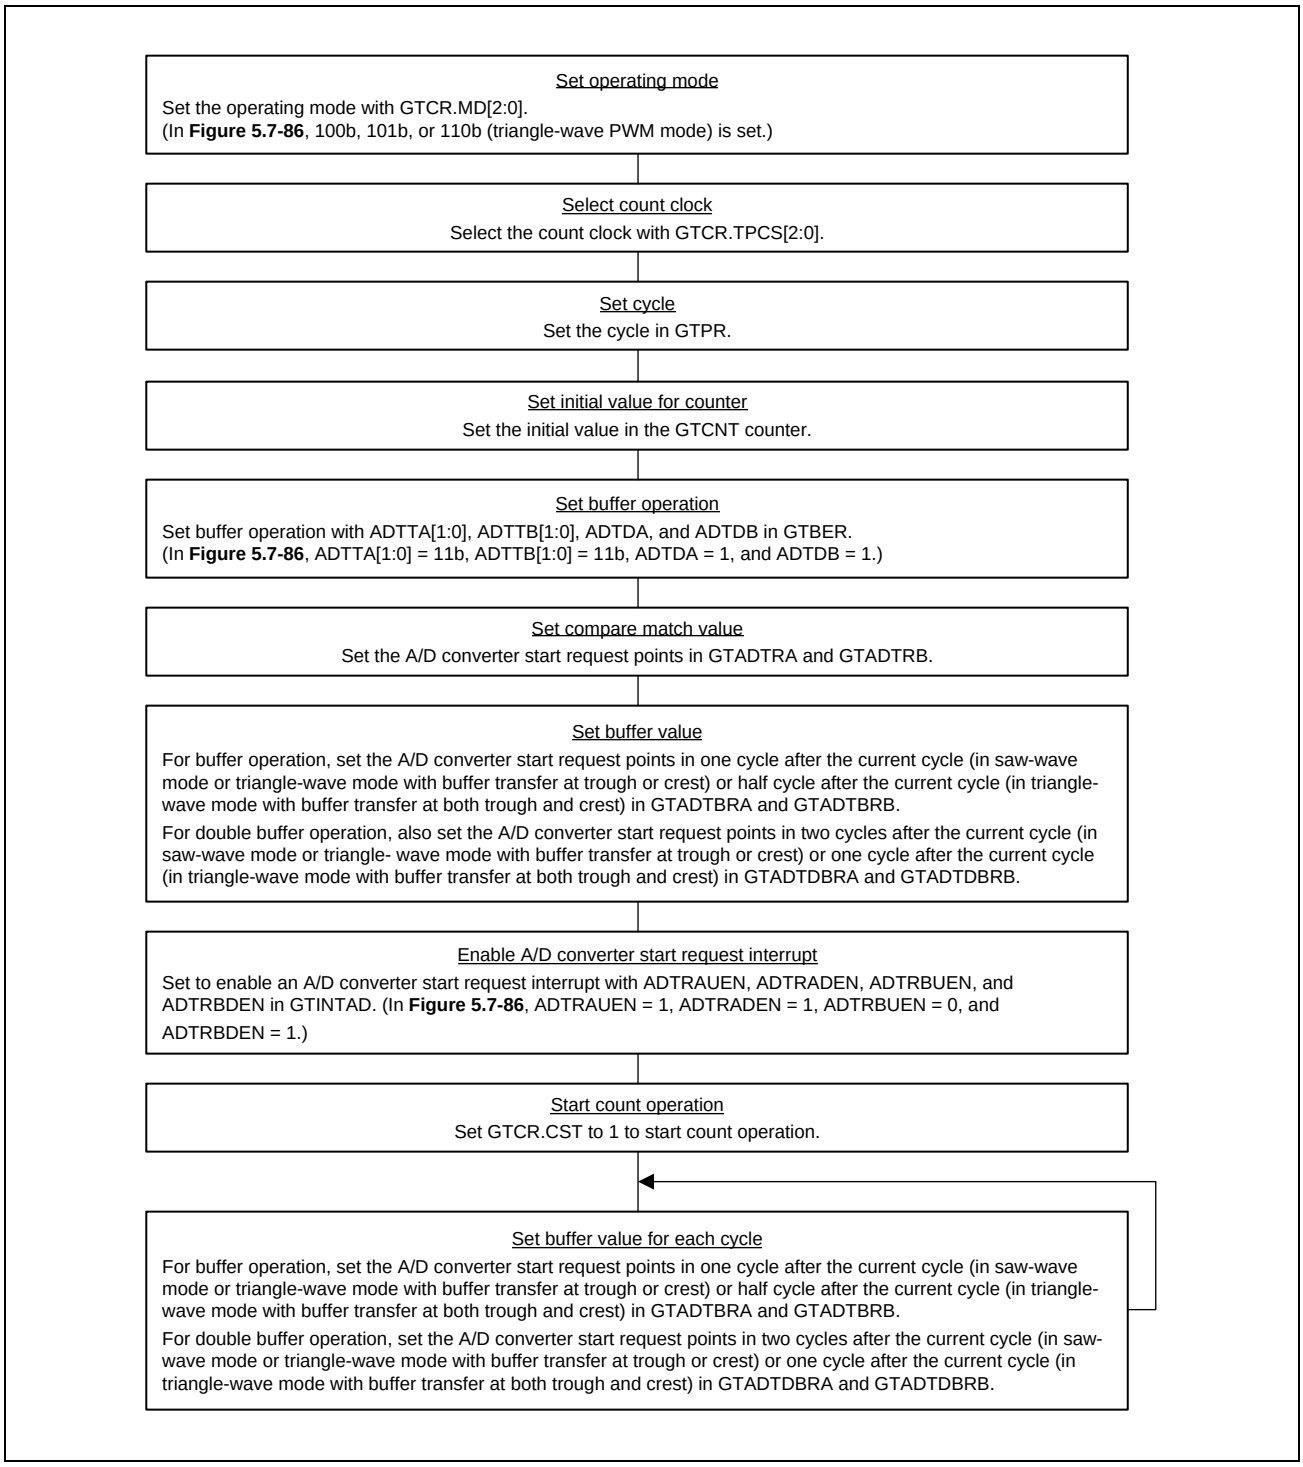

Figure 5.7-87 Example setting for A/D converter start request timing operation

5.7.6 Noise Filter Function

Each pin for use in input capture to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than three sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

Figure 5.7-88 shows the timing of noise filtering.

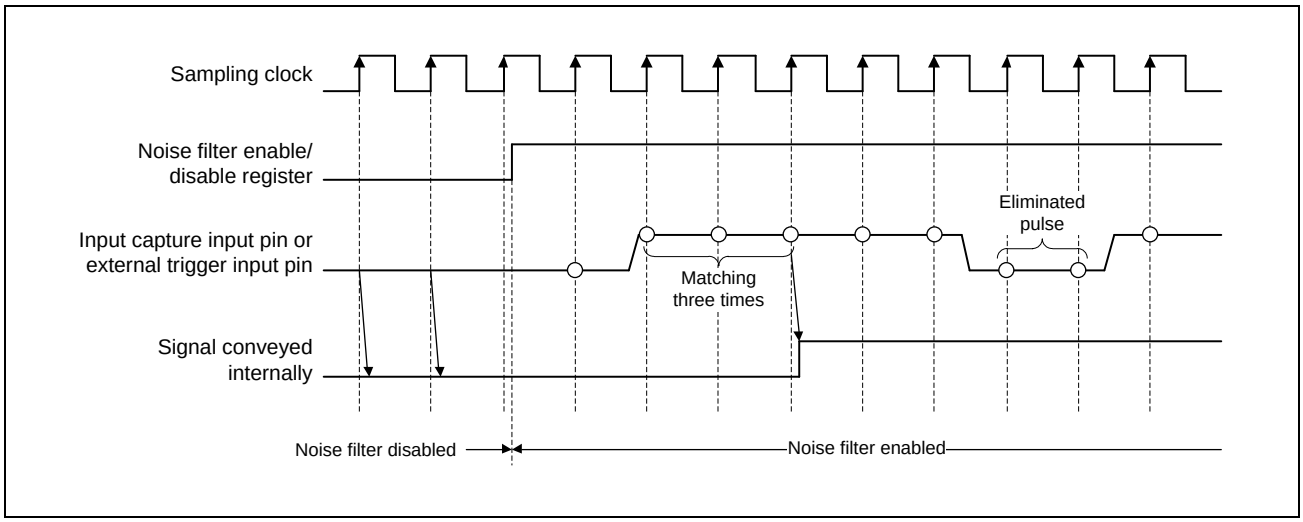

Figure 5.7-88 Timing of noise filtering

If noise filtering is enabled, the input capture operation or external trigger operation performs on the edges of the noise filtered signal after a delay of a sampling interval × 3 + P0ϕ. This is caused by the noise filtering for the input capture input or external trigger operation.

5.7.7 Protection Function

5.7.7.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD,GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR.

5.7.7.2 Disabling of Buffer Operation

If the timing of buffer register write is delayed in relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD setting. Buffer transfer can be temporarily disabled even when a buffer transfer condition is generated during a buffer register write. This can be done by setting the associated GTBER.BD bit to 1 (buffer operation disabled) before a buffer register write and clearing the bit to 0 (buffer operation enabled) after completion of writing to all buffer registers. **Figure 5.7-89** shows an example of operation for disabling buffer operation.

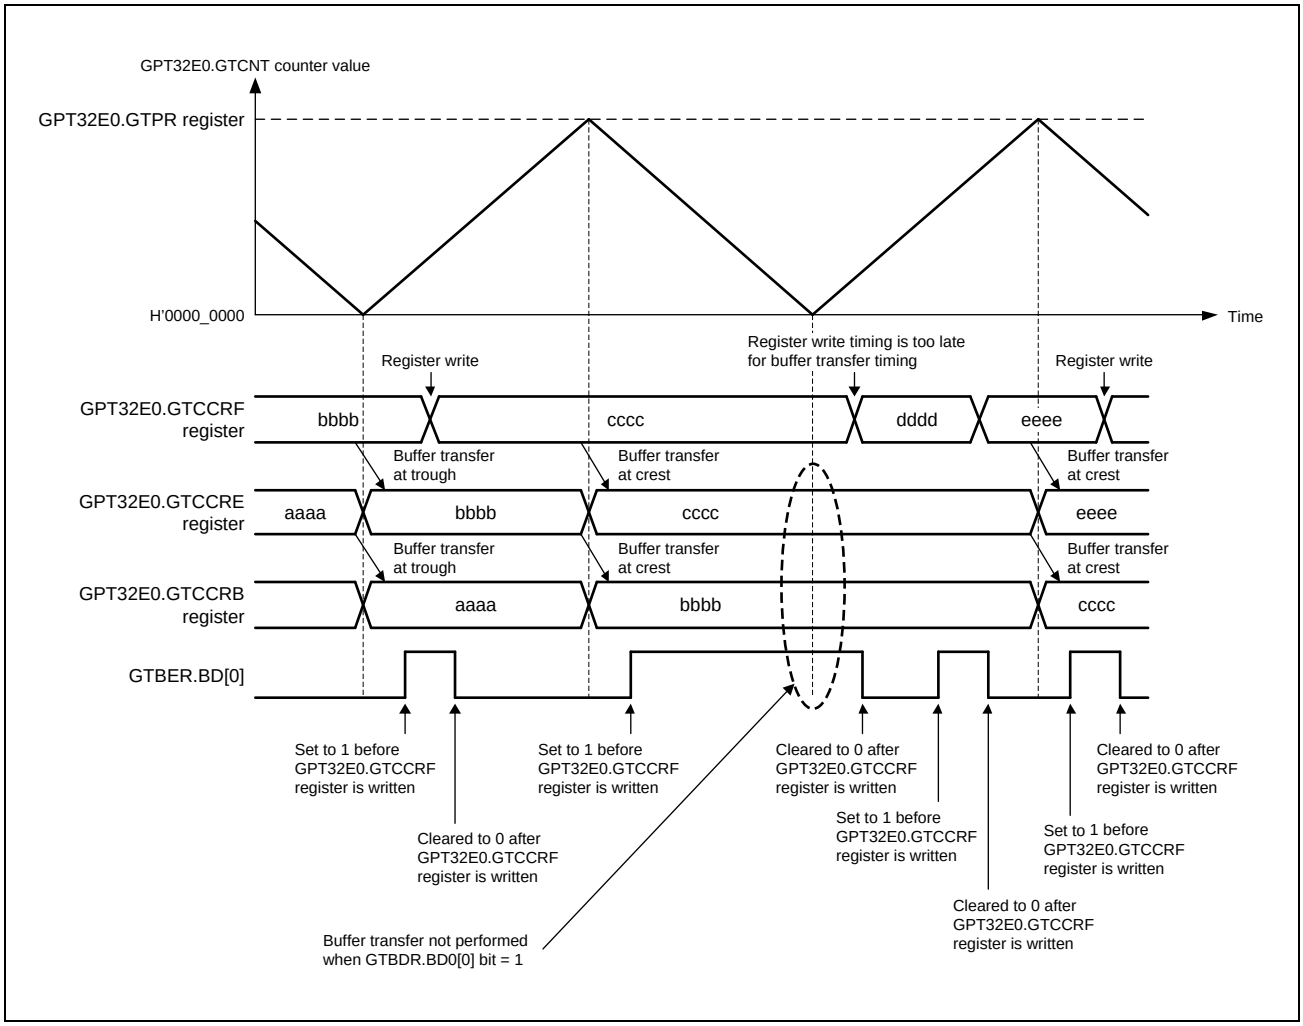

Figure 5.7-89 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

5.7.7.3 GTIOC Pin Output Negate Control

For protection from system failure, the output disable control that changes the GTIOC pin output value forcibly is provided for GTIOC pin output by the request of output disable from POEG.

When dead time error occurs or the GTIOCA pin output value is the same as the GTIOCB pin output value, output protection is required. GPT detects this condition and generates output disable requests to POEG based on the settings in the output disable request permission bits, such as GTINTAD.GRPDTE, GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG receives output disable requests from each channel and calculates external input using an OR operation, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCA pin and the GTIOCB pin) out of four* output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disabled output request is monitored by reading the GTST.ODF bit. The output level during output disable is based on the GTIOR.OADF[1:0] setting for the GTIOCA pin and the GTIOR.OBDF[1:0] setting for the GTIOCB pin. The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. The timing of release of the output disable state is a minimum of 3 P0ϕ cycles after terminating the output disable request. To perform output disable control reliably, allow at least 4 P0ϕ cycles after generating the output disable request (by clearing the output disable request flag in POEG) until the output disable request is terminated.

When event count is performed or when the output disable state is to be released immediately without waiting for an end of cycle, GTIOR.OADF[1:0] must be set to 00b (for GTIOCA pin) or GTIOR.OBDF[1:0] must be set to 00b (for GTIOCB pin).

Figure 5.7-90 shows an example of the GTIOC pin output disable control operation.

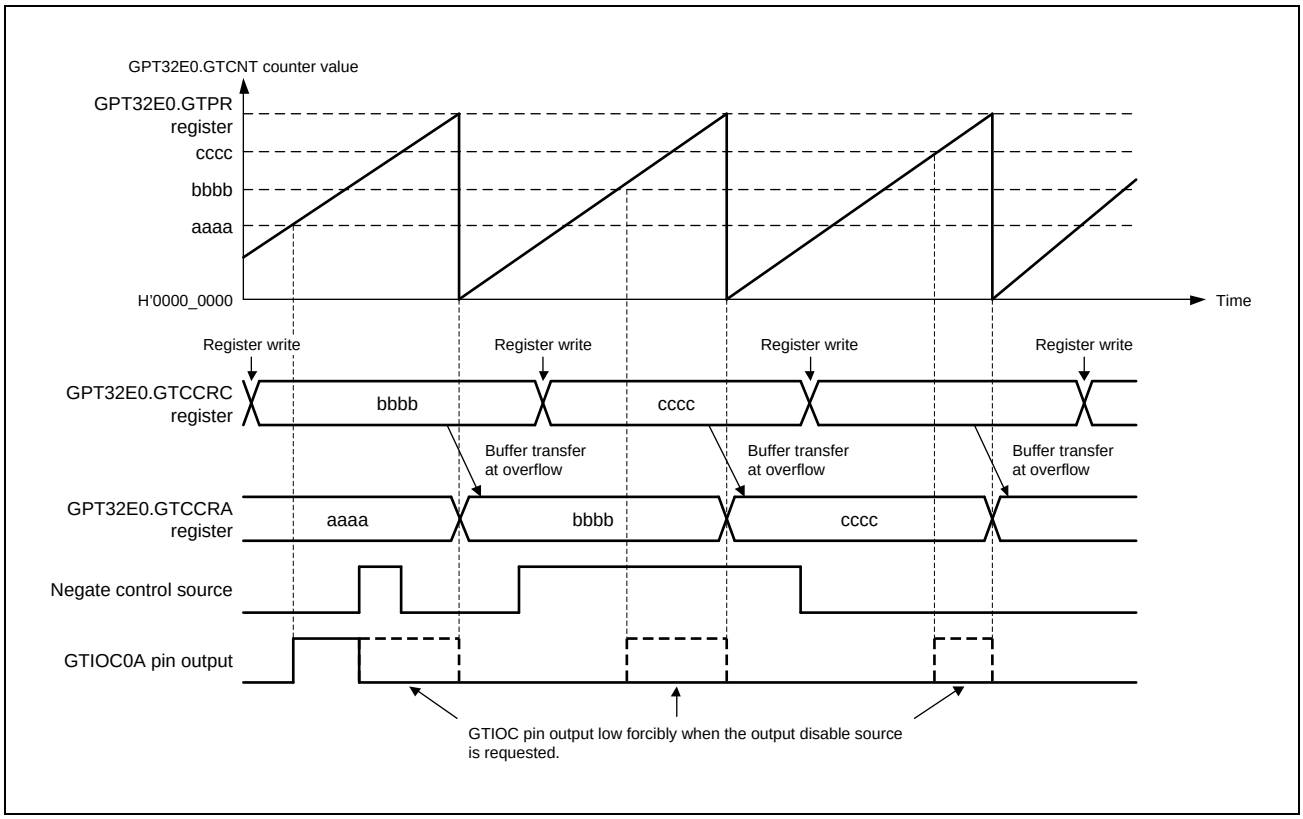

Figure 5.7-90 Example of GTIOC pin output disable control operation with saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable

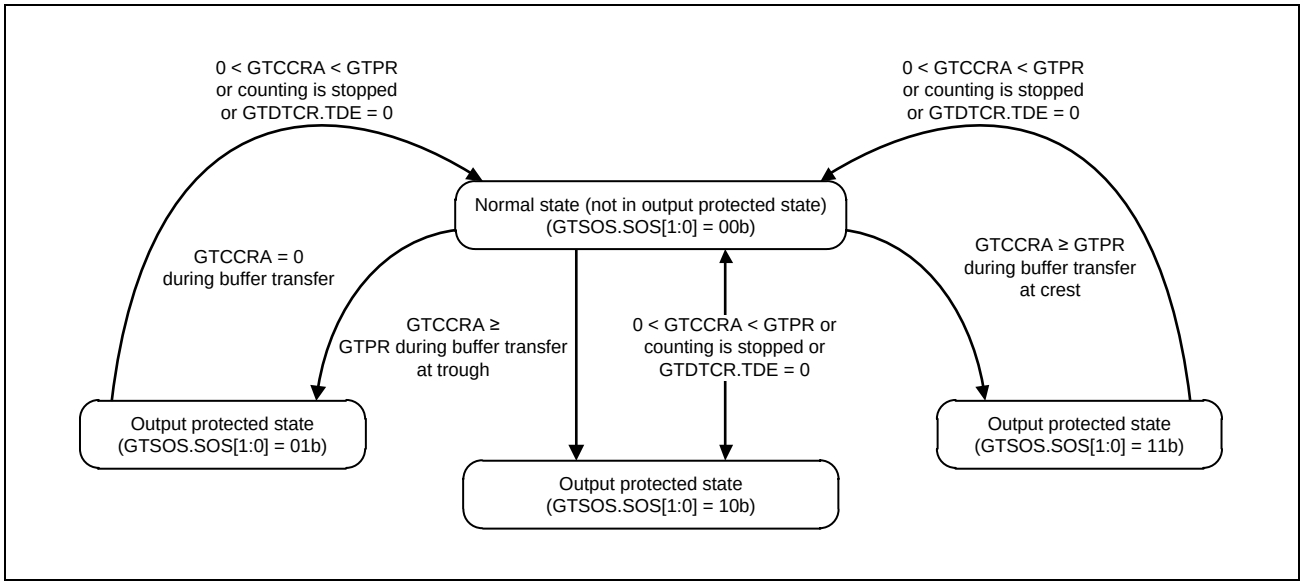
5.7.7.4 Output Protection Function for GTIOC Pin Output

In preparation for incorrect settings of the GTCCRA register (settings outside the range of 0 < GTCCRA < GTPR), the output protection function for the GTIOC pin output (disabling function) is activated when the automatic dead time setting (GTDTCR.TDE = 1) is made in triangle-wave mode. The status of the output protection function can be read from GTSOS.SOS[1:0].

Figure 5.7-91 shows the output protection function state transition.



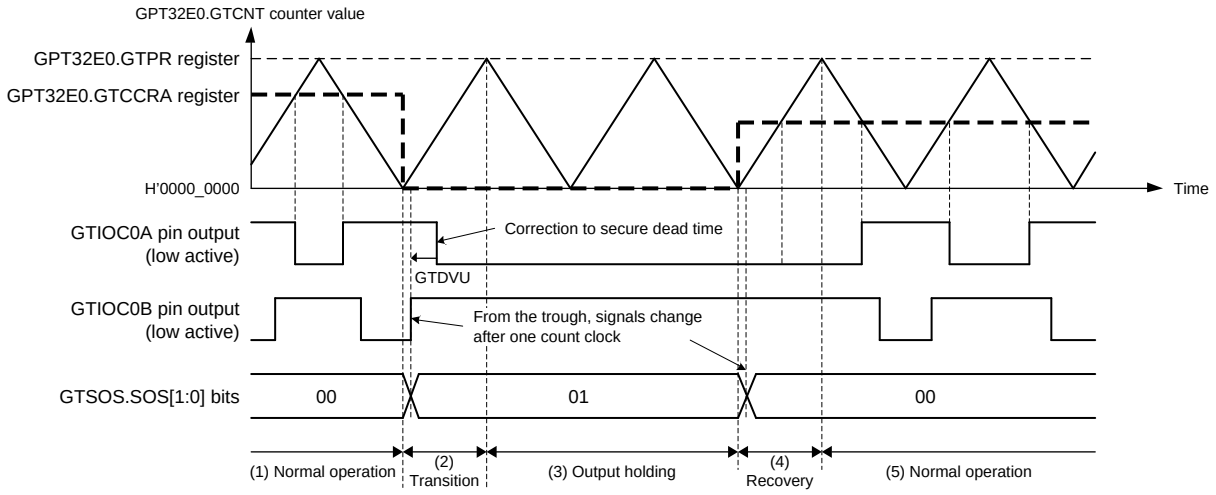


Figure 5.7-91 Output protection function

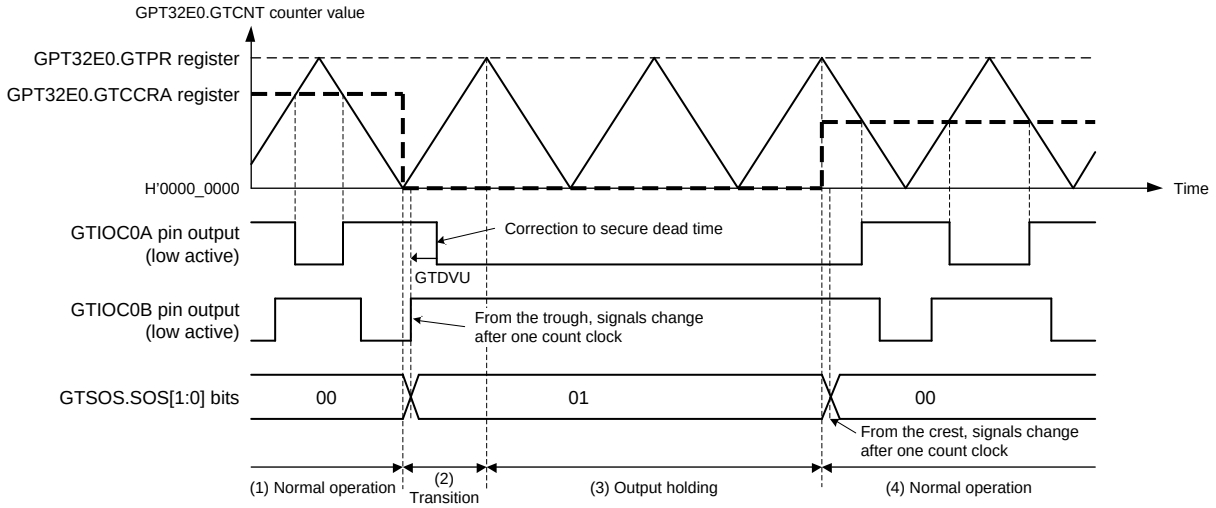
5.7.7.4.1 Output Protection Function When the GTCCRA Register is Set to 0 during Buffer Transfer

Figure 5.7-92 and **Figure 5.7-93** show examples of output protection function operation when the GTCCRA register is set to 0 during buffer transfer at troughs, and **Figure 5.7-94** and **Figure 5.7-95** show examples when the GTCCRA register is set to 0 during buffer transfer at crests.

(1) Normal operation period: Toggle output due to a compare match is performed normally.



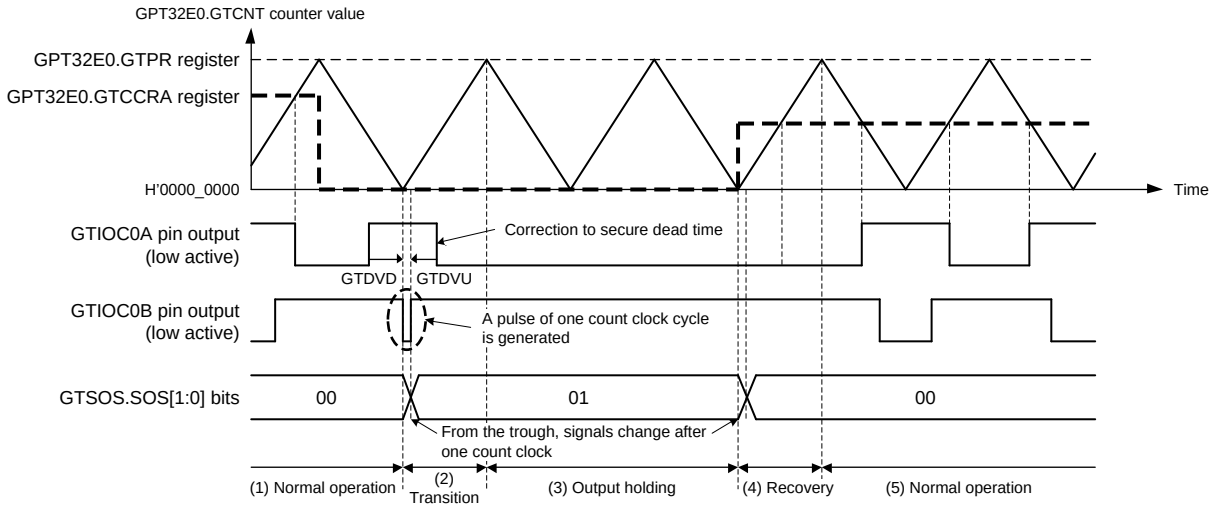
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.

(3) Output holding period: The output is held while GTCCRA register = 0.

(4) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.

(5) Normal operation period: Toggle output due to a compare match isperformed normally.

Figure 5.7-92 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low



(1) Normal operation period: Toggle output due to a compare match is performed normally.

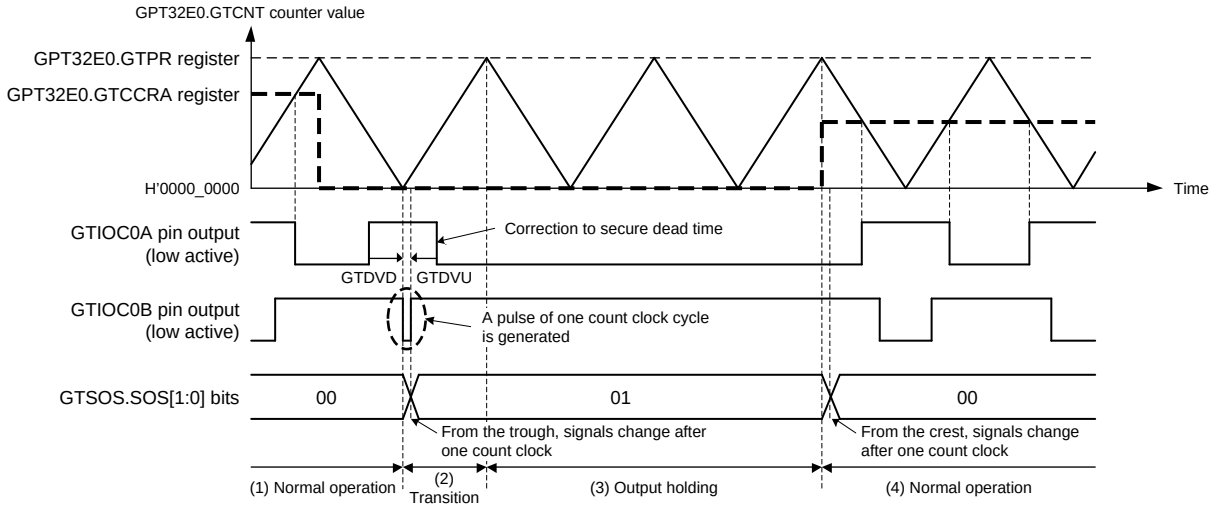
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.

(3) Output holding period: The output is held while GTCCRA register = 0.

(4) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 5.7-93 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

(1) Normal operation period: Toggle output due to a compare match is performed normally.



(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.

(3) Output holding period: The output is held while GTCCRA register = 0.

(4) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.

(5) Normal operation period: Toggle output due to a compare match is performed normally.

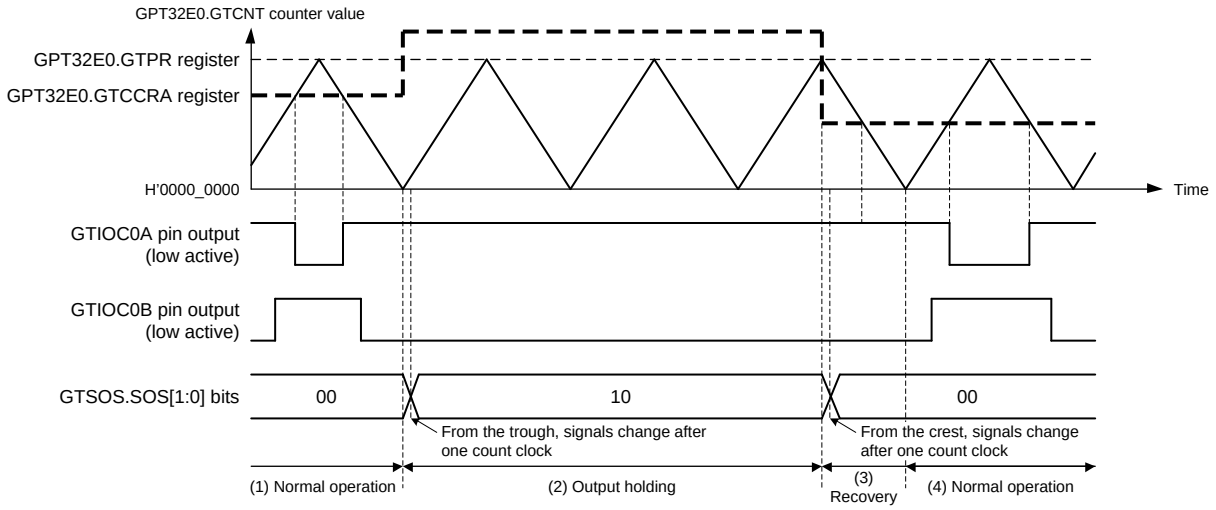
5.7.7.4.2 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Troughs

Figure 5.7-96 and **Figure 5.7-97** show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs.



(1) Normal operation period: Toggle output due to a compare match is performed normally.

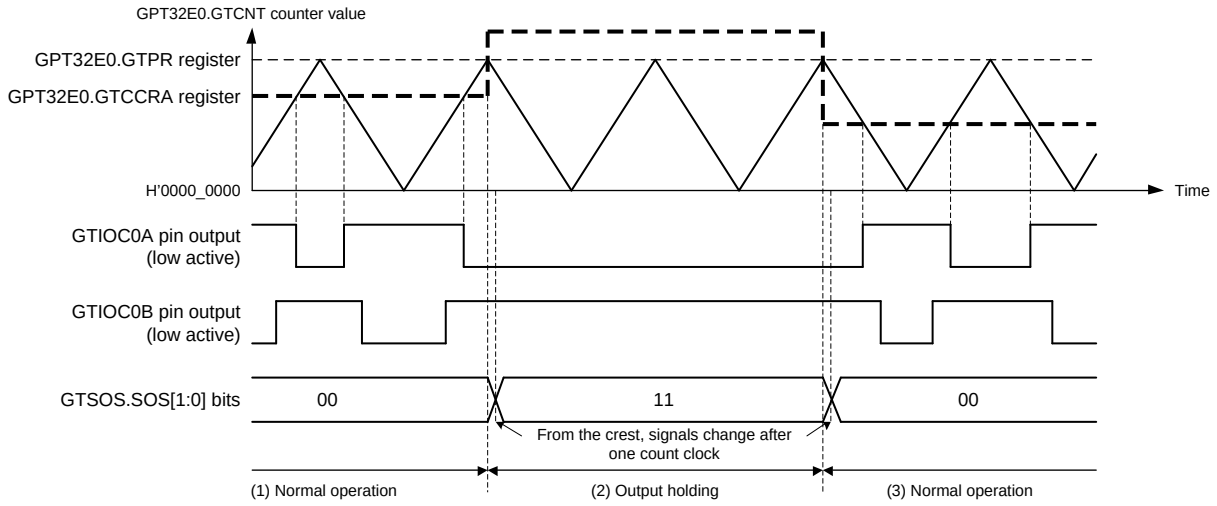
(2) Output holding: When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.

(3) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 5.7-96 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

(1) Normal operation period: Toggle output due to a compare match is performed normally.

(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.



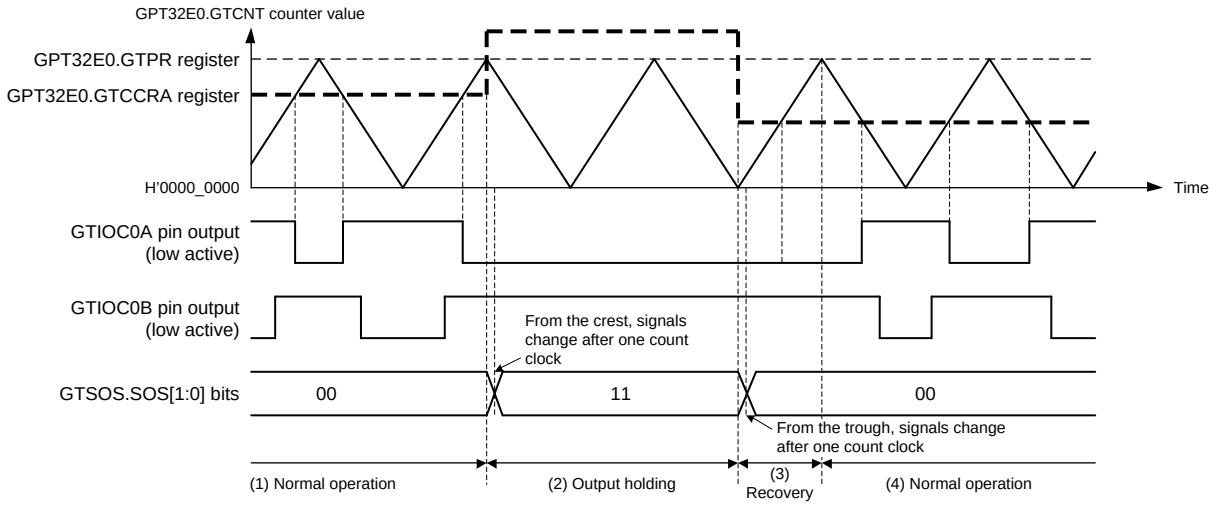
(3) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next trough.

(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 5.7-97 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

5.7.7.4.3 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Crests

Figure 5.7-98 and **Figure 5.7-99** show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests.



(1) Normal operation period: Toggle output due to a compare match is performed normally.

(2) Output holding period:: When GTCCRA register ≥ GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 11b, and the output is held while GTCCRA register ≥ GTPR register.

(3) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 5.7-98 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active- low

(1) Normal operation period: Toggle output due to a compare match is performed normally.

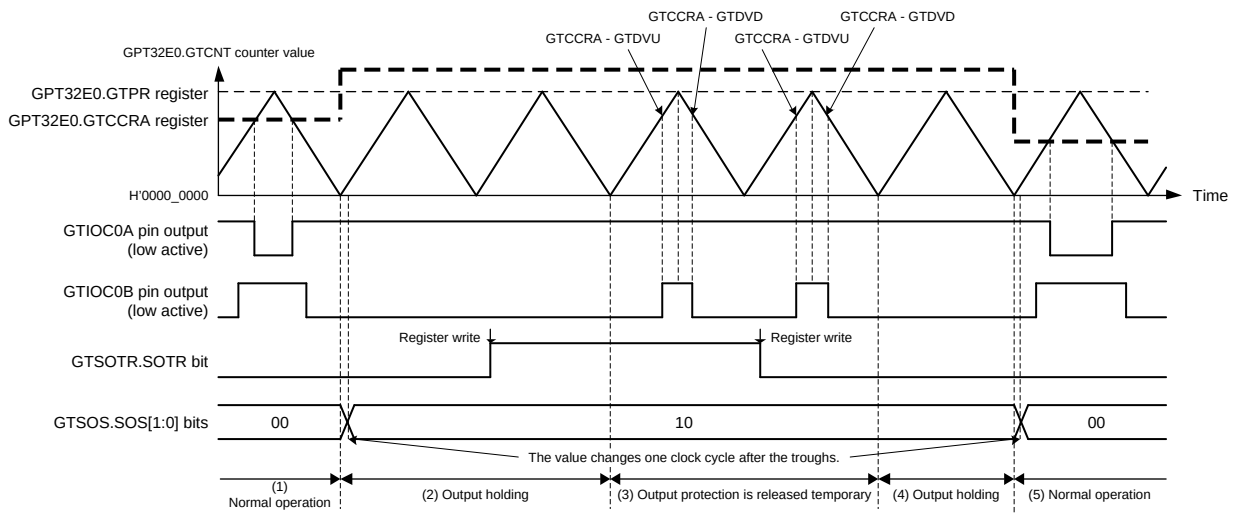
(2) Output holding period: When GTCCRA ≥ GTPR is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] = 11b, and the output is held while GTCCRA ≥ GTPR.

(3) Recovery period: When 0 < GTCCRA < GTPR is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.

(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 5.7-99 Example of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

5.7.7.4.4 Restricted Specification of Output Protection Function



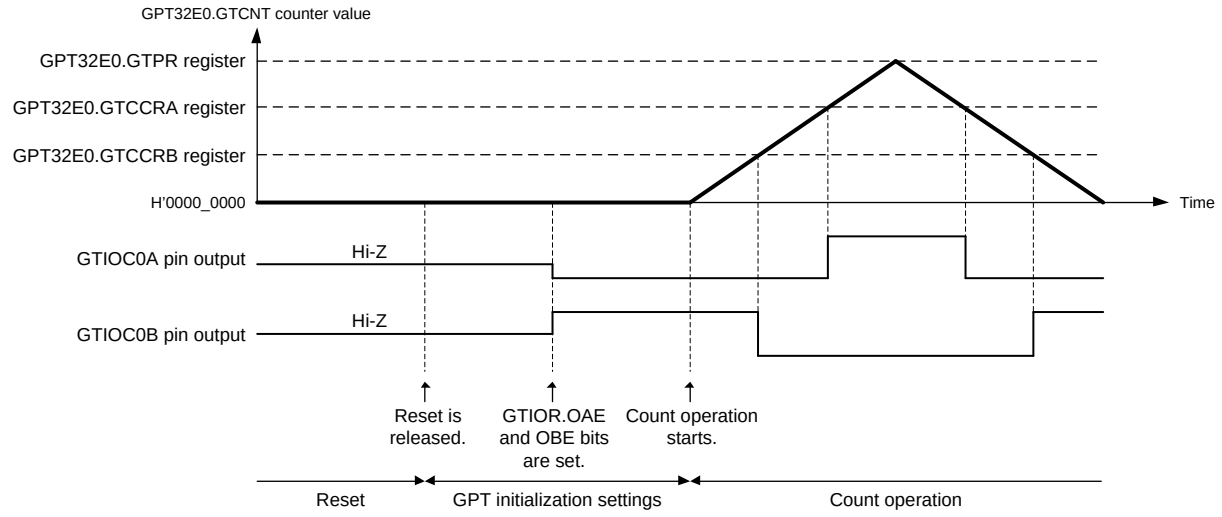
The output protection function deactivates the level of one of the positive and negative outputs, even if an incorrect value is set in the GTCCRA register during counting (a setting outside the range of 0 < GTCCRA < GTPR). However, it will not work properly unless the following conditions are satisfied.

- At count start: The value of the GTCCRA register must be set within the range of (0 < GTCCRA < GTPR).
- During buffer transfer at crest: GTCCRA - GTDVD < GTPR - 1 has to be satisfied..
- During buffer transfer at trough: If GTCCRA ≥ GTPR, GTCCRA - GTDVU > 1 has to be satisfied.

5.7.7.4.5 Temporary cancellation of Output Protection Function

When the GTSOTR.SOTR bit is set to 1 with GTSOS.SOS[1:0] bits equal to 10b (showing output protection state by GTCCRA ≥ GTPR during buffer transfer at troughs), the output protection function for GTIOCB pin is temporarily canceled. GTSOS.SOS[1:0] bits retain the value of 10b even when the output protection function is canceled. When the SOTR bit is set to 0, the output protection function for GTIOCB pin resumes.

Figure 5.7-100 shows examples of temporary cancellation of output protection function operation when the GTCCRA ≥ GTPR is set during buffer transfer at troughs.



(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Output holding period:	When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register. If GTSOTR.SOTR is set to 1 during the output holding period, the GTIOCB output is holding until the first trough after the setting.
(3) Output protection releasing period:	After GTSOTR.SOTR is set to 1, the GTIOCB output is performed normally at the first trough after the setting. If GTSOTR.SOTR is set to 0 during the output protection releasing period, the output is holding at the first trough after the setting.
(4) Output holding period:	Until 0 < GTCCRA register < GTPR register is detected in the trough, the output is holding.
(5) Normal operation period:	When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 5.7-100 Example of temporary cancellation of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

5.7.8 Initialization Method of Output Pins

5.7.8.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port mode, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

[Setting examples]

GTIOR.GTIOA[4:0] bits: Initial output of low, output retained at cycle end, output toggled at compare match

GTIOR.GTIOB[4:0] bits: Initial output of high, output retained at cycle end, output toggled at compare match

Figure 5.7-101 Example of pin settings after reset

5.7.8.2 Pin Initialization Caused by Error during Operation

If an error occurs during GPT operation, the following four types of pin processing can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop.
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values in OADFLT and OBDFLT in GTIOR, and output the arbitrary values on count stop.
- Set the pin to output an arbitrary value as a general output port by setting the PMn, Pn, and PMCn registers of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0 and the control bit associated with the pin in the PMCn to 0, to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

When the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting resumes, operation continues from where it stops. If counting stops, registers must be initialized before counting starts.

5.7.9 Usage Notes

5.7.9.1 GTCCRn Settings during Compare Match Operation (n = A to F)

(1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy the following conditions: GTDVU < GTCCRA, GTDVD < GTCCRA, and GTCCRA < GTPR.

When the setting of GTCCRA = 0 or GTCCRA ≥ GTPR is made during count operation, the output protection function is activated.

However, it will not work properly unless the following conditions are satisfied.

- At count start: The value of the GTCCRA register must be set within the range of (0 < GTCCRA < GTPR).
- During buffer transfer at crest: GTCCRA - GTDVD < GTPR - 1 has to be satisfied..
- During buffer transfer at through: If GTCCRA ≥ GTPR, GTCCRA - GTDVU > 1 has to be satisfied.

For details, see **5.7.7.4 Output Protection Function for GTIOC Pin Output**.

(2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. When GTCCRA > GTPR, no compare match occurs.

Similarly, GTCCRB must be set within the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. When GTCCRB > GTPR, no compare match occurs.

(3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following constraints. If the constraints are not satisfied, correct output waveforms with secured dead time might not be obtained.

- In up-counting: GTCCRC < GTCCRD, GTCCRC > GTDVU, GTCCRD < GTPR - GTDVD
- In down-counting: GTCCRC > GTCCRD, GTCCRC < GTPR – GTDVU, GTCCRD > GTDVD

(4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following constraints. If the constraints are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC < GTCCRD < GTPR
- In down-counting: GTPR > GTCCRC > GTCCRD > 0

Similarly, GTCCRE and GTCCRF must be set to satisfy the following constraints. If the constraints are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE < GTCCRF < GTPR
- In down-counting: GTPR > GTCCRE > GTCCRF > 0

(5) In saw-wave PWM mode

The GTCCRA register must be set with the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. If GTCCRA > GTPR is set, no compare match occurs.

Similarly, GTCCRB must be set with the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. If GTCCRB > GTPR is set, no compare match occurs.

5.7.9.2 Setting Range for the GTCNT Counter

The GTCNT counter register must be set with the range of 0 ≤ GTCNT ≤ GTPR.

5.7.9.3 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[2:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[2:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored.

Note, however, that an event might be accepted or an interrupt might occur after the GTCR.CST bit is set to 0.

5.7.9.4 Priority On Conflicts

(1) GTCNT register

Table 5.7-20 shows a priority order of events updating GTCNT register.

Table 5.7-20 Priority order of sources updating GTCNT

Source updating GTCNT	Priority order
Writing by CPU (Writing to GTCNT/GTCLR)	High
Clear by hardware sources set in GTCSR	↑
Count up or down by hardware sources set in GTUPSR/GTDNSR	↑
Count operation	Low

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

(2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), writing by CPU has a priority over starting/stopping by hardware sources.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. Where there is a conflict between updating the GTCR.CST bit and reading by the CPU, pre-update data is read.

(3) GTCCRn registers (n = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to GTCCRn registers, writing to GTCCRn registers has a priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. Where there is a conflict between updating the GTCCRn registers and reading by the CPU, pre-update data is read.

(4) GTPR registers

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has a priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

(5) GTADTRn registers (n = A, B)

When there is a conflict between buffer transfer operation and writing to the GTADTRn registers, writing to the GTADTRn registers has priority over buffer transfer operation. Where there is a conflict between updating GTADTRn registers and reading by the CPU, pre-update data is read.

(6) GTDVn registers (n = U, D)

When there is a conflict between buffer transfer operation and writing to GTDVn registers, writing to GTDVn registers has priority over buffer transfer operation. When there is a conflict between updating GTDVn registers and reading by the CPU, pre-update data is read.

SECTION 5 TIMER

5.8 Port Output Enable for GPT (POEG)

5.8.1 Overview

The output pins of the general PWM timer (GPT) can be disabled by using the port output enabling function for the GPT (POEG). Specifically, either of the following ways can be used.

- Input level detection of the GTETRGA to GTETRGD pins
- Output-disable request from the GPT
- Register settings

The GTETRGA to GTETRGD pins can also be used as GPT external trigger input pins.

Table 5.8-1 lists the POEG specifications, **Figure 5.8-1** shows the block diagram, and **Table 5.8-2** lists the input pins.

Table 5.8-1 POEG Specifications

Parameter	Specifications
Output-disable control through input level detection	GPT output pins can be disabled when a GTETRGA to GTETRGD rising edge or high level is sampled after polarity and filter selection
Output-disable request from the GPT	• When the GTIOCA pin and the GTIOCB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCA and GTIOCB pins are output-disabled • GPT output pins can be set to be disabled when the GPT output pins detect a dead time error or short circuit detection between the output terminals
Output-disable control by software (registers)	GPT output pins can be disabled by modifying the register settings
Interrupt	• Allows output-disable control by input level detection • Allows output-disable requests from the GPT
External trigger output to the GPT (count start, count stop, count clear, up-count, down-count, or input capture function)	GTETRGA to GTETRGD signals can be output to the GPT after polarity and filter selection
Noise filtering	• Three times sampling for every P0ϕ/1, P0ϕ/8, P0ϕ/32, or P0ϕ/128 can be set for any of the input pins GTETRGA to GTETRGD • Positive or negative polarity can be selected for any of the input pins, GTETRGA to GTETRGD • Signal state after polarity and filter selection can be monitored

GTETRGn (n = A to D) in the subsequent descriptions indicates the GTETRGA to GTETRGD pins. The signal input from each of the pins corresponds to the POEGGn register for which n matches the n of the pin.

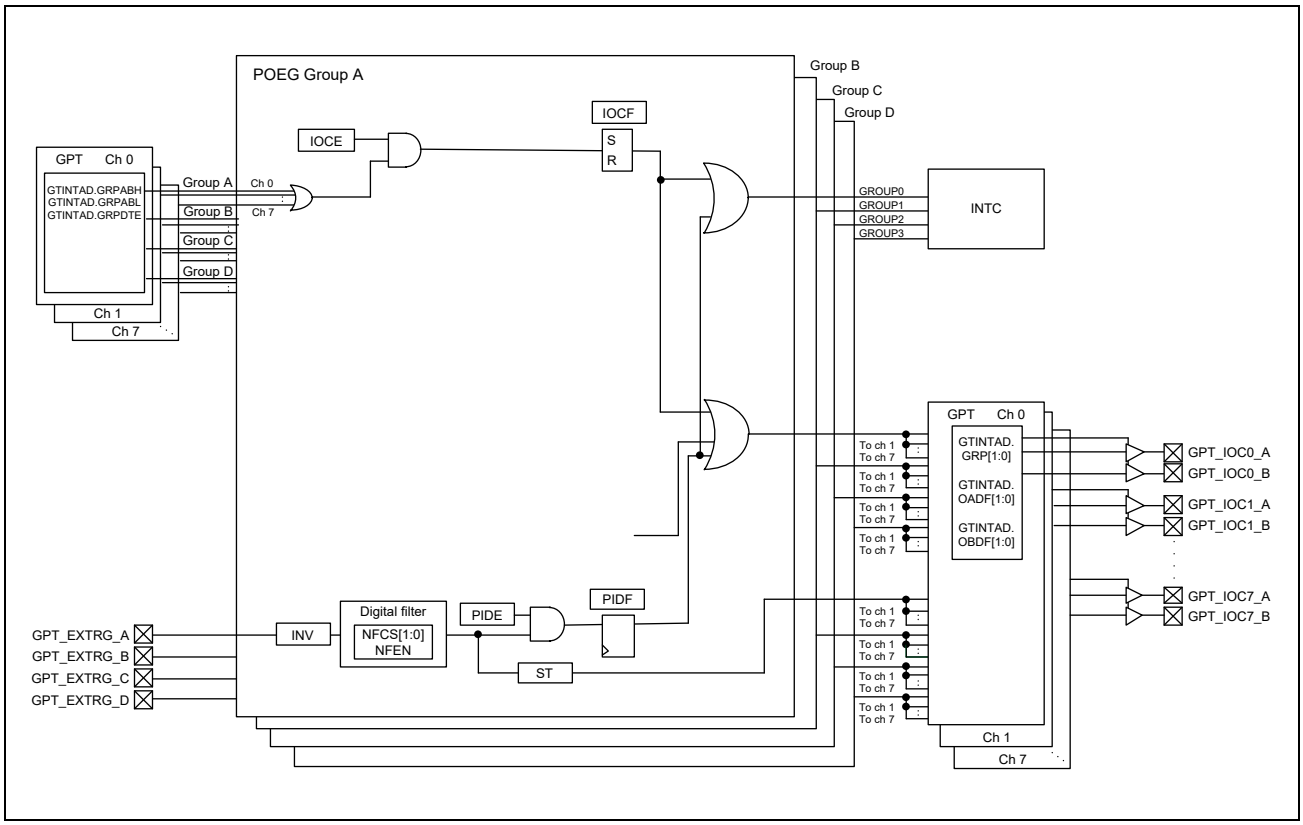


Figure 5.8-1 POEG Block Diagram

Table 5.8-2 POEG Input Pins

Pin Name	Signal Name in This Section	Input/ Output	Description
GPT_EXTRG_A	GTETRGA	Input	GPT output pin output-disable request signal and GPT external trigger input pin A
GPT_EXTRG_B	GTETRGB	Input	GPT output pin output-disable request signal and GPT external trigger input pin B
GPT_EXTRG_C	GTETRGC	Input	GPT output pin output-disable request signal and GPT external trigger input pin C
GPT_EXTRG_D	GTETRGD	Input	GPT output pin output-disable request signal and GPT external trigger input pin D

5.8.2 Register Descriptions

Table 5.8-3 to **Table 5.8-5** shows the register configuration.

Table 5.8-3 Register Configuration 1 (Cortex-A55 Address Space)

Register Name	Abbreviation	Address	Access Size
POEG group A setting register	POEGGA	H'0_1004_8800	32
POEG group B setting register	POEGGB	H'0_1004_8C00	32
POEG group C setting register	POEGGC	H'0_1004_9000	32
POEG group D setting register	POEGGD	H'0_1004_9400	32

Table 5.8-4 Register Configuration 2 (Cortex-M33 Address Space Secure)

Register Name	Abbreviation	Address	Access Size
POEG group A setting register	POEGGA	H'4004_8800	32
POEG group B setting register	POEGGB	H'4004_8C00	32
POEG group C setting register	POEGGC	H'4004_9000	32
POEG group D setting register	POEGGD	H'4004_9400	32

Table 5.8-5 Register Configuration 3 (Cortex-M33 Address Space Non-Secure)

Register Name	Abbreviation	Address	Access Size
POEG group A setting register	POEGGA	H'5004_8800	32
POEG group B setting register	POEGGB	H'5004_8C00	32
POEG group C setting register	POEGGC	H'5004_9000	32
POEG group D setting register	POEGGD	H'5004_9400	32

5.8.2.1 POEG Group n Setting Register (POEGGn) (n = A to D)

The POEGGA to POEGGD registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT. In the descriptions, POEGGn represents all of the POEGGA to POEGGD registers.

b0	PIDF	0	R(/W) *1	Port Input Detection Flag 0: No output-disable request from the GTETRGn pin occurred 1: Output-disable request from the GTETRGn pin occurred.

Note 1. Only 0 can be written, to clear the flag.

Note 2. Can be modified only once after a reset.

5.8.3 Output-Disable Control Operation

The output of the GTIOCxA and GTIOCxB pins can be disabled when any of the following conditions are satisfied.

- Input level or edge detection of the GTETRGn pins

  When POEGGn.PIDE is 1, the POEGGn.PIDF flag is set to 1.

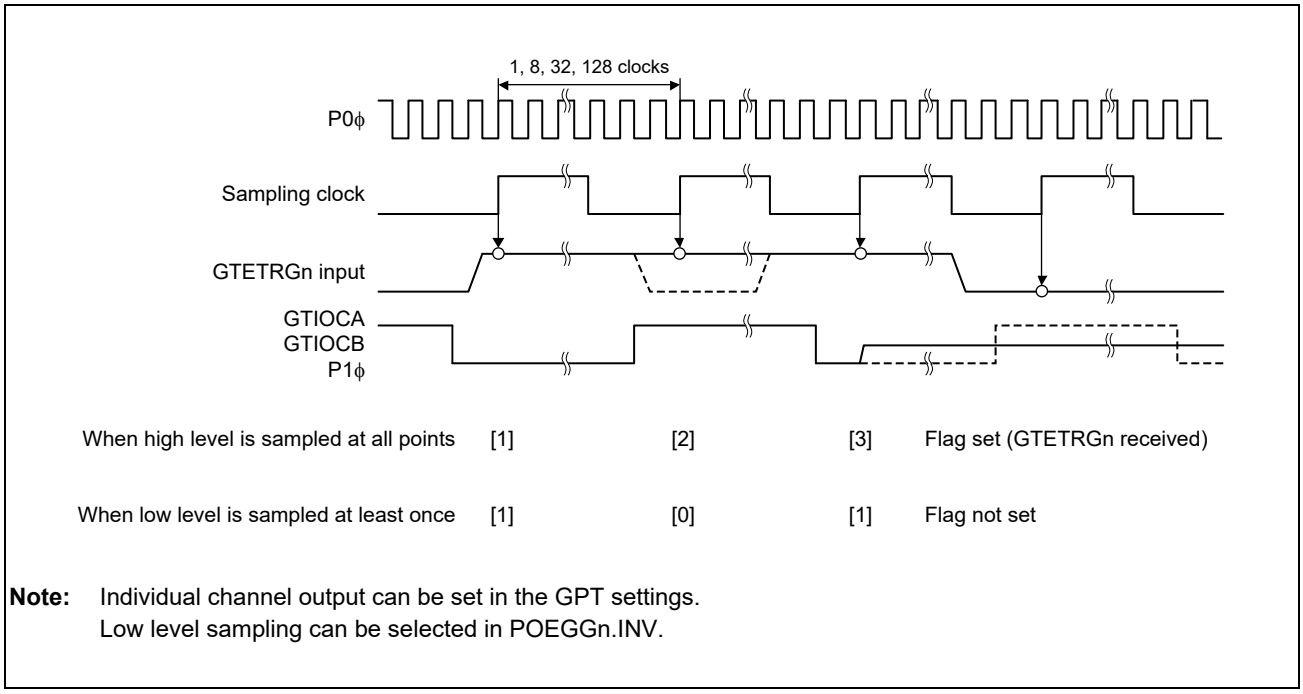
- Output-disable request from the GPT

  When POEGGn.IOCE is 1, the POEGGn.IOCF flag is set to 1.
  The output-disable requests enabled by GRPDTE, GRPABH, and GRPABL bits of the GTINTAD register in the GPT are applied to the group selected by GRP[1:0] bits of the GTINTAD register.

- SSF bit setting

  When POEGGn.SSF is set to 1.

The state of the GTIOCxA and the GTIOCxB pins when the output is disabled is controlled by the GPT module.



For details, see the descriptions of the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits of the general PWM timer (GPT).

5.8.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGGn.PIDE, POEGGn.NFCS[1:0], POEGGn.NFEN, and POEGGn.INV occur on the GTETRGn pins, the GPT output pins are output-disabled.

Digital Filter

Figure 5.8-2 shows high-level detection by the digital filter. When a high level associated with the POEGGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not being output, changes of the levels on the GTETRGn pins are ignored.

Note: Individual channel output can be set in the GPT settings.
Low level sampling can be selected in POEGGn.INV.

Figure 5.8-2 Example of Digital Filter Operation

5.8.3.2 Output-Disable Requests from the GPT

For details on this operation, see the description of **5.7.7.3 GTIOC Pin Output Negate Control** in **5.7 General PWM Timer (GPT)**.

5.8.3.3 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing to the software stop flag, POEGGn.SSF.

5.8.3.4 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following:

- POEGGn.PIDF flag
- POEGGn.IOCF flag
- POEGGn.SSF flag.

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGn, are not disabled and the POEGGn.ST bit is not set to 0.

Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.DTEF, GTST.OABHF, and GTST.OABLF flags in the GPT are set to 0.

Figure 5.8-3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

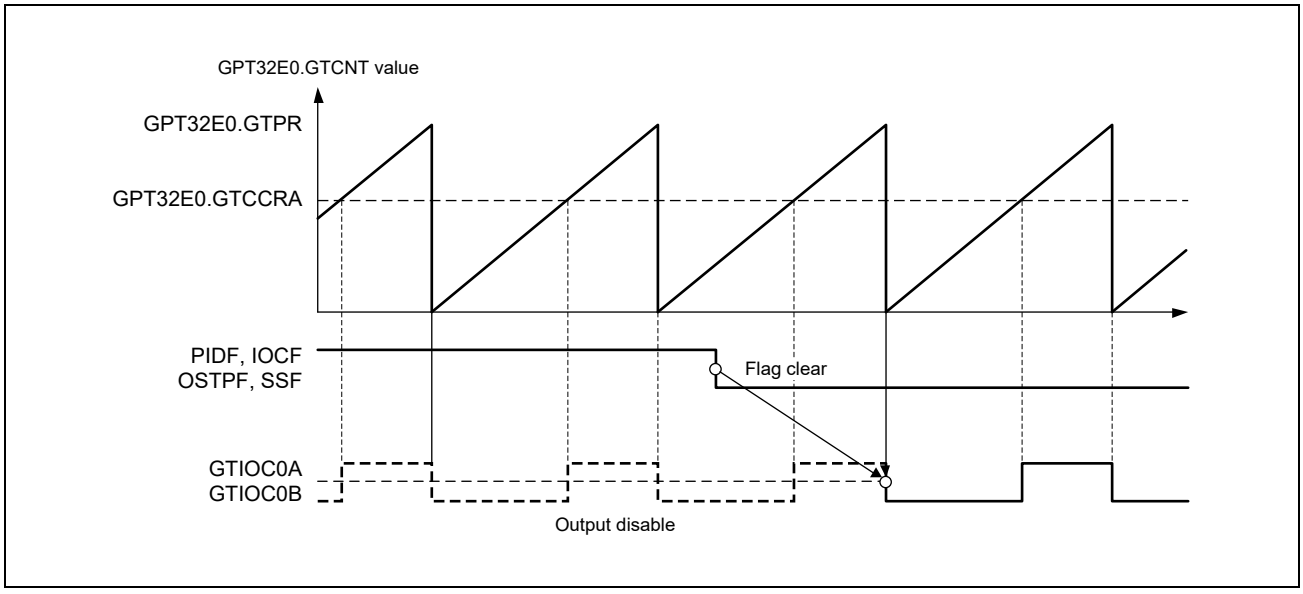


Figure 5.8-3 Output-Disable Release Timing for GPT Pin Outputs

5.8.4 Interrupt Sources

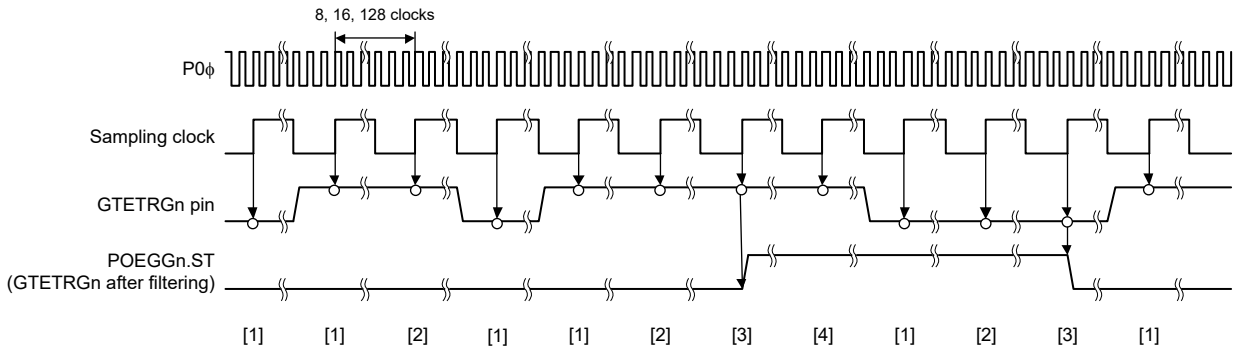
The POEG generates an interrupt request when triggered by these sources:

- Output-disable control by input level detection
- Output-disable request from the GPT
- Output-disable control by the registers.

Table 5.8-6 lists the conditions for interrupt requests.

Table 5.8-6 Interrupt Sources and Conditions

Interrupt Source	Symbol	Associated Flag	Trigger Conditions
POEG group A interrupt	GROUP0	POEGGA.IOCF	Output-disable request from a GPT disable request occurred
		POEGGA.PIDF	Output-disable request from the GTETRGA pin occurred
POEG group B interrupt	GROUP1	POEGGB.IOCF	Output-disable request from a GPT disable request occurred
		POEGGB.PIDF	Output-disable request from the GTETRGB pin occurred
POEG group C interrupt	GROUP2	POEGGC.IOCF	Output-disable request from a GPT disable request occurred
		POEGGC.PIDF	Output-disable request from the GTETRGC pin occurred
POEG group D interrupt	GROUP3	POEGGD.IOCF	Output-disable request from a GPT disable request occurred
		POEGGD.PIDF	Output-disable request from the GTETRGD pin occurred



5.8.5 External Trigger Output to the GPT

The POEG outputs the GTETRGn signals to the GPT as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture.

For the POEGGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in **5.8.3.1 Pin Input Level Detection Operation**. The state after filtering can be monitored in POEGGn.ST.

Figure 5.8-4 shows the output timing of an external trigger to the GPT.

Note: Each channel output can be set in the GPT settings.
Polarity can be reversed in POEGGn.INV.

Figure 5.8-4 Output Timing of External Trigger to GPT

5.8.6 Usage Notes

5.8.6.1 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PMCn and PFCm register settings of IO_TOP. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

SECTION 5 TIMER

5.9 Multi-Function Timer Pulse Unit 3 (MTU3a)

5.9.1 Overview

This LSI has an on-chip multi-function timer pulse unit 3 (MTU3a), consisting of eight 16-bit timer channels and one 32- bit timer channel.

Table 5.9-1 shows the specifications of the MTU and **Table 5.9-2** lists the functions of the MTU. **Figure 5.9-1** and **Figure 5.9-2** are block diagrams of the MTU.

Table 5.9-1 MTU Specifications (1/2)

Item	Description
Pulse input/output	28 lines max.
Pulse input	3 lines
Count clock	11 clocks for each channel (14 clocks for MTU0, 12 clocks for MTU2, and 10 clocks for MTU5, four clocks for MTU1-MTU2 combination (when LWA = 1))
Operating frequency	Up to 100 MHz
Available operations	[MTU0 to MTU4, MTU6, MTU7, and MTU8] • Waveform output on compare match • Input capture function (noise filter setting available) • Counter-clearing operation • Simultaneous writing to multiple timer counters (TCNT) (excluding MTU8) • Simultaneous clearing on compare match or input capture (excluding MTU8) • Simultaneous input and output to registers in synchronization with counter operations (excluding MTU8) • Up to 12-phase PWM output in combination with synchronous operation (excluding MTU8)
	[MTU0 MTU3, MTU4, MTU6, MTU7, and MTU8] • Buffer operation specifiable
	[MTU1, MTU2] • Phase counting mode can be specified independently • 32-bit phase counting mode can be specified for interlocked operation of MTU1 and MTU2 (when TMDR3.LWA = 1) • Cascade connection operation available
	[MTU3, MTU4, MTU6, and MTU7] • Through interlocked operation of MTU3/4 and MTU6/7, the positive and negative signals in six phases (12 phases in total) can be output in complementary PWM and reset-synchronized PWM operation. • In complementary PWM mode, values can be transferred from buffer registers to temporary registers at crests and troughs of the timer-counter values or when the buffer registers (TGRD registers in MTU4 and MTU7) are written to. • Double-buffering selectable in complementary PWM mode
	[MTU3 and MTU4] • Through interlocking with MTU0, a mode for driving AC synchronous motors (brushless DC motors) by using complementary PWM output and reset-synchronized PWM output is settable and allows the selection of two types of waveform output (chopping or level)
	[MTU5] • Capable of operation as a dead-time compensation counter
	[MTU0/MTU5, MTU1, MTU2, and MTU8] 32-bit phase counting mode specifiable by combining MTU1 and MTU2 and through interlocked operation with MTU0/MTU5 and MTU8

Table 5.9-1 MTU Specifications (2/2)

Item	Description
Interrupt-skipping function	In complementary PWM mode, interrupts on crests and troughs of counter values and triggers to start conversion by the A/D converter can be skipped
Interrupt sources	43 sources
Buffer operation	Automatic transfer of register data (transfer from the buffer register to the timer register)
Trigger generation	A/D converter start triggers can be generated
	A/D converter start request delaying function enables A/D converter to be started with any desired timing and to be synchronized with PWM output
Low power consumption function	The MTU3a can be placed in the module-stop state.

Table 5.9-2 MTU Functions (1/2)

Item		MTU0	MTU1	MTU2	MTU1 & MTU2 (LWA = 1)	MTU3	MTU4	MTU5	MTU6	MTU7	MTU8

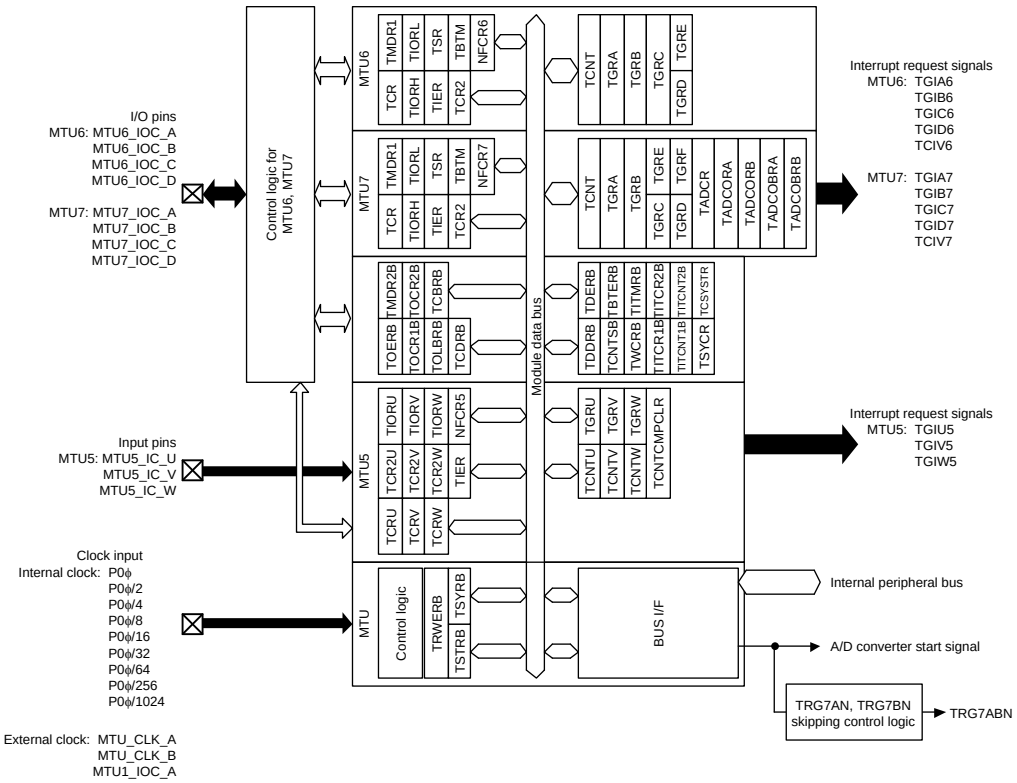
Remarks: ✓: Possible —: Not possible

Note 1. When LWA is 1, the TGRALW capture source can be selected from either of the following: an input from MTIOC1A or MTU0.TGRA compare match/input capture event.
The TGRBLW capture source can be selected from any of the following: an input from MTIOC1B, MTU0.TGRC compare match/ input capture event, or MTU8.TGRC compare match event.



Note 2. Capture in MTU8 is supported only in normal mode.

Note 3. The underflow interrupt source is valid only in complementary PWM mode.

5.9.2 Register Descriptions

Table 5.9-4 shows the register configuration. The MTU address space is offset from the base address. The base address of MTU is as follows.

MTU base address: H'0_1000_0000 (Overall Address Space)
MTU base address: H'4000_0000 (Cortex-M33 Address Space Secure)
MTU base address: H'5000_0000 (Cortex-M33 Address Space Non-Secure)

Table 5.9-4 Register Configuration (1/5)

Channel	Register Name	Abbreviation	Address	Access size
MTU0	Timer control register	TCR	H'1300	8
	Timer mode register 1	TMDR1	H'1301	8

5.9.2.1 Timer Control Register (TCR)

(1) MTU0.TCR, MTU1.TCR, MTU2.TCR, MTU3.TCR, MTU4.TCR, MTU6.TCR, MTU7.TCR, MTU8.TCR

Address(es): MTU0.TCR H'0_1000_1300, MTU1.TCR H'0_1000_1380, MTU2.TCR H'0_1000_1400, MTU3.TCR H'0_1000_1200, MTU4.TCR H'0_1000_1201, MTU6.TCR H'0_1000_1A00, MTU7.TCR H'0_1000_1A01, MTU8.TCR H'0_1000_1600

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TPSC[2:0]	All 0	R/W	Time Prescaler Select See **Table 5.9-7** to **Table 5.9-10**.
b4, b3	CKEG[1:0]	All 0	R/W	Clock Edge Select b4 b3 0 0: Count at rising edge 0 1: Count at falling edge 1 x: Count at both edges
b7 to b5	CCLR[2:0]	All 0	R/W	Counter Clear Source Select See **Table 5.9-5** and **Table 5.9-6**.

Remarks: x: Don't care

The TCR register controls the TCNT operation for each channel in combination with the TCR2 register. The MTU has a total of 11 TCR registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCRU, TCRV, and TCRW) for MTU5. TCR values should be specified only while TCNT operation is stopped.

TPSC[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. The clock source can be selected independently for each channel. See **Table 5.9-7** to **Table 5.9-10** for details.

CKEG[1:0] Bits (Clock Edge Select)

These bits select the count clock source edge, including the MTIOC1A pin. When the internal clock is counted at both edges, the count clock period is halved (e.g. P0ϕ/4 at both edges = P0ϕ/2 at rising edge). If phase counting mode is used on MTU1 and MTU2, the setting of these bits is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the count clock source is P0ϕ/2 or slower. When P0ϕ/1 or the overflow/underflow in another channel is selected for the count clock source, a value can be written to these bits but counter operation compiles with the initial value.

CCLR[2:0] Bits (Counter Clear Source Select)

These bits select the TCNT counter clearing source. See **Table 5.9-5** and **Table 5.9-6** for details.

Table 5.9-5 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8)

Channel	Bit 7 CCLR2	Bit 6 CCLR1	Bit 5 CCLR0	Description
MTU0 MTU3 MTU4 MTU6 MTU7 MTU8	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1
	1	0	0	TCNT clearing disabled
	1	0	1	TCNT cleared by TGRC compare match/input capture*2
	1	1	0	TCNT cleared by TGRD compare match/input capture*2
	1	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1

Note 1. Synchronous operation is selected by setting a SYNC bit in TSYRA or TSYRB to 1 except for MTU8.

Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority and compare match/input capture does not occur.

Table 5.9-6 CCLR[2:0] (MTU1 and MTU2)

Channel	Bit 7 Reserved*2	Bit 6 CCLR1	Bit 5 CCLR0	Description
MTU1 MTU2	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*1

Note 1. Synchronous operation is selected by setting a SYNC bit in TSYRA or TSYRB to 1.

Note 2. Bit-7 is reserved in MTU1 and MTU2. It is read as 0. The write value is ignored.

(2) MTU5.TCRU, MTU5.TCRV, MTU5.TCRW

Address(es): MTU5.TCRU H'0_1000_1C84, MTU5.TCRV H'0_1000_1C94, MTU5.TCRW H'0_1000_1CA4

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TPSC[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	TPSC[1:0]	All 0	R/W	Time Prescaler Select See **Table 5.9-11**.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TPSC[1:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. See **Table 5.9-11** for details.

5.9.2.2 Timer Control Register 2 (TCR2)

(1) MTU0.TCR2, MTU3.TCR2, MTU4.TCR2, MTU6.TCR2, MTU7.TCR2, MTU8.TCR2

Address(es): MTU0.TCR2 H'0_1000_1328, MTU3.TCR2 H'0_1000_124C, MTU4.TCR2 H'0_1000_124D, MTU6.TCR2 H'0_1000_1A4C, MTU7.TCR2 H'0_1000_1A4D, MTU8.TCR2 H'0_1000_1606

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TPSC2[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU1.TCR2, MTU2.TCR2

Address(es): MTU1.TCR2 H'0_1000_1394, MTU2.TCR2 H'0_1000_140C

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PCB[1:0]		TPSC2[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TPSC2[2:0]	All 0	R/W	Time Prescaler Select See **Table 5.9-7** to **Table 5.9-10**.
b4, b3	PCB[1:0]	All 0	R/W	Phase Counting Mode Function Expansion Control Functional Expansion Control for Phase Counting Modes 2, 3, and 5
b7 to b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. The MTU has a total of 11 TCR2 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCR2U, TCR2V, and TCR2W) for MTU5. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. The clock source can be selected independently for each channel. See **Table 5.9-7** to **Table 5.9-10** for details.

PCB[1:0] Bits (Phase Counting Mode Function Expansion Control)

These bits control extended functions for phase counting mode 2, 3, and 5 in MTU1 and MTU2. See **5.9.3.6 Phase Counting Mode**.

(3) MTU5.TCR2U, MTU5.TCR2V, MTU5.TCR2W

Address(es): MTU5.TCR2U H'0_1000_1C85, MTU5.TCR2V H'0_1000_1C95, MTU5.TCR2W H'0_1000_1CA5

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CKEG[1:0]		TPSC2[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TPSC2[2:0]	All 0	R/W	Time Prescaler Select See **Table 5.9-11**.
b4, b3	CKEG[1:0]	All 0	R/W	Clock Edge Select b4 b3 0 0: Counts at the rising edge. 0 1: Counts at the falling edge. 1 x: Counts at both edges.
b7 to b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Remarks: x: Don't care

TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. See **Table 5.9-11** for details.

CKEG[1:0] Bits (Clock Edge Select)

These bits select the edge of the count clock source signal output from the MTIOC1A pin.

Table 5.9-7 TPSC[2:0], TPSC2[2:0] (MTU0)

	TCR2[2:0]			TCR[2:0]			
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0

5.9.2.3 Timer Mode Register 1 (TMDR1)

(1) MTU0.TMDR1

Address(es): MTU0.TMDR1 H'0_1000_1301

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	BFE	BFB	BFA	MD[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU1.TMDR1, MTU2.TMDR1

Address(es): MTU1.TMDR1 H'0_1000_1381, MTU2.TMDR1 H'0_1000_1401

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MD[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(3) MTU3.TMDR1, MTU4.TMDR1, MTU6.TMDR1, MTU7.TMDR1, MTU8.TMDR1

Address(es): MTU3.TMDR1 H'0_1000_1202, MTU4.TMDR1 H'0_1000_1203, MTU6.TMDR1 H'0_1000_1A02, MTU7.TMDR1 H'0_1000_1A03, MTU8.TMDR1 H'0_1000_1601

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	BFB	BFA	MD[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b3 to b0	MD[3:0]	All 0	R/W	Mode Select These bits specify the timer operating mode. See **Table 5.9-12** for details.
b4	BFA	0	R/W	Buffer Operation A 0: TGRA and TGRC operate normally 1: TGRA and TGRC used together for buffer operation
b5	BFB	0	R/W	Buffer Operation B 0: TGRB and TGRD operate normally 1: TGRB and TGRD used together for buffer operation
b6	BFE	0	R/W	Buffer Operation E 0: MTU0.TGRE and MTU0.TGRF operate normally 1: MTU0.TGRE and MTU0.TGRF used together for buffer operation
b7	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

The TMDR1 register specifies the operating mode of each channel. The MTU has a total of eight TMDR1 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8. TMDR1 register values should be specified only while TCNT operation is stopped.

Table 5.9-12 Operating Mode Setting by MD[3:0] Bits (MTU0 to MTU4, MTU6 to MTU8)

1	1	0	1	Complementary PWM mode 1 (transfer at crest)*1					✓		✓		
1	1	1	0	Complementary PWM mode 2 (transfer at trough)*1					✓		✓		
1	1	1	1	Complementary PWM mode 3 (transfer at crest and trough)*1					✓		✓		

Note: Only set the corresponding operating mode listed above for each channel.

Remarks: x: Don't care

Note 1. Reset-synchronized PWM mode and complementary PWM mode can only be set for MTU3 and MTU6. When MTU3 or MTU6 is set to reset-synchronized PWM mode or complementary PWM mode, the MTU4 or MTU7 settings become ineffective and automatically conform to the MTU3 or MTU6 setting, respectively. MTU4 and MTU7 should be set to the initial values (normal mode).

BFA Bit (Buffer Operation A)

This bit specifies whether to operate TGRA in the normal way or to use TGRA and TGRC together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRC occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIEC bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFA bit of MTU3.TMDR1 (MTU6.TMDR1). The BFA bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRC, this bit is reserved. It is read as 0. The write value should be 0. See **Figure 5.9-50** for an illustration of the Tb interval in complementary PWM mode.

BFB Bit (Buffer Operation B)

This bit specifies whether to operate TGRB in the normal way or to use TGRB and TGRD together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRD occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIED bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFB bit of MTU3.TMDR1 (MTU6.TMDR1). The BFB bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRD, this bit is reserved. It is read as 0. The write value should be 0. See **Figure 5.9-50** for an illustration of the Tb interval in complementary PWM mode.

BFE Bit (Buffer Operation E)

This bit specifies whether to operate MTU0.TGRE and MTU0.TGRF in the normal way or to use them together for buffer operation. Compare match with TGRF occurs even when TGRF is used as a buffer register.

In MTU0 to MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

5.9.2.4 Timer Mode Registers 2 (TMDR2A and TMDR2B)

Address(es): MTU.TMDR2A H'0_1000_1270, MTU.TMDR2B H'0_1000_1A70

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DRS
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	DRS	0	R/W	Double Buffer Select 0: Double buffer function is disabled 1: Double buffer function is enabled
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TMDR2A and TMDR2B specify the double buffer function in complementary PWM mode 3 (transfer at the crest and trough of the counter value). The MTU has two TMDR2 registers, one each for MTU3 (TMDR2A) and MTU6 (TMDR2B). TMDR2A and TMDR2B values should be specified only while TCNT operation is stopped.

DRS Bit (Double Buffer Select)

This bit enables or disables the double buffer function in complementary PWM mode.

5.9.2.5 Timer Mode Register 3 (TMDR3)

Address(es): MTU1.TMDR3 H'0_1000_1391

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PHCKSEL	LWA
Initial Value	0	0	0	0	0	0	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	LWA	0	R/W	MTU1/MTU2 Combination Longword Access Control 0: 16-bit access is enabled. 1: 32-bit access is enabled.
b1	PHCKSEL	1	R/W	External Input Phase Clock Select Selects the external clock pin for phase counting mode. 0: MTCLKA and MTCLKB are selected for the external phase clock. 1: MTCLKC and MTCLKD are selected for the external phase clock.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

The TMDR3 register controls longword access to a 32-bit register or counter in a combination of MTU1 and MTU2. There is only one TMDR3 register in MTU1. The counter (TCNTLW), general register A (TGRALW), and general register B (TGRBLW) of MTU1 and MTU2 are accessed in the combinations listed in **Table 5.9-13**.

LWA Bit (MTU1/MTU2 Combination Longword Access Control)

This bit selects a 32-bit access in a combination of MTU1 and MTU2.

When the LWA bit is set to 0, MTU1 and MTU2 operate independently as 16-bit timers and the TCNTLW, TGRALW, and TGRBLW registers cannot be accessed.

When the LWA bit is set to 1, MTU1 and MTU2 are cascaded and operate as a 32-bit timer, which is controlled through the TCR, TCR2, TIOR, and TMDR1 registers in MTU1. The TCR, TCR2, TIOR, and TMDR1 register settings in MTU2 are ignored. The 16-bit registers (TCNT, TGRA, and TGRB) in MTU1 and MTU2 cannot be accessed. MTU2 input capture and compare match are disabled.

Note that MTU1 and MTU2 can be cascaded by setting the LWA bit to 1 only in phase-counting mode. Cascade connection cannot be used in normal, PWM1, or PWM2 mode. When setting the LWA bit to 1, be sure to select phase-counting mode.

In addition, initialize the TCNT, TGRA, and TGRB registers in MTU1 and MTU2 before setting the LWA bit to 1.

PHCKSEL Bit (External Input Phase Clock Select)

When the MTU1 and MTU2 registers are combined for 32-bit phase counting mode or MTU2 phase counting mode, this bit selects either the A- or B-phase signal from the external clock. See **Table 5.9-66 Clock Input Pins in Phase Counting Mode** for details.

Table 5.9-13 Setting and Combination of the TMDR3 Register

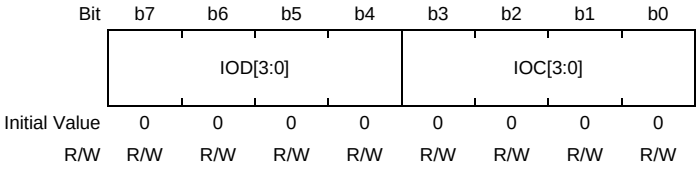
	TMDR3.LWA = 0		TMDR3.LWA = 1	
Register	Symbol	Access mode	Symbol	Access mode
Counter in MTU1*1	MTU1.TCNT	Word	MTU1.TCNT_1_LW	Longword
Counter in MTU2	MTU2.TCNT	Word		
General register A in MTU1	MTU1.TGRA	Word	MTU1.TGRA_1_LW	Longword
General register A in MTU2	MTU2.TGRA	Word		
General register B in MTU1	MTU1.TGRB	Word	MTU1.TGRB_1_LW	Longword
General register B in MTU2	MTU2.TGRB	Word		

Note 1. When the LWA bit is set to 1, setting the count clock for MTU1 as MTU2.TCNT overflow/underflow is not required.

5.9.2.6 Timer I/O Control Register (TIOR)

(1) MTU0.TIORH, MTU1.TIOR, MTU2.TIOR, MTU3.TIORH, MTU4.TIORH, MTU6.TIORH, MTU7.TIORH, MTU8.TIORH

Address(es): MTU0.TIORH H'0_1000_1302, MTU1.TIOR H'0_1000_1382, MTU2.TIOR H'0_1000_1402, MTU3.TIORH H'0_1000_1204, MTU4.TIORH H'0_1000_1206, MTU6.TIORH H'0_1000_1A04, MTU7.TIORH H'0_1000_1A06, MTU8.TIORH H'0_1000_1602



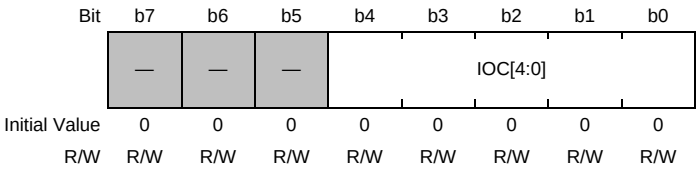
Bit	b7	b6	b5	b4	b3	b2	b1	b0
	IOB[3:0]				IOA[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b3 to b0	IOA[3:0]	All 0	R/W	I/O Control A*1 See the following tables. MTU0.TIORH: **Table 5.9-28** MTU1.TIOR: **Table 5.9-30** MTU2.TIOR: **Table 5.9-31** MTU3.TIORH: **Table 5.9-32** MTU4.TIORH: **Table 5.9-34** MTU6.TIORH: **Table 5.9-36** MTU7.TIORH: **Table 5.9-38** MTU8.TIORH: **Table 5.9-40**
b7 to b4	IOB[3:0]	All 0	R/W	I/O Control B*1 See the following tables. MTU0.TIORH: **Table 5.9-14** MTU1.TIOR: **Table 5.9-16** MTU2.TIOR: **Table 5.9-17** MTU3.TIORH: **Table 5.9-18** MTU4.TIORH: **Table 5.9-20** MTU6.TIORH: **Table 5.9-22** MTU7.TIORH: **Table 5.9-24** MTU8.TIORH: **Table 5.9-26**

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

(2) MTU0.TIORL, MTU3.TIORL, MTU4.TIORL, MTU6.TIORL, MTU7.TIORL, MTU8.TIORL

Address(es): MTU0.TIORL H'0_1000_1303, MTU3.TIORL H'0_1000_1205, MTU4.TIORL H'0_1000_1207, MTU6.TIORL H'0_1000_1A05,MTU7.TIORL H'0_1000_1A07, MTU8.TIORL H'0_1000_1603



Bit	Bit Name	Initial Value	R/W	Description
b3 to b0	IOC[3:0]	All 0	R/W	I/O Control C*1 See the following tables. MTU0.TIORL: **Table 5.9-29** MTU3.TIORL: **Table 5.9-33** MTU4.TIORL: **Table 5.9-35** MTU6.TIORL: **Table 5.9-37** MTU7.TIORL: **Table 5.9-39** MTU8.TIORL: **Table 5.9-41**
b7 to b4	IOD[3:0]	All 0	R/W	I/O Control D*1 See the following tables. MTU0.TIORL: **Table 5.9-15** MTU3.TIORL: **Table 5.9-19** MTU4.TIORL: **Table 5.9-21** MTU6.TIORL: **Table 5.9-23** MTU7.TIORL: **Table 5.9-25** MTU8.TIORL: **Table 5.9-27**

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

(3) MTU5.TIORU, MTU5.TIORV, MTU5.TIORW

Address(es): MTU5.TIORU H'0_1000_1C86, MTU5.TIORV H'0_1000_1C96, MTU5.TIORW H'0_1000_1CA6

Bit	Bit Name	Initial Value	R/W	Description
b4 to b0	IOC[4:0]	All 0	R/W	I/O Control C See the following table. MTU5.TIORU, MTU5.TIORV, MTU5.TIORW: **Table 5.9-42**
b7 to b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

The TIOR register controls the TGR register. The MTU has a total of 17 TIOR registers, two each for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, one each for MTU1 and MTU2, and three (MTU5.TIORU/TIORV/TIORW) for MTU5. The TIOR register should be set when the TMDR register setting is normal mode, PWM mode, or phase counting mode.

Note that TIOR is affected by the TMDR1 setting.

The initial output specified by TIOR is valid when the counter is stopped (the CSTn bits in TSTRA and TSTRB are cleared to 0). Also note that, in PWM mode 2, the output at the point at which the counter is cleared to 0 is specified. When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

Table 5.9-14 TIORH (MTU0)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU0.TGRB Function	MTIOC0B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*1

Remarks: Don't care

Note 1. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 5.9-15 TIORL (MTU0)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	IOD2	IOD1	IOD0	MTU0.TGRD Function	MTIOC0D Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*1	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*2

Remarks: Don't care

Note 1. When the MTU0.TMDR1.BFB is set to 1 and MTU0.TGRD is used as a buffer register, this setting is invalid and input capture/ output compare is not generated.

Note 2. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 5.9-16 TIOR (MTU1)

Bit 7	Bit 6	Bit 5	Bit 4	Description

1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Note 1. When the BFB bit in MTU7.TMDR1 is set to 1 and MTU7.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 5.9-26 TIORH (MTU8)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU8.TGRB Function	MTIOC8B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1)*1

Remarks: x: Don’t care

Note 1. Input capture will not be generated in MTU8 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 5.9-27 TIORL (MTU8)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	IOD2	IOD1	IOD0	MTU8.TGRD Function	MTIOC8D Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Note 1. When the BFB bit of the TMDR1 register is set to 1 and the TGRD register is used as a buffer register in MTU8, this setting is invalid and input capture/output compare is not generated.

Table 5.9-28 TIORH (MTU0)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU0.TGRA Function	MTIOC0A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*1
1	1	1	x		Input capture on generation of compare match with MTU8.TGRC

Remarks: x: Don't care

Note 1. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 5.9-29 TIORL (MTU0)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU0.TGRC Function	MTIOC0C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*1	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*2

Remarks: x: Don’t care

Note 1. When the BFA bit in MTU0.TMDR1 is set to 1 and MTU0.TGRC is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Note 2. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 5.9-30 TIOR (MTU1)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU1.TGRA/TGRALW Function	MTIOC1A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Input capture at generation of MTU0.TGRA compare match/input capture.

Remarks: x: Don’t care

Table 5.9-31 TIOR (MTU2)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU2.TGRA Function	MTIOC2A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Table 5.9-32 TIORH (MTU3)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU3.TGRA Function	MTIOC3A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Table 5.9-33 TIORL (MTU3)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU3.TGRC Function	MTIOC3C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Note 1. When the BFA bit in MTU3.TMDR1 is set to 1 and MTU3.TGRC is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 5.9-34 TIORH (MTU4)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU4.TGRA Function	MTIOC4A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Table 5.9-35 TIORL (MTU4)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU4.TGRC Function	MTIOC4C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Note 1. When the BFA bit in MTU4.TMDR1 is set to 1 and MTU4.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 5.9-36 TIORH (MTU6)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU6.TGRA Function	MTIOC6A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Table 5.9-37 TIORL (MTU6)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU6.TGRC Function	MTIOC6C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Note 1. When the BFA bit in MTU6.TMDR1 is set to 1 and MTU6.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 5.9-38 TIORH (MTU7)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU7.TGRA Function	MTIOC7A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Table 5.9-39 TIORL (MTU7)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU7.TGRC Function	MTIOC7C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Note 1. When the BFA bit in MTU7.TMDR1 is set to 1 and MTU7.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 5.9-40 TIORH (MTU8)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU8.TGRA Function	MTIOC8A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Table 5.9-41 TIORL (MTU8)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU8.TGRC Function	MTIOC8C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Note 1. When the MTU8.TMDR1.BFA bit is set to 1 and the MTU8.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 5.9-42 TIORU, TIORV, and TIORW (MTU5)

Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC4	IOC3	IOC2	IOC1	IOC0	MTU5.TGRU, MTU5.TGRV, MTU5.TGRW Function	MTIC5U, MTIC5V, MTIC5W Pin Function
0	0	0	0	0	Output compare register	No function
0	0	0	0	1		Setting prohibited
0	0	0	1	x		Setting prohibited
0	0	1	x	x		Setting prohibited
0	1	x	x	x		Setting prohibited
1	0	0	0	0	Input capture register*1	Setting prohibited
1	0	0	0	1		Input capture at rising edge.
1	0	0	1	0		Input capture at falling edge.
1	0	0	1	1		Input capture at both edges.
1	0	1	x	x		Input capture on generation of compare match with MTU8.TGRC
1	1	0	0	0		Setting prohibited
1	1	0	0	1		Measurement of low pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	0	1	0		Measurement of low pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	0	1	1		Measurement of low pulse width of external input signal. Capture at crest and trough of complementary PWM mode.
1	1	1	0	0		Setting prohibited
1	1	1	0	1		Measurement of high pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	1	1	0		Measurement of high pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	1	1	1		Measurement of high pulse width of external input signal. Capture at crest and trough of complementary PWM mode.

Remarks: x: Don’t care

Note 1. Setting the IOC[4:0] bits to “H’19”, “H’1A”, “H’1B”, “H’1D”, “H’1E”, or “H’1F” is only allowed when the external pulse width measurement function is used or the dead time compensation function, in coordination with MTU6 and MTU7, is used. For details, refer to **5.9.3.11 External Pulse Width Measurement**, and **5.9.3.12 Dead Time Compensation**.

5.9.2.7 Timer Compare Match Clear Register (TCNTCMPCLR)

Address(es): MTU5.TCNTCMPCLR H'0_1000_1CB6

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CMPCLR5U	CMPCLR5V	CMPCLR5W
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	CMPCLR5W	0	R/W	TCNT Compare Clear 5W 0: Disables MTU5.TCNTW to be cleared to H'0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture 1: Enables MTU5.TCNTW to be cleared to H'0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture
b1	CMPCLR5V	0	R/W	TCNT Compare Clear 5V 0: Disables MTU5.TCNTV to be cleared to H'0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture 1: Enables MTU5.TCNTV to be cleared to H'0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture
b2	CMPCLR5U	0	R/W	TCNT Compare Clear 5U 0: Disables MTU5.TCNTU to be cleared to H'0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture 1: Enables MTU5.TCNTU to be cleared to H'0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TCNTCMPCLR specifies requests to clear MTU5.TCNTU, MTU5.TCNTV, and MTU5.TCNTW. The MTU has one TCNTCMPCLR (on MTU5).

5.9.2.8 Timer Interrupt Enable Register (TIER)

(1) MTU1.TIER, MTU2.TIER

Address(es): MTU1.TIER H'0_1000_1384, MTU2.TIER H'0_1000_1404

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	TCIEU	TCIEV	—	—	TGIEB	TGIEA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU0.TIER, MTU3.TIER, MTU6.TIER

Address(es): MTU0.TIER H'0_1000_1304, MTU3.TIER H'0_1000_1208, MTU6.TIER H'0_1000_1A08

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(3) MTU4.TIER, MTU7.TIER

Address(es): MTU4.TIER H'0_1000_1209, MTU7.TIER H'0_1000_1A09

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	TTGE2	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(4) MTU8.TIER

Address(es): MTU8.TIER H'0_1000_1604

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TGIEA	0	R/W	TGR Interrupt Enable A 0: Interrupt requests (TGIA) disabled 1: Interrupt requests (TGIA) enabled
b1	TGIEB	0	R/W	TGR Interrupt Enable B 0: Interrupt requests (TGIB) disabled 1: Interrupt requests (TGIB) enabled
b2	TGIEC	0	R/W	TGR Interrupt Enable C 0: Interrupt requests (TGIC) disabled 1: Interrupt requests (TGIC) enabled
b3	TGIED	0	R/W	TGR Interrupt Enable D 0: Interrupt requests (TGID) disabled 1: Interrupt requests (TGID) enabled
b4	TCIEV	0	R/W	Overflow Interrupt Enable 0: Interrupt requests (TCIV) disabled 1: Interrupt requests (TCIV) enabled
b5	TCIEU	0	R/W	Underflow Interrupt Enable 0: Interrupt requests (TCIU) disabled 1: Interrupt requests (TCIU) enabled
b6	TTGE2	0	R/W	A/D Converter Start Request Enable 2 0: A/D converter start request generation by MTUn.TCNT underflow (trough) disabled 1: A/D converter start request generation by MTUn.TCNT underflow (trough) enabled
b7	TTGE	0	R/W	A/D Converter Start Request Enable 0: A/D converter start request generation disabled 1: A/D converter start request generation enabled

Note: n = 4, 7

The TIER register enables or disables interrupt requests from each channel. The MTU has a total of ten TIER registers, two for MTU0 and one each for MTU1 to MTU8.

TGIEA and TGIEB Bits (TGR Interrupt Enable A and B)

Each bit enables or disables interrupt requests (TGIn) (n = A, B).

TGIEC and TGIED Bits (TGR Interrupt Enable C and D)

Each bit enables or disables an interrupt request (TGIn) (n = C, D).

In MTU1 and MTU2, these bits are reserved. They are read as 0. The write value should be 0.

TCIEV Bit (Overflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIV).

TCIEU Bit (Underflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIU).

In MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables generation of A/D converter start requests by MTUn.TCNT underflow (trough) in complementary PWM mode (n = 4, 7).

In MTU0 to MTU3, MTU6, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE Bit (A/D Converter Start Request Enable)

This bit enables or disables generation of A/D converter start requests by TGRA input capture/compare match. MTU8 is a reserved bit. It is read as 0. The write value should be 0.

(5) MTU0.TIER2

Address(es): MTU0.TIER2 H'0_1000_1324

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE2	—	—	—	—	—	TGIEF	TGIEE
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TGIEE	0	R/W	TGR Interrupt Enable E 0: Interrupt requests (TGIE) disabled 1: Interrupt requests (TGIE) enabled
b1	TGIEF	0	R/W	TGR Interrupt Enable F 0: Interrupt requests (TGIF) disabled 1: Interrupt requests (TGIF) enabled
b6 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b7	TTGE2	0	R/W	A/D Converter Start Request Enable 2 0: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE disabled 1: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE enabled

TGIEE and TGIEF Bits (TGR Interrupt Enable E and F)

Each bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRn (n = E, F).

TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables AD converter start requests by compare match between TCNT and TGRE in MTU0.

(6) MTU5.TIER

Address(es): MTU5.TIER H'0_1000_1CB2

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TGIE5U	TGIE5V	TGIE5W
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TGIE5W	0	R/W	TGR Interrupt Enable 5W 0: Interrupt requests TGIW5 disabled 1: Interrupt requests TGIW5 enabled
b1	TGIE5V	0	R/W	TGR Interrupt Enable 5V 0: Interrupt requests TGIV5 disabled 1: Interrupt requests TGIV5 enabled
b2	TGIE5U	0	R/W	TGR Interrupt Enable 5U 0: Interrupt requests TGIU5 disabled 1: Interrupt requests TGIU5 enabled
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TGIE5n Bits (TGR Interrupt Enable 5n)

Each bit enables or disables interrupt requests (TGIn5) (n = U, V, W).

5.9.2.9 Timer Status Register (TSR)

(1) MTU1.TSR, MTU2.TSR

Address(es): MTU1.TSR H'0_1000_1385, MTU2.TSR H'0_1000_1405

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	—	—	—	—	—	—
Initial Value	1	1	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU3.TSR, MTU4.TSR, MTU6.TSR, MTU7.TSR

Address(es): MTU3.TSR H'0_1000_122C, MTU4.TSR H'0_1000_122D, MTU6.TSR H'0_1000_1A2C, MTU7.TSR H'0_1000_1A2D

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	—	—	—	—	—	—
Initial Value	1	1	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b5 to b0	—	All 0	R/W	Reserved The read value is undefined. The write value should be 1.
b6	—	1	R/W	Reserved This bit is read as 1. The write value should be 1.
b7	TCFD	1	R	Count Direction Flag 0: TCNT counts down 1: TCNT counts up

TSR indicates the states of each of the channels. The MTU has a total of six TSR registers, one each for MTU1 to MTU4, MTU6, and MTU7.

TCFD Flag (Count Direction Flag)

Status flag that indicates the direction in which TCNT is counting in MTU1 to MTU4, MTU6, and MTU7.

5.9.2.10 Timer Buffer Operation Transfer Mode Register (TBTM)

(1) MTU0.TBTM

Address(es): MTU0.TBTM H'0_1000_1326

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TTSE	TTSB	TTSA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU3.TBTM, MTU4.TBTM, MTU6.TBTM, MTU7.TBTM

Address(es): MTU3.TBTM H'0_1000_1238, MTU4.TBTM H'0_1000_1239, MTU6.TBTM H'0_1000_1A38, MTU7.TBTM H'0_1000_1A39

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TTSB	TTSA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TTSA	0	R/W	Timing Select A 0: When compare match A occurs in each channel, data is transferred from TGRC to TGRA 1: When TCNT is cleared in each channel, data is transferred from TGRC to TGRA
b1	TTSB	0	R/W	Timing Select B 0: When compare match B occurs in each channel, data is transferred from TGRD to TGRB 1: When TCNT is cleared in each channel, data is transferred from TGRD to TGRB
b2	TTSE	0	R/W	Timing Select E 0: When compare match E occurs in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE 1: When MTU0.TCNT is cleared in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TBTM specifies the timing for transferring data from the buffer register to the timer general register in PWM mode. The MTU has a total of five TBTM registers, one each for MTU0, MTU3, MTU4, MTU6, and MTU7.

TTSA Bit (Timing Select A)

This bit specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSA bit in the channel to 1.

TTSB Bit (Timing Select B)

This bit specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSB bit in the channel to 1.

TTSE Bit (Timing Select E)

This bit specifies the timing for transferring data from MTU0.TGRF to MTU0.TGRE when they are used together for buffer operation.

In MTU3, MTU4, MTU6, and MTU7, this bit is reserved. It is read as 0 and the write value should be 0. When a channel is not set to PWM mode, do not set the TTSE bit in the channel to 1.

5.9.2.11 Timer Input Capture Control Register (TICCR)

Address(es): MTU1.TICCR H'0_1000_1390

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	I2BE	I2AE	I1BE	I1AE
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	I1AE	0	R/W	Input Capture Enable 0: Does not include the MTIOC1A pin in the MTU2.TGRA input capture conditions 1: Includes the MTIOC1A pin in the MTU2.TGRA input capture conditions
b1	I1BE	0	R/W	Input Capture Enable 0: Does not include the TMTIOC1B pin in the MTU2.TGRB input capture conditions 1: Includes the MTIOC1B pin in the MTU2.TGRB input capture conditions
b2	I2AE	0	R/W	Input Capture Enable 0: Does not include the MTIOC2A pin in the MTU1.TGRA input capture conditions 1: Includes the MTIOC2A pin in the MTU1.TGRA input capture conditions
b3	I2BE	0	R/W	Input Capture Enable 0: Does not include the MTIOC2B pin in the MTU1.TGRB input capture conditions 1: Includes the MTIOC2B pin in the MTU1.TGRB input capture conditions
b7 to b4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TICCR specifies input capture conditions when MTU1.TCNT and MTU2.TCNT are cascaded. The MTU has one TICCR for MTU1.

5.9.2.12 Timer Synchronous Clear Register (TSYCR)

Address(es): MTU6.TSYCR H'0_1000_1A50

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CE0A	CE0B	CE0C	CE0D	CE1A	CE1B	CE2A	CE2B
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	CE2B	0	R/W	Clear Enable 2B 0: Disables counter clearing by the MTU2.TGIB2 interrupt generation timing. 1: Enables counter clearing by the MTU2.TGIB2 interrupt generation timing.
b1	CE2A	0	R/W	Clear Enable 2A 0: Disables counter clearing by the MTU2.TGIA2 interrupt generation timing*1. 1: Enables counter clearing by the MTU2.TGIA2 interrupt generation timing*1.
b2	CE1B	0	R/W	Clear Enable 1B 0: Disables counter clearing by the MTU1.TGIB1 interrupt generation timing*1. 1: Enables counter clearing by the MTU1.TGIB1 interrupt generation timing*1.
b3	CE1A	0	R/W	Clear Enable 1A 0: Disables counter clearing by the MTU1.TGIA1 interrupt generation timing*1. 1: Enables counter clearing by the MTU1.TGIA1 interrupt generation timing*1.
b4	CE0D	0	R/W	Clear Enable 0D 0: Disables counter clearing by the MTU0.TGID0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGID0 interrupt generation timing*1.
b5	CE0C	0	R/W	Clear Enable 0C 0: Disables counter clearing by the MTU0.TGIC0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIC0 interrupt generation timing*1.
b6	CE0B	0	R/W	Clear Enable 0B 0: Disables counter clearing by the MTU0.TGIB0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIB0 interrupt generation timing*1.
b7	CE0A	0	R/W	Clear Enable 0A 0: Disables counter clearing by the MTU0.TGIA0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIA0 interrupt generation timing*1.

Note 1. This does not depend on the TIERn.TGIEm bit setting. (n = 0, 1, 2; m = A, B, C, D)

TSYCR specifies synchronous clear conditions for MTU6.TCNT and MTU7.TCNT. The MTU has one TSYCR for MTU1.

CEnm Bits (Clear Enable nm; n = 0, 1, 2; m = A, B, C, D)

These bits enable or disable counter clearing by the MTUn.TGImn interrupt generation timing.

5.9.2.13 Timer Counter (TCNT)

(1) MTU0.TCNT to MTU7.TCNT

Address(es): MTU0.TCNT H'0_1000_1306, MTU1.TCNT H'0_1000_1386, MTU2.TCNT H'0_1000_1406, MTU3.TCNT H'0_1000_1210, MTU4.TCNT H'0_1000_1212, MTU5.TCNTU H'0_1000_1C80, MTU5.TCNTV H'0_1000_1C90, MTU5.TCNTW H'0_1000_1CA0, MTU6.TCNT H'0_1000_1A10, MTU7.TCNT H'0_1000_1A12

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCNT must not be accessed in eight bits; it should be accessed in 16 bits.

(2) MTU8.TCNT

Address(es): MTU8.TCNT H'0_1000_1608

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCNT must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

MTU0.TCNT to MTU7.TCNT are 16-bit readable/writable counters and MTU8.TCNT is a 32-bit readable/writable counter. The MTU has a total of 11 TCNT counters, one each for MTU0 to MTU4, MTU6, MTU7, and MTU8 and three (TCNTU, TCNTV, and TCNTW) for MTU5. The TCNT counters in MTU0 to MTU4, MTU6, and MTU7 are initialized to H'0000 by a reset, and the TCNT counter in MTU8 is initialized to H'0000_0000 by a reset. The TCNTU, TCNTV, and TCNTW counters in MTU5 are initialized to H'0000 by a reset. In MTU0 to MTU4, MTU6, and MTU7, the TCNT counters must not be accessed in 8-bit units; they should be accessed in 16-bit units. The MTU8.TCNT counter must not be accessed in 8- or 16-bit units; it should be accessed in 32-bit units.

The MTU1.TCNT and MTU2.TCNT counters are read as H'0000 when TMDR3.LWA is 1. See **5.9.2.5 Timer Mode Register 3 (TMDR3)** for details.

5.9.2.14 Timer Longword Counter (TCNTLW)

Address(es): MTU1.TCNTLW H'0_1000_13A0

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCNTLW must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The TCNTLW counter is a 32-bit readable/writable counter. Only one counter of this type is provided, and is formed by combining MTU1.TCNT and MTU2.TCNT. Such operation is only effective when TMDR3.LWA is 1. The TCNTLW counter is initialized to H'0000_0000 by a reset. This counter is read as H'0000_0000 when TMDR3.LWA is 0. See **5.9.2.5 Timer Mode Register 3 (TMDR3)** for details. This register can only be used in 32-bit phase counting mode.

5.9.2.15 Timer General Register (TGR)

(1) MTU0.TGR to MTU7.TGR

Address(es): MTU0.TGRA H'0_1000_1308, MTU0.TGRB H'0_1000_130A, MTU0.TGRC H'0_1000_130C, MTU0.TGRD H'0_1000_130E, MTU0.TGRE H'0_1000_1320, MTU0.TGRF H'0_1000_1322, MTU1.TGRA H'0_1000_1388, MTU1.TGRB H'0_1000_138A, MTU2.TGRA H'0_1000_1408, MTU2.TGRB H'0_1000_140A, MTU3.TGRA H'0_1000_1218, MTU3.TGRB H'0_1000_121A, MTU3.TGRC H'0_1000_1224, MTU3.TGRD H'0_1000_1226, MTU3.TGRE H'0_1000_1272, MTU4.TGRA H'0_1000_121C, MTU4.TGRB H'0_1000_121E, MTU4.TGRC H'0_1000_1228, MTU4.TGRD H'0_1000_122A, MTU4.TGRE H'0_1000_1274, MTU4.TGRF H'0_1000_1276, MTU5.TGRU H'0_1000_1C82, MTU5.TGRV H'0_1000_1C92, MTU5.TGRW H'0_1000_1CA2, MTU6.TGRA H'0_1000_1A18, MTU6.TGRB H'0_1000_1A1A, MTU6.TGRC H'0_1000_1A24, MTU6.TGRD H'0_1000_1A26, MTU6.TGRE H'0_1000_1A72, MTU7.TGRA H'0_1000_1A1C, MTU7.TGRB H'0_1000_1A1E, MTU7.TGRC H'0_1000_1A28, MTU7.TGRD H'0_1000_1A2A, MTU7.TGRE H'0_1000_1A74, MTU7.TGRF H'0_1000_1A76

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TGR must not be accessed in eight bits; it should be accessed in 16 bits. The initial value of TGR is H'FFFF.

(2) MTU8.TGR

Address(es): MTU8.TGRA H'0_1000_160C, MTU8.TGRB H'0_1000_1610, MTU8.TGRC H'0_1000_1614, MTU8.TGRD H'0_1000_1618

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TGR must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The MTU0.TGR to MTU7.TGR registers are 16-bit readable/writable registers; the MTU8.TGR register is a 32-bit readable/writable register. The MTU has a total of 39 TGR registers, six for MTU0, two each for MTU1 and MTU2, five each for MTU3 and MTU6, six each for MTU4 and MTU7, three for MTU5 and four for MTU8.

The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.

MTU0.TGRE and MTU0.TGRF function as compare registers. When the MTU0.TCNT count matches the MTU0.TGRE value, an A/D converter start request can be issued. The TGRF register can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF. MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW function as compare match, input capture, or external pulse width measurement registers.

The MTU1.TGRA, MTU2.TGRA, MTU1.TGRB, and MTU2.TGRB registers are read as H'0000 when TMDR3.LWA is 1. See **5.9.2.5 Timer Mode Register 3 (TMDR3)** for details.

5.9.2.16 Timer Longword General Registers (TGRALW and TGRBLW)

Address(es): MTU1.TGRALW H'0_1000_13A4, MTU1.TGRBLW H'0_1000_13A8

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TGRALW and TGRBLW must not be accessed in 8 or 16 bits; they should be accessed in 32 bits.

The TGRALW (TGRBLW) register is a 32-bit readable/writable register. Two general registers of this type are provided, and are formed by combining the TGRA (TGRB) registers in MTU1 and MTU2. Such operation is only effective when TMDR3.LWA is 1.

The TGRALW (TGRBLW) register is initialized to H'FFFF_FFFF by a reset, but it is read as H'0000_0000 when TMDR3.LWA is 0. See **5.9.2.5 Timer Mode Register 3 (TMDR3)** for details.

The TGRALW (TGRBLW) register functions as an output compare or input capture register when TMDR3.LWA is 1. This register can only be used in 32-bit phase counting mode.

5.9.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR)

(1) MTU.TSTRA (MTU0, MTU1, MTU2, MTU3, MTU4, MTU8)

Address(es): MTU.TSTRA H'0_1000_1280

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CST4	CST3	—	—	CST8	CST2	CST1	CST0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	CST0	0	R/W	Counter Start 0 0: MTU0.TCNT counting is stopped 1: MTU0.TCNT performs count operation
b1	CST1	0	R/W	Counter Start 1 0: MTU1.TCNT counting is stopped 1: MTU1.TCNT performs count operation
b2	CST2	0	R/W	Counter Start 2 0: MTU2.TCNT counting is stopped 1: MTU2.TCNT performs count operation
b3	CST8	0	R/W	Counter start 8 0: MTU8.TCNT counting is stopped 1: MTU8.TCNT performs count operation.
b5, b4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	CST3	0	R/W	Counter Start 3 0: MTU3.TCNT counting is stopped 1: MTU3.TCNT performs count operation
b7	CST4	0	R/W	Counter Start 4 0: MTU4.TCNT counting is stopped 1: MTU4.TCNT performs count operation

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRA is also set to 1 automatically.

The TSTRA register starts or stops TCNT operation in MTU0 to MTU4 and MTU8. TSTRA starts or stops TCNT operation in MTU0 to MTU4.

TSTRB starts or stops TCNT operation in MTU6 and MTU7. TSTR starts or stops TCNT operation in MTU5.

Before setting the operating mode in TMDR1 or setting the TCNT count clock in TCR, be sure to stop the TCNT counting.

CSTn Bits (Counter Start n) (n = 0, 1, 2, 3, 4, 8)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. In this case, the initial output value specified by the TOCR1A or TOCR2A register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode.

In the other modes, the level of the output compare signal from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the level of output from the pin will be updated to the specified initial output value.

(2) MTU.TSTRB (MTU6, MTU7)

Address(es): MTU.TSTRB H'0_1000_1A80

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CST7	CST6	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b5 to b0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	CST6	0	R/W	Counter Start 6 0: MTU6.TCNT counting is stopped 1: MTU6.TCNT performs count operation
b7	CST7	0	R/W	Counter Start 7 0: MTU7.TCNT counting is stopped 1: MTU7.TCNT performs count operation

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRB is also set to 1 automatically.

CSTn Bits (Counter Start n) (n = 6, 7)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. In this case, the initial output value specified by the TOCR1B or TOCR2B register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode.

In the other modes, the level of the output compare signal from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the level of output from the pin will be updated to the specified initial output value.

(3) MTU5.TSTR (MTU5)

Address(es): MTU5.TSTR H'0_1000_1CB4

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CSTU5	CSTV5	CSTW5
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	CSTW5	0	R/W	Counter Start W5 0: MTU5.TCNTW counting is stopped 1: MTU5.TCNTW performs count operation
b1	CSTV5	0	R/W	Counter Start V5 0: MTU5.TCNTV counting is stopped 1: MTU5.TCNTV performs count operation
b2	CSTU5	0	R/W	Counter Start U5 0: MTU5.TCNTU counting is stopped 1: MTU5.TCNTU performs count operation
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

5.9.2.18 Timer Synchronous Registers (TSYRA and TSYRB)

(1) MTU.TSYRA (MTU0, MTU1, MTU2, MTU3, MTU4)

Address(es): MTU.TSYRA H'0_1000_1281

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC4	SYNC3	—	—	—	SYNC2	SYNC1	SYNC0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	SYNC0	0	R/W	Timer Synchronous Operation 0 0: MTU0.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU0.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b1	SYNC1	0	R/W	Timer Synchronous Operation 1 0: MTU1.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU1.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b2	SYNC2	0	R/W	Timer Synchronous Operation 2 0: MTU2.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU2.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b5 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	SYNC3	0	R/W	Timer Synchronous Operation 3 0: MTU3.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU3.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b7	SYNC4	0	R/W	Timer Synchronous Operation 4 0: MTU4.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU4.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)

TSYRA selects independent operation or synchronous operation of TCNT in MTU0 to MTU4. TSYRB selects independent operation or synchronous operation of TCNT in MTU6 and MTU7. A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

SYNCn Bits (Timer Synchronous Operation n) (n = 0, 1, 2, 3, 4)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

(2) MTU.TSYRB (MTU6, MTU7)

Address(es): MTU.TSYRB H'0_1000_1A81

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC7	SYNC6	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b5 to b0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	SYNC6	0	R/W	Timer Synchronous Operation 6 0: MTU6.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU6.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b7	SYNC7	0	R/W	Timer Synchronous Operation 7 0: MTU7.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU7.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)

SYNCn Bits (Timer Synchronous Operation n) (n = 6, 7)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits TCR.CCLR[2:0].

5.9.2.19 Timer Counter Synchronous Start Register (TCSYSTR)

Address(es): MTU.TCSYSTR H'0_1000_1282

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	SCH0	SCH1	SCH2	SCH3	SCH4	—	SCH6	SCH7
Initial Value	0	0	0	0	0	0	0	0
R/W	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R/(W)*1	R/(W)*1

Bit	Bit Name	Initial Value	R/W	Description
b0	SCH7	0	R/(W) *1	Synchronous Start 7 0: Does not specify synchronous start for MTU7.TCNT 1: Specifies synchronous start for MTU7.TCNT
b1	SCH6	0	R/(W) *1	Synchronous Start 6 0: Does not specify synchronous start for MTU6.TCNT 1: Specifies synchronous start for MTU6.TCNT
b2	—	0	R	Reserved This bit is read as 0. The write value should be 0.
b3	SCH4	0	R/(W) *1	Synchronous Start 4 0: Does not specify synchronous start for MTU4.TCNT 1: Specifies synchronous start for MTU4.TCNT
b4	SCH3	0	R/(W) *1	Synchronous Start 3 0: Does not specify synchronous start for MTU3.TCNT 1: Specifies synchronous start for MTU3.TCNT
b5	SCH2	0	R/(W) *1	Synchronous Start 2 0: Does not specify synchronous start for MTU2.TCNT 1: Specifies synchronous start for MTU2.TCNT
b6	SCH1	0	R/(W) *1	Synchronous Start 1 0: Does not specify synchronous start for MTU1.TCNT 1: Specifies synchronous start for MTU1.TCNT
b7	SCH0	0	R/(W) *1	Synchronous Start 0 0: Does not specify synchronous start for MTU0.TCNT 1: Specifies synchronous start for MTU0.TCNT

Note 1. Only 1 can be written to this bit. It is automatically cleared to 0 when counting begins.

TCSYSTR specifies synchronous start of the counters.

SCH7 Bit (Synchronous Start 7)

This bit controls synchronous start of TCNT in MTU7. [Clearing condition]

- When the CST7 bit in TSTRB is set to 1 while SCH7 = 1

SCH6 Bit (Synchronous Start 6)

This bit controls synchronous start of TCNT in MTU6. [Clearing condition]

- When the CST6 bit in TSTRB is set to 1 while SCH6 = 1

SCH4 Bit (Synchronous Start 4)

This bit controls synchronous start of TCNT in MTU4. [Clearing condition]

- When the CST4 bit in TSTRA is set to 1 while SCH4 = 1

SCH3 Bit (Synchronous Start 3)

This bit controls synchronous start of TCNT in MTU3. [Clearing condition]

- When the CST3 bit in TSTRA is set to 1 while SCH3 = 1

SCH2 Bit (Synchronous Start 2)

This bit controls synchronous start of TCNT in MTU2. [Clearing condition]

- When the CST2 bit in TSTRA is set to 1 while SCH2 = 1

SCH1 Bit (Synchronous Start 1)

This bit controls synchronous start of TCNT in MTU1. [Clearing condition]

- When the CST1 bit in TSTRA is set to 1 while SCH1 = 1

SCH0 Bit (Synchronous Start 0)

This bit controls synchronous start of TCNT in MTU0. [Clearing condition]

- When the CST0 bit in TSTRA is set to 1 while SCH0 = 1

5.9.2.20 Timer Read/Write Enable Registers (TRWERA and TRWERB)

Address(es): MTU.TRWERA H'0_1000_1284, MTU.TRWERB H'0_1000_1A84

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RWE
Initial Value	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	RWE	1	R/W	Read/Write Enable 0: Read/write access to the registers is disabled 1: Read/write access to the registers is enabled
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TRWERA enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU3 and MTU4.

TRWERB enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU6 and MTU7.

RWE Bit (Read/Write Enable)

This bit enables or disables access to the registers that have write-protection capability against accidental modification.

[Clearing condition]

When 0 is written to the RWE bit after reading RWE = 1

- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERA)

  24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERA, TOCR1A, TOCR2A, TGCRA, TCDRA, TDDRA, and MTUn.TCNT (n = 3, 4)

- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERB)

  23 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERB, TOCR1B, TOCR2B, TCDRB, TDDRB, and MTUn.TCNT (n = 6, 7)

5.9.2.21 Timer Output Master Enable Registers (TOERA and TOERB)

(1) MTU.TOERA

Address(es): MTU.TOERA H'0_1000_120A

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OE4D	OE4C	OE3D	OE4B	OE4A	OE3B
Initial Value	1	1	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OE3B	0	R/W	Master Enable MTIOC3B 0: MTU output is disabled*1 1: MTU output is enabled
b1	OE4A	0	R/W	Master Enable MTIOC4A 0: MTU output is disabled*1 1: MTU output is enabled
b2	OE4B	0	R/W	Master Enable MTIOC4B 0: MTU output is disabled*1 1: MTU output is enabled
b3	OE3D	0	R/W	Master Enable MTIOC3D 0: MTU output is disabled*1 1: MTU output is enabled
b4	OE4C	0	R/W	Master Enable MTIOC4C 0: MTU output is disabled*1 1: MTU output is enabled
b5	OE4D	0	R/W	Master Enable MTIOC4D 0: MTU output is disabled*1 1: MTU output is enabled
b7, b6	—	All 1	R/W	Reserved These bits are read as 1. The write value should be 1.

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the port mode register (PMn) and port register (Pn) of I/O ports to output the inactive level from general I/O ports, and then set the port mode control register (PMCn) to use general I/O ports. For details, refer to **4.2 Pin Function Controller (PFC)**.

TOERA enables or disables output settings for output pins MTIOC4D, MTIOC4C, MTIOC3D, MTIOC4B, MTIOC4A, and MTIOC3B.

These pins do not output values correctly if the bits of the TOERA register are not appropriately set. Write a desired value to the TOERA register before setting up the TIOR registers in MTU3 and MTU4.

Set the TOERA register after clearing the CST3 and CST4 bits in the TSTRA register to 0 (see **Figure 5.9-44** and **Figure 5.9-48**).

(2) MTU.TOERB

Address(es): MTU.TOERB H'0_1000_1A0A

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OE7D	OE7C	OE6D	OE7B	OE7A	OE6B
Initial Value	1	1	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OE6B	0	R/W	Master Enable MTIOC6B 0: MTU output is disabled*1 1: MTU output is enabled
b1	OE7A	0	R/W	Master Enable MTIOC7A 0: MTU output is disabled*1 1: MTU output is enabled
b2	OE7B	0	R/W	Master Enable MTIOC7B 0: MTU output is disabled*1 1: MTU output is enabled
b3	OE6D	0	R/W	Master Enable MTIOC6D 0: MTU output is disabled*1 1: MTU output is enabled
b4	OE7C	0	R/W	Master Enable MTIOC7C 0: MTU output is disabled*1 1: MTU output is enabled
b5	OE7D	0	R/W	Master Enable MTIOC7D 0: MTU output is disabled*1 1: MTU output is enabled
b7, b6	—	All 1	R/W	Reserved These bits are read as 1. The write value should be 1.

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the port mode register (PMn) and port register (Pn) of I/O ports to output the inactive level from general I/O ports, and then set the port mode control register (PMCn) to use general I/O ports. For details, refer to **4.2 Pin Function Controller (PFC)**.

TOERB enables or disables output settings for output pins MTIOC7D, MTIOC7C, MTIOC6D, MTIOC7B, MTIOC7A, and MTIOC6B.

These pins do not output values correctly if the bits of the TOERB register are not appropriately set. Write a desired value to the TOERB register before setting up the TIOR registers in MTU6 and MTU7.

Set the TOERB register after clearing the CST6 and CST7 bits in the TSTRB register to 0 (see **Figure 5.9-44** and **Figure 5.9-48**).

5.9.2.22 Timer Output Control Registers 1 (TOCR1A and TOCR1B)

Address(es): MTU.TOCR1A H'0_1000_120E, MTU.TOCR1B H'0_1000_1A0E

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	PSYE	—	—	TOCL	TOCS	OLSN	OLSP
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OLSP	0	R/W	Output Level Select P*1 *3 See **Table 5.9-43**.
b1	OLSN	0	R/W	Output Level Select N*1 *3 See **Table 5.9-44**.
b2	TOCS	0	R/W	TOC Select 0: TOCR1j setting is selected (j = A, B) 1: TOCR2j setting is selected
b3	TOCL	0	R/W	TOC Register Write Protection*2 *4 0: Write access to the TOCS, OLSN, and OLSP bits is enabled 1: Write access to the TOCS, OLSN, and OLSP bits is disabled
b5, b4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	PSYE	0	R/W	PWM Synchronous Output Enable 0: Toggle output is disabled 1: Toggle output is enabled
b7	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

Note 1. Clearing the TOCR1j.TOCS bit to 0 makes this bit setting valid.

Note 2. Setting the TOCR1j.TOCL bit to 1 prevents accidental modification when the CPU goes out of control.

Note 3. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSP bit is valid.

Note 4. This bit can be set to 1 only once after a reset. After 1 is written, 0 cannot be written to the bit.

TOCR1A and TOCR1B enable or disable PWM-synchronized toggle output in complementary PWM mode and reset-synchronized PWM mode, and control inversion of PWM output level.

OLSP Bit (Output Level Select P)

This bit selects the positive-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

OLSN Bit (Output Level Select N)

This bit selects the negative-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

TOCS Bit (TOC Select)

This bit selects either the TOCR1j or TOCR2j (j = A, B) setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.

TOCL Bit (TOC Register Write Protection)

This bit enables or disables write access to the TOCS, OLSN, and OLSP bits in TOCR1j (j = A, B).

PSYE Bit (PWM Synchronous Output Enable)

This bit enables or disables toggle output synchronized with the PWM cycle.

Table 5.9-43 Output Level Select Function

Bit 0	Function			
			Compare Match Output	
OLSP	Initial Output	Active Level	Up-Counting	Down-Counting
0	High level	Low level	Low level	High level
1	Low level	High level	High level	Low level

Table 5.9-44 Output Level Select Function

Bit 1	Function			
			Compare Match Output	
OLSN	Initial Output	Active Level	Up-Counting	Down-Counting
0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Figure 5.9-3 shows an example of output in complementary PWM mode (one phase) when OLSN = 1 and OLSP = 1.

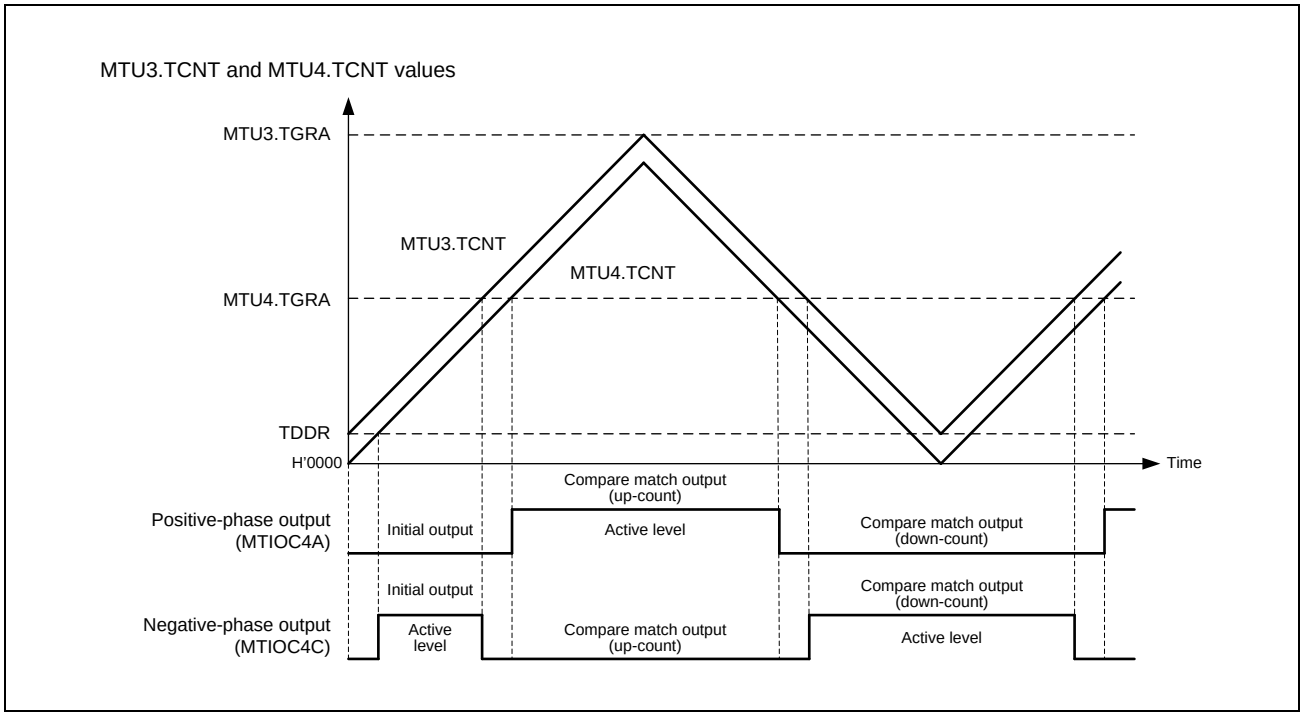

Figure 5.9-3 Example of Output in Complementary PWM Mode

5.9.2.23 Timer Output Control Registers 2 (TOCR2A and TOCR2B)

Address(es): MTU.TOCR2A H'0_1000_120F, MTU.TOCR2B H'0_1000_1A0F

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	BF[1:0]		OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OLS1P	0	R/W	Output Level Select 1P*1 *2 This bit selects the output level on MTIOC3B or MTIOC6B in reset-synchronized PWM mode and complementary PWM mode. See **Table 5.9-45**.
b1	OLS1N	0	R/W	Output Level Select 1N*1 *2 This bit selects the output level on MTIOC3D or MTIOC6D in reset-synchronized PWM mode and complementary PWM mode. See **Table 5.9-46**.
b2	OLS2P	0	R/W	Output Level Select 2P*1 *2 This bit selects the output level on MTIOC4A or MTIOC7Ain reset-synchronized PWM mode and complementary PWM mode. See **Table 5.9-47**.
b3	OLS2N	0	R/W	Output Level Select 2N*1 *2 This bit selects the output level on MTIOC4C or MTIOC7C in reset-synchronized PWM mode and complementary PWM mode. See **Table 5.9-48**.
b4	OLS3P	0	R/W	Output Level Select 3P*1 *2 This bit selects the output level on MTIOC4B or MTIOC7B in reset-synchronized PWM mode and complementary PWM mode. See **Table 5.9-49**.
b5	OLS3N	0	R/W	Output Level Select 3N*1 *2 This bit selects the output level on MTIOC4D or MTIOC7D in reset-synchronized PWM mode and complementary PWM mode. See **Table 5.9-50**.
b7, b6	BF[1:0]	All 0	R/W	TOLBR Buffer Transfer Timing Select These bits select the timing for transferring data from TOLBRj to TOCR2j. See **Table 5.9-51** for details.

Note: j = A, B

Note 1. Setting the TOCR1j.TOCS bit to 1 makes this bit setting valid.

Note 2. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSiP bits are valid (i = 1 to 3).

TOCR2A and TOCR2B control inversion of PWM output level in complementary PWM mode and reset-synchronized PWM mode.

The initial output is selected while the counter is stopped.

Table 5.9-45 MTIOCmB Output Level Select Function

Note: m = 4, 7

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Table 5.9-51 Setting of TOCR2j.BF[1:0] Bits

Bit 7	Bit 6	Description	
BF1	BF0	Complementary PWM Mode	Reset-Synchronized PWM Mode
0	0	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.
	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest of the MTUn.TCNT count.	Transfers data from the buffer register (TOLBRj) to TOCR2j when MTUm.TCNT or MTUn.TCNT is cleared.
1	0	Transfers data from the buffer register (TOLBRj) to TOCR2j at the trough of the MTUn.TCNT count.	Setting prohibited
	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest and trough of the MTUn.TCNT count.	Setting prohibited

Note: n = 4, 7;
m = 3, 6;
j = A, B

5.9.2.24 Timer Output Level Buffer Registers (TOLBRA and TOLBRB)

Address(es): MTU.TOLBRA H'0_1000_1236, MTU.TOLBRB H'0_1000_1A36

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OLS1P	0	R/W	Output Level Select 1P Specify the buffer value to be transferred to the OLS1P bit in TOCR2j.
b1	OLS1N	0	R/W	Output Level Select 1N Specify the buffer value to be transferred to the OLS1N bit in TOCR2j.
b2	OLS2P	0	R/W	Output Level Select 2P Specify the buffer value to be transferred to the OLS2P bit in TOCR2j.
b3	OLS2N	0	R/W	Output Level Select 2N Specify the buffer value to be transferred to the OLS2N bit in TOCR2j.
b4	OLS3P	0	R/W	Output Level Select 3P Specify the buffer value to be transferred to the OLS3P bit in TOCR2j.
b5	OLS3N	0	R/W	Output Level Select 3N Specify the buffer value to be transferred to the OLS3N bit in TOCR2j.
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note: j = A, B

TOLBRA and TOLBRB are buffer registers for TOCR2A and TOCR2B and specify the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Figure 5.9-4 shows an example of the PWM output level setting procedure in buffer operation.

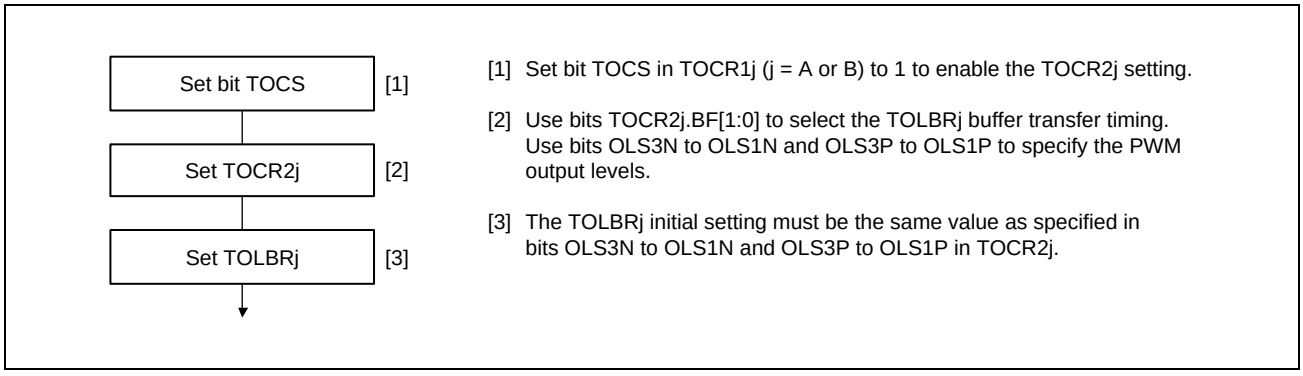

Figure 5.9-4 Example of PWM Output Level Setting Procedure in Buffer Operation

5.9.2.25 Timer Gate Control Register A (TGCRA)

Address(es): MTU.TGCRA H'0_1000_120D

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	BDC	N	P	FB	WF	VF	UF
Initial Value	1	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	UF	0	R/W	Output Phase Switch These bits turn on or off the positive-phase/negative-phase output. The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See **Table 5.9-52**.
b1	VF	0	R/W	
b2	WF	0	R/W	
b3	FB	0	R/W	External Feedback Signal Enable 0: Output is switched by external input (input sources are TGRA, TGRB, and TGRC input capture signals in MTU0) 1: Output is switched by software (TGCRA's UF, VF, and WF settings)
b4	P	0	R/W	Positive-Phase Output (P) Control 0: Level output 1: Reset-synchronized PWM or complementary PWM output
b5	N	0	R/W	Negative-Phase Output (N) Control 0: Level output 1: Reset-synchronized PWM or complementary PWM output
b6	BDC	0	R/W	Brushless DC Motor 0: Ordinary output 1: Functions of this register are effective.
b7	—	1	R/W	Reserved This bit is read as 1. The write value should be 1.

TGCRA controls the output waveform necessary for brushless DC motor control in reset-synchronized PWM mode and complementary PWM mode. TGCRA register settings are ineffective for anything other than complementary PWM mode and reset-synchronized PWM mode.

UF, VF, and WF Bits (Output Phase Switch)

The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See **Table 5.9-52** for details.

FB Bit (External Feedback Signal Enable)

This bit selects whether the positive-/negative-phase output is switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0 or by writing 0 or 1 to bits 2 to 0 in TGCRA.

When the FB bit in the TGCRA register is 0, the output signals from MTU3 and MTU4 are switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0.

P Bit (Positive-Phase Output (P) Control)

This bit selects either the level output or the reset-synchronized PWM/complementary PWM output for the positive-phase output pins (MTIOC3B, MTIOC4A, and MTIOC4B pins).

N Bit (Negative-Phase Output (N) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the negative-phase output pins (MTIOC3D, MTIOC4C, and MTIOC4D pins).

BDC Bit (Brushless DC Motor)

This bit selects whether to make the functions of TGCRA effective or ineffective.

Table 5.9-52 Output Level Select Function

Bit 2	Bit 1	Bit 0	Function					
			MTIOC3B	MTIOC4A	MTIOC4B	MTIOC3D	MTIOC4C	MTIOC4D
WF	VF	UF	U Phase	V Phase	W Phase	U Phase	V Phase	W Phase
0	0	0	OFF	OFF	OFF	OFF	OFF	OFF
		1	ON	OFF	OFF	OFF	OFF	ON
	1	0	OFF	ON	OFF	ON	OFF	OFF
		1	OFF	ON	OFF	OFF	OFF	ON
1	0	0	OFF	OFF	ON	OFF	ON	OFF
		1	ON	OFF	OFF	OFF	ON	OFF
	1	0	OFF	OFF	ON	ON	OFF	OFF
		1	OFF	OFF	OFF	OFF	OFF	OFF

5.9.2.26 Timer Subcounters (TCNTSA and TCNTSB)

Address(es): MTU.TCNTSA H'0_1000_1220, MTU.TCNTSB H'0_1000_1A20

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: TCNTSA and TCNTSB must not be accessed in eight bits; it should be accessed in 16 bits.

TCNTSA and TCNTSB are 16-bit read-only counters that are used only in complementary PWM mode. The initial value of TCNTSA and TCNTSB after a reset is H'0000.

5.9.2.27 Timer Cycle Data Registers (TCDRA and TCDRB)

Address(es): MTU.TCDRA H'0_1000_1214, MTU.TCDRB H'0_1000_1A14

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCDRA and TCDRB must not be accessed in eight bits; it should be accessed in 16 bits.

TCDRA and TCDRB are 16-bit readable/writable registers used only in complementary PWM mode. Set half the PWM carrier cycle as the TCDRA and TCDRB values. The TCDRA and TCDRB registers are constantly compared with the TCNTSA and TCNTSB counters in complementary PWM mode, respectively. When a match occurs, the TCNTSA and TCNTSB counters switch the count direction (down-count to up-count). The initial value of TCDRA and TCDRB after a reset is H'FFFF.

5.9.2.28 Timer Cycle Buffer Registers (TCBRA and TCBRB)

Address(es): MTU.TCBRA H'0_1000_1222, MTU.TCBRB H'0_1000_1A22

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCBRA and TCBRB must not be accessed in eight bits; it should be accessed in 16 bits.

TCBRA and TCBRB are 16-bit readable/writable registers, used only in complementary PWM mode, that function as buffer registers for TCDRA and TCDRB. The TCBRA and TCBRB values are transferred to TCDRA and TCDRB with the transfer timing set in TMDR1. The initial value of TCBRA and TCBRB after a reset is H'FFFF.

5.9.2.29 Timer Dead Time Data Registers (TDDRA and TDDRB)

Address(es): MTU.TDDRA H'0_1000_1216, MTU.TDDRB H'0_1000_1A16

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TDDRA and TDDRB must not be accessed in eight bits; it should be accessed in 16 bits.

TDDRA and TDDRB are 16-bit readable/writable registers, used only in complementary PWM mode, which specify the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counter offset value. In complementary PWM mode, when the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counters are cleared and then restarted, the TDDRA (TDDRB) value is loaded into the MTU3.TCNT (MTU6.TCNT) counter and the count operation starts. The initial value of TDDRA and TDDRB after a reset is H'FFFF.

5.9.2.30 Timer Dead Time Enable Registers (TDERA and TDERB)

Address(es): MTU.TDERA H'0_1000_1234, MTU.TDERB H'0_1000_1A34

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TDER
Initial Value	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/(W)

Bit	Bit Name	Initial Value	R/W	Description
b0	TDER	1	R/(W)	Dead Time Enable 0: No dead time is generated 1: Dead time is generated*1
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. TDDRA and TDDRB must be set to 1 or a larger value.

TDERA and TDERB control dead time generation in complementary PWM mode. The MTU has one TDER each for MTU3 and MTU6. TDERA and TDERB should be modified only while TCNT stops.

TDER Bit (Dead Time Enable)

This bit specifies whether to generate dead time.

[Clearing condition]

- When 0 is written to TDER after reading TDER = 1

5.9.2.31 Timer Buffer Transfer Set Registers (TBTERA and TBTERB)

Address(es): MTU.TBTERA H'0_1000_1232, MTU.TBTERB H'0_1000_1A32

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	BTE[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	BTE[1:0]	All 0	R/W	Buffer Transfer Disable and Interrupt Skipping Link Setting These bits enable or disable transfer from the buffer registers*1 used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping function 1. For details, see **Table 5.9-53**.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Applicable buffer registers (TBTERA):
MTU3.TGRC, MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, and TCBRA
Applicable buffer registers (TBTERB):
MTU6.TGRC, MTU6.TGRD, MTU7.TGRC, MTU7.TGRD, and TCBRB

TBTERA and TBTERB enable or disable transfer from the buffer registers used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping 1 operation.

Table 5.9-53 Setting of BTE[1:0] Bits in TBTERA and TBTERB

Bit 1	Bit 0	
BTE1	BTE0	Description
0	0	Enables transfer from the buffer registers to the temporary registers*1 and does not link the transfer with interrupt skipping function 1.
	1	Disables transfer from the buffer registers to the temporary registers.
1	0	Links transfer from the buffer registers to the temporary registers with interrupt skipping function 1.*2
	1	Setting prohibited

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR1. For details, refer to **5.9.3.8 Complementary PWM Mode**.

Note 2. When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits are cleared to 0 in the timer interrupt skipping set register (TITCR1A (TITCR1B)) or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), be sure to disable link of buffer transfer with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTERA (TBTERB)) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

5.9.2.32 Timer Waveform Control Registers (TWCRA and TWCRB)

Address(es): MTU.TWCRA H'0_1000_1260, MTU.TWCRB H'0_1000_1A60

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CCE	—	—	—	—	—	SCC	WRE
Initial Value	0*2	0	0	0	0	0	0	0
R/W	R/(W)	R/W	R/W	R/W	R/W	R/W	R/(W)	R/(W)*3

Bit	Bit Name	Initial Value	R/W	Description
b0	WRE	0	R/(W) *3	Waveform Retain Enable 0: Initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output 1: Initial output is inhibited
b1	SCC*1 *3	0	R/(W)	Synchronous Clearing Control (Only valid in register TWCRB) 0: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is enabled. 1: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is disabled.
b6 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b7	CCE*2	0	R/(W)	Compare Match Clear Enable 0: Counters are not cleared at MTU3.TGRA (MTU6.TGRA) compare match 1: Counters are cleared at MTU3.TGRA (MTU6.TGRA) compare match

Note 1. This bit is only valid in register TWCRB and is a reserved bit in register TWCRA.

Note 2. Do not set to 1 when complementary PWM mode 1 is not selected.

Note 3. Do not set to 1 when complementary PWM mode is not selected.

TWCRA and TWCRB control the output waveform when synchronous counter clearing occurs in MTU3.TNCT and MTU4.TNCT (MTU6.TNCT and MTU7.TNCT) in complementary PWM mode and specifies whether to clear the counters at MTU3.TGRA (MTU6.TGRA) compare match.

The CCE bit and WRE bit in TWCRA and TWCRB should be modified only while TCNT stops.

WRE Bit (Waveform Retain Enable)

This bit selects the waveform output when synchronous counter clearing occurs in complementary PWM mode. The initial output is inhibited with this function only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial values

specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output regardless of the WRE bit setting. The initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are also output when synchronous clearing occurs in the Tb interval at the trough immediately after MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start operation.

For the Tb interval at the trough in complementary PWM mode, see **Figure 5.9-50**.

[Setting condition]

- When 1 is written to the WRE bit after reading WRE = 0

SCC Bit (Synchronous Clearing Control)

The setting of this bit selects whether MTU6.TCNT and MTU7.TCNT are or are not cleared when counter-synchronous clearing is generated for MTU0, MTU1, MTU2–MTU6, MTU7 in complementary PWM mode.

Make the complementary PWM mode settings for MTU6 and MTU7 when this function is in use. When writing a new value to the SCC bit while the counter is operating, do not change the values of the CCE and WRE bits.

Synchronous clearing from the MTU module only becomes disabled due to the setting of the SCC bit when synchronous clearing is generated outside the Tb interval in the trough. If synchronous clearing is generated within the Tb interval in the trough including immediately after the value at which MTU6.TCNT and MTU7.TCNT start, MTU6.TCNT and MTU7.TCNT are cleared.

Regarding the Tb interval in the trough in complementary PWM mode, see **Figure 5.9-50**.

[Setting condition]

- Writing of 1 to the SCC bit after reading it as 0

The corresponding bit in register TWCRA is reserved and is read as 0. When writing to TWCRA, write 0 to this bit.

CCE Bit (Compare Match Clear Enable)

This bit specifies whether to clear counters at MTU3.TGRA (MTU6.TGRA) compare match in complementary PWM mode.

[Setting condition]

When 1 is written to CCE after reading CCE = 0

5.9.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C)

(1) MTU0.NFCR0, MTU1.NFCR1, MTU2.NFCR2, MTU3.NFCR3, MTU4.NFCR4, MTU6.NFCR6, MTU7.NFCR7, MTU8.NFCR8

Address(es): MTU0.NFCR0 H'0_1000_1290, MTU1.NFCR1 H'0_1000_1291, MTU2.NFCR2 H'0_1000_1292, MTU3.NFCR3 H'0_1000_1293, MTU4.NFCR4 H'0_1000_1294, MTU6.NFCR6 H'0_1000_1A93, MTU7.NFCR7 H'0_1000_1A94, MTU8.NFCR8 H'0_1000_1298

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	NFAEN	0	R/W	Noise Filter A Enable 0: The noise filter for the MTIOCnA pin is disabled. 1: The noise filter for the MTIOCnA pin is enabled.
b1	NFBEN	0	R/W	Noise Filter B Enable 0: The noise filter for the MTIOCnB pin is disabled. 1: The noise filter for the MTIOCnB pin is enabled.
b2	NFCEN	0	R/W*1	Noise Filter C Enable 0: The noise filter for the MTIOCnC pin is disabled. 1: The noise filter for the MTIOCnC pin is enabled.
b3	NFDEN	0	R/W*1	Noise Filter D Enable 0: The noise filter for the MTIOCnD pin is disabled. 1: The noise filter for the MTIOCnD pin is enabled.
b5, b4	NFCS[1:0]	All 0	R/W	Noise Filter Clock Select b5 b4 0 0: P0ϕ/1 0 1: P0ϕ/8 1 0: P0ϕ/32 1 1: Clock source for counting
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. These bits are reserved in the NFCR1 and NFCR2 registers. These bits are read as 0 and writing to them has no effect.

The NFCRn register (n = 0 to 4, 6, 7, or 8) specifies the noise filter function of the input capture input pin of the corresponding channel.

NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTIOCnC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTIOCnD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

(2) MTU0.NFCRC

Address(es): MTU0.NFCRC H'0_1000_1299

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	NFAEN	0	R/W	Noise Filter A Enable 0: The noise filter for the MTCLKA pin is disabled. 1: The noise filter for the MTCLKA pin is enabled.
b1	NFBEN	0	R/W	Noise Filter B Enable 0: The noise filter for the MTCLKB pin is disabled. 1: The noise filter for the MTCLKB pin is enabled.
b2	NFCEN	0	R/W	Noise Filter C Enable 0: The noise filter for the MTCLKC pin is disabled. 1: The noise filter for the MTCLKC pin is enabled.
b3	NFDEN	0	R/W	Noise Filter D Enable 0: The noise filter for the MTCLKD pin is disabled. 1: The noise filter for the MTCLKD pin is enabled.
b5, b4	NFCS[1:0]	All 0	R/W	Noise Filter Clock Select b5 b4 0 0: P0ϕ/1 0 1: P0ϕ/2 1 0: P0ϕ/8 1 1: P0ϕ/32
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

The NFCRC register is used in common with all channels and specifies the noise filter function of the external clock pins.

NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTCLKA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTCLKB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTCLKC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTCLKD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. After setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval to set the input capture function.

5.9.2.34 Noise Filter Control Register 5 (NFCR5)

Address(es): MTU5.NFCR5 H'0_1000_1A95

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		—	NFWEN	NFVEN	NFUEN
Initial Value	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
b0	NFUEN	0	R/W	Noise Filter U Enable 0: The noise filter for the MTIC5U pin is disabled. 1: The noise filter for the MTIC5U pin is enabled.
b1	NFVEN	0	R/W	Noise Filter V Enable 0: The noise filter for the MTIC5V pin is disabled. 1: The noise filter for the MTIC5V pin is enabled.
b2	NFWEN	0	R/W	Noise Filter W Enable 0: The noise filter for the MTIC5W pin is disabled. 1: The noise filter for the MTIC5W pin is enabled.
b3	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.
b5, b4	NFCS[1:0]	All 0	R/W	Noise Filter Clock Select b5 b4 0 0: P0ϕ/1 0 1: P0ϕ/8 1 0: P0ϕ/32 1 1: Clock source for counting
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

NFUEN Bit (Noise Filter U Enable)

This bit disables or enables the noise filter for input from the MTIC5U pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFVEN Bit (Noise Filter V Enable)

This bit disables or enables the noise filter for input from the MTIC5V pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFWEN Bit (Noise Filter W Enable)

This bit disables or enables the noise filter for input from the MTIC5W pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

5.9.2.35 Timer A/D Converter Start Request Control Register (TADCR)

(1) MTU4.TADCR

Address(es): MTU4.TADCR H'0_1000_1240

b5	UT4BE	0	R/W	Up-Count TRG4BN Enable 0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT up-count operation 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT up-count operation
b6	DT4AE	0	R/W	Down-Count TRG4AN Enable*3 0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT down-count operation 1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT down-count operation
b7	UT4AE	0	R/W	Up-Count TRG4AN Enable 0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT up-count operation 1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT up-count operation
b13 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
b15, b14	BF[1:0]	All 0	R/W	MTU4.TADCOBRA/TADCOBRB Transfer Timing Select See **Table 5.9-54** for details. These bits specify the transfer timing from MTU4.TADCOBRA and MTU4.TADCOBRB to MTU4.TADCORA and MTU4.TADCORB.

Note: The TADCR register in MTU4 must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. Clear the bit to 0 when interrupt skipping is disabled (the T3AEN or T4VEN bit in TITCR1A is cleared to 0 or the T3ACOR or T4VCOR bits in TITCR1A are cleared to 0).

Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.

Note 3. Clear the bit to 0 when complementary PWM mode is not selected.

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function. The MTU has one TADCR each for MTU4 and MTU7.

Table 5.9-54 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU4)

Bit 15	Bit 14	Description			
BF[1]	BF[0]	Complementary PWM Mode	Reset-Synchronized PWM Mode	PWM Mode 1	Normal Mode
0	0	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).
0	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the crest of the TCNT count in MTU4.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU3.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU4.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU4.
1	0	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the trough of the TCNT count in MTU4.	Setting prohibited	Setting prohibited	Setting prohibited
1	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the crest and trough of the TCNT count in MTU4.	Setting prohibited	Setting prohibited	Setting prohibited

(2) MTU7.TADCR

Address(es): MTU7.TADCR H'0_1000_1A40

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b3	ITA6AE	0	R/W	TGIA6 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7AN and TGIA6 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7AN and TGIA6 interrupt skipping 1 are linked
b4	DT7BE	0	R/W	Down-Count TRG7BN Enable*3 0: A/D converter start requests (TRG7BN) disabled during MTU7.TCNT down-count operation 1: A/D converter start requests (TRG7BN) enabled during MTU7.TCNT down-count operation
b5	UT7BE	0	R/W	Up-Count TRG7BN Enable 0: A/D converter start requests (TRG7BN) disabled during MTU7.TCNT up-count operation 1: A/D converter start requests (TRG7BN) enabled during MTU7.TCNT up-count operation
b6	DT7AE	0	R/W	Down-Count TRG7AN Enable*3 0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT down-count operation 1: A/D converter start requests (TRG7AN) enabled during MTU7.TCNT down-count operation
b7	UT7AE	0	R/W	Up-Count TRG7AN Enable 0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT up-count operation 1: A/D converter start requests (TRG7AN) enabled during MTU7.TCNT up-count operation
b13 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
b15, b14	BF[1:0]	All 0	R/W	MTU7.TADCOBRA/TADCOBRB Transfer Timing Select See **Table 5.9-55** for details. These bits specify the transfer timing from MTU7.TADCOBRA and MTU7.TADCOBRB to MTU7.TADCORA and MTU7.TADCORB.

Note: The TADCR register in MTU7 must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. Clear the bit to 0 when interrupt skipping is disabled (the T6AEN or T7VEN bit in TITCR1B is cleared to 0 or the T6ACOR or T7VCOR bits in TITCR1B are cleared to 0).

Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.

Note 3. Clear the bit to 0 when complementary PWM mode is not selected.

Table 5.9-55 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU7)

Bit 15	Bit 14	Description			
BF[1]	BF[0]	Complementary PWM Mode	Reset-Synchronized PWM Mode	PWM Mode 1	Normal Mode
0	0	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).
0	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the crest of the TCNT count in MTU7.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU6.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU7.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU7.
1	0	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the trough of the TCNT count in MTU7.	Setting prohibited	Setting prohibited	Setting prohibited
1	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the crest and trough of the TCNT count in MTU7.	Setting prohibited	Setting prohibited	Setting prohibited

5.9.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA and TADCORB)

Address(es): MTU4.TADCORA H'0_1000_1244, MTU4.TADCORB H'0_1000_1246, MTU7.TADCORA H'0_1000_1A44, MTU7.TADCORB H'0_1000_1A46

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TADCORA and TADCORB must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. When the A/D converter start request delaying function linked with skipping function 1 (for details, see **5.9.3.9 (5) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1**) is used, the value of this register should be H'0002 to TCDRA setting - 2 in MTU4 and H'0002 to TCDRB setting - 2 in MTU7.

Note 2. When interrupt skipping function 2 is used and the difference between the TADCORA value and the TADCORB value is small, the skipping count may not be counted correctly and the A/D converter start request may not be generated with the expected timing in some cases. The TADCORA and TADCORB values should satisfy the following conditions.

(1) When skipping function 2 is specified with the skipping count set to 0
- The difference between the TADCORA and TADCORB values should be equal to or greater than 4.
- The TADCORA compare interval should be equal to or greater than 4 P0ϕ cycles (the TADCORA update value should be the previous value + 4 or greater, or previous value − 4 or smaller).
- The TADCORB compare interval should be equal to or greater than 4 P0ϕ cycles (the TADCORB update value should be the previous value + 4 or greater, or previous value − 4 or smaller).

(2) When skipping function 2 is specified with the skipping count set to 1 or greater
- The difference between the TADCORA and TADCORB values should be equal to or greater than 2.
- The TADCORB compare interval should be equal to or greater than 2 P0ϕ cycles (the TADCORB update value should be the previous value + 2 or greater, or previous value − 2 or smaller).

TADCORA and TADCORB are 16-bit readable/writable registers that issue a corresponding A/D converter start request when the MTUn.TCNT (n = 4, 7) count reaches the value in TADCORA or TADCORB.

MTUn.TADCORA and TADCORB are initialized to H'FFFF by a reset.

5.9.2.37 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA and TADCOBRB)

Address(es): MTU4.TADCOBRA H'0_1000_1248, MTU4.TADCOBRB H'0_1000_124A, MTU7.TADCOBRA H'0_1000_1A48, MTU7.TADCOBRB H'0_1000_1A4A

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TADCOBRA and TADCOBRB must not be accessed in eight bits; it should be accessed in 16 bits.

TADCOBRA and TADCOBRB are 16-bit readable/writable registers whose values are transferred to TADCORA and TADCORB, respectively, when the crest or trough of the MTUn.TCNT count is reached.

TADCOBRA and TADCOBRB are initialized to H'FFFF by a reset.

5.9.2.38 Timer Interrupt Skipping Mode Registers (TITMRA and TITMRB)

Address(es): MTU.TITMRA H'0_1000_123A, MTU.TITMRB H'0_1000_1A3A

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TITM
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TITM	0	R/W	Interrupt Skipping Function Select Selects one of the two types of interrupt skipping functions. 0: Selects interrupt skipping function 1*1 1: Selects interrupt skipping function 2*2
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. TITCR1A or TITCR1B is used to enable interrupt skipping function 1.

Note 2. TITCR2A or TITCR2B is used to enable interrupt skipping function 2.

TITMRA and TITMRB are used to select either of two skipping functions for the TITMRA and TITMRB registers.

5.9.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A and TITCR1B)

(1) MTU.TITCR1A

Address(es): MTU.TITMRA H'0_1000_1230

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	T3AEN	T3ACOR[2:0]			T4VEN	T4VCOR[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	T4VCOR[2:0]	All 0	R/W	TCIV4 Interrupt Skipping Count Setting These bits specify the TCIV4 interrupt skipping count within the range from 0 to 7.*1 For details, see **Table 5.9-56**.
b3	T4VEN	0	R/W	T4VEN 0: TCIV4 interrupt skipping disabled 1: TCIV4 interrupt skipping enabled
b6 to b4	T3ACOR[2:0]	All 0	R/W	TGIA3 Interrupt Skipping Count Setting These bits specify the TGIA3 interrupt skipping count within the range from 0 to 7. For details, see **Table 5.9-57**.
b7	T3AEN	0	R/W	T3AEN 0: TGIA3 interrupt skipping disabled 1: TGIA3 interrupt skipping enabled

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0 to clear the skipping counter (TITCNT1A).

(2) MTU.TITCR1B

Address(es): MTU.TITCR1B H'0_1000_1A30

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	T6AEN	T6ACOR[2:0]			T7VEN	T7VCOR[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	T7VCOR[2:0]	All 0	R/W	TCIV7 Interrupt Skipping Count Setting These bits specify the TCIV7 interrupt skipping count within the range from 0 to 7.*1 For details, see **Table 5.9-58**.
b3	T7VEN	0	R/W	T7VEN 0: TCIV7 interrupt skipping disabled 1: TCIV7 interrupt skipping enabled
b6 to b4	T6ACOR[2:0]	All 0	R/W	TGIA6 Interrupt Skipping Count Setting These bits specify the TGIA6 interrupt skipping count within the range from 0 to 7.*1 For details, see **Table 5.9-59**.
b7	T6AEN	0	R/W	T6AEN 0: TGIA6 interrupt skipping disabled 1: TGIA6 interrupt skipping enabled

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0 to clear the skipping counter (TITCNT1B).

TITCR1A and TITCR1B enable or disable interrupt skipping and specify the interrupt skipping count.

The setting in the TITCR1A (TITCR1B) register is valid only while the TITM bit in TITMRA (TITMRB) is set to 0; when the TITM bit in TITMRA (TITMRB) is set to 1, the setting in TITCR1A (TITCR1B) is cleared.

Table 5.9-56 Setting of Interrupt Skipping Count by T4VCOR[2:0] Bits

Bit 2	Bit 1	Bit 0	
T4VCOR2	T4VCOR1	T4VCOR0	Description
0	0	0	Does not skip TCIV4 interrupts.
		1	Sets the TCIV4 interrupt skipping count to 1.
	1	0	Sets the TCIV4 interrupt skipping count to 2.
		1	Sets the TCIV4 interrupt skipping count to 3.
1	0	0	Sets the TCIV4 interrupt skipping count to 4.
		1	Sets the TCIV4 interrupt skipping count to 5.
	1	0	Sets the TCIV4 interrupt skipping count to 6.
		1	Sets the TCIV4 interrupt skipping count to 7.

Table 5.9-57 Setting of Interrupt Skipping Count by T3ACOR[2:0] Bits

Bit 6	Bit 5	Bit 4	
T3ACOR2	T3ACOR1	T3ACOR0	Description
0	0	0	Does not skip TGIA3 interrupts.
		1	Sets the TGIA3 interrupt skipping count to 1.
	1	0	Sets the TGIA3 interrupt skipping count to 2.
		1	Sets the TGIA3 interrupt skipping count to 3.
1	0	0	Sets the TGIA3 interrupt skipping count to 4.
		1	Sets the TGIA3 interrupt skipping count to 5.
	1	0	Sets the TGIA3 interrupt skipping count to 6.
		1	Sets the TGIA3 interrupt skipping count to 7.

Table 5.9-58 Setting of Interrupt Skipping Count by T7VCOR[2:0] Bits

Bit 2	Bit 1	Bit 0	
T7VCOR2	T7VCOR1	T7VCOR0	Description
0	0	0	Does not skip TCIV7 interrupts.
		1	Sets the TCIV7 interrupt skipping count to 1.
	1	0	Sets the TCIV7 interrupt skipping count to 2.
		1	Sets the TCIV7 interrupt skipping count to 3.
1	0	0	Sets the TCIV7 interrupt skipping count to 4.
		1	Sets the TCIV7 interrupt skipping count to 5.
	1	0	Sets the TCIV7 interrupt skipping count to 6.
		1	Sets the TCIV7 interrupt skipping count to 7.

Table 5.9-59 Setting of Interrupt Skipping Count by T6ACOR[2:0] Bits

Bit 6	Bit 5	Bit 4	
T6ACOR2	T6ACOR1	T6ACOR0	Description
0	0	0	Does not skip TGIA6 interrupts.
		1	Sets the TGIA6 interrupt skipping count to 1.
	1	0	Sets the TGIA6 interrupt skipping count to 2.
		1	Sets the TGIA6 interrupt skipping count to 3.
1	0	0	Sets the TGIA6 interrupt skipping count to 4.
		1	Sets the TGIA6 interrupt skipping count to 5.
	1	0	Sets the TGIA6 interrupt skipping count to 6.
		1	Sets the TGIA6 interrupt skipping count to 7.

5.9.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B)

(1) MTU.TITCNT1A

Address(es): MTU.TITCNT1A H'0_1000_1231

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	T3ACNT[2:0]			—	T4VCNT[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	T4VCNT[2:0]	All 0	R	TCIV4 Interrupt Counter While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs.
b3	—	0	R	Reserved This bit is read as 0.
b6 to b4	T3ACNT[2:0]	All 0	R	TGIA3 Interrupt Counter While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs.
b7	—	0	R	Reserved This bit is read as 0.

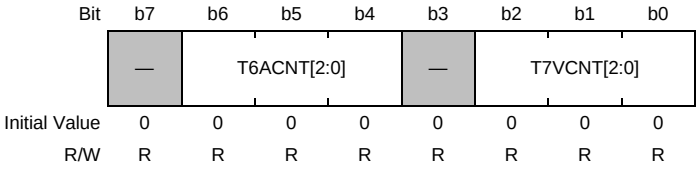
Note: To clear the TITCNT1A, clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0.

TITCNT1A and TITCNT1B are 8-bit readable/writable counters. TITCNTA and TITCNTB retain their values even after stopping the count operation of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

T4VCNT[2:0] Bits (TCIV4 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T4VEN bit in TITCR1A is cleared to 0
- When the T4VCOR[2:0] bits in TITCR1A are cleared to 000b
- When the T4VCNT[2:0] bits in TITCNT1A match the T4VCOR[2:0] bits in TITCR1A



T3ACNT[2:0] Bits (TGIA3 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T3AEN bit in TITCR1A is cleared to 0
- When the T3ACOR[2:0] bits in TITCR1A are cleared to 000b
- When the T3ACNT[2:0] bits in TITCNT1A match the T3ACOR[2:0] bits in TITCR1A

(2) MTU.TITCNT1B

Address(es): MTU.TITCNT1B H'0_1000_1A31

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	T7VCNT[2:0]	All 0	R	TCIV7 Interrupt Counter While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs.
b3	—	0	R	Reserved This bit is read as 0.
b6 to b4	T6ACNT[2:0]	All 0	R	TGIA6 Interrupt Counter While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs.
b7	—	0	R	Reserved This bit is read as 0.

Note: To clear the TITCNT1B, clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0.

T7VCNT[2:0] Bits (TCIV7 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T7VEN bit in TITCR1B is cleared to 0
- When the T7VCOR[2:0] bits in TITCR1B are cleared to 000b
- When the T7VCNT[2:0] bits in TITCNT1B match the T7VCOR[2:0] bits in TITCR1B

T6ACNT[2:0] Bits (TGIA6 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T6AEN bit in TITCR1B is cleared to 0
- When the T6ACOR[2:0] bits in TITCR1B are cleared to 000b
- When the T6ACNT[2:0] bits in TITCNT1B match the T6ACOR[2:0] bits in TITCR1B

5.9.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B)

(1) MTU.TITCR2A

Address(es): MTU.TITCR2A H'0_1000_123B

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG4COR[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TRG4COR [2:0]	All 0	R/W	TRG4AN/TRG4BN Interrupt Skipping Count Setting These bits specify the TRG4AN/TRG4BN interrupt skipping count within the range from 0 to 7. For details, see **Table 5.9-60**.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TITCR2A and TITCR2B specify the interrupt skipping count for TRG4AN and TRG4BN (TRG7AN and TRG7BN). This setting is valid only while TITMRA or TITMRB is set to 1.

Table 5.9-60 Setting of Interrupt Skipping Count by TRG4COR[2:0] Bits

Bit 2	Bit 1	Bit 0	
TRG4COR2	TRG4COR1	TRG4COR0	Description
0	0	0	Does not skip TRG4AN and TRG4BN interrupts.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 1.
	1	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 2.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 3.
1	0	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 4.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 5.
	1	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 6.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 7.

(2) MTU.TITCR2B

Address(es): MTU.TITCR2B H'0_1000_1A3B

Bit	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TRG7COR [2:0]	All 0	R/W	TRG7AN/TRG7BN Interrupt Skipping Count Setting These bits specify the TRG7AN/TRG7BN interrupt skipping count within the range from 0 to 7. For details, see **Table 5.9-61**.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Table 5.9-61 Setting of Interrupt Skipping Count by TRG7COR[2:0] Bits

Bit 2	Bit 1	Bit 0	
TRG7COR2	TRG7COR1	TRG7COR0	Description
0	0	0	Does not skip TRG7AN and TRG7BN interrupts.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 1.
	1	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 2.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 3.
1	0	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 4.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 5.
	1	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 6.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 7.

5.9.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B)

(1) MTU.TITCNT2A

Address(es): MTU.TITCNT2A H'0_1000_123C

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG4CNT[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TRG4CNT [2:0]	All 0	R	TRG4AN/TRG4BN Interrupt Counter These bits start counting from the value set in TRG4COR[2:0] and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.
b7 to b3	—	All 0	R	Reserved These bits are read as 0.

TITCNT2A and TITCNT2B start counting from the values set in the TRG4COR[2:0] and TRG7COR[2:0] bits and the count decrements every time TRG4AN or TRG4BN (TITCNT2A) is generated or TRG7AN or TRG7BN (TITCNT2B) is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts or the TRG7AN and TRG7BN interrupts become valid.

TRG4CNT[2:0] Bits (TRG4AN/TRG4BN Interrupt Counter)

These bits start counting from the value set in the TRG4COR[2:0] bits and the count decrements every time a TRG4AN or TRG4BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRA is 0
- When the TRG4COR[2:0] bits in TITCR2A are cleared to 000b
- When the count of TRG4AN and TRG4BN occurrence matches the TRG4COR[2:0] value in TITCR2A

(2) MTU.TITCNT2B

Address(es): MTU.TITCNT2B H'0_1000_1A3C

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG7CNT[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TRG7CNT [2:0]	All 0	R	TRG7AN/TRG7BN Interrupt Counter These bits start counting from the value set in TRG7COR[2:0] and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.
b7 to b3	—	All 0	R	Reserved These bits are read as 0.

TRG7CNT[2:0] Bits (TRG7AN/TRG7BN Interrupt Counter)

These bits start counting from the value set in the TRG7COR[2:0] bits and the count decrements every time a TRG7AN or TRG7BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRB is 0
- When the TRG7COR[2:0] bits in TITCR2B are cleared to 000b
- When the count of TRG7AN and TRG7BN occurrence matches the TRG7COR[2:0] value in TITCR2B

5.9.2.43 Bus Master Interface

The timer counter (MTU8.TCNT), general registers (MTU8.TGRn) for MTU8, and MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers when TMDR3.LWA = 1 are 32-bit registers. A 32-bit data bus to the bus master enables 32-bit read/write access. 8- and 16-bit read/write are not allowed. Access these registers in 32-bit units.

Excluding MTU8, the timer counters (MTU0.TCNT to MTU7.TCNT), general registers (MTU0.TGRn to MTU7.TGRn), timer sub counters (TCNTSA and TCNTSB), timer cycle buffer registers (TCBRA and TCBRB), timer dead time data registers (TDDRA and TDDRB), timer cycle data registers (TCDRA and TCDRB), timer A/D converter start request control registers (MTU4.TADCR and MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA, MTU4.TADCORB, MTU7.TADCORA, and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA, MTU4.TADCOBRB, MTU7.TADCOBRA, and MTU7.TADCOBRB) are 16-bit registers. A 16-bit data bus to the bus master enables 16-bit read/write access. 8-bit read/ write is not allowed. Access the registers in 16-bit units.

All registers other than the above registers are 8-bit registers. Read from/write to these registers in 8-bit units.

5.9.3 Operation

5.9.3.1 Basic Functions

Each channel has TCNT and TGR. TCNT in each channel performs up-counting and is also capable of free-running count, periodic count, and external event count operations.

Each TGR can be used as an input capture register or an output compare register.

(1) Counter Operation

When one of bits CST0 to CST4 and CST8 in TSTRA, bits CST6 and CST7 in TSTRB, and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR is set to 1, TCNT for the corresponding channel begins counting. TCNT can perform various count operations such as free-running count or periodic count operations.

(a) Example of Count Operation Setting Procedure

Figure 5.9-5 shows an example of the count operation setting procedure.

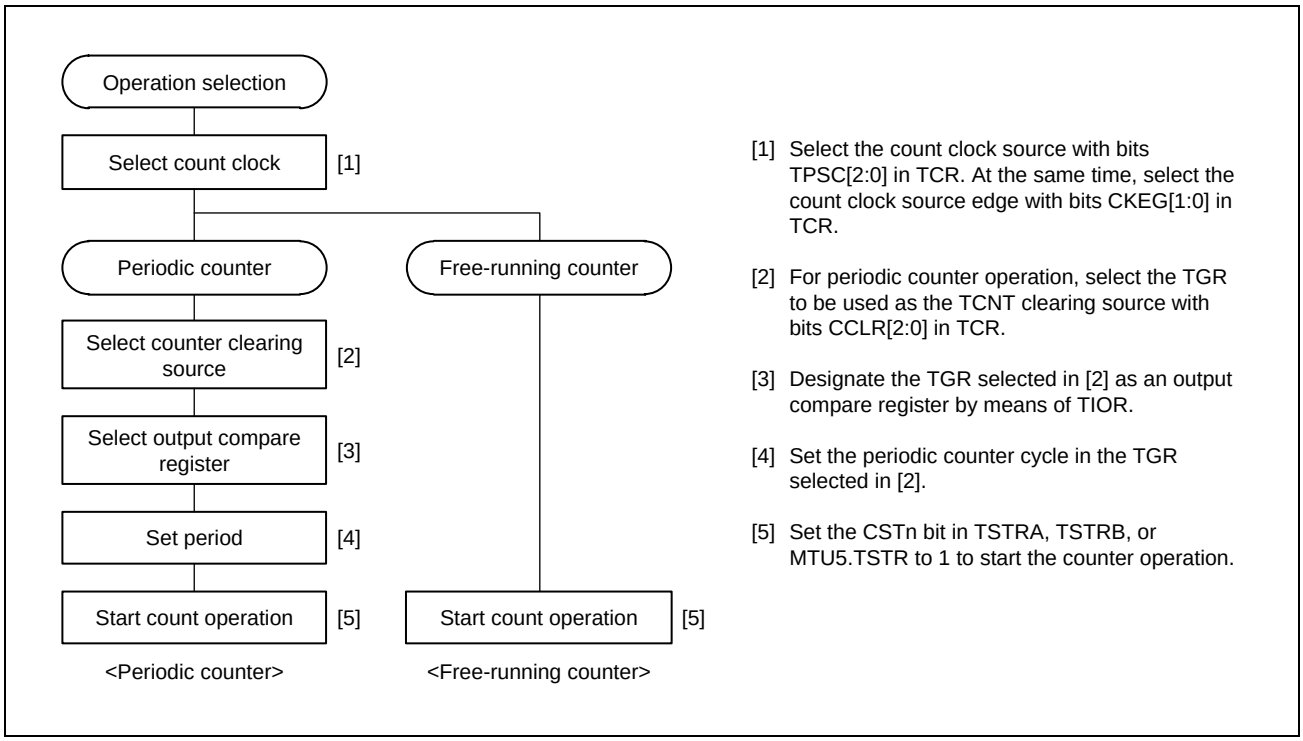

Figure 5.9-5 Example of Count Operation Setting Procedure

(b) Free-Running Count Operation and Periodic Count Operation

Immediately after a reset, all TCNT counters are designated as free-running counters. When the CSTn bit in TSTRA, TSTRB, or TSTR in MTU5 is set to 1, the corresponding TCNT counter starts up-counting as a free-running counter. When TCNT overflows (from H'FFFF to H'0000), if the corresponding TIER.TCIEV bit is 1, an interrupt request is issued to the CPU. After an overflow, TCNT starts counting up again from H'0000.

Figure 5.9-6 illustrates free-running counter operation.

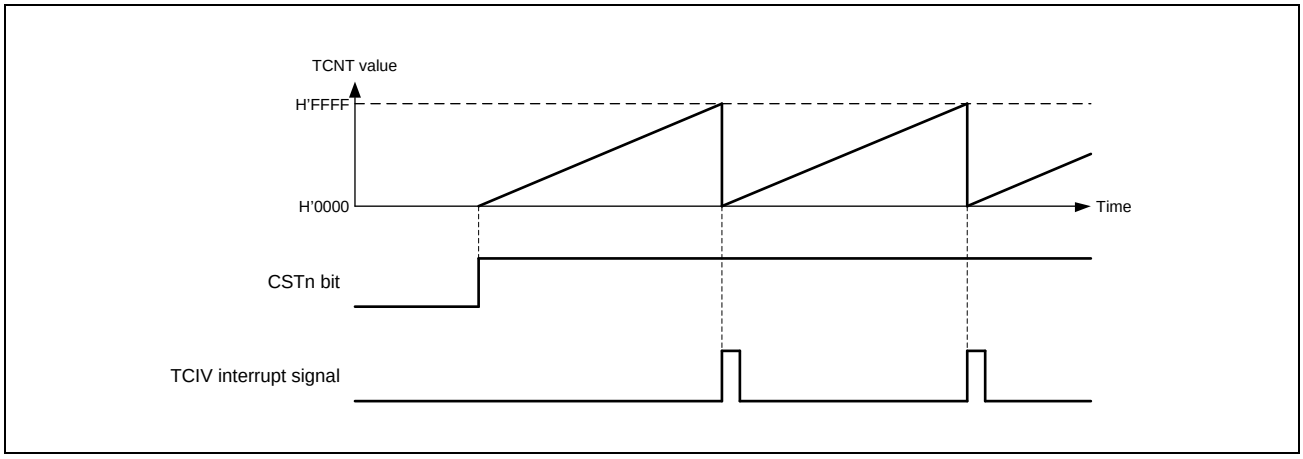

Figure 5.9-6 Free-Running Counter Operation

When compare match is selected as the TCNT clearing source, TCNT for the relevant channel performs periodic count operation. TGR for setting the cycle is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR[2:0] in TCR. After the settings have been made, TCNT starts up-counting as a periodic counter when the corresponding CSTn bit in TSTRA, TSTRB, or TSTR in MTU5 is set to 1. When the count matches the value in TGR, TCNT is cleared to H'0000.

If the value of the corresponding TIER.TGIE bit is 1 at this point, an interrupt request is issued to the CPU. After a compare match, TCNT starts counting up again from H'0000.

Figure 5.9-7 illustrates periodic counter operation.

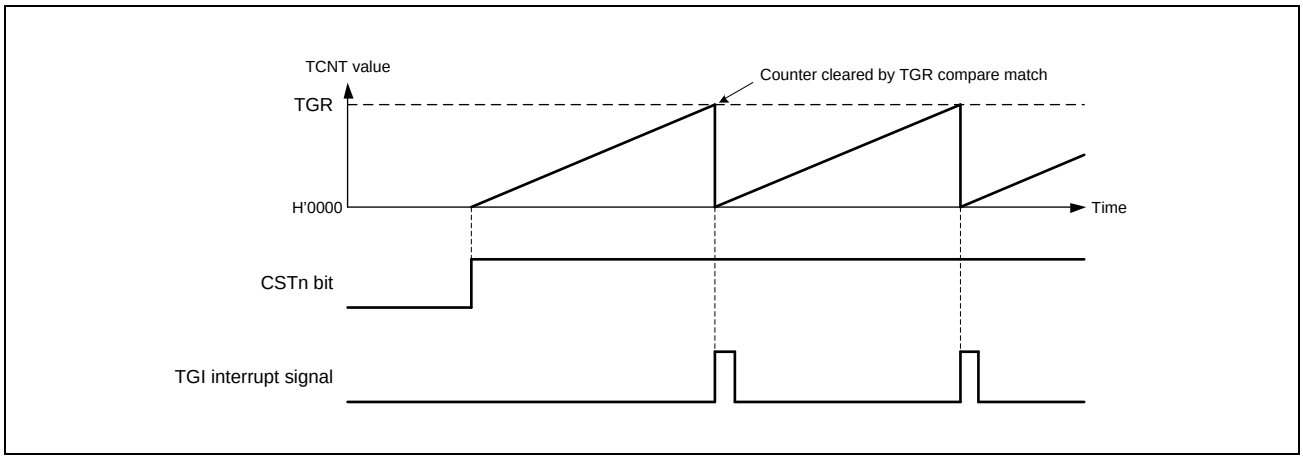

Figure 5.9-7 Periodic Counter Operation

(2) Waveform Output by Compare Match

Upon compare match, low, high, or toggle output from the corresponding pin can be performed. The compare match output operation is not available in MTU5.

(a) Example of Procedure for Setting Waveform Output by Compare Match

Figure 5.9-8 shows an example of the procedure for setting waveform output by compare match

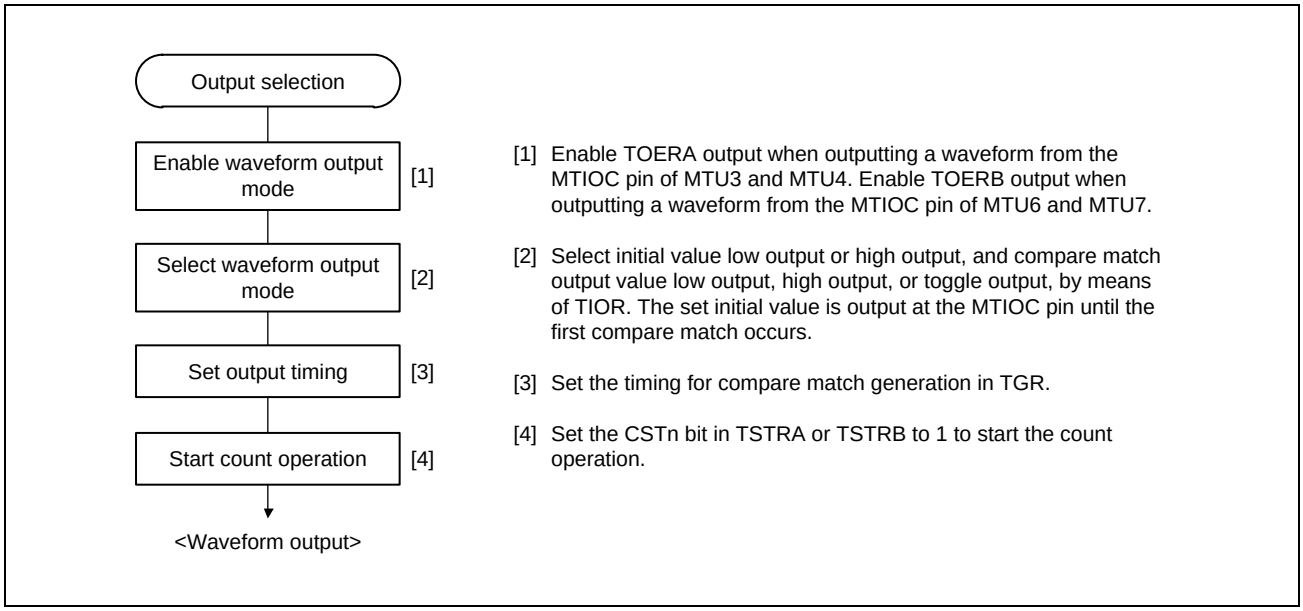

Figure 5.9-8 Example of Procedure for Setting Waveform Output by Compare Match

(b) Examples of Waveform Output Operation

Figure 5.9-9 shows an example of low output and high output.

In this example, TCNT has been designated as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the pin level is the same as the specified level, the pin level does not change.

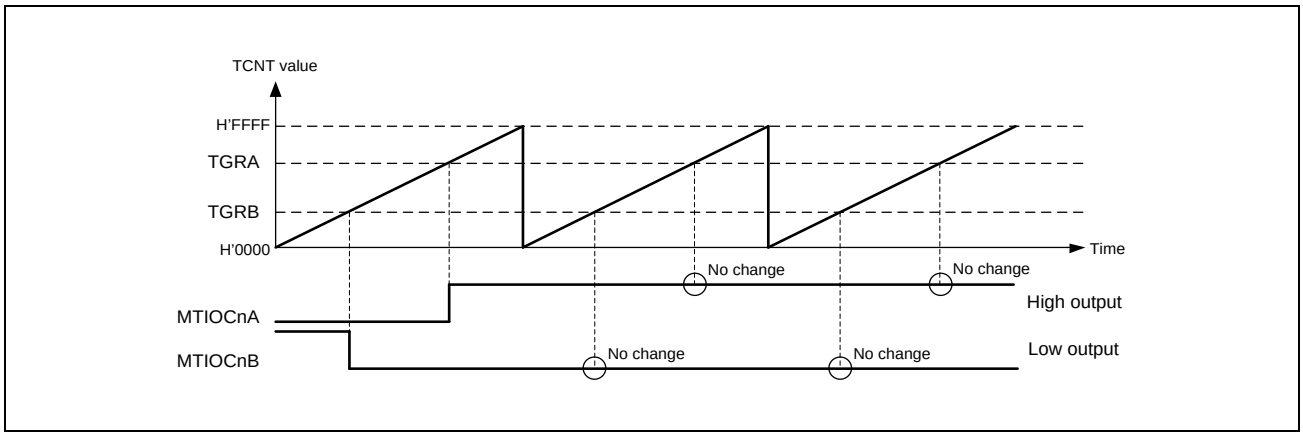

Figure 5.9-9 Example of low output and high output Operation (n = 0 to 4, 6, 7, 8)

Figure 5.9-10 shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made so that the output is toggled by both compare match A and compare match B.

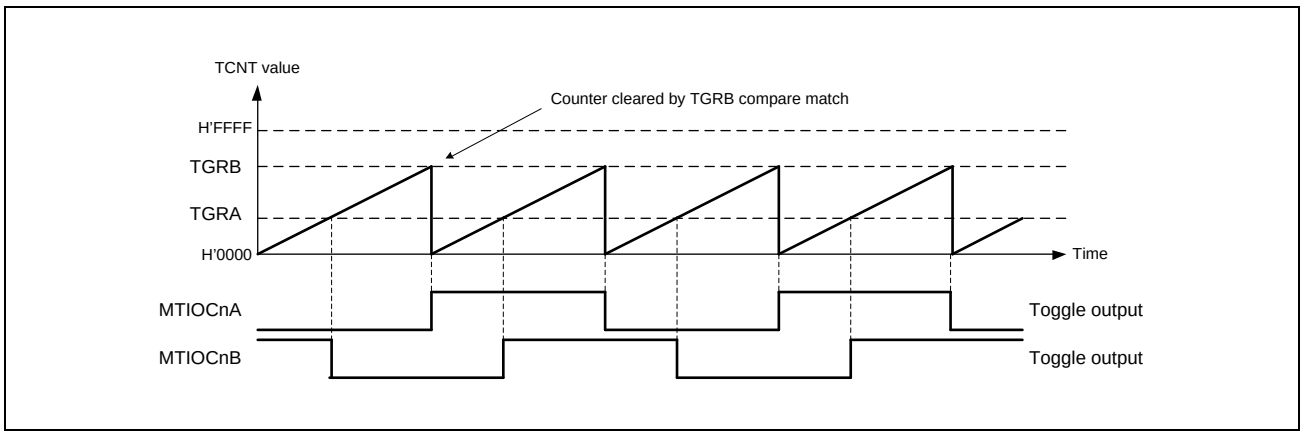

Figure 5.9-10 Example of Toggle Output Operation (n = 0 to 4, 6, 7, 8)

(3) Input Capture Function

The TCNT value can be transferred to TGR on detection of the MTIOCnm, MTIC5U, MTIC5V, or MTIC5W pin (n = 0 to 4, 6, 7, 8; m = A to D), input edge.

The rising edge, falling edge, or both edges can be selected as the detection edge. For MTU0 and MTU1, another channel's count clock or compare match signal can also be specified as the input capture source.

NOTE

When another channel's count clock is used as the input capture input for MTU0 and MTU1, P0ϕ/1 should not be selected as the count clock used for input capture input. Input capture will not be generated if P0ϕ/1 is selected.

(a) Example of Input Capture Operation Setting Procedure

Figure 5.9-11 shows an example of the input capture operation setting procedure.

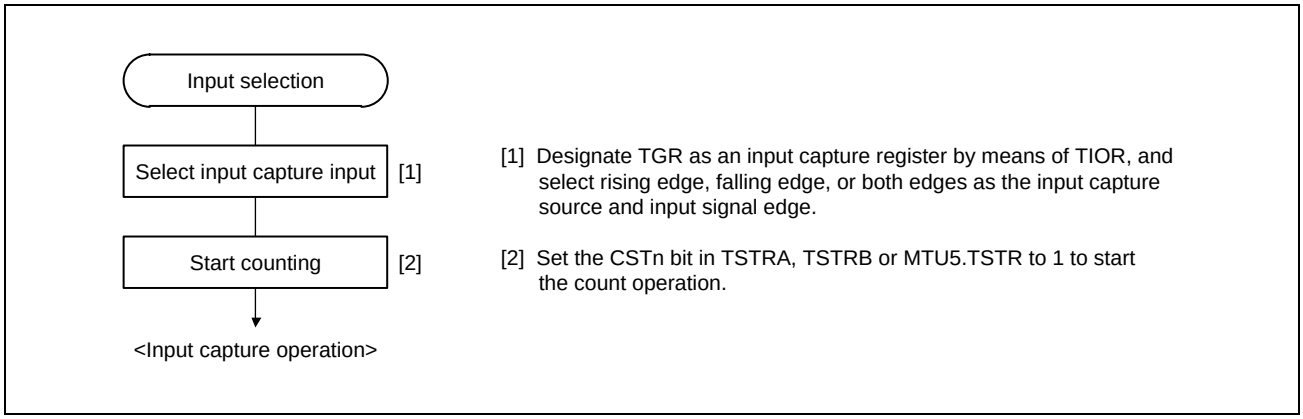

Figure 5.9-11 Example of Input Capture Operation Setting Procedure

(b) Example of Input Capture Operation

Figure 5.9-12 shows an example of input capture operation.

In this example, both rising and falling edges have been selected as the MTIOCnA pin input capture input edge, the falling edge has been selected as the MTIOCnB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT. (n = 0 to 4, 6, 7, 8)

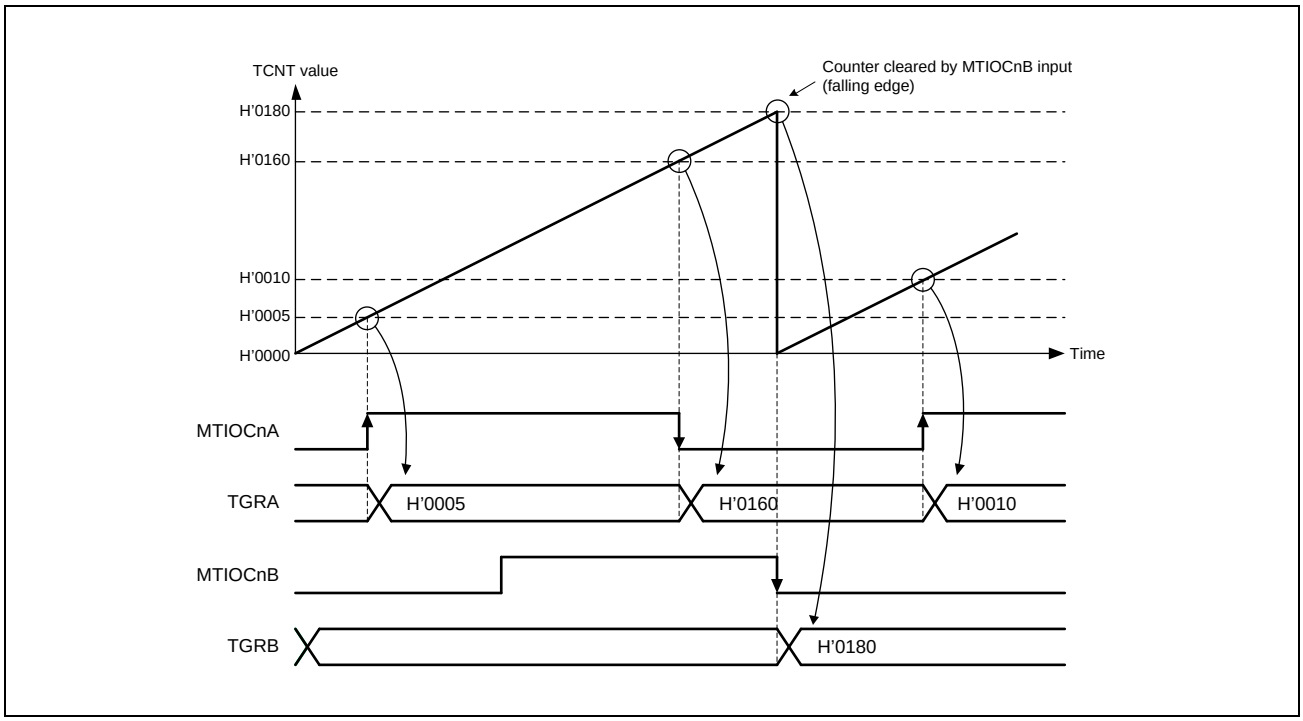

Figure 5.9-12 Example of Input Capture Operation (n = 0 to 4, 6, 7, 8)

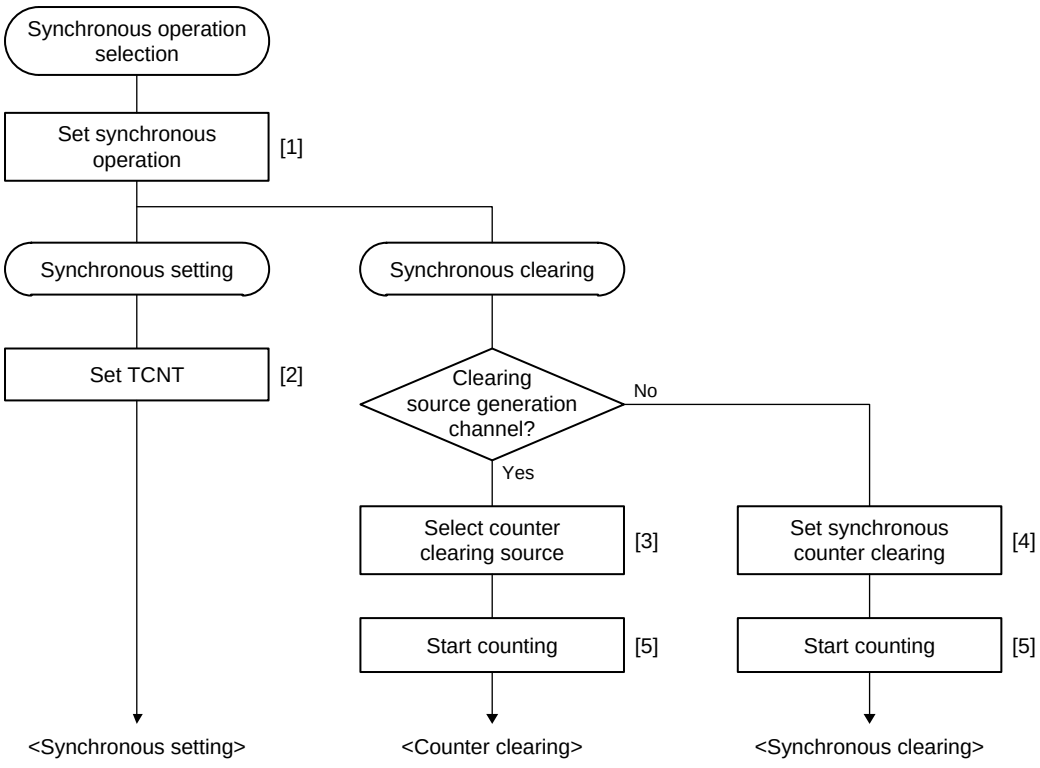
5.9.3.2 Synchronous Operation



In synchronous operation, the values in multiple TCNT counters can be modified simultaneously (synchronous setting). In addition, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.

Synchronous operation can increase the number of TGR registers assigned to the same time base.

MTU0 to MTU4, MTU6, and MTU7 can all be designated for synchronous operation. MTU5 and MTU8 cannot be used for synchronous operation.

(1) Example of Synchronous Operation Setting Procedure

Figure 5.9-13 shows an example of the synchronous operation setting procedure.

[1] Set to 1 in the SYNC bits in TSYRA and TSYRB corresponding to the channels to be designated for synchronous operation.
[2] When the TCNT counter of any of the channels designated for synchronous operation is written to, the same value is simultaneously written to the other TCNT counters.
[3] Use the CCLR[2:0] bits in TCR to specify TCNT clearing by input capture/output compare, etc.
[4] Use the CCLR[2:0] bits in TCR to designate synchronous clearing for the counter clearing source.
[5] Set to 1 in the CSTn bits in TSTRA and TSTRB for the relevant channels, to start the count operation.

Figure 5.9-13 Example of Synchronous Operation Setting Procedure

(2) Example of Synchronous Operation

Figure 5.9-14 shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for MTU0 to MTU 2, MTU0.TGRB compare match has been set as the counter clearing source in MTU0, and synchronous clearing has been set for the counter clearing source in MTU1 and MTU2.

Three-phase PWM waveforms are output from pins MTIOC0A, MTIOC1A, and MTIOC2A. At this time, synchronous setting and synchronous clearing by MTU0.TGRB compare match are performed for the TCNT counters in MTU0 to MTU2, and the data set in MTU0.TGRB is used as the PWM cycle.

For details of PWM modes, see **5.9.3.5 PWM Modes**.

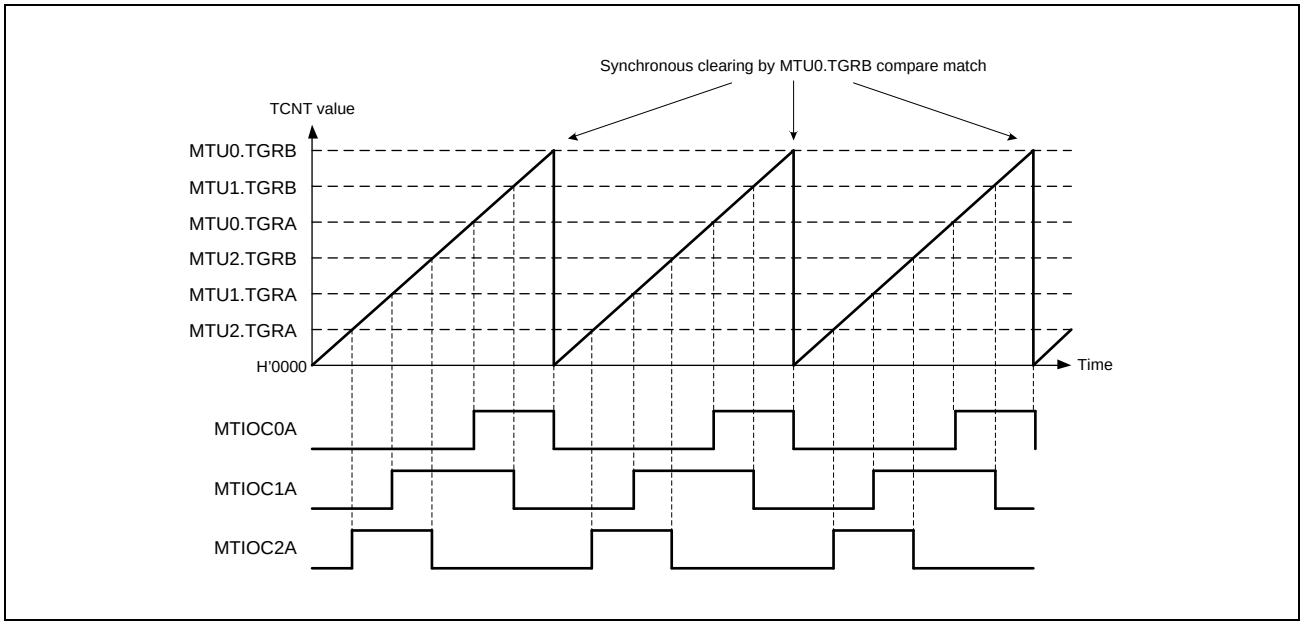


Figure 5.9-14 Example of Synchronous Operation

5.9.3.3 Buffer Operation

Buffer operation, provided for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, enables TGRC and TGRD to be used as buffer registers. In MTU0, TGRF can also be used as a buffer register.

Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

NOTE

MTU0.TGRE cannot be designated as an input capture register and can only operate as a compare match register.

Table 5.9-62 shows the register combinations used in buffer operation.

Table 5.9-62 Register Combinations in Buffer Operation

Channel	Timer General Register	Buffer Register
MTU0	TGRA	TGRC
	TGRB	TGRD
	TGRE	TGRF
MTU3	TGRA	TGRC
	TGRB	TGRD
MTU4	TGRA	TGRC
	TGRB	TGRD
MTU6	TGRA	TGRC
	TGRB	TGRD
MTU7	TGRA	TGRC
	TGRB	TGRD
MTU8	TGRA	TGRC
	TGRB	TGRD

When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in **Figure 5.9-15**.

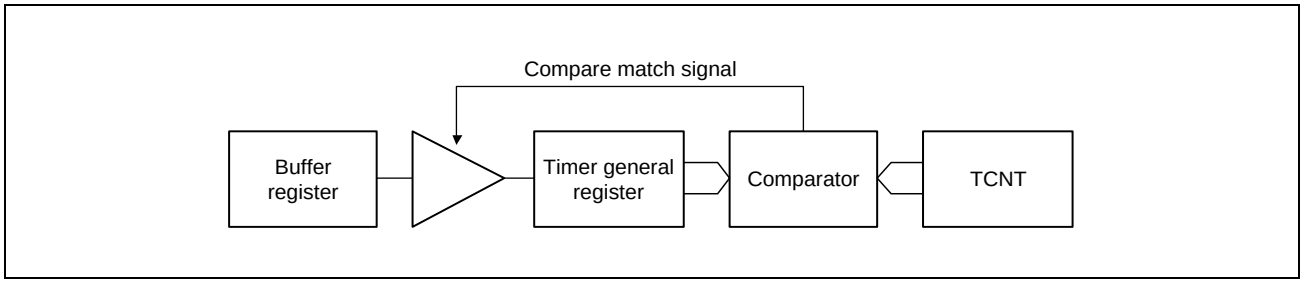

Figure 5.9-15 Compare Match Buffer Operation

When TGR is an input capture register

When an input capture occurs, the value in TCNT is transferred to TGR and the value previously held in TGR is transferred to the buffer register.

This operation is illustrated in **Figure 5.9-16**.

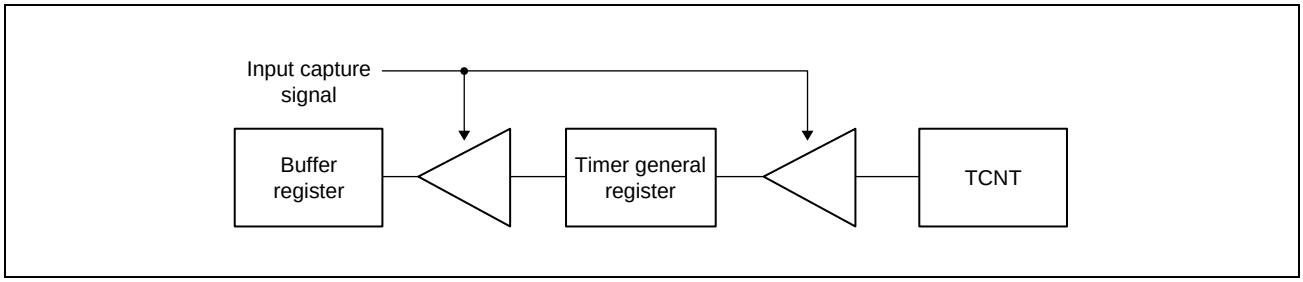

Figure 5.9-16 Input Capture Buffer Operation

(1) Example of Buffer Operation Setting Procedure

Figure 5.9-17 shows an example of the buffer operation setting procedure.

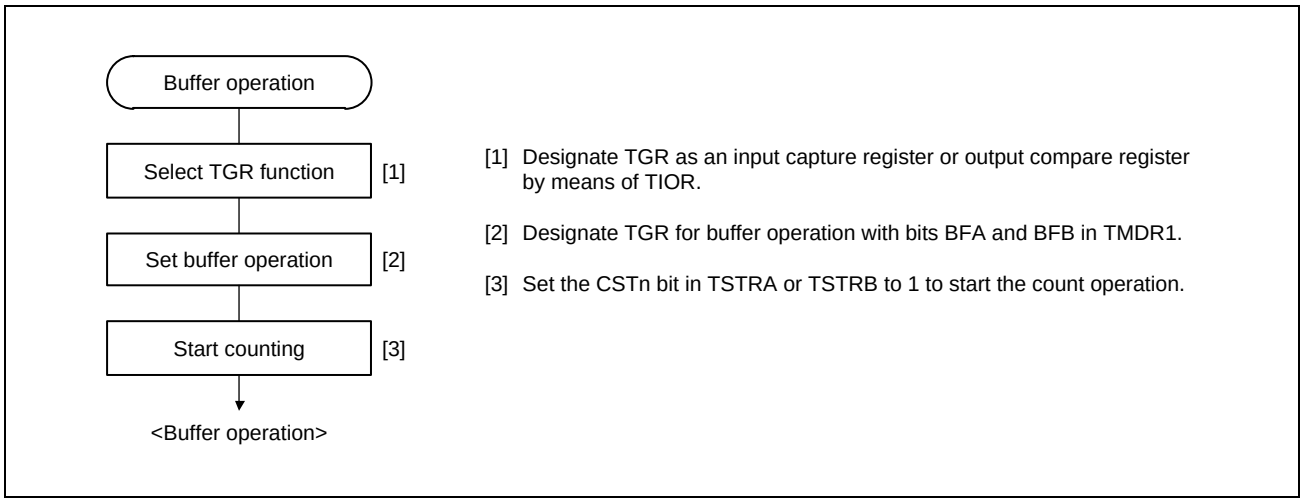

Figure 5.9-17 Example of Buffer Operation Setting Procedure

(2) Examples of Buffer Operation

(a) When TGR is an Output Compare Register

Figure 5.9-18 shows an operation example in which PWM mode 1 has been designated for MTU0, and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. In this example, the TTSA bit in TBTM is cleared to 0.

As buffer operation has been set, when compare match A occurs, the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, see **5.9.3.5 PWM Modes**.

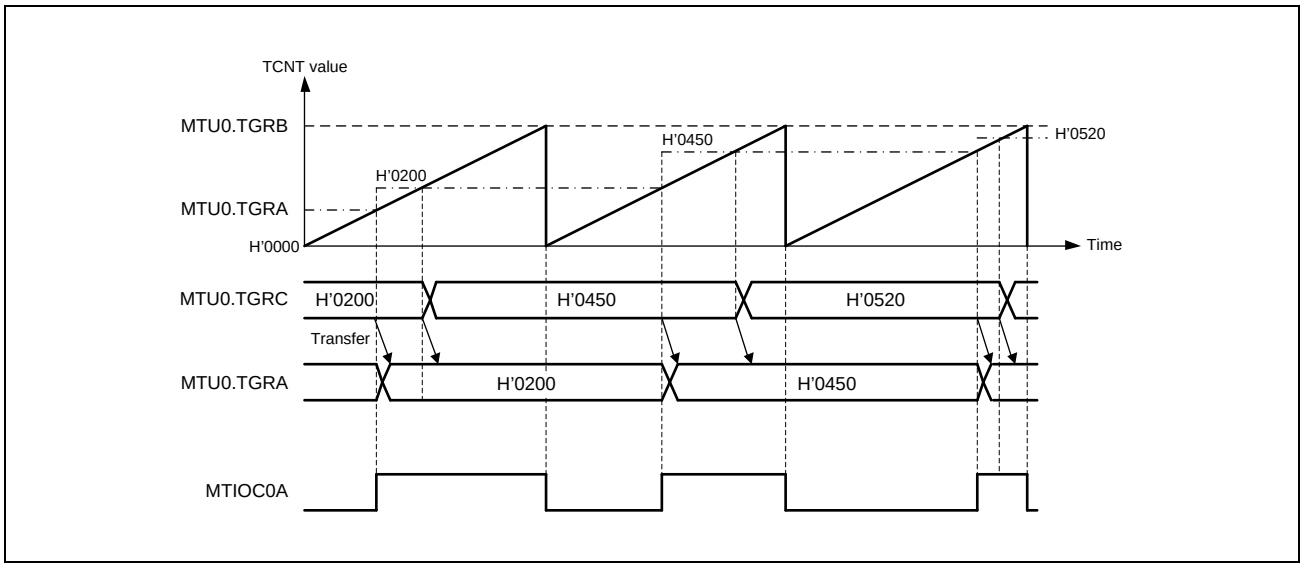

Figure 5.9-18 Example of Buffer Operation (1)

(b) When TGR is an Input Capture Register

Figure 5.9-19 shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the MTIOCnA pin input capture input edge. (n = 0 to 4, 6, 7, 8)

As buffer operation has been set, when the TCNT value is transferred to TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

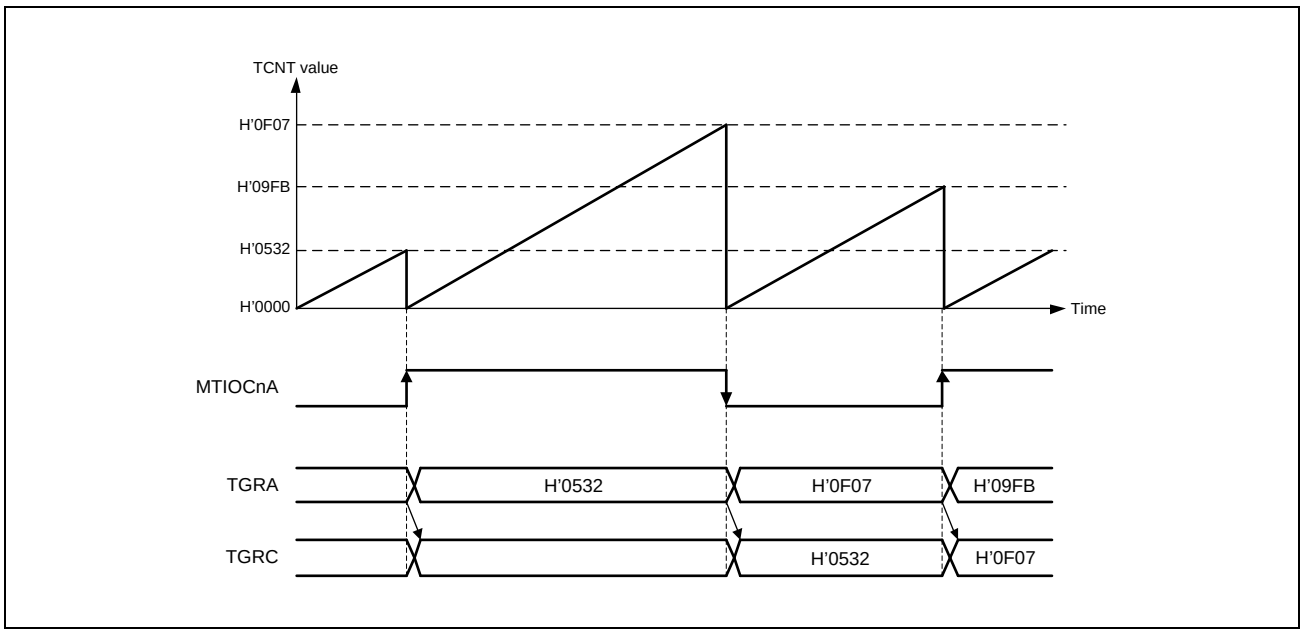

Figure 5.9-19 Example of Buffer Operation (2) (n = 0 to 4, 6, 7, 8)

(3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for MTU0 or in PWM mode 1 for MTU3, MTU4, MTU6, and MTU7 by setting the buffer operation transfer mode registers (MTUn.TBTM (n = 0, 3, 4, 6, 7)). Either compare match (value after reset) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (H'FFFF to H'0000)
- When H'0000 is written to TCNT during counting
- When TCNT is cleared to H'0000 under the condition specified in the CCLR[2:0] bits in TCR

NOTE

TBTM must be modified only while TCNT stops.

Figure 5.9-20 shows an operation example in which PWM mode 1 is designated for MTU0 and buffer operation is designated for MTU0.TGRA and MTU0.TGRC. The settings used in this example are MTU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. The TTSA bit in MTU0.TBTM is set to 1.

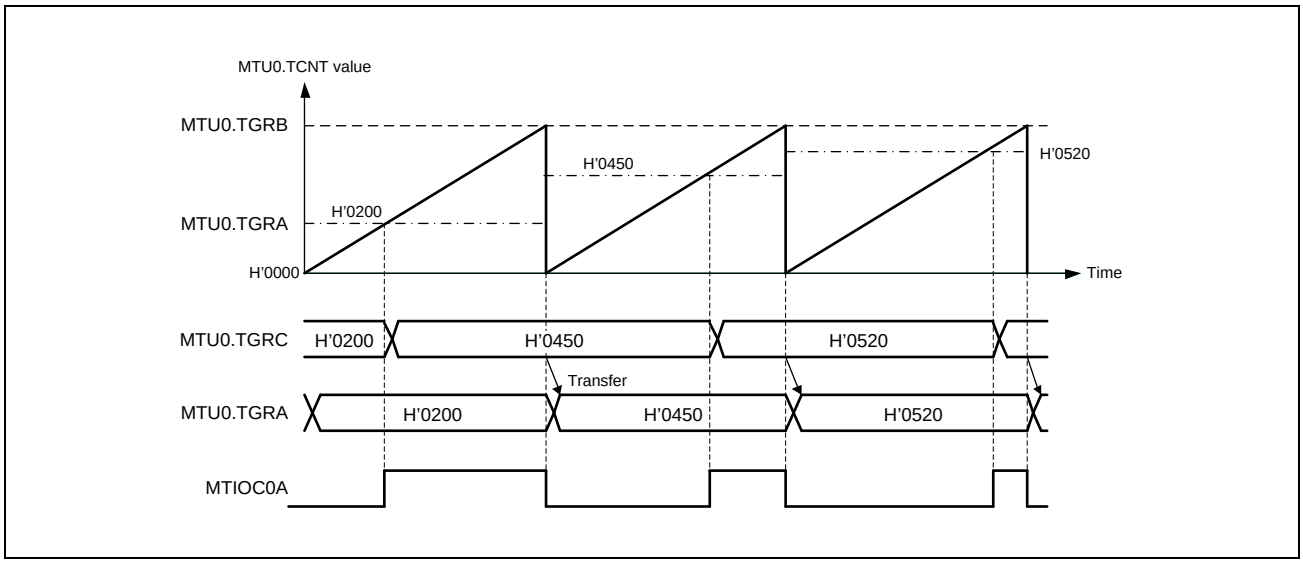

Figure 5.9-20 Example of Buffer Operation When MTU0.TCNT Clearing is Selected for MTU0.TGRC to MTU0.TGRA Transfer Timing

5.9.3.4 Cascaded Operation

In cascaded operation, two 16-bit counters in different channels are used together as a 32-bit counter.

There are two functions for connecting MTU1 and MTU2 to use as a 32-bit counter: cascade connection to be set when the MTU1.TMDR3.LWA bit is 0, and cascade connection 32-bit phase counting mode to be set when the MTU1.TMDR3.LWA bit is 1. For details on cascade connection 32-bit phase counting mode, refer to **5.9.3.6.2 Cascade Connection 32-Bit Phase Counting Mode**. This section describes the cascade connection function to be set when the MTU1.TMDR3.LWA bit is 0.

This function works when the LWA bit of TMDR3 in MTU1 is set to 0 and the TPSC[2:0] bits of TCR in MTU1 are set so that TCNT in MTU1 counts at an overflow/underflow of TCNT in MTU2.

Underflow occurs only when the MTU2 to which the lower 16 bits allocated is in phase counting mode.

Table 5.9-63 shows the register combinations used in cascaded operation.

NOTE

When phase counting mode is set for MTU1, the count clock setting is invalid and the counters operate independently in phase counting mode.

Table 5.9-63 Cascaded Combinations

Combination	Upper 16 Bits	Lower 16 Bits
MTU1 and MTU2	MTU1.TCNT	MTU2.TCNT

For simultaneous input capture of MTU1.TCNT and MTU2.TCNT during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The input-capture condition is of edges in the signal produced by taking the logical OR of the input level on the main input pin and the input level on the added input pin. Accordingly, if either is at the high level, a change in the level of the other will not produce an edge for detection. For details, see **5.9.3.4 (4) Cascaded Operation Example (c)**. For input capture in cascade connection, refer to **5.9.6.20 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection**.

Table 5.9-64 shows the TICCR setting and input capture input pins.

Table 5.9-64 TICCR Setting and Input Capture Input Pins

Target Input Capture	TICCR Setting	Input Capture Input Pin
Input capture from MTU1.TCNT to MTU1.TGRA	I2AE bit = 0 (Initial value)	MTIOC1A
	I2AE bit = 1	MTIOC1A, MTIOC2A
Input capture from MTU1.TCNT to MTU1.TGRB	I2BE bit = 0 (Initial value)	MTIOC1B
	I2BE bit = 1	MTIOC1B, MTIOC2B
Input capture from MTU2.TCNT to MTU2.TGRA	I1AE bit = 0 (Initial value)	MTIOC2A
	I1AE bit = 1	MTIOC2A, MTIOC1A
Input capture from MTU2.TCNT to MTU2.TGRB	I1BE bit = 0 (Initial value)	MTIOC2B
	I1BE bit = 1	MTIOC2B, MTIOC1B

(1) Example of Cascaded Operation Setting Procedure

Figure 5.9-21 shows an example of the cascaded operation setting procedure.

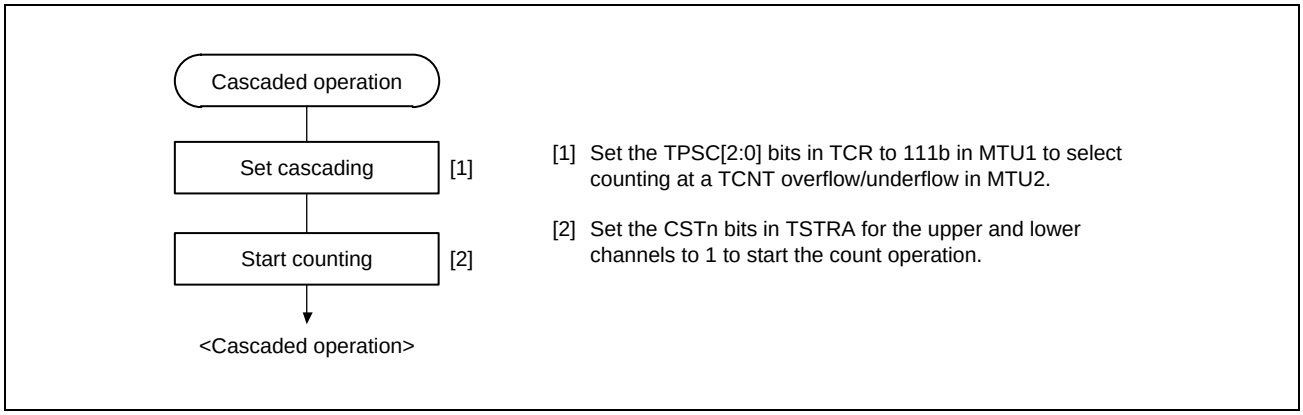

Figure 5.9-21 Cascaded Operation Setting Procedure

(2) Cascaded Operation Example (a)

Figure 5.9-22 shows the operation when MTU1.TCNT is set for counting at MTU2.TCNT overflow/underflow and MTU2 is set for phase counting mode 1 while MTU1.TCNT and MTU2.TCNT are cascaded.

MTU1.TCNT is incremented by MTU2.TCNT overflow and decremented by MTU2.TCNT underflow.

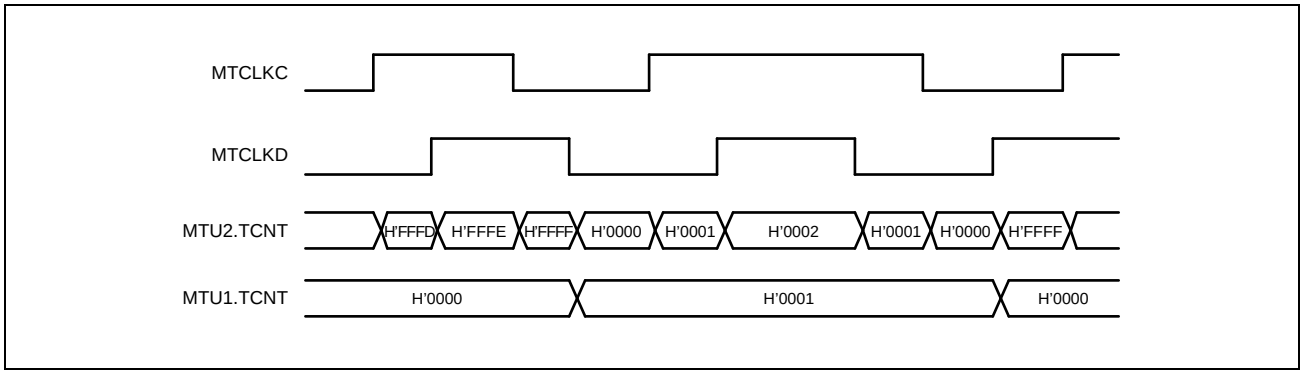

Figure 5.9-22 Cascaded Operation Example (a)

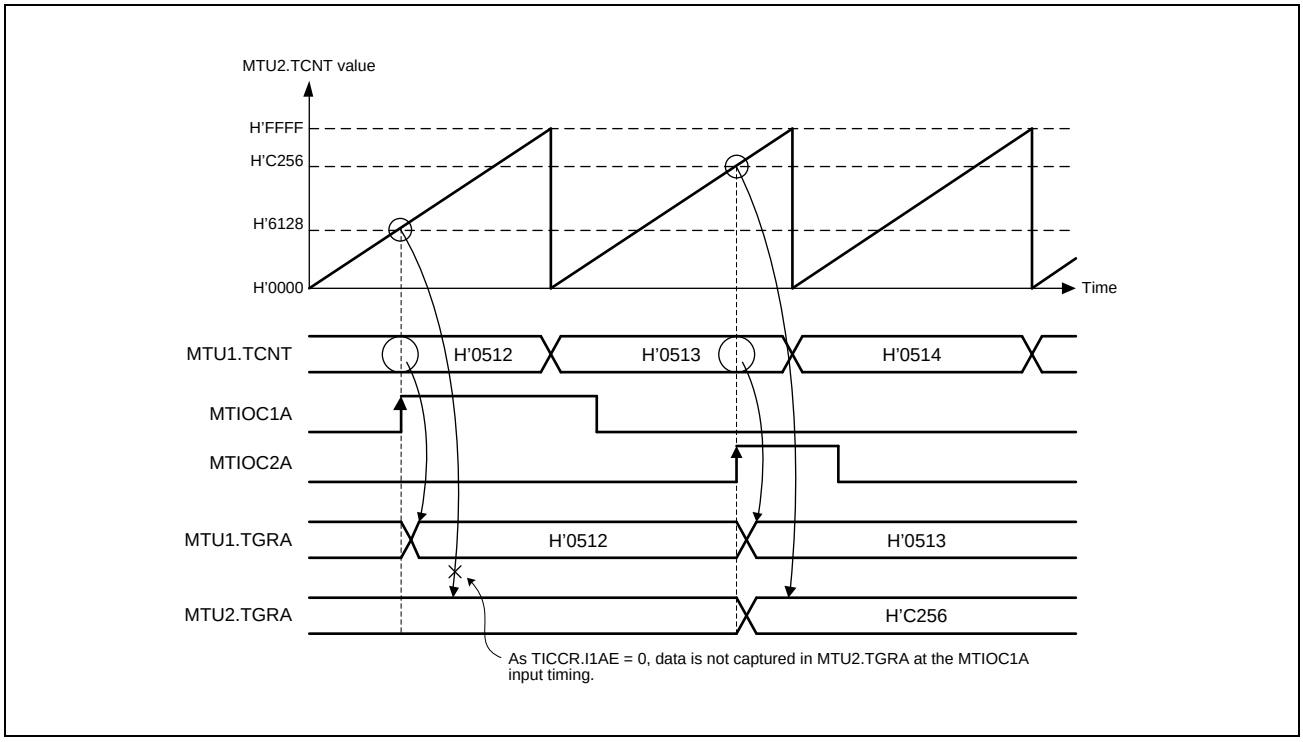
(3) Cascaded Operation Example (b)

Figure 5.9-23 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the I2AE bit in TICCR has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the MTU1.TIOR.IOA[3:0] bits have selected the MTIOC1A rising edge for the input capture timing while the MTU2.TIOR.IOA[3:0] bits have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, the rising edge of both MTIOC1A and MTIOC2A is used for the MTU1.TGRA input capture condition. For the MTU2.TGRA input capture condition, the MTIOC2A rising edge is used.



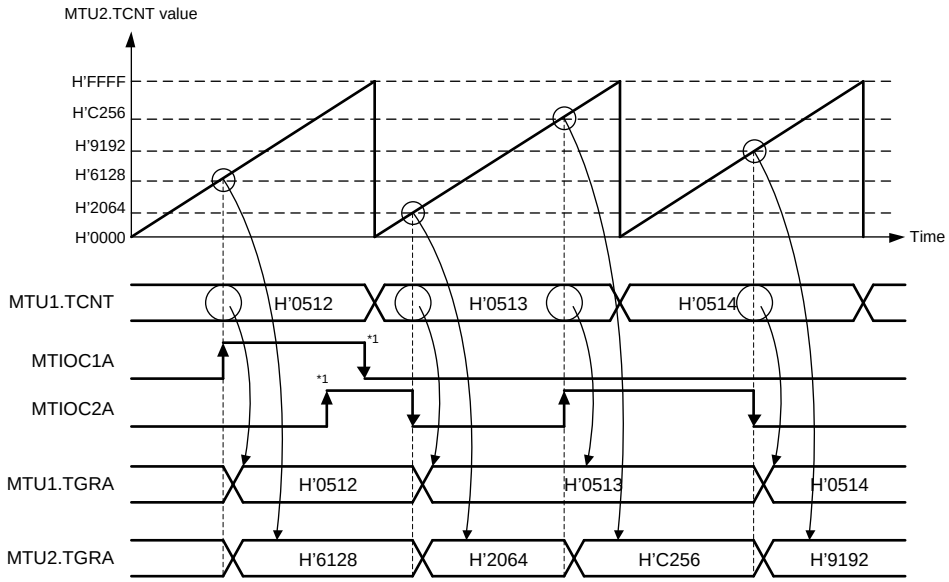


Figure 5.9-23 Cascaded Operation Example (b)

(4) Cascaded Operation Example (c)

Figure 5.9-24 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE and I1AE bits have been set to 1 to include the MTIOC2A and MTIOC1A pins in the MTU1.TGRA and MTU2.TGRA input capture conditions, respectively. In this example, the IOA[3:0] bits in both MTU1.TIOR and MTU2.TIOR have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of MTIOC1A and MTIOC2A input is used for the MTU1.TGRA and MTU2.TGRA input capture conditions.

Note 1. When either of the input signals is driven high, the selected edge of the other cannot act as the input capture condition.

Figure 5.9-24 Cascaded Operation Example (c)

(5) Cascaded Operation Example (d)

Figure 5.9-25 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE bit has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the IOA[3:0] bits in MTU1.TIOR have selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing while the IOA[3:0] bits in MTU2.TIOR have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, as MTU1.TIOR has selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing, the MTIOC2A edge is not used for MTU1.TGRA input capture condition although the I2AE bit in TICCR has been set to 1.

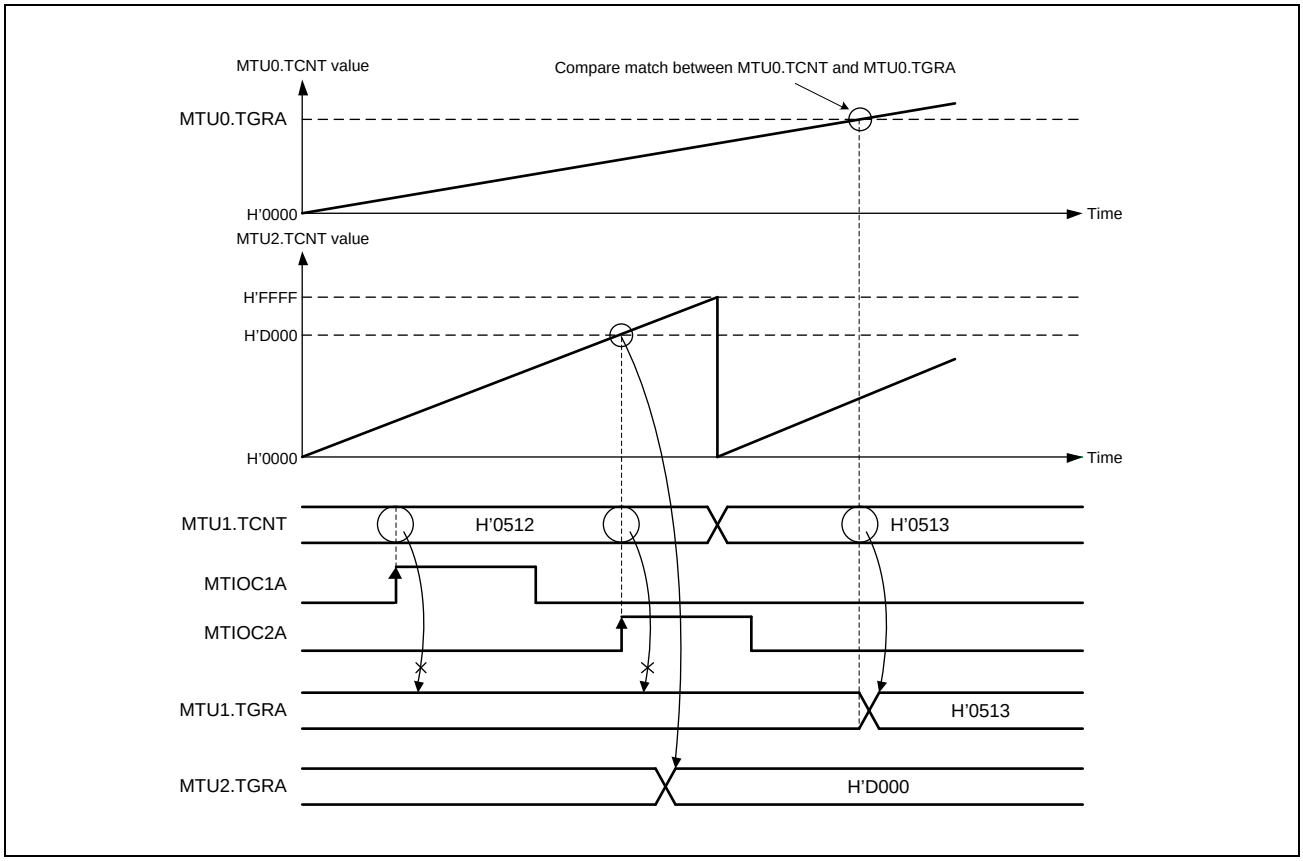

Figure 5.9-25 Cascaded Operation Example (d)

5.9.3.5 PWM Modes

PWM modes are provided to output PWM waveforms from the external pins. The output level can be selected as low, high, or toggle output in response to a compare match of each TGR.

PWM waveforms in the range of 0% to 100% duty cycle can be output according to the TGR settings.

By designating TGR compare match as the counter clearing source, the PWM cycle can be specified in that register. Every channel except MTU5 and MTU8 can be set to PWM mode independently. Synchronous operation is also possible between the channels placed in PWM mode or between a channel in PWM mode and another channel in a different mode.

There are two PWM modes as described below.

PWM Mode 1

PWM waveforms are output from the MTIOCnA and MTIOCnC pins by pairing TGRA with TGRB and TGRC with TGRD. The levels specified by the TIOR.IOA[3:0] and IOC[3:0] bits are output from the MTIOCnA and MTIOCnC pins at compare matches A and C, and the level specified by the TIOR.IOB[3:0] and IOD[3:0] bits are output at compare matches B and D (n = 0 to 4, 6, 7). The initial output value is set in TGRA or TGRC. If the values set in paired TGRs are identical, the output value does not change even when a compare match occurs.

In PWM mode 1, PWM waveforms in up to 12 phases can be output.

PWM Mode 2

PWM waveform output is generated using one TGR as the cycle register and the others as duty registers. The level specified in TIOR is output at compare matches. Upon counter clearing by a cycle register compare match, the initial value set in TIOR is output from each pin. If the values set in the cycle and duty registers are identical, the output value does not change even when a compare match occurs.

In PWM mode 2, up to eight phases of PWM waveforms can be output when synchronous clearing is used as synchronous operation in the channels that cannot be placed in PWM mode 2.

The correspondence between PWM output pins and registers is shown in **Table 5.9-65**.

Table 5.9-65 PWM Output Registers and Output Pins

Channel	Register	Output Pins	
		PWM Mode 1	PWM Mode 2
MTU0	TGRA	MTIOC0A	MTIOC0A
	TGRB		MTIOC0B
	TGRC	MTIOC0C	MTIOC0C
	TGRD		MTIOC0D
MTU1	TGRA	MTIOC1A	MTIOC1A
	TGRB		MTIOC1B
MTU2	TGRA	MTIOC2A	MTIOC2A
	TGRB		MTIOC2B
MTU3	TGRA	MTIOC3A	Setting prohibited
	TGRB		
	TGRC	MTIOC3C	
	TGRD		
MTU4	TGRA	MTIOC4A	
	TGRB		
	TGRC	MTIOC4C	
	TGRD		
MTU6	TGRA	MTIOC6A	
	TGRB		
	TGRC	MTIOC6C	
	TGRD		
MTU7	TGRA	MTIOC7A	
	TGRB		
	TGRC	MTIOC7C	
	TGRD		

Note: In PWM mode 2, PWM waveform output is not possible for the TGR register in which the PWM cycle is set.

(1) Example of PWM Mode Setting Procedure

Figure 5.9-26 shows an example of the PWM mode setting procedure.

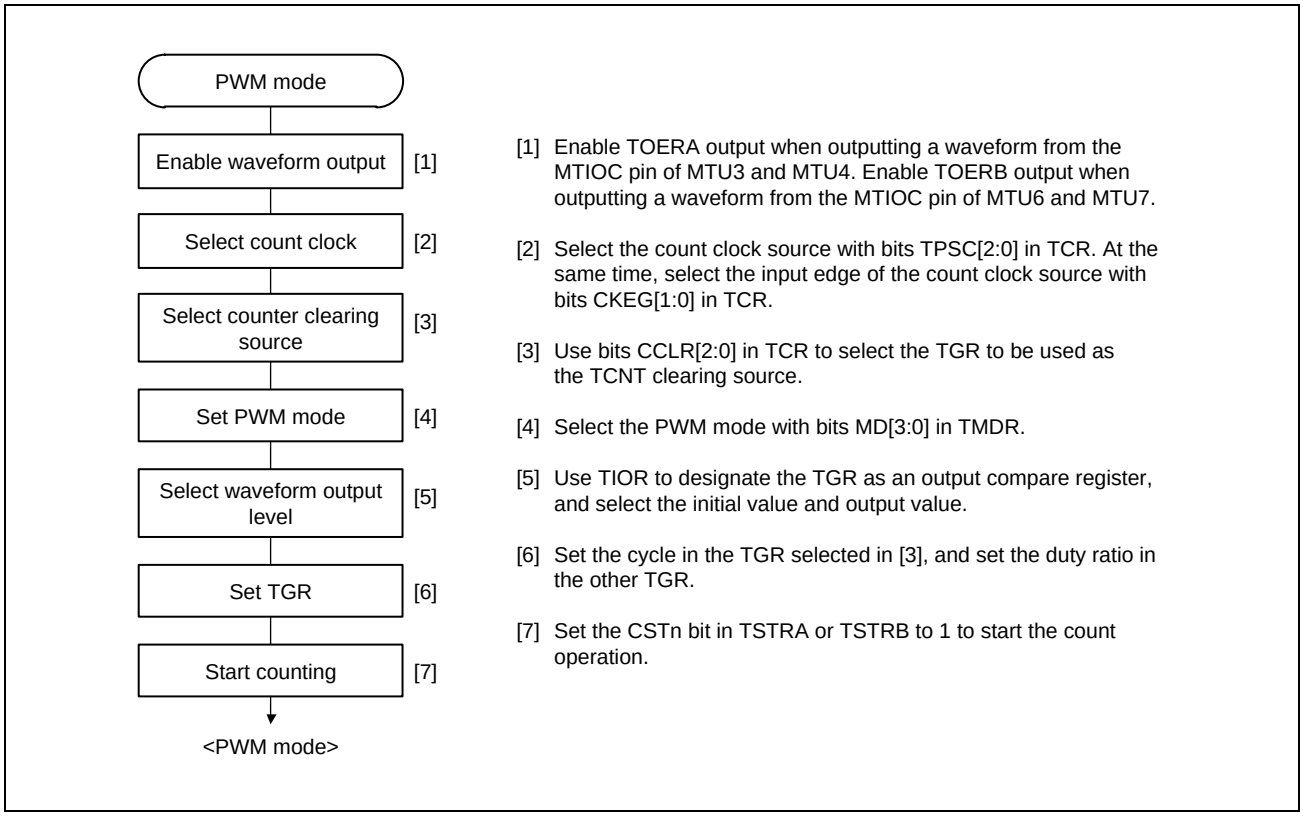

Figure 5.9-26 Example of PWM Mode Setting Procedure

(2) Examples of PWM Mode Operation

Figure 5.9-27 shows an example of operation in PWM mode 1.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set as the initial output value and output value for TGRA, and 1 is set as the output value for TGRB.

In this case, the value set in TGRA is used as the cycle, and the value set in TGRB is used as the duty ratio.

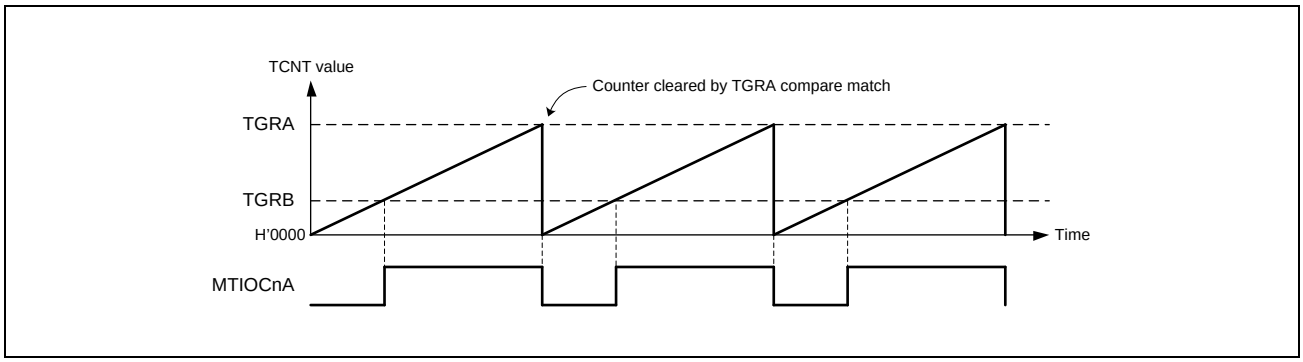

Figure 5.9-27 Example of PWM Mode 1 Operation (n = 0 to 4, 6, 7)

Figure 5.9-28 shows an example of operation in PWM mode 2.

In this example, synchronous operation is designated for MTU0 and MTU1, MTU1.TGRB compare match is set as the TCNT clearing source, and low is set as the initial output value and high as the output value for the other TGR registers (MTU0.TGRA to MTU0.TGRD and MTU1.TGRA), outputting 5-phase PWM waveforms.

In this case, the value set in MTU1.TGRB is used as the cycle, and the values set in the other TGRs are used as the duty ratio.

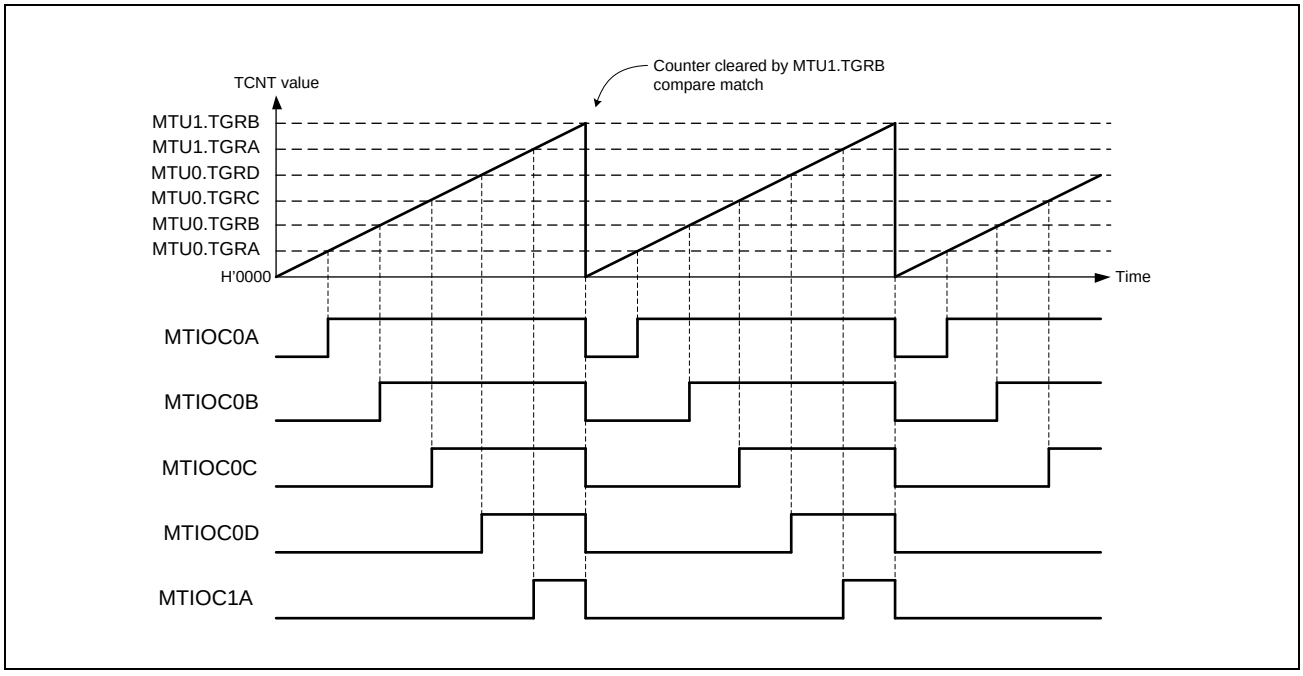

Figure 5.9-28 Example of PWM Mode 2 Operation

Figure 5.9-29 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode 1. In these examples, TGRA compare match is selected as the TCNT clearing source, the initial output value and the output value for TGRA are set to the low level, and the output value for TGRB is set to the high level.

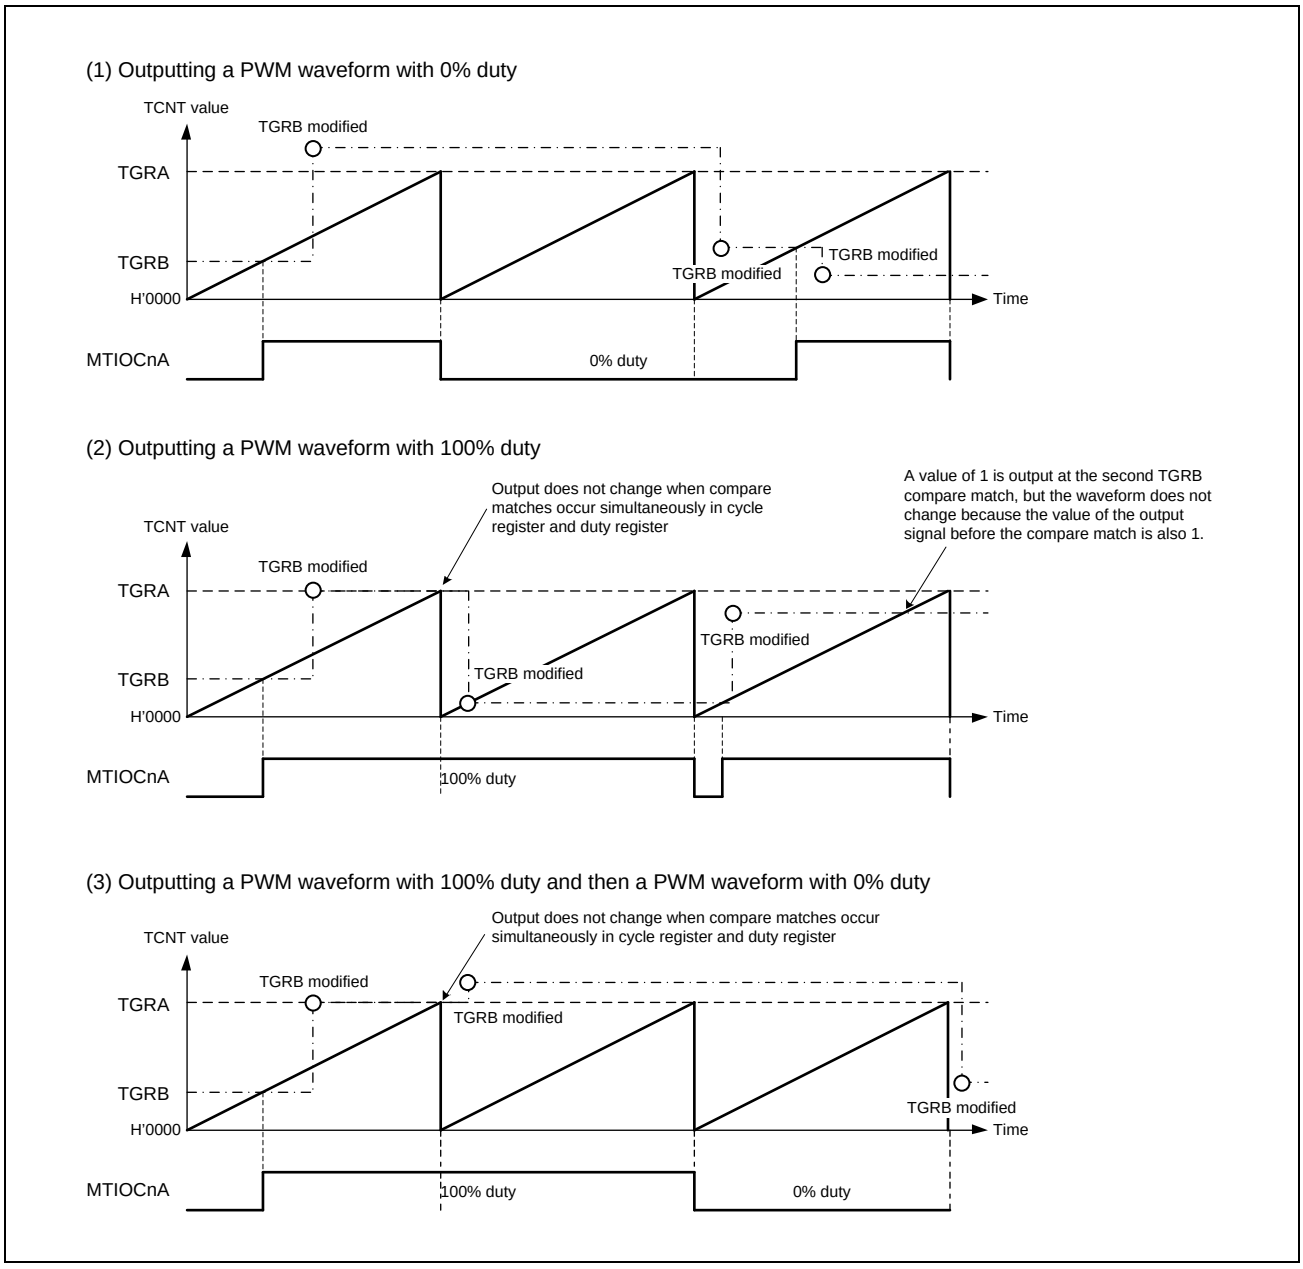

Figure 5.9-29 Examples of PWM Mode Operation (PWM Waveform Output with 0% Duty and 100% Duty) (n = 0 to 4, 6, 7)

5.9.3.6 Phase Counting Mode

There are two phase counting modes: 16-bit phase counting mode in which MTU1 and MTU2 operate independently, and cascade connection 32-bit phase counting mode in which MTU1 and MTU2 are cascaded.

In phase counting mode, the phase difference between two external input clocks is detected and the corresponding TCNT is incremented or decremented.

Two external clock input pins for each phase counting mode are not affected by the settings of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. The two external clock input pins used in 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2 can be selected by MTU1.TMDR3.PHCKSEL. In a phase counting mode other than 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2, MTCLKA and MTCLKB are selected for A-phase and B-phase, respectively. In phase counting mode, the external clock pins MTCLKA, MTCLKB, MTCLKC, and MTCLKD are used for two-phase encoder pulse input.

Table 5.9-66 lists the external clock input pins to be connected in each phase counting mode.

Table 5.9-66 Clock Input Pins in Phase Counting Mode

Phase Counting Mode	TMDR3.PHCKSEL bit	External Clock Input Pins	
		A-Phase	B-Phase
MTU1 16-bit phase counting mode	x (Don't care)	MTCLKA	MTCLKB
MTU2 16-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD
Cascade connection 32-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD

5.9.3.6.1 16-Bit Phase Counting Mode

When the MTU1.TMDR3.LWA is 0, 16-bit phase counting mode can be set individually for MTU1 and MTU2.

In 16-bit phase counting mode, the phase difference between two external input clocks is detected and the 16-bit counter TCNT of the corresponding channel is incremented or decremented.

When 16-bit phase counting mode is specified, an external clock is selected as the count clock and TCNT operates as an up-counter/down-counter regardless of the setting of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. However, the functions of TCR.CCLR[1:0],TIOR, TIER, and TGR are enabled, and input capture/compare match and interrupt functions can be used.

These external input pins can be used for two-phase encoder pulse input.

If an overflow occurs during TCNT up-counting, a TCIV interrupt is generated when the corresponding TCIEV bit in the TIER register is set to 1.

If an underflow occurs during TCNT down-counting, a TCIU interrupt is generated when the corresponding TCIEU bit in the TIER register is set to 1.

The TCFD bit in TSR is the count direction flag. Read the TCFD flag to check whether TCNT is counting up or down.

(1) Example of 16-Bit Phase Counting Mode Setting Procedure

Figure 5.9-30 shows an example of the phase counting mode setting procedure.

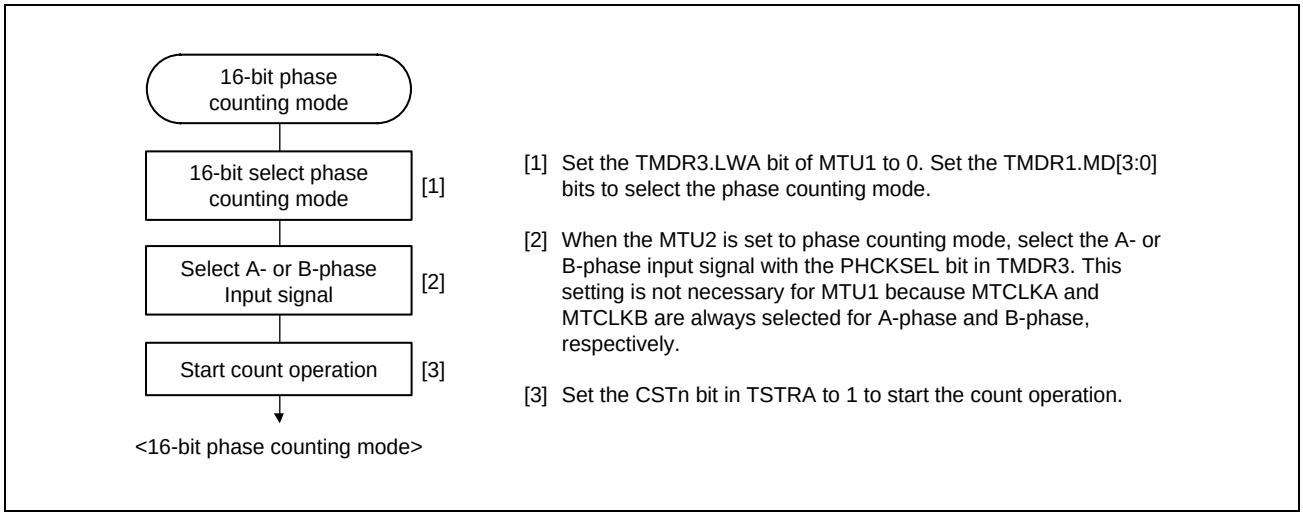

Figure 5.9-30 Example of 16-Bit Phase Counting Mode Setting Procedure

(2) Examples of 16-Bit Phase Counting Mode Operation

In phase counting mode, TCNT is incremented or decremented according to the phase difference between two external clocks. There are five modes according to the count conditions. Each mode operates under the condition PHCKSEL = 1, which means the phase clock for MTU1 is input from MTCLKA or MTCLKB and that for MTU2 is input from MTCLKC or MTCLKD.

(a) Phase Counting Mode 1

Figure 5.9-31 shows an example of operation in phase counting mode 1, and **Table 5.9-67** summarizes the TCNT up- counting and down-counting conditions.

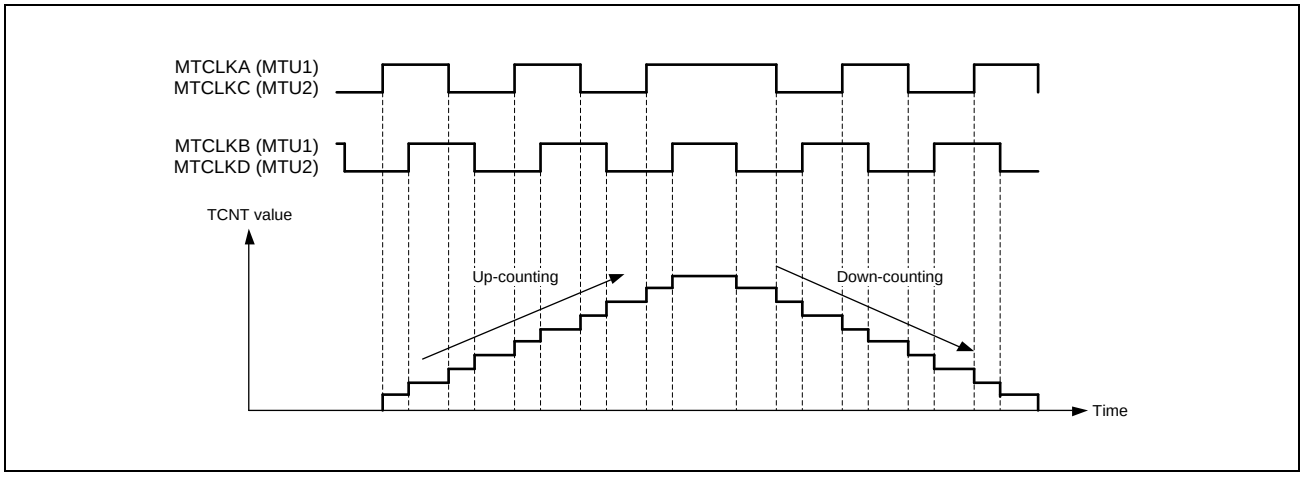

Figure 5.9-31 Example of Operation in Phase Counting Mode 1

(3) 16-Bit Phase Counting Mode Application Example

Figure 5.9-41 shows an example in which MTU1 is in phase counting mode, and MTU1 is coupled with MTU0 to input 2-phase encoder pulses of a servo motor in order to detect position or speed.

MTU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to MTCLKA and MTCLKB.

In MTU0, MTU0.TGRC compare match is specified as the TCNT clearing source and MTU0.TGRA and MTU0.TGRC are used for the compare match function and are set with the speed control cycle and position control cycle.

MTU0.TGRB is used for input capture, with MTU0.TGRB and MTU0.TGRD operating in buffer mode. The MTU1 count clock is designated as the MTU0.TGRB input capture source, and the widths of 2-phase encoder 4-multiplication pulses are detected.

MTU1.TGRA and MTU1.TGRB for MTU1 are designated for the input capture function and MTU0.TGRA and MTU0.TGRC compare matches in MTU0 are selected as the input capture sources to store the up/down-counter values for the control cycles.

This procedure enables the accurate detection of position and speed.

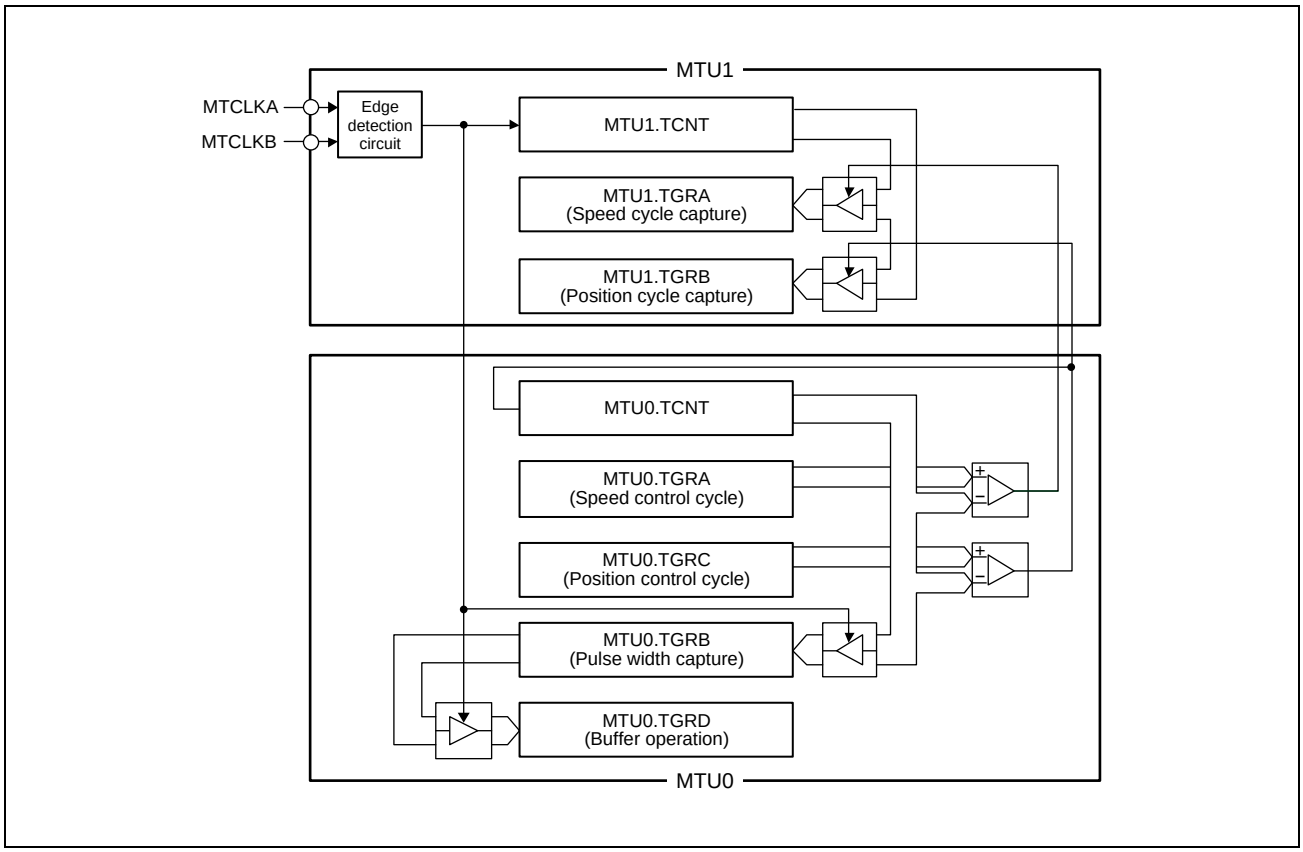

Figure 5.9-41 16-Bit Phase Counting Mode Application Example

5.9.3.6.2 Cascade Connection 32-Bit Phase Counting Mode

When MTU1 is set to phase counting mode by setting MTU1.TMDR3.LWA = 1, MTU1 and MTU2 are connected to operate in cascade connection 32-bit phase counting mode as shown in **Figure 5.9-42**. When this mode is used, the TCR, TCR2, TIOR, TIER, TGR, and TSR registers are controlled by MTU1 and the settings of MTU2 are disabled. See **Figure 5.9-43** for the procedure for setting cascade connection 32-bit phase counting mode.

In this mode, three-phase (A, B, and Z) signals can be input. As an encoder pulse signal, the external input phase clocks MTCLKA and MTCLKB or MTCLKC and MTCLKD can be selected for A-phase and B-phase, and MTIOC1A can be selected for Z-phase, respectively. See **Table 5.9-70** for selecting external clock input of A-phase and B-phase. A counter event is generated using an A-phase or B-phase pulse and counted by the 32-bit counter MTU1.TCNTLW.

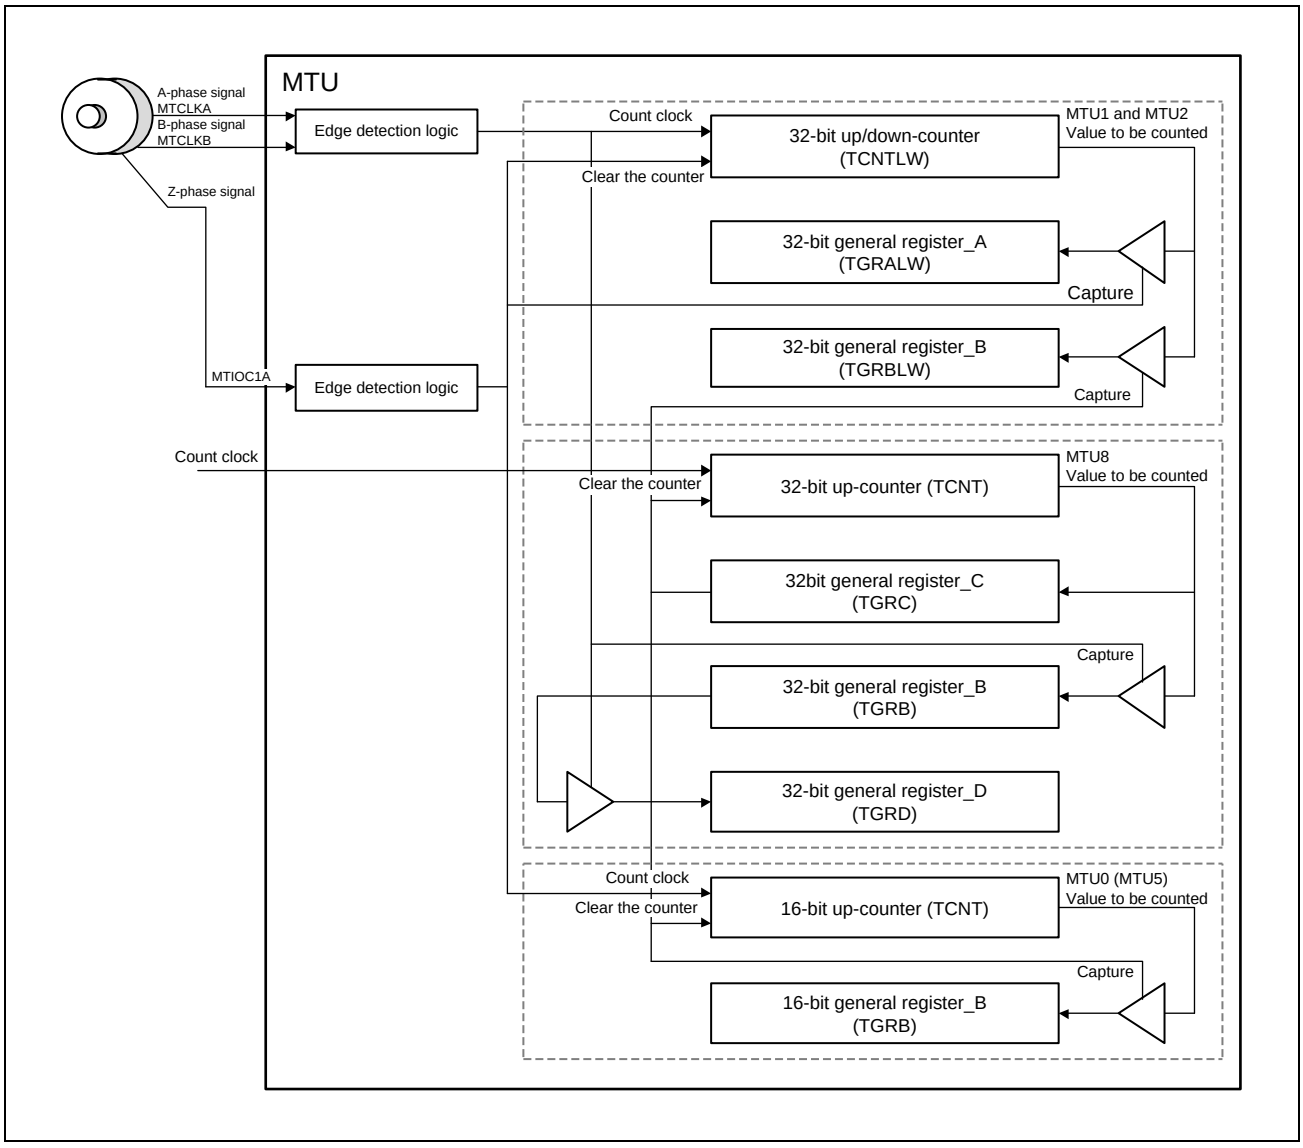
An input capture can also be generated using a Z-phase signal; thus, an angular velocity can be measured using the value captured in the general register.

Furthermore, MTU8 can be used as a channel for measuring a 1-ms interval, and a compare match signal can be output at a 1-ms interval to the MTU1 and MTU2, which operate in cascade connection 32-bit phase counting mode. That is, a compare match signal of MTU8 is used as a capture signal of MTU1 and MTU2, and the number of A-phase and B-phase pulses for a 1-ms period can be measured.

When MTU0 or MTU5 is specified as the channel for measuring Z-phase signal pulses, this compare match signal of TGRC in MTU8 can be output as a capture signal or a clear signal to MTU0 or MTU5; thus, the Z-phase count can be measured at 1-ms intervals.

In addition, a counter event signal of combined MTU1 and MTU2 can be used as a capture signal of TGRD in MTU8, and measurement can be performed including the intervals of A, B, or both phase pulses. In this case, the TGRD register in MTU8 should be set to buffer operation.

Refer to **5.9.3.4 Cascaded Operation**, for details on the cascade connection function for connecting MTU1 and MTU2 in a mode other than cascade connection 32-bit phase counting mode.



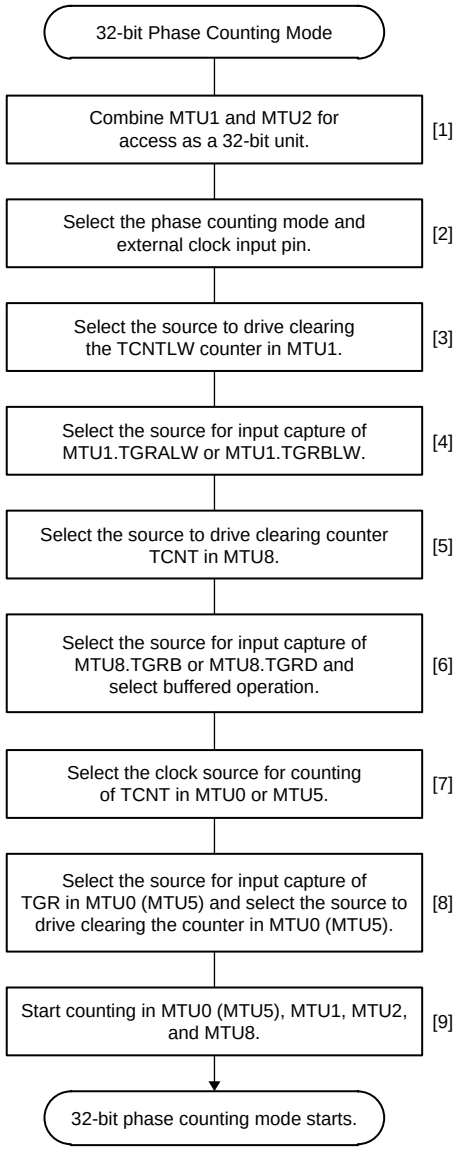


Figure 5.9-42 Block Diagram for Operation in Cascade Connection 32-Bit Phase Counting Mode

(1) Example of Setting Cascade Connection 32-Bit Phase Counting Mode

Figure 5.9-43 shows an example of the procedure for setting cascade connection 32-bit phase counting mode.

[1] Set the LWA bit in MTU1.TMDR3 to 1 and combine MTU1 and MTU3 for access as a 32-bit unit.*1

[2] Select phase counting mode with the MD[3:0] bits in MTU1.TMDR1 and select the external clock input pin with the PHCKSEL bits in MTU1.TMDR3.

[3] Set the CCLR[2:0] bits of TCR in MTU1 to 001b to select input capture of TGRALW in MTU1 as the source of the signal to drive clearing the TCNTLW counter in MTU1.

[4] Set the IOA[3:0] bits in MTU1.TIOR to select the effective edge (rising, falling or both) of the signal produced by input capture of TGRALW in MTU1. After that, set the IOB[3:0] bits in MTU1.TIOR to 1110b to select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU1.TGRBLW.

[5] Set the CCLR[2:0] bits in MTU8.TCR to 101b to select the compare match signal of MTU8.TGRC as the source to drive clearing counter TCNT in MTU8.

[6] Select the source for input capture of MTU8.TGRB as the clock for counting of TCNTLW in MTU1 by setting the IOB[3:0] bits in MTU8.TIORH to 1110b. At the same time, select buffered operation for TGRB and TGRD by setting the BFB bit in MTU8.TMDR1 to 1.

[7] Set the TPSC2[2:0] bits in MTU0.TCR2 to 111b to select the MTIOC1A pin as the clock source for counting of TCNT in MTU0.
(When using TCNT in MTU5, set the TPSC2[2:0] bits in MTU5.TCR2 to 111b).

[8] Select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU0.TGRA by setting the IOA[3:0] bits in MTU0.TIORH to 1110b. (When using TCNT in MTU5, set the TIORU, TIORV, or TIORW bit in MTU5 is set to 10100b).
After that, select input capture of MTU0.TGRA as the source to drive clearing counter TCNT in MTU0 by setting the CCLR[2:0] bits in MTU0.TCR to 001b.

[9] Start counting in MTU0, MTU1, MTU2, and MTU8 by setting the CST0, CST1, CST2, and CST8 bits in TSTRA to 1 at the same time.
(When using TCNT in MTU5, set the counter corresponding to TSTR in MTU5 to 1).

Note 1. When the LWA bit in MTU1.TMDR3 is set to 1, the TCR, TCR2, TMDR, and TIOR registers in MTU1 are effective in controlling cascaded operation. In this case, the settings of these registers in MTU2 are ignored.

Figure 5.9-43 Procedure for Setting Cascade Connection 32-Bit Phase Counting Mode

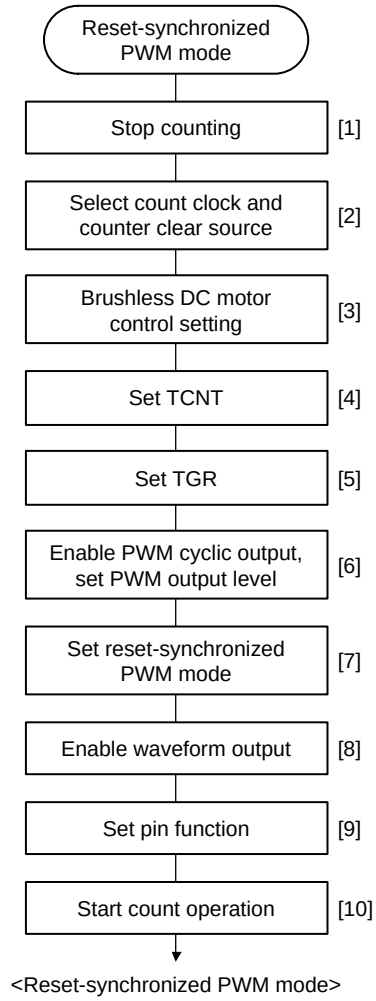
5.9.3.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, three phases of positive and negative PWM waveforms (six phases in total) that share a common wave transition point can be output by combining MTU3 and MTU4 and MTU6 and MTU7.

When set for reset-synchronized PWM mode, the MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D pins function as PWM output pins and timer counters 6 and 12 (MTU3.TCNT and MTU6.TCNT) functions as an up-counter.

Table 5.9-72 shows the PWM output pins used. **Table 5.9-73** shows the settings of the registers.

Table 5.9-72 Output Pins for Reset-Synchronized PWM Mode



Channel	Output Pin	Description
MTU3	MTIOC3B	PWM output pin 1
	MTIOC3D	PWM output pin 1' (negative-phase waveform of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform of PWM output 2)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform of PWM output 3)
MTU6	MTIOC6B	PWM output pin 4
	MTIOC6D	PWM output pin 4' (negative-phase waveform of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform of PWM output 6)

Table 5.9-73 Register Settings for Reset-Synchronized PWM Mode

Register	Setting
MTU3.TCNT	Initial setting (H’0000)
MTU4.TCNT	Initial setting (H’0000)
MTU3.TGRA	Set the count cycle for MTU3.TCNT
MTU3.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC3B and MTIOC3D pins
MTU4.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC4A and MTIOC4C pins
MTU4.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC4B and MTIOC4D pins
MTU6.TCNT	Initial setting (H’0000)
MTU7.TCNT	Initial setting (H’0000)
MTU6.TGRA	Set the count cycle for MTU6.TCNT
MTU6.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC6B and MTIOC6D pins
MTU7.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC7A and MTIOC7C pins
MTU7.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC7B and MTIOC7D pins

(1) Example of Procedure for Setting Reset-Synchronized PWM Mode

Figure 5.9-44 shows an example of the procedure for specifying the reset-synchronized PWM mode.

[1] Clear the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 0 to stop the TCNT count operation. Specify the reset-synchronized PWM mode while MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) are stopped.

[2] Set the TCR.TPSC[2:0] and TCR.CKEG[1:0] bits of MTU3 (MTU6) to select the count clock source and clock edge for MTU3 (MTU6). Set the TCR.CCLR[2:0] bits to select TGRA compare match as the counter clear source.

[3] To control a brushless DC motor, set the TGCRA.BDC bit and set the feedback signal input source and output chopping or gate signal direct output (only when MTU3 and MTU4 are used).

[4] Set MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) to H'0000.

[5] MTU3.TGRA (MTU6.TGRA) is the cycle register. Set the PWM cycle in MTU3.TGRA (MTU6.TGRA).
Set the PWM output transition timing in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB).
Note that the setting values should be within the range of compare match with MTU3.TCNT (MTU6.TCNT).

$X \leq$ MTU3.TGRA (X: Set value)

[6] Set the PSYE bit in the TOCR1A (TOCR1B) register to enable or disable toggle output synchronized with the PMW cycle, and set the OLSP and OLSN bits to select the PWM output level.
When specifying the PWM output level using the TOCR2A (TOCR2B) and TOLBRA (TOLBRB) in buffer operation, see Timer Output Level Buffer Registers (TOLBRA and TOLBRB).

[7] Set the MD[3:0] bits in MTU3.TMDR1 (MTU6.TMDR1) register to 1000b to select the reset-synchronized PWM mode. Specify the buffer operation (BFA = 1) of the MTU3.TGRA (MTU6.TGRA) register and the buffer operation (BFB = 1) of the MTU3.TGRB register when necessary. Set the MTU4.TMDR1 (MTU7.TMDR1) register to the initial value (normal operation; BFA = 0 and BFB = 0).

[8] Set the TOERA (TOERB) register to enable or disable output from the PWM output pin. Then, set the MTU3.TIORH (MTU6.TIORH), MTU3.TIORL (MTU6.TIORL), MTU4.TIORH (MTU7.TIORH), and MTU4.TIORL (MTU7.TIORL) registers to H'00.

[9] Set the port mode control registers (PMCn) and Pmn port fuction control reigister (PFCm) of the GPIO ports.

[10] Set the TSTRA.CST3 (TSTRB.CST6) bit to 1 to start count operation.

Note: The output waveform starts to toggle at the point of MTU3.TCNT (MTU6.TCNT) = MTU3.TGRA (MTU6.TGRA) = X by setting X = MTU3.TGRA (MTU6.TGRA), i.e., cycle = duty ratio.

Figure 5.9-44 Procedure for Selecting Reset-Synchronized PWM Mode

(2) Example of Reset-Synchronized PWM Mode Operation

Figure 5.9-45 shows an example of operation in the reset-synchronized PWM mode.

MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) operate as up-counters. The counters are cleared when a compare match occurs between MTU3.TCNT (MTU6.TCNT) and MTU3.TGRA (MTU6.TGRA), and then begin incrementing from H’0000. The output from the PWM pins toggles every time a compare match occurs in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) and the counters are cleared.

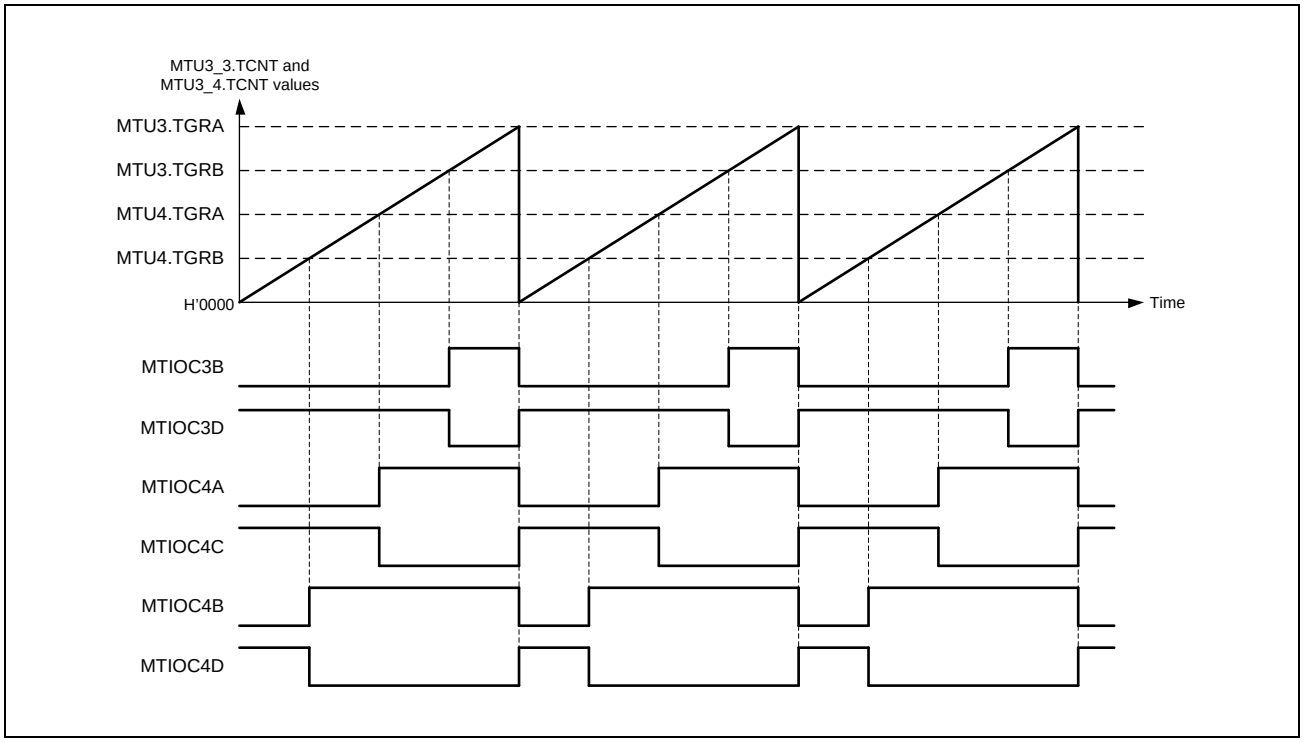


Figure 5.9-45 Example of Reset-Synchronized PWM Mode Operation
(When OLSN = 1 and OLSP = 1 in MTU3.TOCR1 and MTU4.TOCR1)

5.9.3.8 Complementary PWM Mode

In complementary PWM mode, dead time can be set for PWM waveforms to be output. The dead time is the period during which the upper and lower arm transistors are set to the inactive level in order to prevent short-circuiting of the arms.

Six positive-phase and six negative-phase PWM waveforms (12 phases in total) with dead time can be output by combining MTU3/ MTU4 and MTU6/MTU7. PWM waveforms without dead time can also be output.

In complementary PWM mode, MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B,

MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D pins function as PWM output pins, and the MTIOC3A and MTIOC6A pins can be set for toggle output synchronized with the PWM cycle.

MTU3.TCNT, MTU4.TCNT, MTU6.TCNT, and MTU7.TCNT function as up/down-counters.

Table 5.9-74 shows the PWM output pins used. **Table 5.9-75** shows the settings of the registers used.

A function to directly cut off the PWM output by using an external signal is supported as a port function.

Table 5.9-74 Output Pins for Complementary PWM Mode

Channel	Output Pin	Description
MTU3	MTIOC3A	Toggle output synchronized with PWM cycle (or I/O port)
	MTIOC3B	PWM output pin 1
	MTIOC3C	I/O port*1
	MTIOC3D	PWM output pin 1' (negative-phase waveform output of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform output of PWM output 1)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform output of PWM output 1)
MTU6	MTIOC6A	Toggle output synchronized with PWM cycle (or I/O port)
	MTIOC6B	PWM output pin 4
	MTIOC6C	I/O port*1
	MTIOC6D	PWM output pin 4' (negative-phase waveform output of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform output of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform output of PWM output 6)

Note 1. Avoid setting the MTIOC3C and MTIOC6C pins as timer I/O pins in complementary PWM mode.

Table 5.9-75 Register Settings for Complementary PWM Mode (1/2)

Channel	Counter / Register	Description	Read/Write from CPU
MTU3	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERA setting*1
	TGRA	Set MTU3.TCNT upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWERA setting*1
	TGRB	PWM output 1 compare register	Maskable by TRWERA setting*1
	TGRC	MTU3.TGRA buffer register	Readable/writable
	TGRD	PWM output 1/MTU3.TGRB buffer register	Readable/writable
	TGRE	MTU3.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU4	TCNT	Starts up-counting after being initialized to H'0000	Maskable by TRWERA setting*1
	TGRA	PWM output 2 compare register	Maskable by TRWERA setting*1
	TGRB	PWM output 3 compare register	Maskable by TRWERA setting*1
	TGRC	PWM output 2/MTU4.TGRA buffer register	Readable/writable
	TGRD	PWM output 3/MTU4.TGRB buffer register	Readable/writable
	TGRE	MTU4.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU4.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU6	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERB setting*2
	TGRA	Set MTU6.TCNT upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWERB setting*2
	TGRB	PWM output 4 compare register	Maskable by TRWERB setting*2
	TGRC	MTU6.TGRA buffer register	Readable/writable
	TGRD	PWM output 4/MTU6.TGRB buffer register	Readable/writable
	TGRE	MTU6.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU7	TCNT	Starts up-counting after being initialized to H'0000	Maskable by TRWERB setting*2
	TGRA	PWM output 5 compare register	Maskable by TRWERB setting*2
	TGRB	PWM output 6 compare register	Maskable by TRWERB setting*2
	TGRC	PWM output 5/MTU7.TGRA buffer register	Readable/writable
	TGRD	PWM output 6/MTU7.TGRB buffer register	Readable/writable
	TGRE	MTU7.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU7.TGRB buffer register B (when double buffer function is used)	Readable/writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).

Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

Table 5.9-75 Register Settings for Complementary PWM Mode (2/2)

Counter / Register	Description	Read/Write from CPU
Timer dead time data register A (TDDRA)	Set MTU4.TCNT and MTU3.TCNT offset value (dead time value)	Maskable by TRWERA setting*1
Timer dead time data register B (TDDRB)	Set MTU7.TCNT and MTU6.TCNT offset value (dead time value)	Maskable by TRWERB setting*2
Timer cycle data register A (TCDRA)	Set MTU4.TCNT upper limit value (1/2 carrier cycle)	Maskable by TRWERA setting*1
Timer cycle data register B (TCDRB)	Set MTU7.TCNT upper limit value (1/2 carrier cycle)	Maskable by TRWERB setting*2
Timer cycle buffer register A (TCBRA)	TCDRA buffer register	Readable/writable
Timer cycle buffer register B (TCBRB)	TCDRB buffer register	Readable/writable
Sub counter A (TCNTSA)	Sub counter A for dead time generation	Read-only
Sub counter B (TCNTSB)	Sub counter B for dead time generation	Read-only
Temporary register 1A (TEMP1A)	PWM output 1/MTU3.TGRB temporary register A	Not readable or writable
Temporary register 1B (TEMP1B)	PWM output 1/MTU3.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 2A (TEMP2A)	PWM output 2/MTU4.TGRA temporary register A	Not readable or writable
Temporary register 2B (TEMP2B)	PWM output 2/MTU4.TGRA temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 3A (TEMP3A)	PWM output 3/MTU4.TGRB temporary register A	Not readable or writable
Temporary register 3B (TEMP3B)	PWM output 3/MTU4.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 4A (TEMP4A)	PWM output 4/MTU6.TGRB temporary register A	Not readable or writable
Temporary register 4B (TEMP4B)	PWM output 4/MTU6.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 5A (TEMP5A)	PWM output 5/MTU7.TGRA temporary register A	Not readable or writable
Temporary register 5B (TEMP5B)	PWM output 5/MTU7.TGRA temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 6A (TEMP6A)	PWM output 6/MTU7.TGRB temporary register A	Not readable or writable
Temporary register 6B (TEMP6B)	PWM output 6/MTU7.TGRB temporary register B (when double buffer function is used)	Not readable or writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).

Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

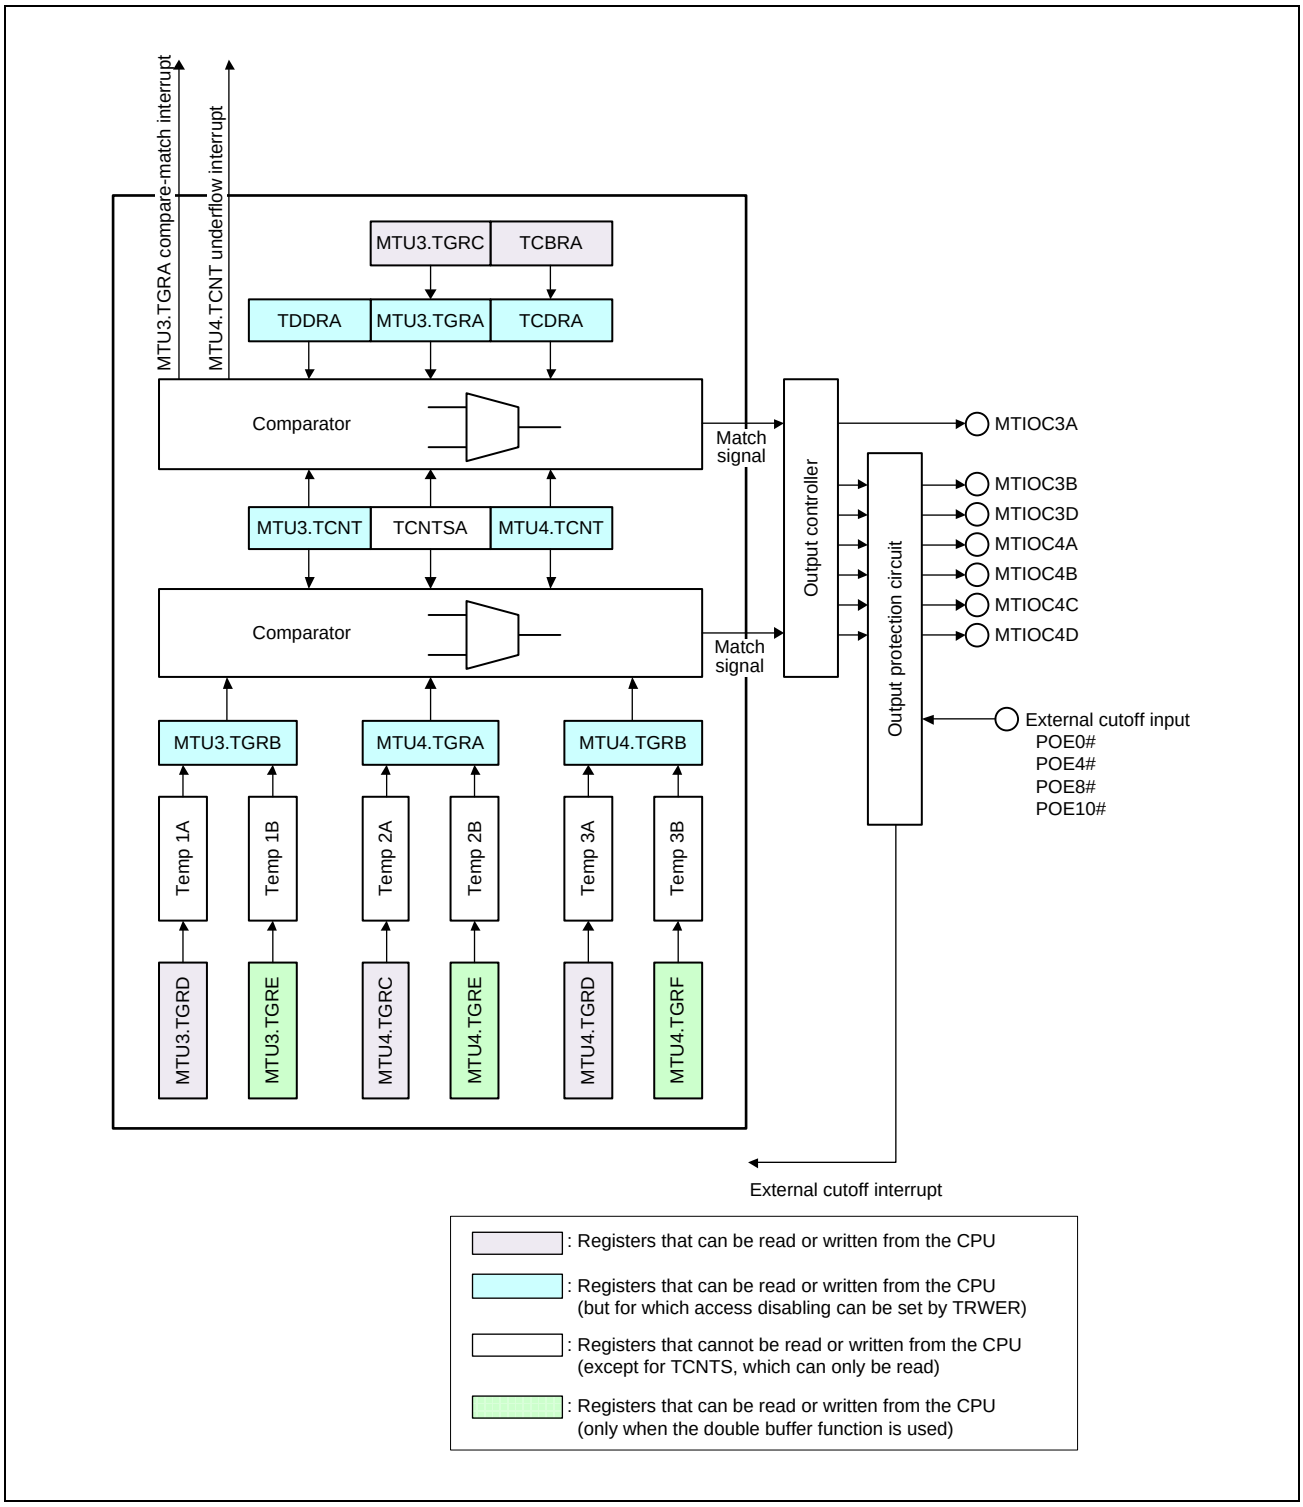

Figure 5.9-46 Block Diagram of MTU3 and MTU4 in Complementary PWM Mode

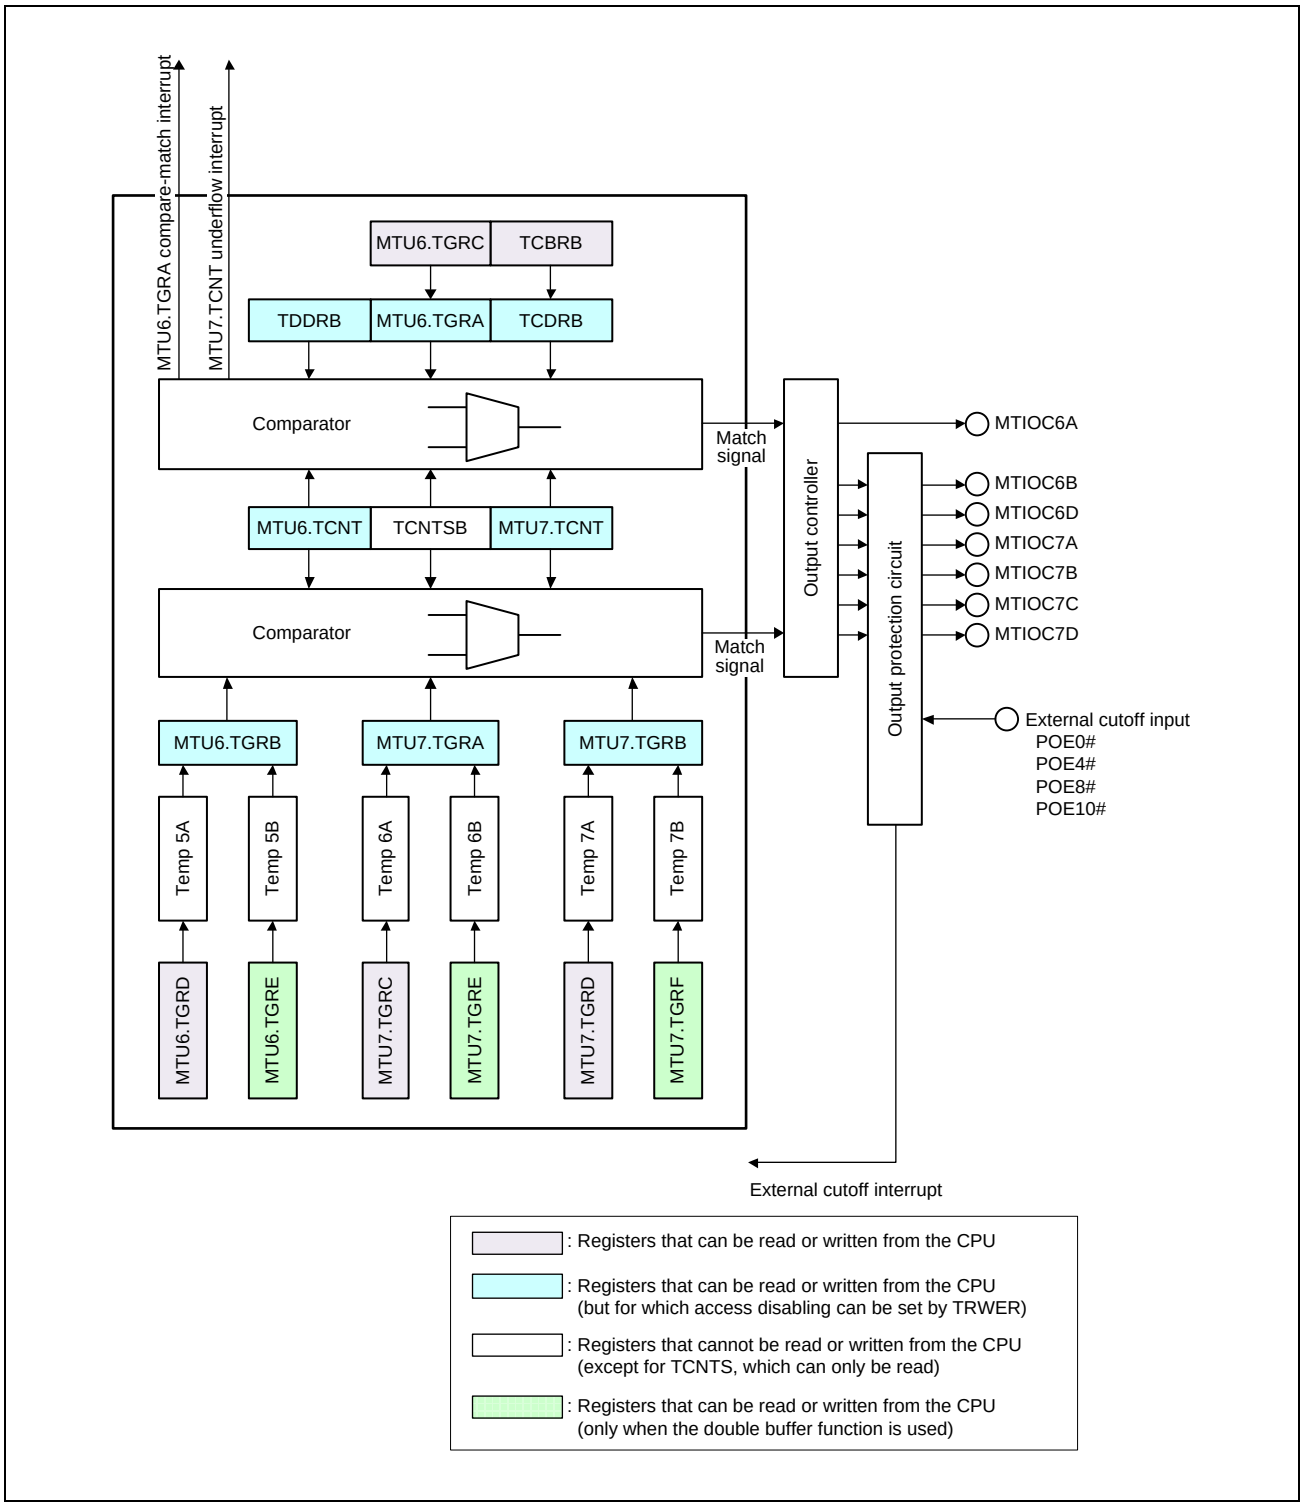

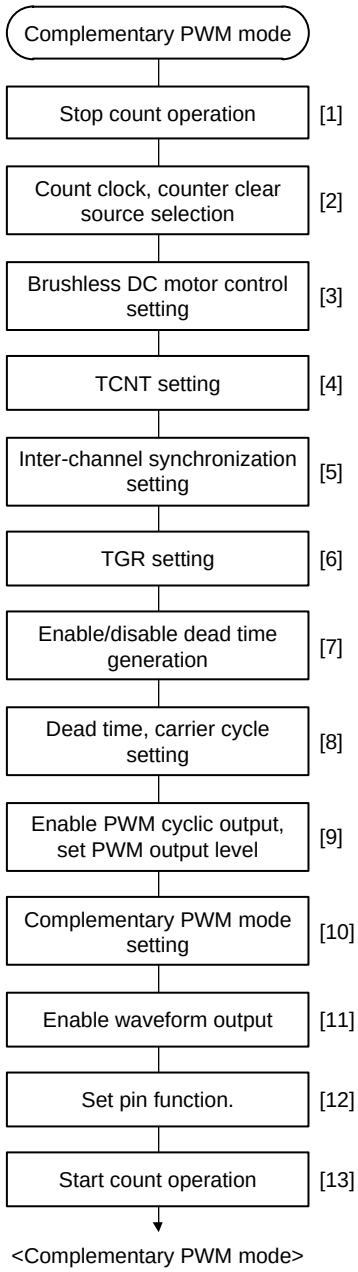

Figure 5.9-47 Block Diagram of MTU6 and MTU7 in Complementary PWM Mode

(1) Example of Complementary PWM Mode Setting Procedure

Figure 5.9-48 shows an example of the complementary PWM mode setting procedure.

[1] Clear the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 0 to stop the TCNT count operation.
Specify complementary PWM mode while MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) are stopped.

[2] Set the TCR.TPSC[2:0] and TCR.CKEG[1:0] bits of MTU3 and MTU4 (MTU6 and MTU7) to select the same count clock source and clock edge for MTU3 and MTU4 (MTU6 and MTU7).
Set the TCR.CCLR[2:0] bits only when restarting by synchronous clearing with another channel during complementary PWM operation.

[3] To control a brushless DC motor, set the TGCRA.BDC bit and set the feedback signal input source and output chopping or gate signal direct output (only when MTU3 and MTU4 are used).

[4] Set the dead time in MTU3.TCNT (MTU6.TCNT). Set MTU4.TCNT (MTU7.TCNT) to H'0000.

[5] Make this setting only when restarting by synchronous clearing with another channel during complementary PWM mode operation. In this case, set the TSYRA register (TSYRB) to synchronize the channel generating the synchronous clear with MTU3 and MTU4 (MTU6 and MTU7).

[6] When MTU3 and MTU6 are used, set the PWM output duty ratio in the duty registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB) and buffer registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD).
Be sure to set the same value in each pair of the duty registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD) and buffer registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB).
Only when the double buffer function is used, set the PWM output duty value − 1 in the buffer registers (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF).
When MTU6 and MTU7 are used, set the value to the following registers:
Duty registers (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)
Buffer registers (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)
Buffer registers when the double buffer function is used (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)

[7] This setting is necessary only when no dead time should be generated. Make appropriate settings in the TDERA (TDERB) register so that no dead time generated.

[8] Set the dead time in the TDDRA (TDDRB) register, 1/2 the PWM cycle in the TCDRA (TCDRB) register and TCBRA (TCBRB) register, and 1/2 the PWM cycle plus the dead time in MTU3.TGRA (MTU6.TGRA) and MTU3.TGRC (MTU6.TGRC).
When no dead time generation is selected, set 1 in the TDDRA (TDDRB) register and 1/2 the PWM cycle + 1 in MTU3.TGRA (MTU6.TGRA) and MTU3.TGRC (MTU6.TGRC).

[9] Set the PSYE bit in the TOCR1A register to enable or disable toggle output synchronized with the PWM cycle, and set the OLSP and OLSN bits to select the PWM output level. When specifying the PWM output level using the TOCR2A (TOCR2B) and TOLBRA (TOLBRA) in buffer operation, see Timer Output Level Buffer Registers (TOLBRA and TOLBRB).

[10] Select complementary PWM mode in MTU3.TMDR1 (MTU6.TMDR1). Specify the buffer operation (BFA = 1) of MTU3.TGRA (MTU6.TGRA) and the buffer operation (BFB = 1) of MTU3.TGRB (MTU6.TGRB).
Only when the double buffer function is used, set the TMDR2A (TMDR2B) register to enable the double buffer function.

[11] Set the TOERA (TOERB) register to enable or disable output from the PWM output pin. Then, set the MTU3.TIORH (MTU6.TIORH), MTU3.TIORL (MTU6.TIORL), MTU4.TIORH (MTU7.TIORH), and MTU4.TIORL (MTU7.TIORL) to H'00.

[12] Set the port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports.

[13] Set the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 1 simultaneously to start count operation.

Figure 5.9-48 Example of Complementary PWM Mode Setting Procedure

(2) Outline of Complementary PWM Mode Operation

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. **Figure 5.9-49** illustrates counter operation in complementary PWM mode (MTU3 and MTU4), and **Figure 5.9-50** shows an example of operation in complementary PWM mode.

(a) Counter Operation

In complementary PWM mode, three counters — MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) — in each unit perform up-/down-count operations.

MTU3.TCNT (MTU6.TCNT) is automatically initialized to the value set in TDDRA (TDDRB) when complementary PWM mode is selected and the CST3 bit in TSTRA (TSTRB) is 0. When the CST3 bit is set to 1, MTU3.TCNT (MTU6.TCNT) counts up to the value set in MTU3.TGRA (MTU6.TGRA), then switches to down-counting when it matches MTU3.TGRA (MTU6.TGRA). When the MTU4.TCNT (MTU7.TCNT) value matches H’0000, MTU3.TCNT (MTU6.TCNT) switches to up-counting, and the operation is repeated in this way.

TCNT in MTU4 (MTU7) should be initialized to H’0000 after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA). On reaching H’0000, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way. TCNTSA (TCNTSB) is a read-only counter. It does not need to be initialized after a reset.

In counting up by MTU3.TCNT and MTU4.TCNT (or MTU6.TCNT and MTU7.TCNT), MTU3.TCNT (or MTU6.TCNT) starts counting up when it matches TCDRA (or TCDRB) and switches to counting down when it matches MTU3.TGRA (or MTU6.TGRA). Furthermore, when MTU4.TCNT (or MTU7.TCNT) matches TDDRA (or TDDRB), TCNTSA (or TCNTSB) is set to the value in MTU3.TGRA (or MTU6.TGRA) and counting is stopped.

When MTU4.TCNT (MTU7.TCNT) matches TDDRA (TDDRB) during down-counting of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT), TCNTSA (TCNTSB) starts up-counting, and when MTU4.TCNT (MTU7.TCNT) matches H’0000, the operation switches to down-counting. When MTU3.TCNT (MTU6.TCNT) matches TCDRA (TCDRB), TCNTSA (TCNTSB) is cleared to H’0000 and stops counting.

TCNTSA (TCNTSB) is compared with the compare register and temporary register, in which the PWM duty is specified, only during the count operation.

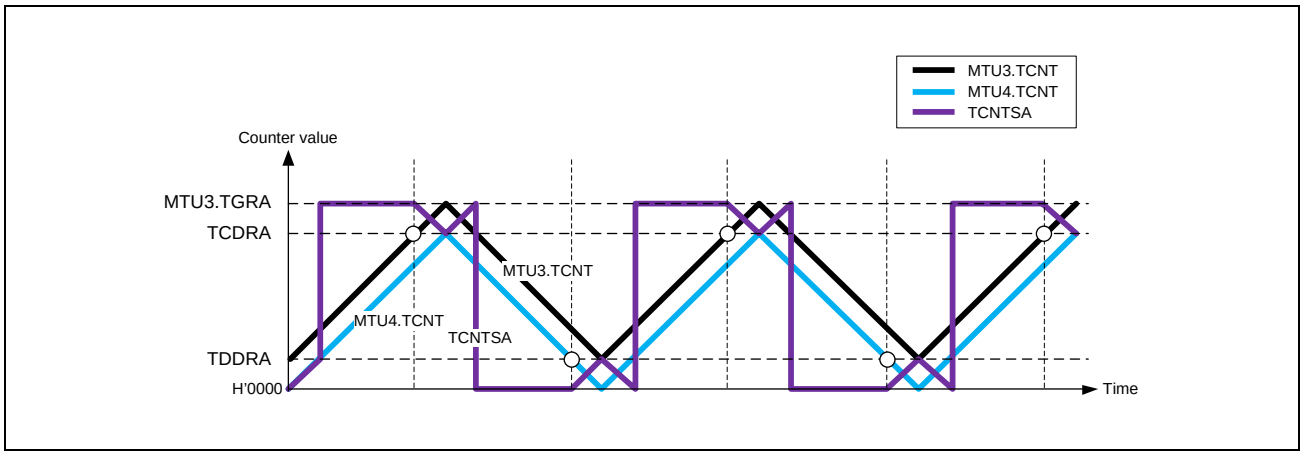

Figure 5.9-49 Count Operation in Complementary PWM Mode (MTU3 and MTU4)

(b) Register Operation

In complementary PWM mode, nine registers (compare registers, buffer registers, and temporary registers) are used to control the duty ratio for the PWM output. **Figure 5.9-50** shows an example of operation in complementary PWM mode (MTU3 and MTU4).

MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB) are constantly compared with the counters to generate PWM waveforms. When these registers match the counter, the value set in the OLSN and OLSP bits in the timer output control registers (TOCR1A and TOCR1B) is output from the PWM output pin. MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD) are buffer registers for these compare registers.

When the double buffer function is used, MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) are also used as buffer registers B. For details of double buffer operation, refer to **5.9.3.8(2) (s) Double Buffer Function in Complementary PWM Mode**.

Data in a compare register can be changed by writing new data to the corresponding buffer register. The buffer registers can be read or written at any time.

When modifying data in a buffer register, write to MTU4.TGRD (MTU7.TGRD) last and enable data transfer from the buffer register to a temporary register. At this time, transfer from the TCBRA (TCBRB) register and MTU3.TGRC (MTU6.TGRC) register, which operate as buffer registers for the timer cycle registers, to temporary registers is also enabled. Data is transferred to all five temporary registers at the same time.

When transfer is enabled in the Ta interval, data written to a buffer register is transferred to the temporary register. The data is not transferred to the temporary register in the Tb1 and Tb2 intervals. Data enabled for transfer in this interval is transferred to the temporary register at the end of this interval.

The value transferred to a temporary register is transferred to the compare register at the end of the Tb1 interval (when matches MTU3.TGRA (MTU6.TGRA) while TCNTSA (TCNTSB) is counting up), or at the end of the Tb2 interval (when matches H’0000 while TCNTSA (TCNTSB) is counting down). The timing for transfer from the temporary register to the compare register can be selected with bits MD[3:0] in the timer mode register 1 (TMDR1). **Figure 5.9-50** shows an example in which the trough is selected for the transfer timing.

In the Tb interval in which data is not transferred to the temporary register (Tb1 in **Figure 5.9-50**), the temporary register has the same function as the compare register and is compared with the counter. In this interval, therefore, there are two compare match registers for one output phase; the compare register contains the pre-change data and the temporary register contains new data. In this interval, three counters MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) and two registers (compare register and temporary register) are compared, and PWM output is controlled accordingly.

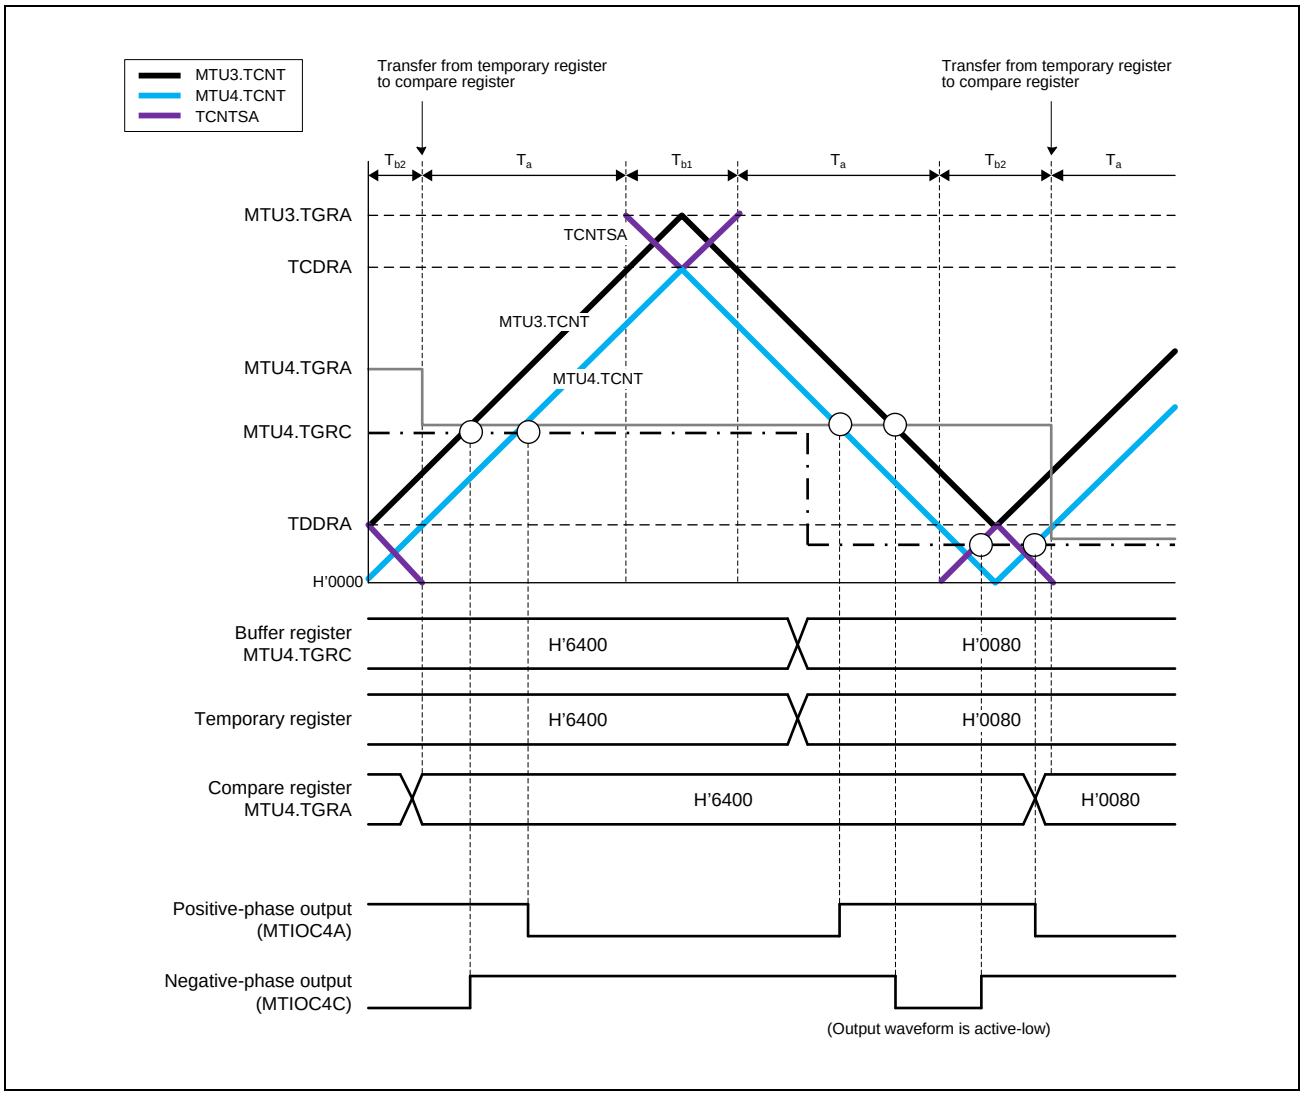

Figure 5.9-50 Example of Operation in Complementary PWM Mode (MTU3 and MTU4)

(c) Initial Setting

In complementary PWM mode, there are nine registers that require initial setting. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).

Before setting complementary PWM mode with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits, initial values should be set in the following registers.

The TOCR1A, TOCR2A, TOCR1B, and TOCR2B registers are used to set the PWM output level. MTU3.TGRC (MTU6.TGRC) operates as the buffer register for MTU3.TGRA (MTU6.TGRA), and should be set with 1/2 the PWM cycle + dead time Td. The timer cycle buffer register (TCBRA or TCBRB) operates as the buffer register for the timer cycle data register (TCDRA or TCDRB), and should be set with 1/2 the PWM cycle. Set dead time Td in the timer dead time data register (TDDRA or TDDRB).

When dead time is not needed, the TDER bit in the timer dead time enable register (TDERA or TDERB) should be cleared to 0, MTU3.TGRC and MTU3.TGRA (MTU6.TGRC and MTU6.TGRA) should be set to 1/2 the PWM carrier cycle + 1, and TDDRA (TDDRB) should be set to 1.

Set the respective initial PWM duty values in three buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)).

Set the respective (initial PWM duty – 1) values in three buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)) only when the double buffer function is used.

The values set in the five buffer registers excluding TDDRA (TDDRB) are transferred to the corresponding compare registers as soon as complementary PWM mode is set.

Set MTU4.TCNT (MTU7.TCNT) to H’0000 before setting complementary PWM mode.

Table 5.9-76 Registers and Counters Requiring Initial Setting

Register and Counter	Setting
TOCR1A, TOCR2A, TOCR1B, TOCR2B	PWM output level
MTU3.TGRC MTU6.TGRC	1/2 PWM cycle + dead time Td (1/2 PWM cycle + 1 when dead time generation is disabled by the TDERA or TDERB setting)
TDDRA, TDDRB	Dead time Td (1 when dead time generation is disabled by the TDERA or TDERB setting)
TCBRA, TCBRB	1/2 PWM cycle
MTU3.TGRD, MTU4.TGRC, MTU4.TGRD MTU6.TGRD, MTU7.TGRC, MTU7.TGRD	Initial PWM duty ratio value for each phase
MTU3.TGRE, MTU4.TGRE, MTU4.TGRF MTU6.TGRE, MTU7.TGRE, MTU7.TGRF	Initial PWM duty ratio – 1 value for each phase (only when double buffer function is used)
MTU4.TCNT MTU7.TCNT	H’0000

Note: The value set in MTU3.TGRC (MTU6.TGRC) should be the sum of 1/2 the PWM cycle set in TCBRA (TCBRB) and dead time Td set in TDDRA (TDDRB). When dead time generation is disabled by TDERA (TDERB), TGRC should be set to 1/2 the PWM cycle + 1.

(d) PWM Output Level Setting

In complementary PWM mode, the PWM output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2A or TOCR2B).

The output level can be set for each of the three positive phases and three negative phases of 6-phase output. Complementary PWM mode should be cleared before setting or changing output levels.

(e) Dead Time Setting

In complementary PWM mode, dead time can be set for PWM output.

The dead time is set in the timer dead time data register (TDDRA or TDDRB). The value set in TDDRA (TDDRB) is used as the MTU3.TCNT (MTU6.TCNT) counter start value and creates a non-overlapping interval between MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT). Complementary PWM mode should be cleared before changing the contents of TDDRA (TDDRB).

(f) Dead Time Suppressing

Dead time generation is suppressed by clearing the TDER bit in the timer dead time enable register (TDERA or TDERB) to 0. TDERA (TDERB) can be cleared to 0 only when 0 is written to it after reading TDER = 1.

MTU3.TGRA and MTU4.TGRC (MTU6.TGRA and MTU7.TGRC) should be set to 1/2 PWM cycle + 1 and the timer dead time data register (TDDRA or TDDRB) should be set to 1.

By the above settings, PWM waveforms without dead time can be obtained. **Figure 5.9-51** shows an example of operation without dead time (MTU3 and MTU4).

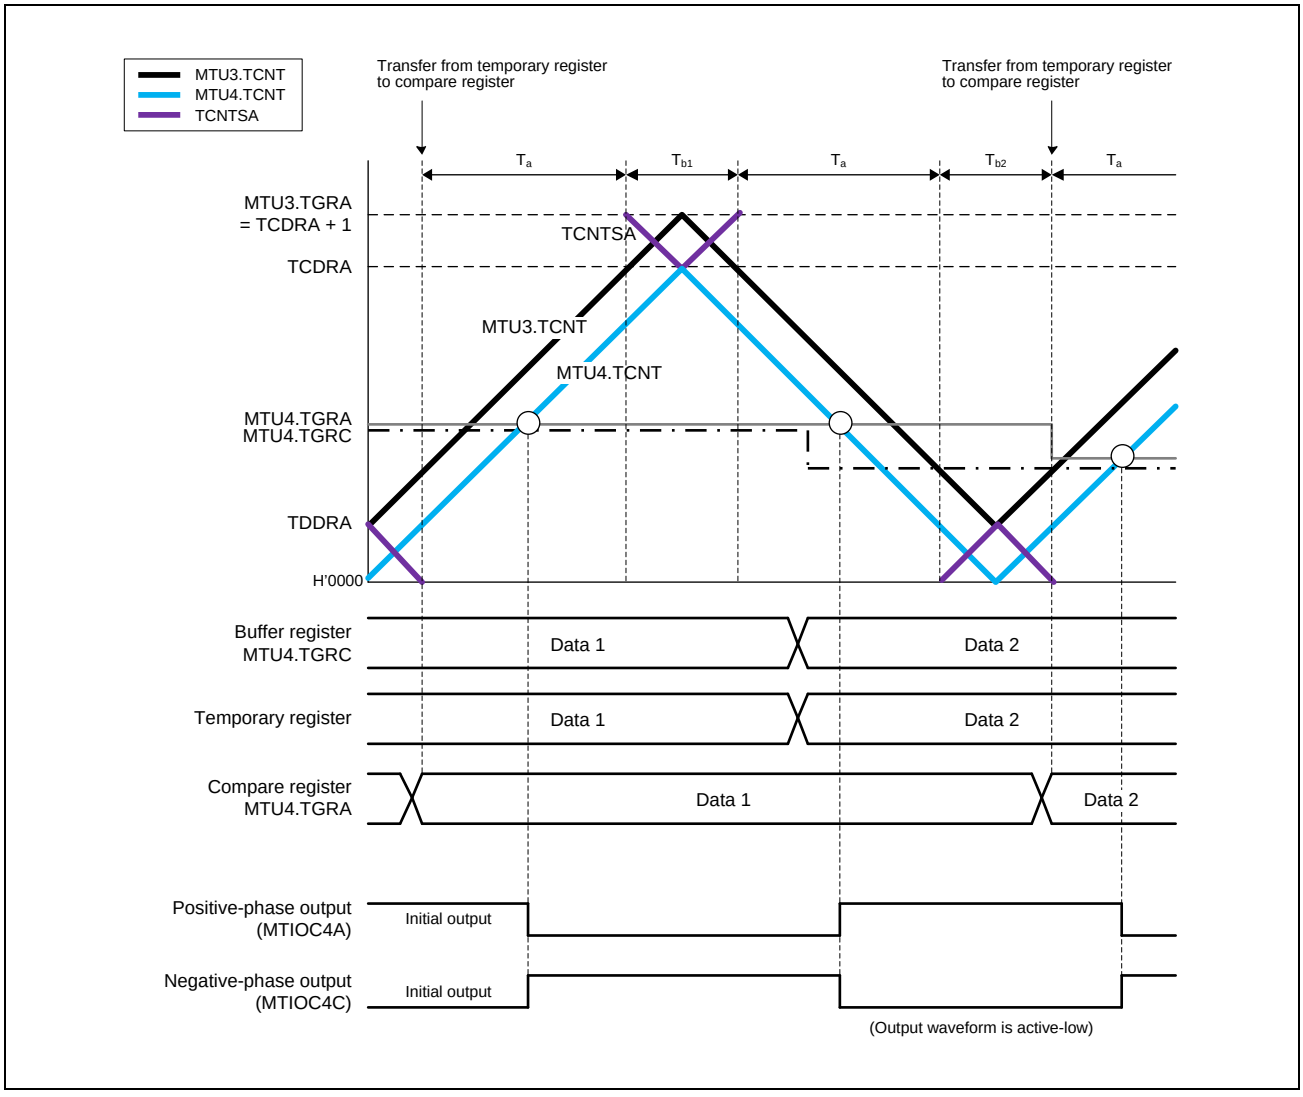

Figure 5.9-51 Example of Operation without Dead Time (MTU3 and MTU4)

(g) PWM Cycle Setting

In complementary PWM mode, the PWM cycle is set in two registers—MTU3.TGRA (MTU6.TGRA), in which the MTU3.TCNT (MTU6.TCNT) upper limit value is set, and TCDRA (TCDRB), in which the MTU4.TCNT (MTU7.TCNT) upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + TDDRA (TDDRB) setting
Without dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + 1

In addition, the settings should be made so as to achieve the following relationship between the TCDRA (TCDRB) register and the TDDRA (TDDRB) register:

TCDRA (TCDRB) setting > TDDRA (TDDRB) setting × 2 + 2

The MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) settings are made by setting values in buffer registers MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB). When data is written to MTU4.TGRD (MTU7.TGRD) to enable transfers, the values set in MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB) are transferred simultaneously to the MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) with the transfer timing selected with the MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits.

The new PWM cycle is reflected from the next cycle when data is updated at the crest, or from the current cycle when updated in the trough. **Figure 5.9-52** illustrates the operation when the PWM cycle is updated at the crest.

See the following **5.9.3.8(2) (h) Register Data Updating**, for the method of updating the data in each buffer register.

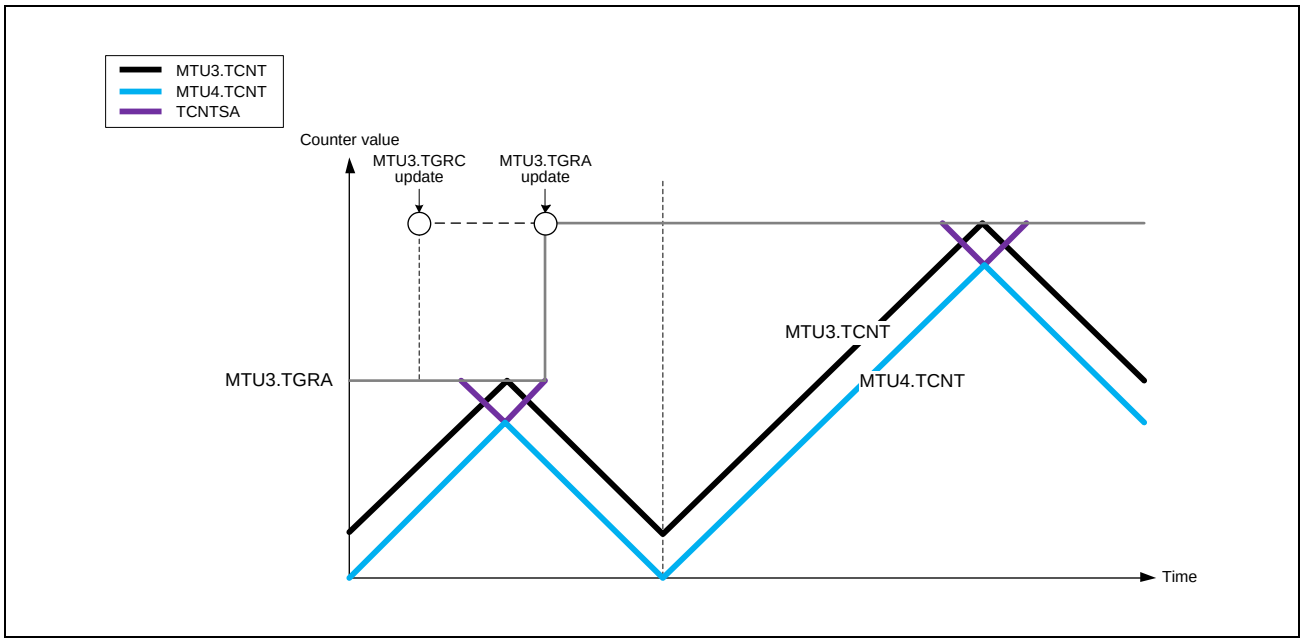

Figure 5.9-52 Example of PWM Cycle Updating (MTU3 and MTU4)

(h) Register Data Updating

In complementary PWM mode, buffer registers are used to update the data in five compare registers for PWM duty and PWM cycle. The update data can be written to the buffer registers at any time.

There is a temporary register between each of these registers and its buffer register. While sub counter TCNTSA (TCNTSB) is not counting, if buffer register data is updated, the temporary register value also changes. Data is not transferred from buffer registers to temporary registers while TCNTSA (TCNTSB) is counting; in this case, the value written to a buffer register is transferred after TCNTSA (TCNTSB) halts.

The temporary register value is transferred to the compare register at the data update timing set with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits. **Figure 5.9-53** shows an example of data updating in complementary PWM mode (MTU3 and MTU4). This example shows the mode in which data is updated at both the counter crest and trough.

When updating buffer register data, be sure to write to MTU4.TGRD (MTU7.TGRD) at the end of the update. Data is transferred from buffer registers to the temporary registers simultaneously for all five registers after the write to MTU4.TGRD (MTU7.TGRD).

Even when not updating all five registers or when not updating the MTU4.TGRD (MTU7.TGRD) data, be sure to write to MTU4.TGRD (MTU7.TGRD) after writing data to the registers to be updated. In this case, the data written to MTU4.TGRD (MTU7.TGRD) should be the same as the data prior to the write operation.

See **5.9.3.8(2) (s) Double Buffer Function in Complementary PWM Mode**, for data updating when the double buffer function is used.

● Data update timing: counter crest and trough

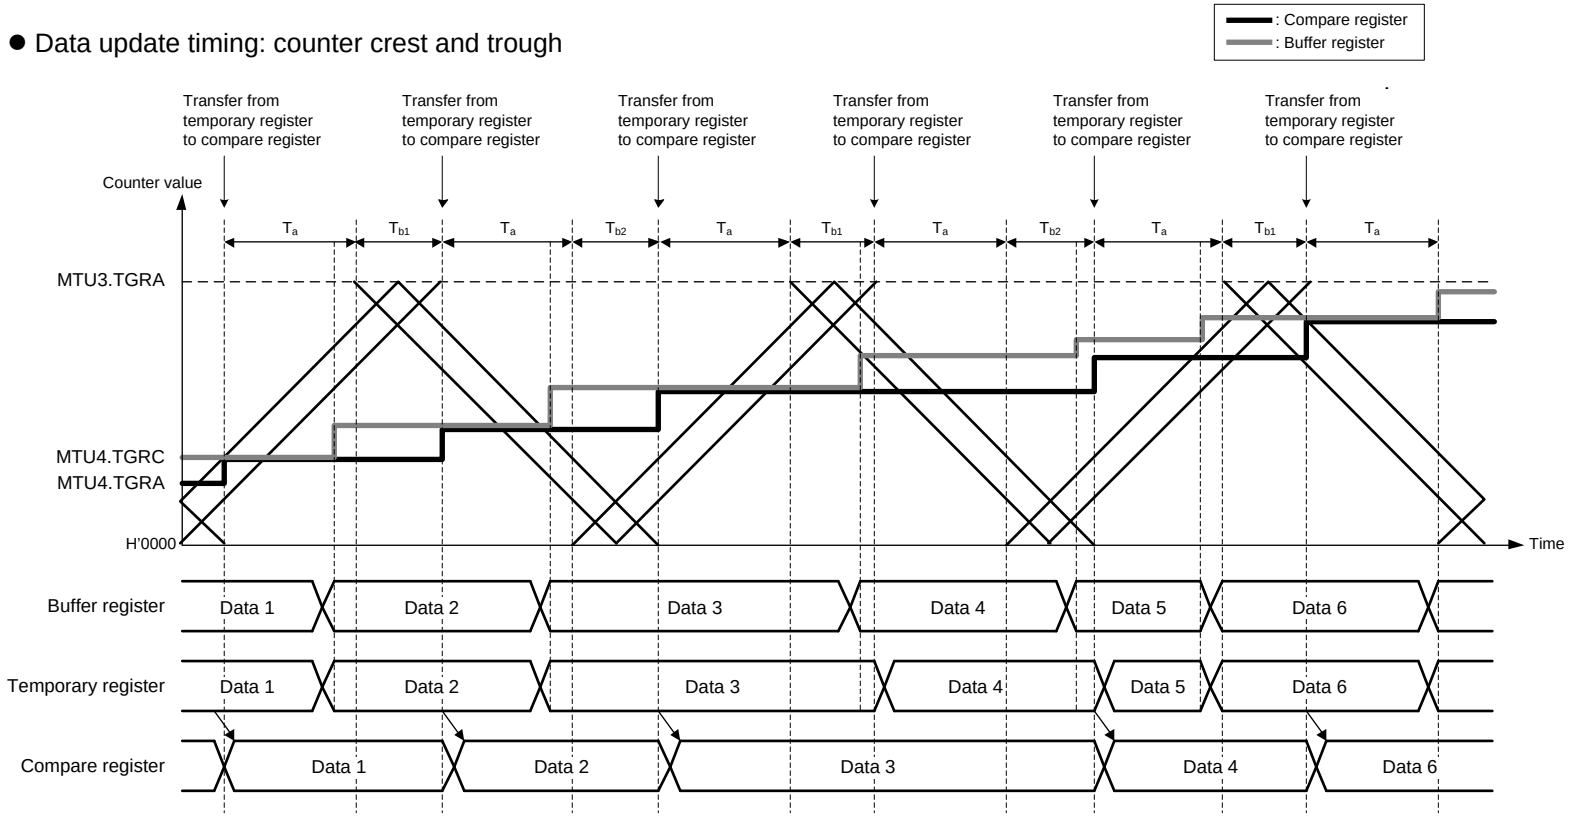

Figure 5.9-53 Example of Data Updating in Complementary PWM Mode (MTU3 and MTU4)

(i) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of the OLSN and OLSP bits in the TOCR1A (TOCR1B) register or the OLS1N to OLS3N and OLS1P to OLS3P bits in the TOCR2A register (TOCR2B). This initial output is the non-active level of the PWM output and continues from when complementary PWM mode is set with the MTU3.TMDR1 (MTU6.TMDR1) until MTU4.TCNT (MTU7.TCNT) exceeds the value set in the TDDRA (TDDRB) register. **Figure 5.9-54** shows an example of the initial output in complementary PWM mode.

An example of the waveform when the initial PWM duty ratio value is smaller than the TDDRA (TDDRB) value is shown in **Figure 5.9-55**.

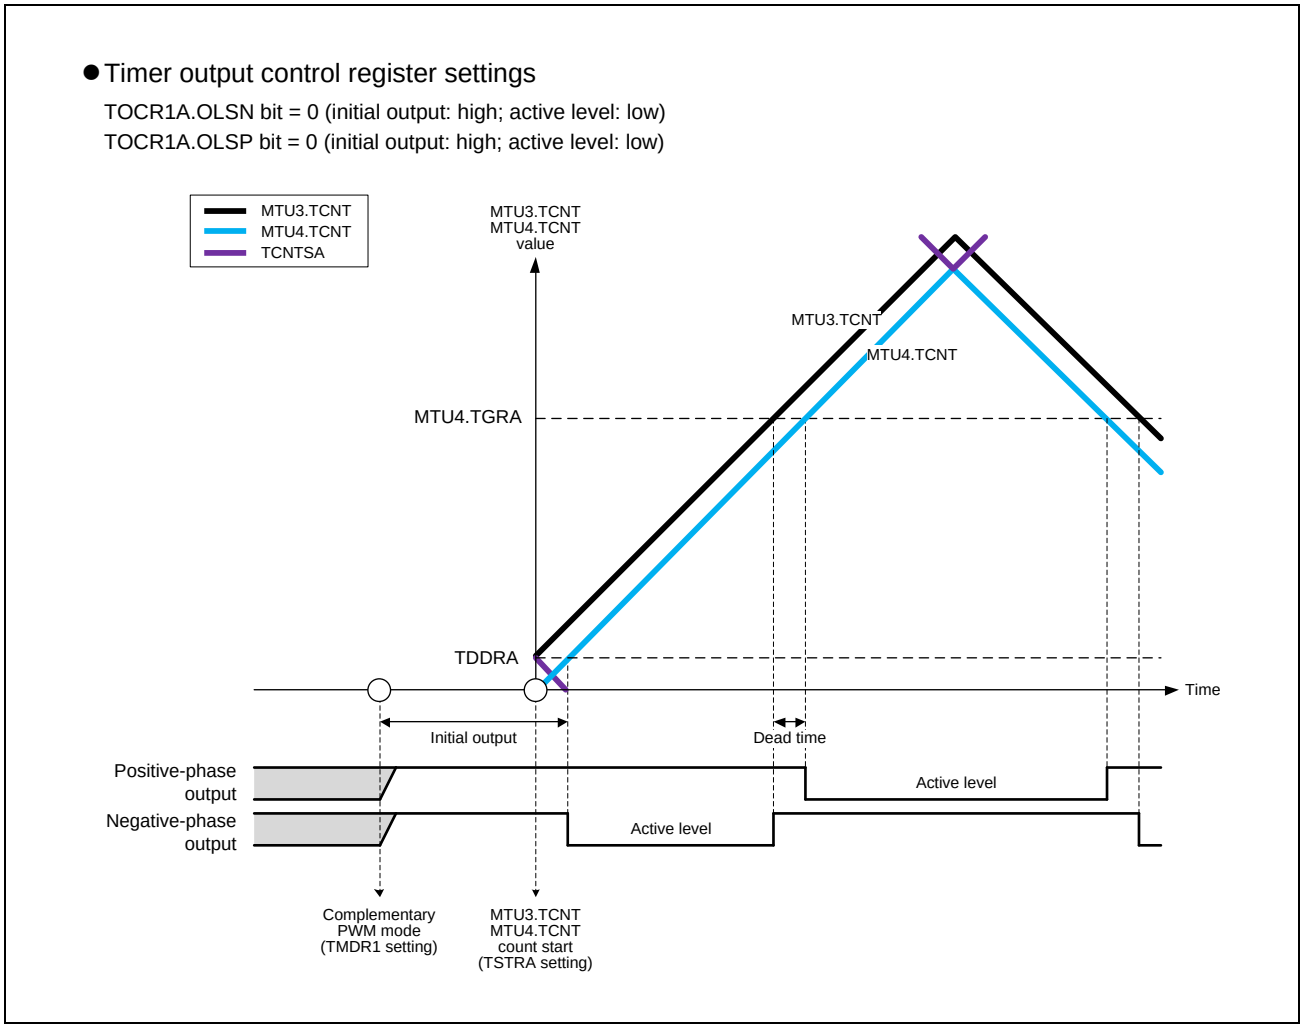

Figure 5.9-54 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (1)

● Timer output control register settings

TOCR1A.OLSN bit = 0 (initial output: high; active level: low)
TOCR1A.OLSP bit = 0 (initial output: high; active level: low)

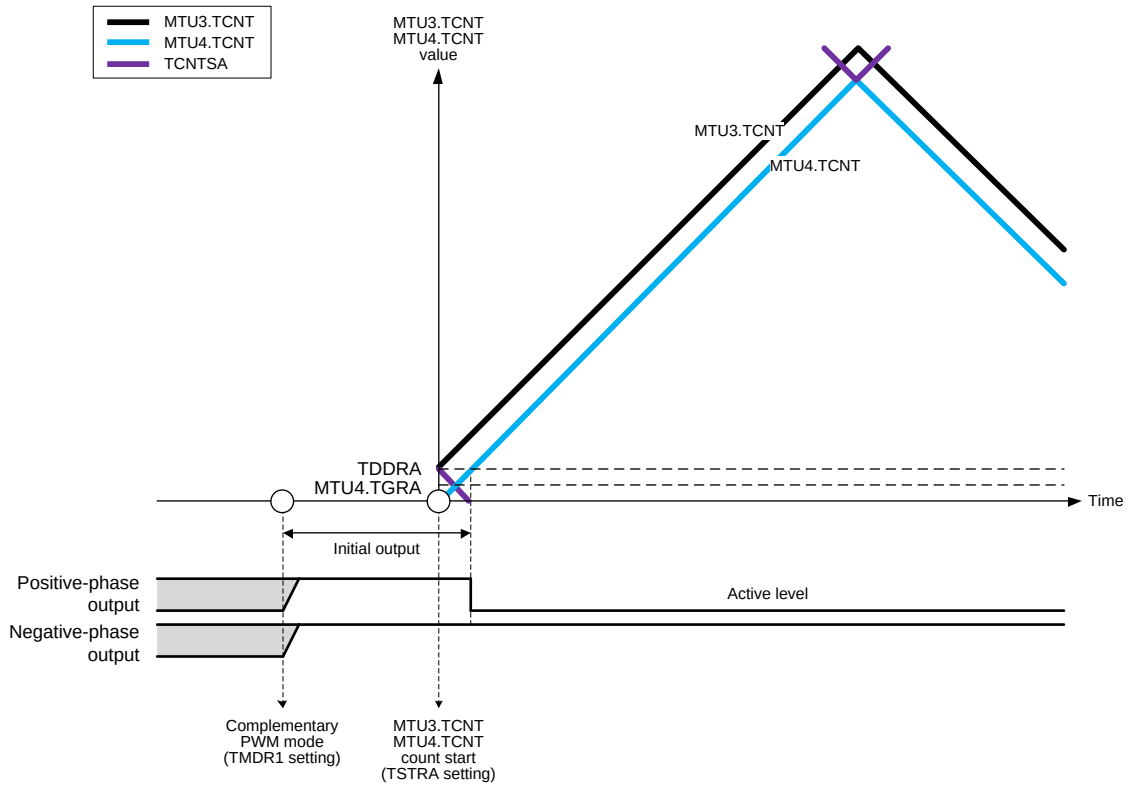

Figure 5.9-55 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (2)

(j) Method for Generating PWM Output in Complementary PWM Mode

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Dead time can be set for PWM waveforms to be output.

A PWM waveform is generated by output of the level selected in the timer output control register in the event of a compare match between a counter and a compare register. While TCNTSA (TCNTSB) is counting, the compare register and temporary register values are simultaneously compared to create consecutive PWM output from 0 to 100% duty ratio. The relative timing of turn-on and turn-off compare match occurrence may vary, but the compare match that turns off each phase takes precedence to secure the dead time and ensure that the positive-phase and negative-phase turn-on times do not overlap. **Figure 5.9-56** to **Figure 5.9-58** show examples of waveform generation in complementary PWM mode.

The positive-phase and negative-phase turn-off timing is generated by a compare match with the counter indicated by a solid line, and the turn-on timing is generated by a compare match with the counter indicated by a dotted line, which operates with a delay equal to the dead time behind the counter indicated by a solid line. In the T1 period, compare match a that turns off the negative phase has the highest priority, and compare matches before a are ignored. In the T2 period, compare match c that turns off the positive phase has the highest priority, and compare matches before c are ignored.

In most cases, compare matches occur in the order a → b → c → d (or c → d → a' → b') as shown in **Figure 5.9-56**.

If compare matches deviate from the a → b → c → d order, since the time for which the negative phase is off is shorter than twice the dead time, the positive phase is not turned on. If compare matches deviate from the c → d → a' → b' order, since the time for which the positive phase is off is shorter than twice the dead time, the negative phase is not turned on. As shown in **Figure 5.9-57**, if compare match c follows compare match a before compare match b, compare match b is ignored and the negative phase is turned on by compare match d. This is because turning off the positive phase has priority due to the occurrence of compare match c (positive-phase off timing) before compare match b (positive-phase on timing) (consequently, the waveform does not change because the positive phase goes from off to off).

Similarly, in the example in **Figure 5.9-58**, turning off the negative phase has priority due to the occurrence of compare match a' (negative-phase off timing) before compare match d (negative-phase on timing). As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare matches at turn-off timings take precedence, and turn-on timing compare matches that occur before a turn-off timing compare match are ignored.

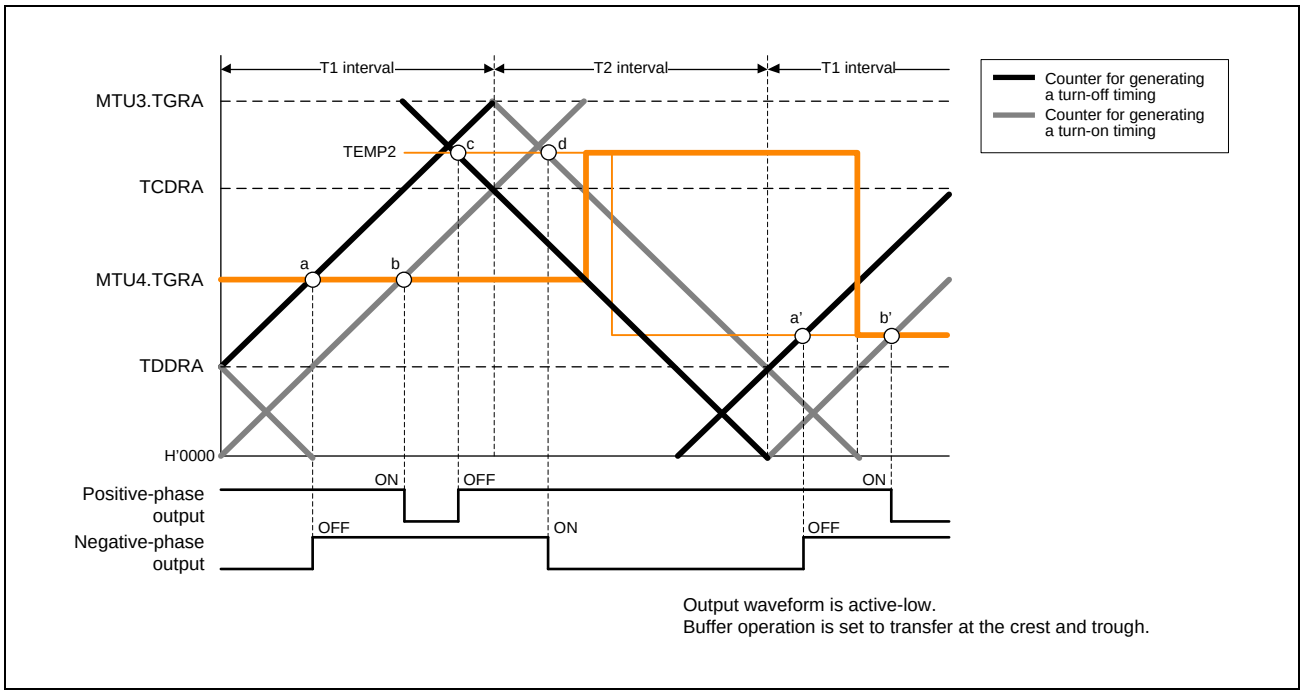

Figure 5.9-56 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

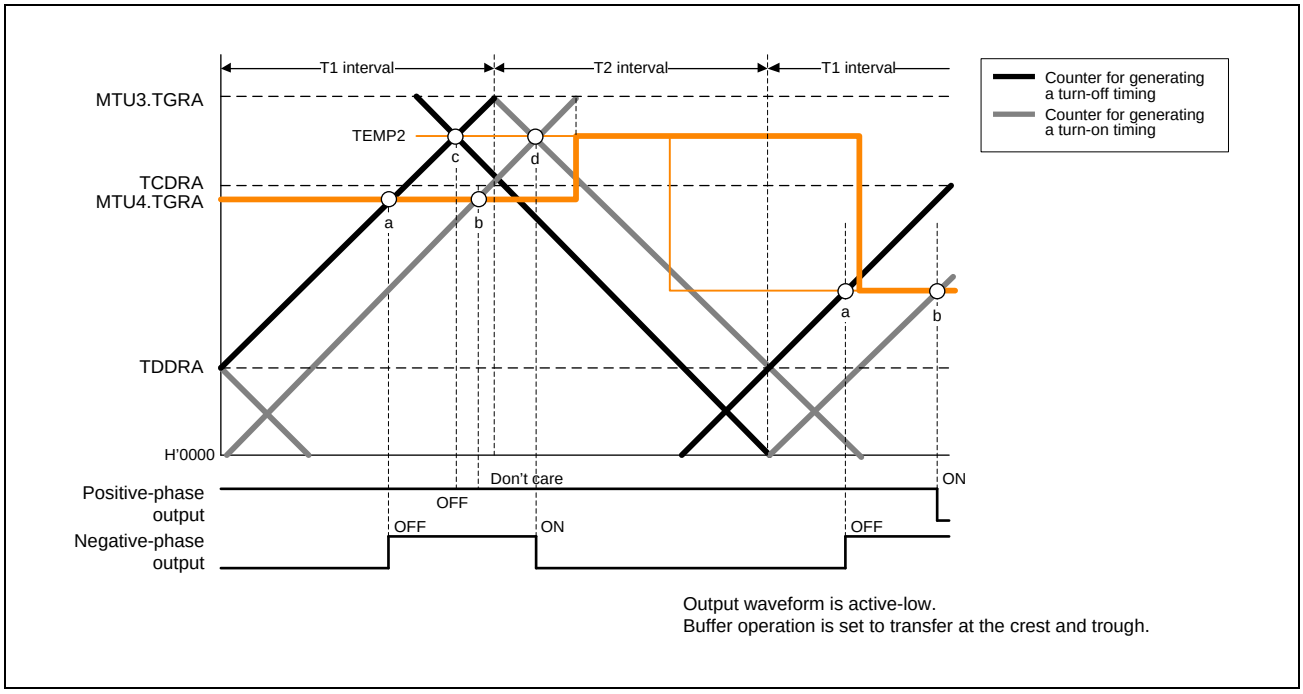

Figure 5.9-57 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (2)

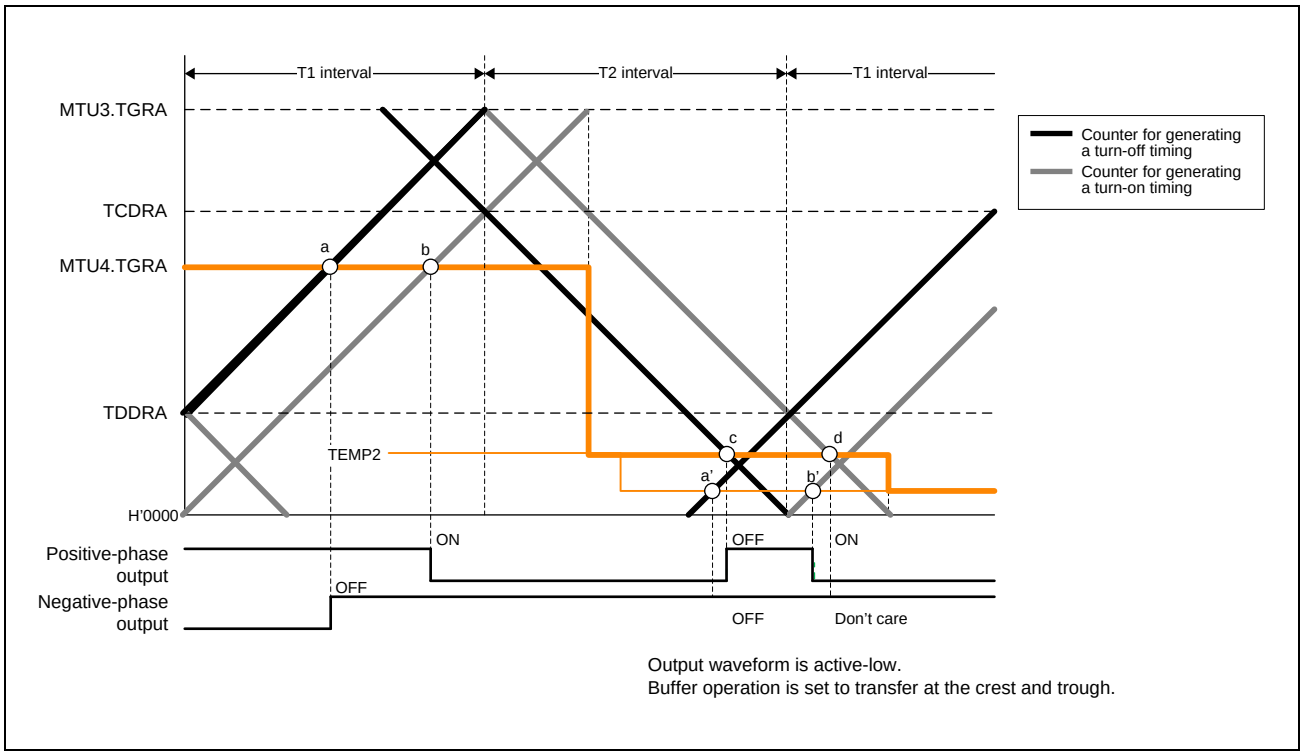

Figure 5.9-58 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (3)

(k) 0% and 100% Duty Ratio Output in Complementary PWM Mode

In complementary PWM mode, 0% and 100% duty PWM output can be output as required. **Figure 5.9-59** to **Figure 5.9-63** show output examples.

A 100% duty waveform is output when the compare register value is set to H'0000. The waveform in this case has a positive phase with a 100% on-state. A 0% duty waveform is output when the compare register value is set to the same value as MTU3.TGRA (MTU6.TGRA). The waveform in this case has a positive phase with a 100% off-state.

Turn-on and turn-off compare matches occur simultaneously, but if a turn-on compare match and turn-off compare match for the same phase occur simultaneously, both compare matches are ignored and the waveform does not change.

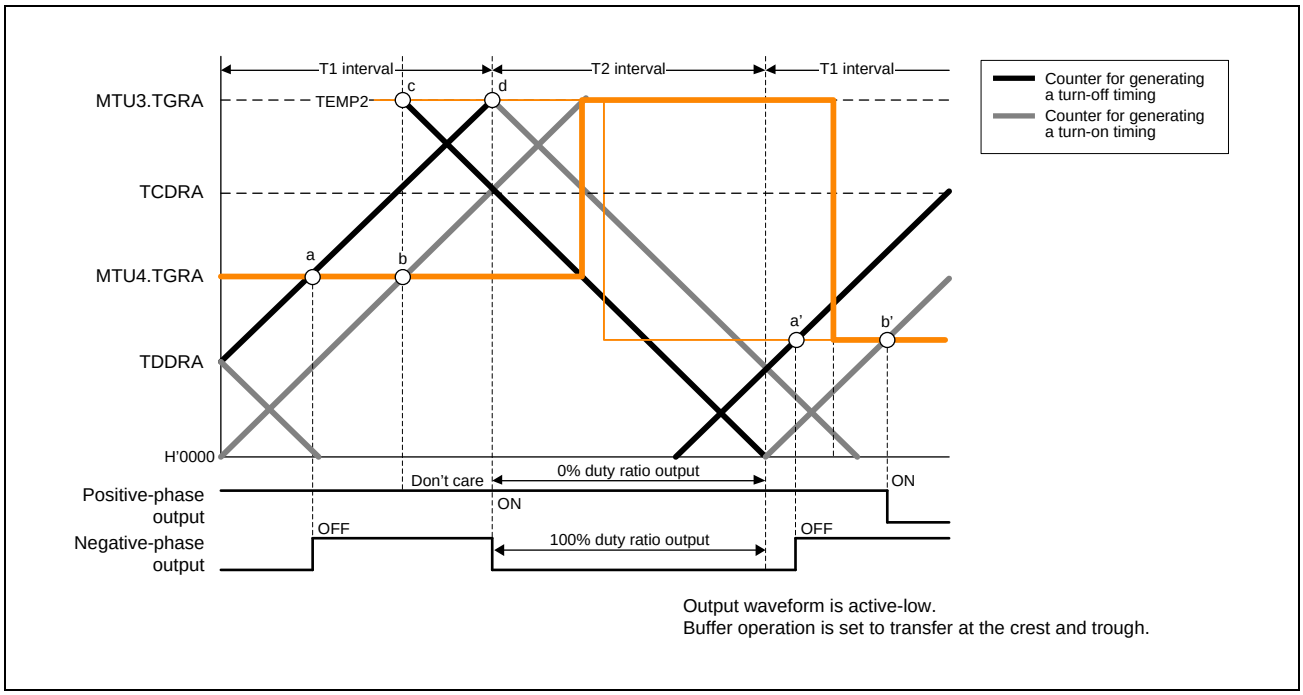

Figure 5.9-59 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

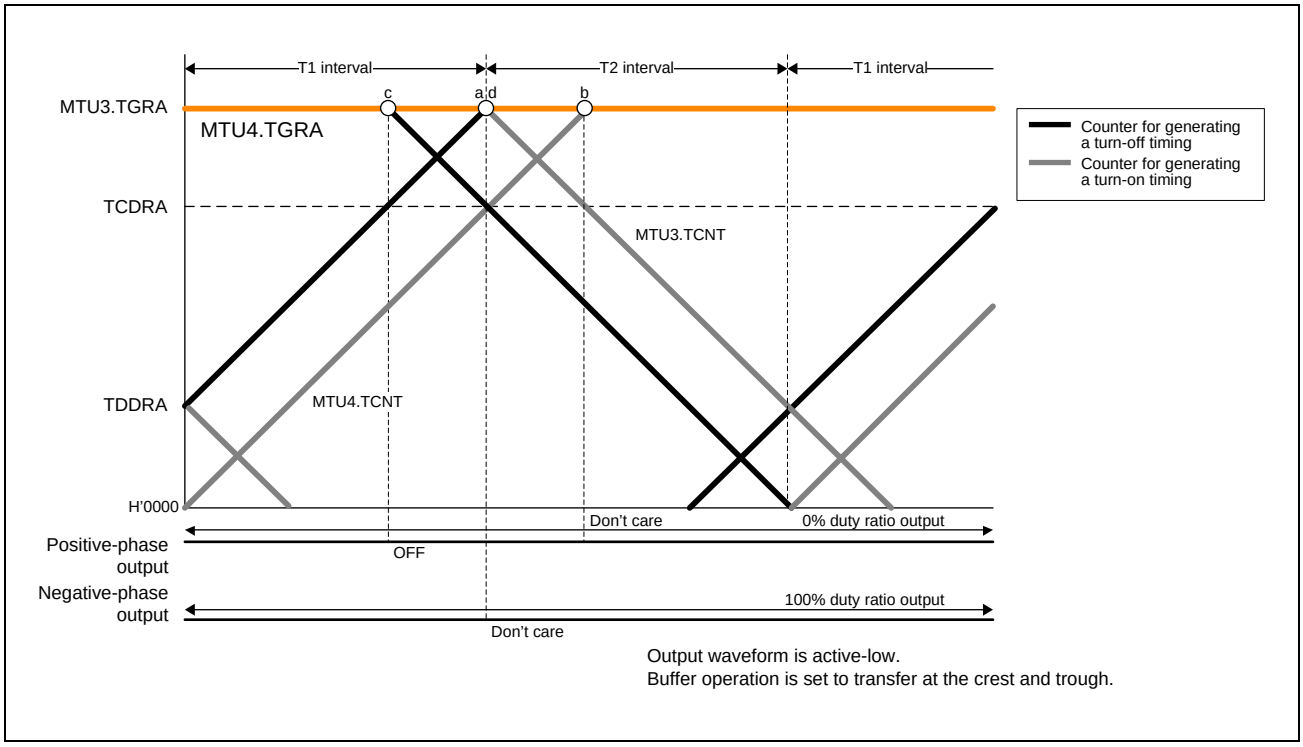

Figure 5.9-63 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (5)

(l) Toggle Output Synchronized with PWM Cycle

In complementary PWM mode, toggle output from the PWM output pin in synchronization with the PWM cycle can be enabled by setting the PSYE bit in the TOCR1A (TOCR1B) register to 1. An example of a toggle output waveform is shown in **Figure 5.9-64**.

This output is toggled by a compare match between MTU3.TCNT and MTU3.TGRA (MTU6.TCNT and MTU6.TGRA) and a compare match between MTU4.TCNT (MTU7.TCNT) and H’0000.

The MTIOC3A (MTIOC6A) pin is assigned for this toggle output. The initial output is high-level output.

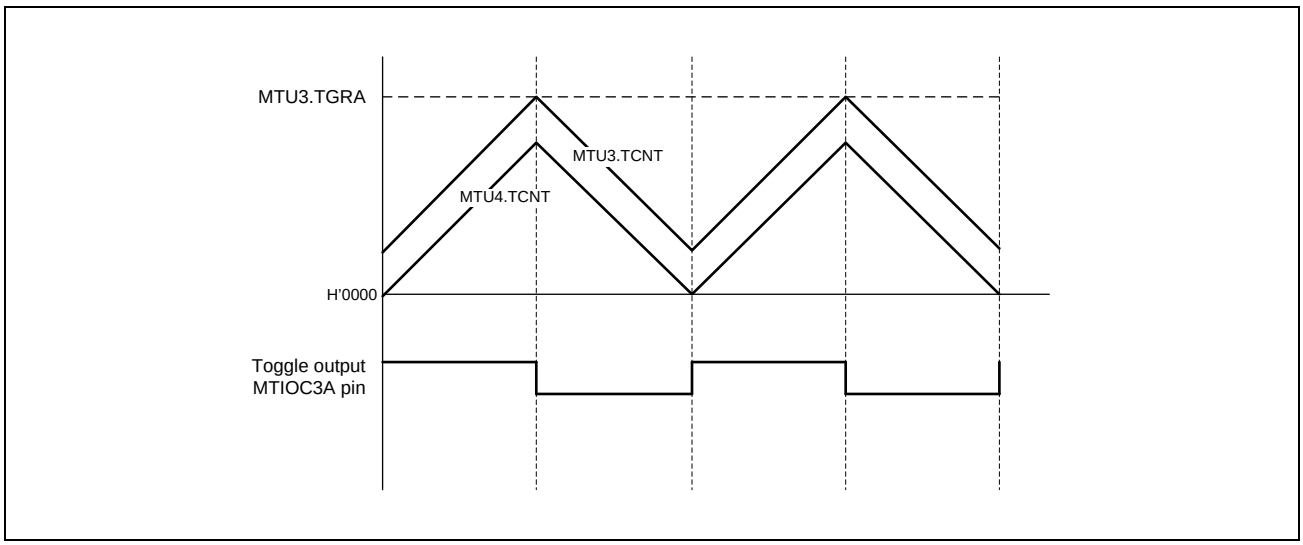

Figure 5.9-64 Example of Toggle Output Waveform Synchronized with PWM Output (MTU3 and MTU4)

(m) Counter Clearing by Another Channel

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by another channel source when a mode for synchronization with another channel is specified through the TSYRA (TSYRB) register and synchronous clearing is selected with MTU3.TCR.CCLR[2:0] (MTU6.TCR.CCLR[2:0]) bits.

Figure 5.9-65 illustrates an example of this operation.

Use of this function enables a counter to be cleared and restarted through an external signal.

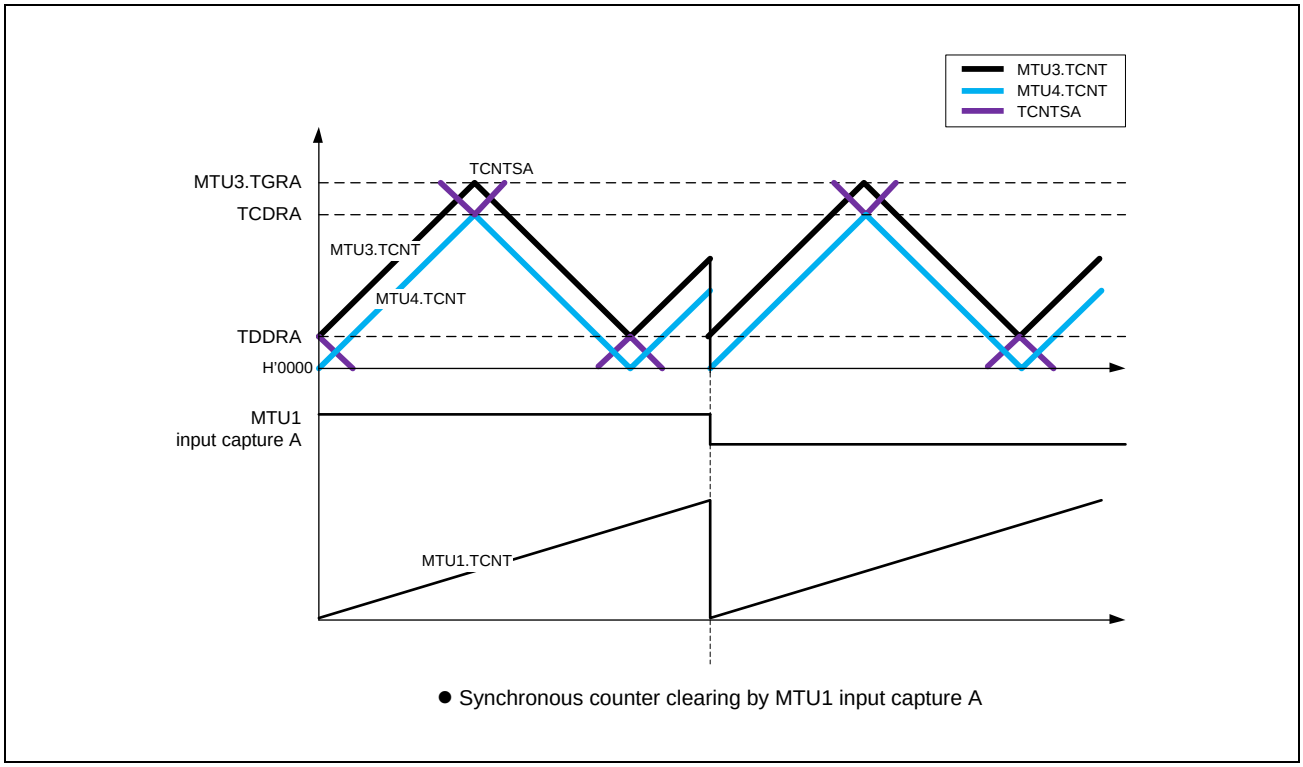

Figure 5.9-65 Counter Clearing Synchronized with Another Channel (MTU3 and MTU4)

(n) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCRA (TWCRB) to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval (Tb2 interval) at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression through the WRE bit = 1 is applicable only when synchronous clearing occurs in the Tb2 interval as indicated by (10) or (11) in **Figure 5.9-66**. When synchronous clearing occurs outside that interval, the initial value specified by the OLSN and OLSP bits in TOCR1A (TOCR1B) is output. Even in the Tb2 interval, if synchronous clearing occurs in the initial value output period (indicated by (1) in **Figure 5.9-66**) immediately after the counters start operation, initial value output is not suppressed.

This function can be used in both channel combinations of MTU 3 and MTU4 and MTU6 and MTU7. In MTU3 and MTU4, synchronous clearing in MTU0, MTU1, and MTU2 can cause counter clearing; in MTU6 and MTU7, compare match or input capture generated in MTU0, MTU1, and MTU2 can cause counter clearing.

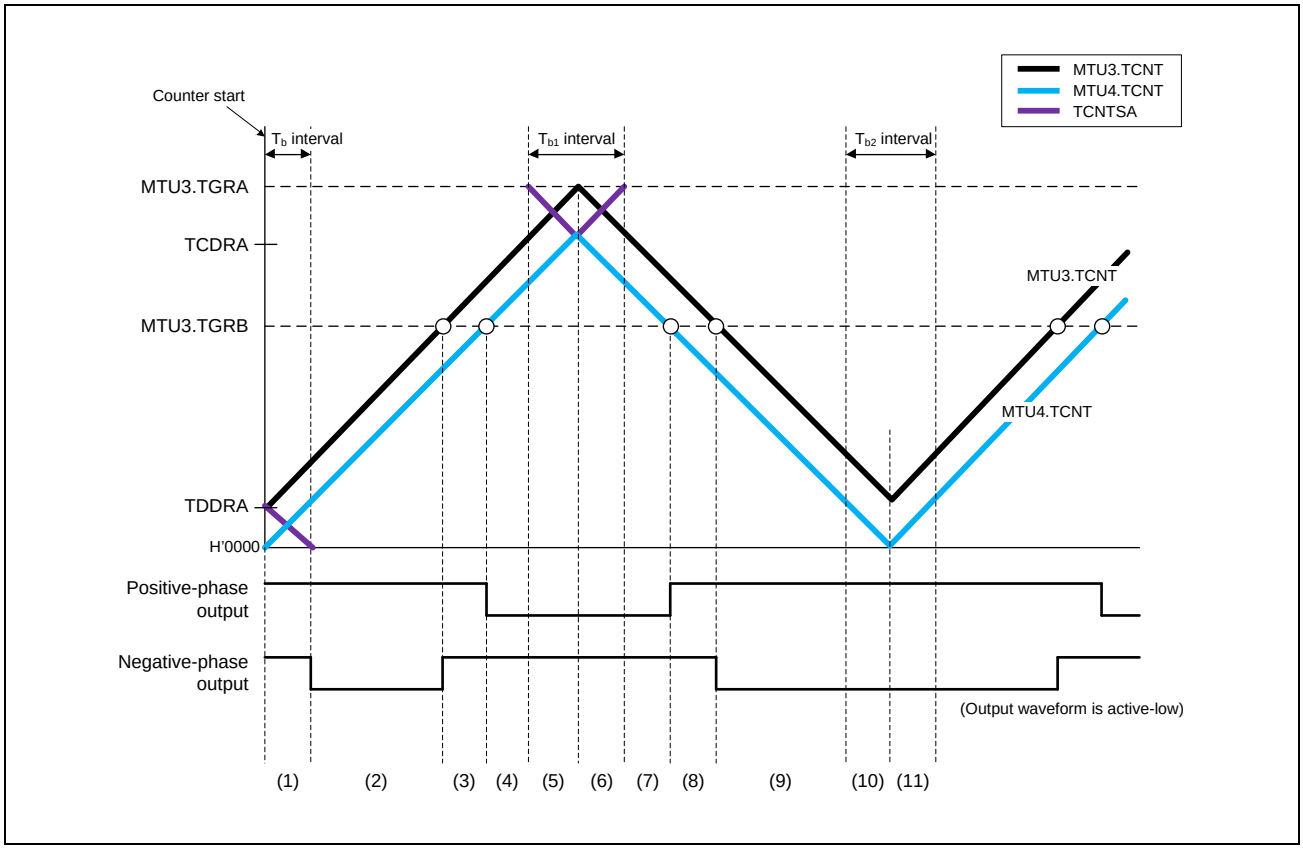

Figure 5.9-66 Timing for Synchronous Counter Clearing (MTU3 and MTU4)

- Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode.

An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in **Figure 5.9-67**.

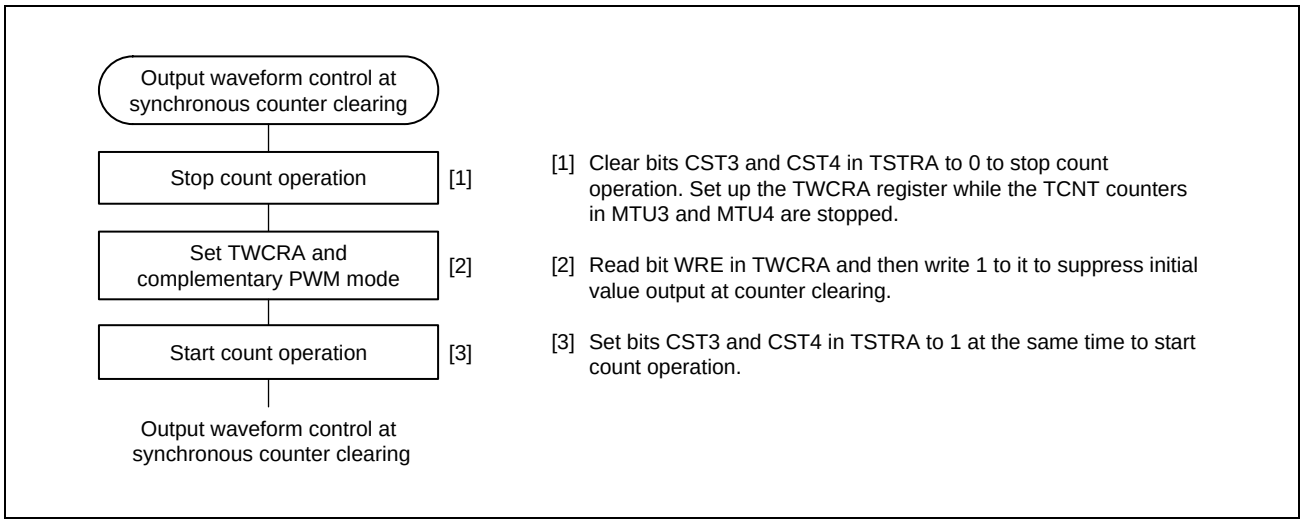

Figure 5.9-67 Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode (MTU3 and MTU4)

- Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Figure 5.9-68 to **Figure 5.9-71** show examples of output waveform control in which MTU3 and MTU4 operate in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCRA is set to 1. In the examples shown in **Figure 5.9-68** to **Figure 5.9-71**, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in **Figure 5.9-66**, respectively.
In MTU6 and MTU7, these examples are equivalent to the cases when MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing is generated while the SCC bit is cleared to 0 and the WRE bit is set to 1 in TWCRB.

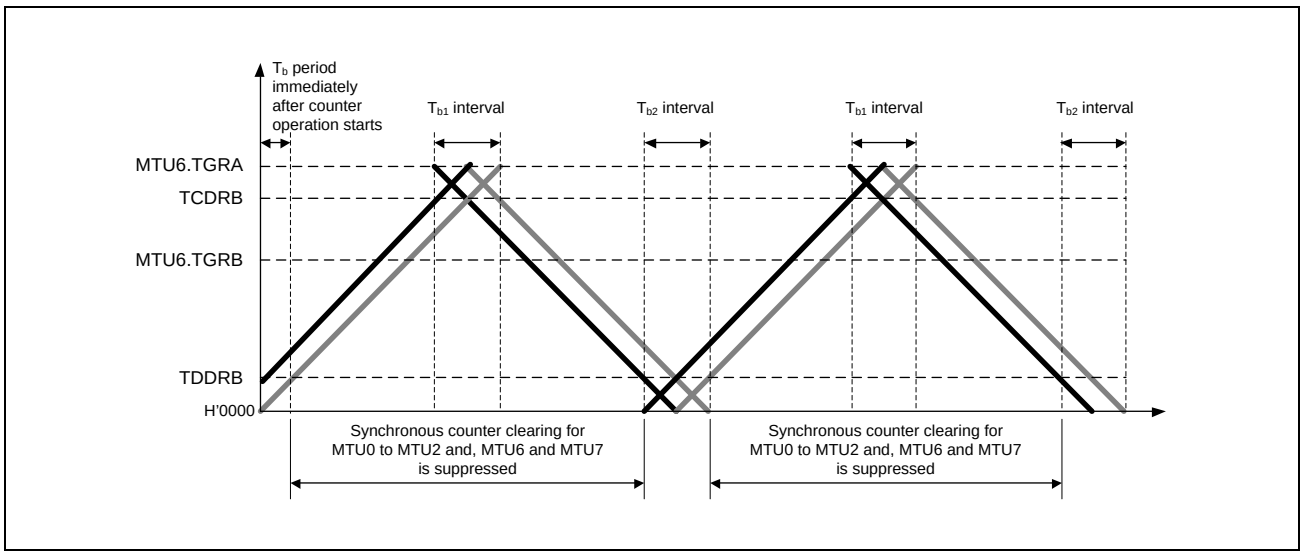
(o) Suppressing Synchronous Counter Clearing for MTU0 to MTU2 and MTU6 and MTU7

In MTU6 and MTU7, setting the SCC bit in TWCRB to 1 suppresses synchronous counter clearing caused by MTU0 to MTU2.

Synchronous counter clearing is suppressed only within the interval shown in **Figure 5.9-72**. When using this function, MTU6 and MTU7 should be set to complementary PWM mode.

For details of synchronous clearing caused by MTU0 to MTU2, refer to **5.9.3.10 (2) Synchronous Counter Clearing for MTU6 and MTU7**.



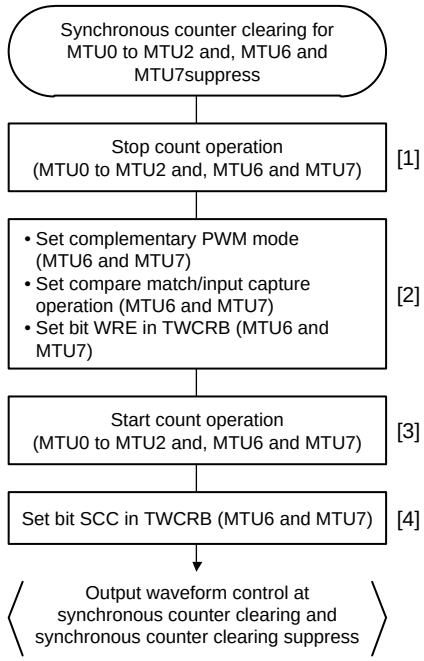


Figure 5.9-72 Synchronous Clearing-Suppressed Interval Specified by TWCRB.SCC Bit for MTU0, MTU1 and MTU2, and MTU6 and MTU7

- Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

An example of the procedure for suppressing synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7 is shown in **Figure 5.9-73**.

[1] Clear bits CSTn of the timer start register (TSTRB) in MTU6 and MTU7 to 0 to stop count operation. Clear bits CSTn of TSTRA in MTU0 to MTU2 to 0 to stop count operation.

[2] Set the complementary PWM mode in MTU6 and MTU7 and compare match/input capture operation in MTU0 to MTU2. When bit WRE in TWCRA or TWCRB should be set, make appropriate setting here.

[3] Set bits CST6 and CST7 in MTU6 and MTU7 to 1 to start count operation. For synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7, set bits CSTn of TSTRA in MTU0 to MTU2 to 1 to start count operation in any one of MTU0.TCNT to MTU2.TCNT.

[4] Read TWCRB and then set bit SCC in TWCRB to 1 to suppress synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7*1. Here, do not modify the CCE and WRE bit values in TWCRB of MTU6 and MTU7. Synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7 is suppressed in the synchronous counter clearing-suppressed periods.

Note 1. The TWCRB.SCC bit value can be modified during count operation. However, if a synchronous clearing occurs when bit TWCRB.SCC is modified from 0 to 1, the synchronous clearing may not be suppressed. If a synchronous clearing occurs when bit TWCRB.SCC is modified from 1 to 0, the synchronous clearing may be suppressed.

Figure 5.9-73 Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

- Examples of Suppression of Synchronous Counter Clearing for MTU 0 to MTU2, and MTU6 and MTU7

Figure 5.9-74 to **Figure 5.9-77** show examples of operation in which MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing for MTU 0 to MTU2, and MTU6 and MTU7 is suppressed by setting the SCC bit in TWCRB in MTU6 and MTU7 to 1. In the examples shown in **Figure 5.9-74** to **Figure 5.9-77**, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in **Figure 5.9-66**, respectively. In these examples, the WRE bit in TWCRB in MTU6 and MTU7 is set to 1.

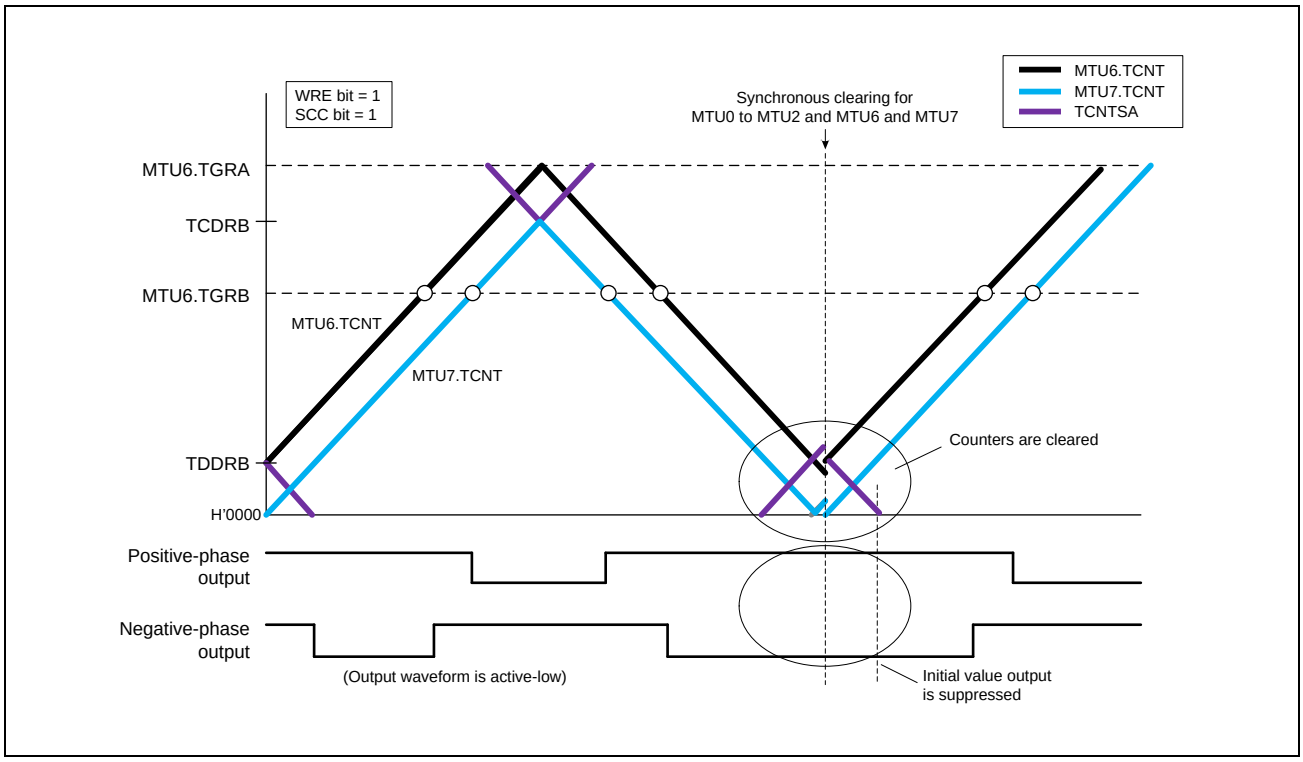

Figure 5.9-77 Example of Synchronous Clearing in Tb2 interval
(Timing (11) in **Figure 5.9-66**; TWCRB.WRE Bit is 1 and SCC Bit is 1 in MTU6 and MTU7)

(p) Counter Clearing by MTU3.TGRA (MTU6.TGRA) Compare Match

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by MTU3.TGRA (MTU6.TGRA) compare match when the TWCRA.CCE (TWCRB.CCE) bit.

Figure 5.9-78 illustrates an operation example.

NOTES

1. Use this function only in complementary PWM mode 1 (transfer at crest).
2. Do not specify synchronous clearing by another channel (do not set 1 in the SYNC0 to SYNC4 or SYNC6 to SYNC7 bits in the timer synchronous register (TSYRA or TSYRB) and the CEOA to CEOD or CEIA to CEID bits in TSYCR).
3. Do not set the PWM duty value to H'0000.
4. Do not set the PSYE bit in timer output control register 1 (TOCR1A or TOCR1B) to 1.

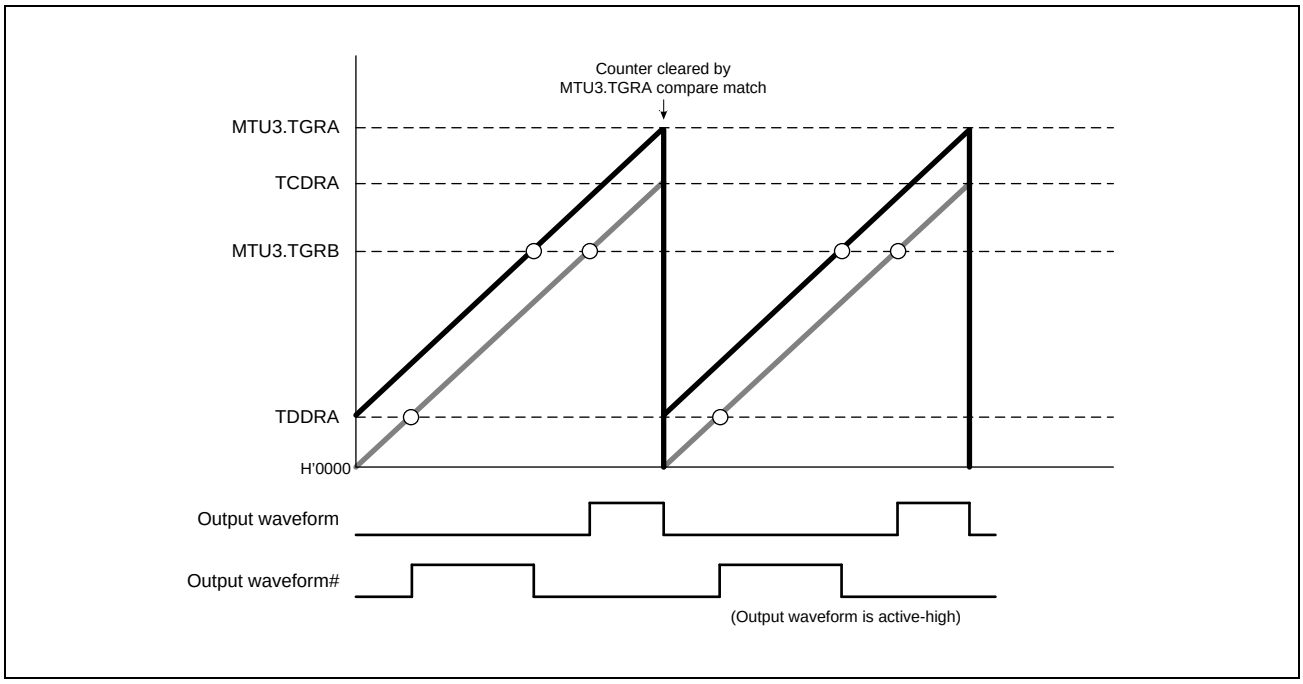

Figure 5.9-78 Example of Counter Clearing Operation by MTU3.TGRA Compare Match

(q) Example of Waveform Output for Driving AC Synchronous Motor (Brushless DC Motor)

In complementary PWM mode when MTU3 and MTU4 are used, a brushless DC motor can easily be controlled using TGCRA. **Figure 5.9-79** to **Figure 5.9-82** show examples of brushless DC motor driving waveforms created using TGCRA.

To switch the output phases for a 3-phase brushless DC motor by means of external signals detected with a Hall element, etc., clear the TGCRA.FB bit to 0. In this case, the external signals indicating the magnetic pole position should be input to pins MTIOC0A, MTIOC0B, and MTIOC0C in MTU0 (make appropriate settings with the port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports). When an edge is detected at pin MTIOC0A, MTIOC0B, or MTIOC0C, the output on/off state is switched automatically.

When the TGCRA.FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCRA is cleared to 0 or set to 1.

The driving waveforms are output from the 6-phase PWM output pins for complementary PWM mode.

With this 6-phase output, while the output is turned on, chopping output is available through complementary PWM mode output function by setting the N bit or P bit in TGCRA to 1. When the N bit or P bit is 0, the level output is selected.

The active level of the 6-phase output (on output level) can be set with the TOCR1A.OLSN and TOCR1A.OLSP bits regardless of the setting of the N and P bits.

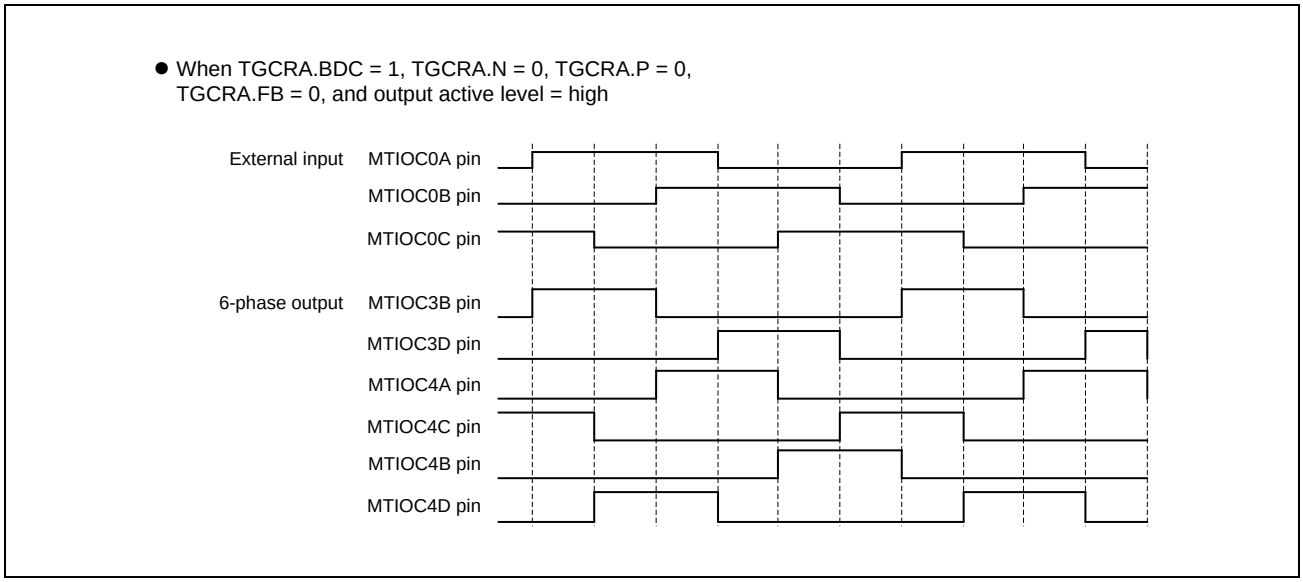

Figure 5.9-79 Example of Output Phase Switching by External Input (1)

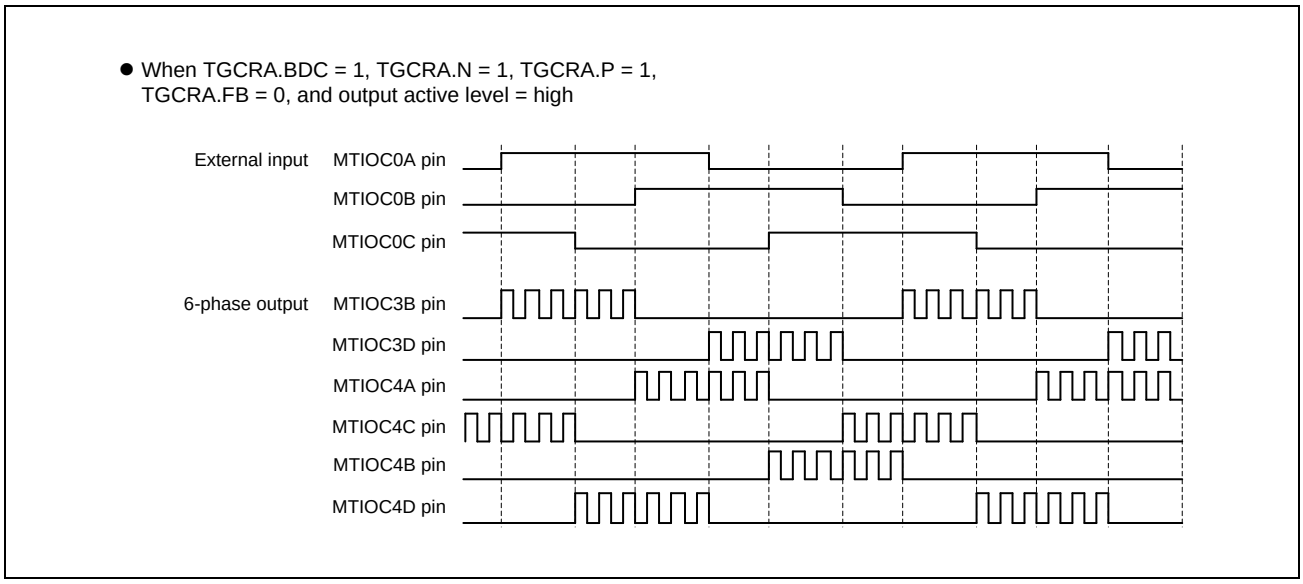

Figure 5.9-80 Example of Output Phase Switching by External Input (2)

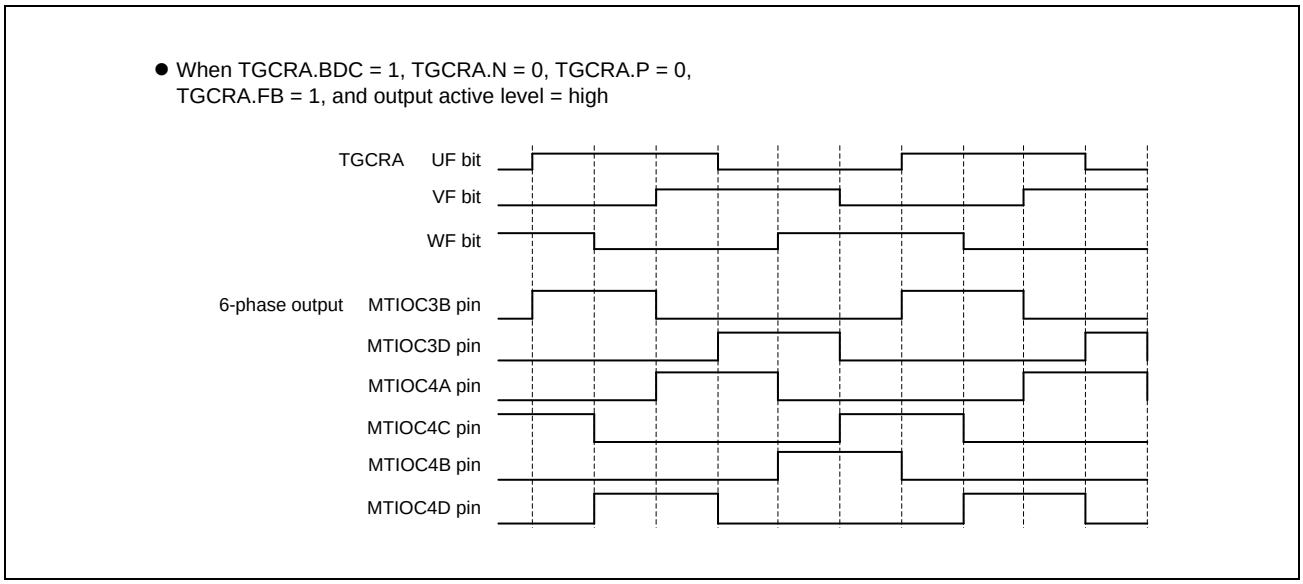

Figure 5.9-81 Example of Output Phase Switching through UF, VF, and WF Bit Settings (1)

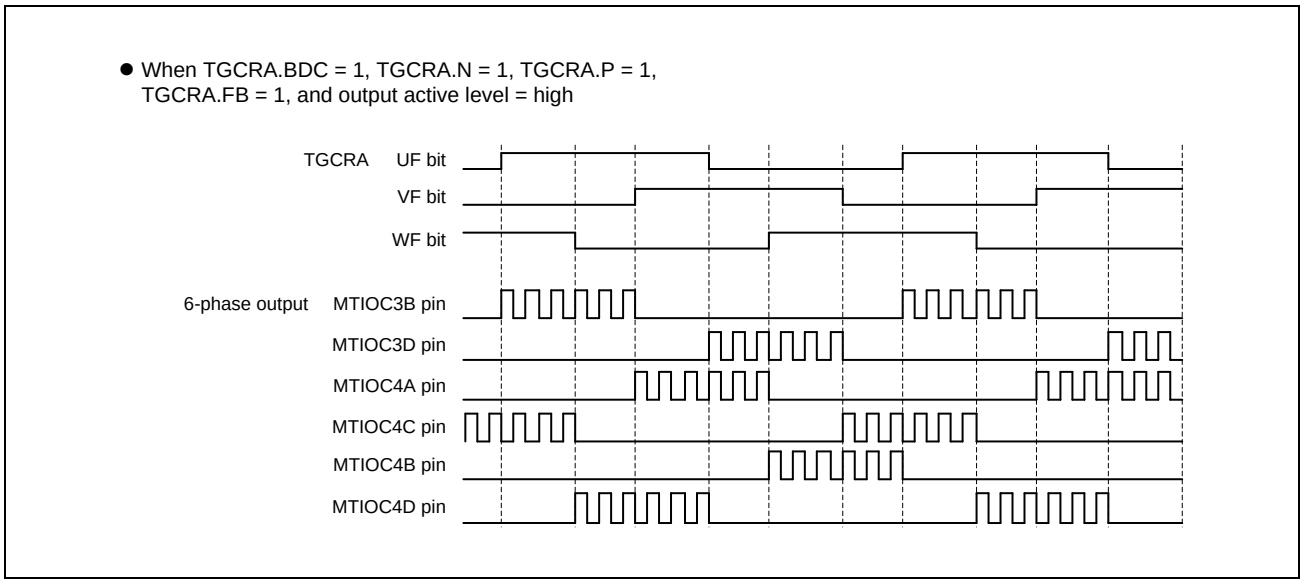

Figure 5.9-82 Example of Output Phase Switching through UF, VF, and WF Bit Settings (2)

(r) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using MTU3.TGRA (MTU6.TGRA) compare match, MTU4.TCNT (MTU7.TCNT) underflow (trough), or compare match on a channel other than MTU3 and MTU4 (MTU6 and MTU7).

When start requests using MTU3.TGRA (MTU6.TGRA) compare match are specified, A/D conversion can be started at the crest of the MTU3.TCNT (MTU6.TCNT) count.

A/D converter start requests can be specified by setting the TIER.TTGE bit. To issue an A/D converter start request at an MTU4.TCNT (MTU7.TCNT) underflow (trough), set the MTU4.TIER.TTGE2 (MTU7.TIER.TTGE2) bit to 1.

(s) Double Buffer Function in Complementary PWM Mode

In complementary PWM mode 3 (transfer at the crest and trough), the PWM output setting resolution can be improved from ±2 to ±1 by setting the TMDR2A.DRS (TMDR2B.DRS) bit to 1.

When setting buffer registers A (TGRD in MTU3, TGRC and TGRD in MTU4, TGRD in MTU6, and TGRC and TGRD in MTU7), set also buffer registers B (TGRE in MTU3, TGRE and TGRF in MTU4, TGRE in MTU6, and TGRE and TGRF in MTU7) at the same time. Each buffer register B should be set to the buffer register A value or (buffer register A value – 1). For details of the setting procedure, refer to **5.9.3.8 (1) Example of Complementary PWM Mode Setting Procedure**.

NOTE

When a buffer register B is set to the buffer register A value, symmetric PWM waveforms are output. When a buffer register B is set to (buffer register A value – 1), asymmetric PWM waveforms are output.

Figure 5.9-83 shows an example of double buffer operation. Each register data is transferred as follows.

- After TGRD (buffer A) in MTU4 or MTU7 is written to, data is transferred from TGRD (buffer A) in MTU4 or MTU7 to Temp3A or Temp6A (temporary A) and from TGRF (buffer B) in MTU4 or MTU7 to Temp3B or Temp6B (temporary B).
- With timing (1) in the figure, data is transferred from Temp3A or Temp6A (temporary A) to TGRB (compare) in MTU4 or MTU7.
- With timing (2) in the figure, data is transferred from Temp3B or Temp6B (temporary B) to TGRB (compare) in MTU4 or MTU7.

In the crest interval (Tb1 interval), the compare register and temporary register A are valid; in the trough interval (Tb2 interval), the compare register and temporary register B are valid.

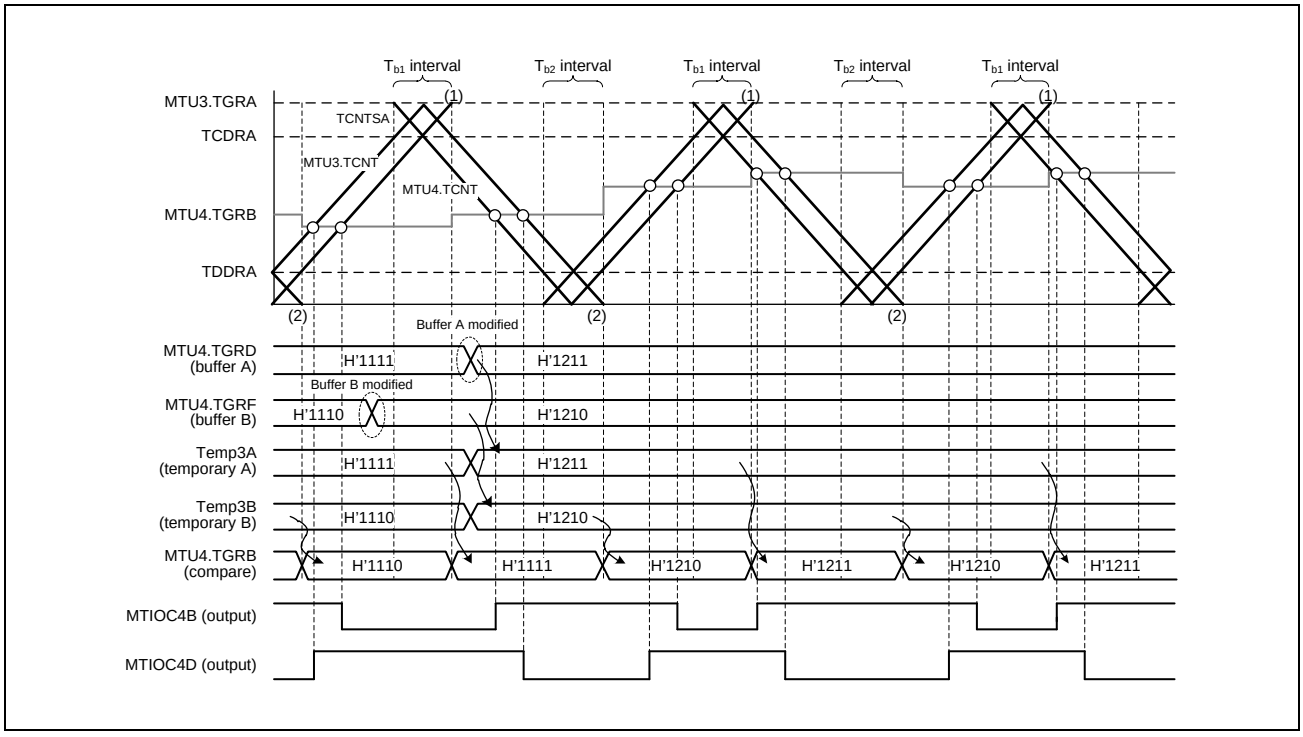

Figure 5.9-83 Example of Double Buffer Operation

Figure 5.9-84 shows an example when the buffer write value is smaller than the TDDRA (TDDRB) value, and **Figure 5.9-85** shows an example when the write value is greater than TCDRA (TCDRB).

In the crest interval, the output is controlled according to the compare match with the compare register or temporary register A; in the trough interval, the output is controlled according to the compare match with the compare register or temporary register B.

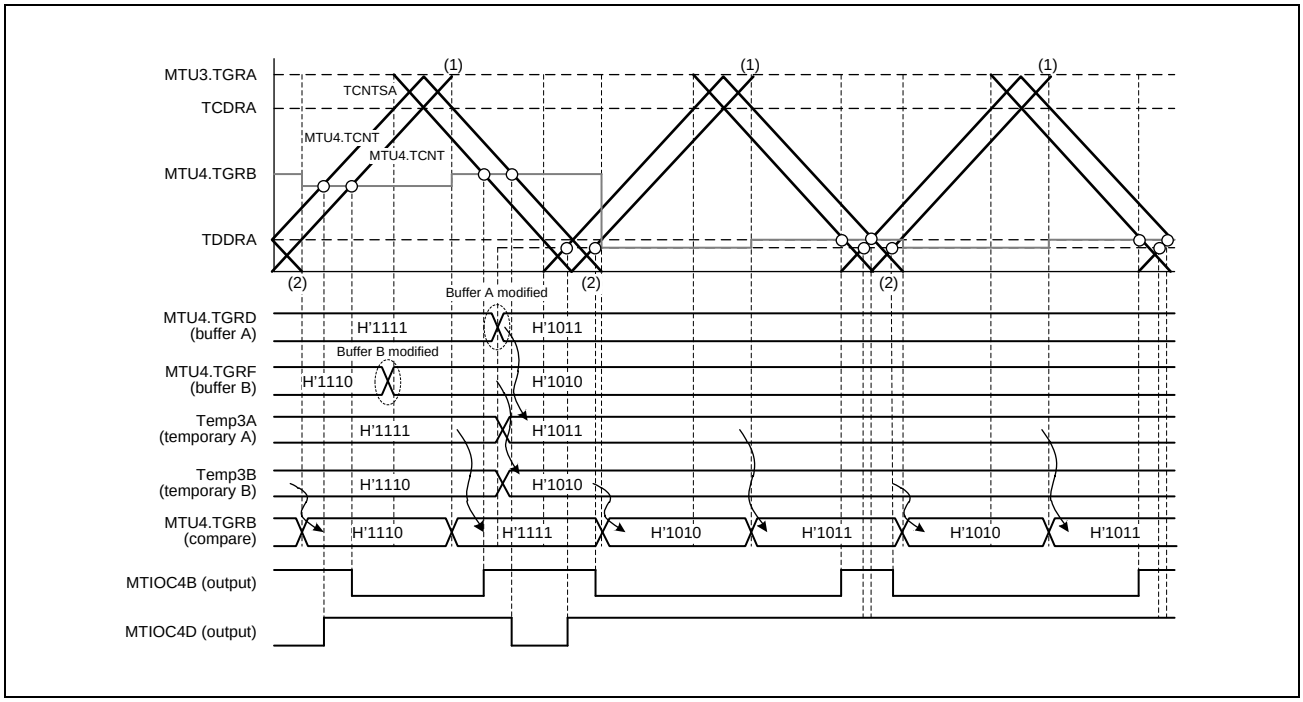

Figure 5.9-84 Example of Double Buffer Operation (Buffer Write Value is Smaller than TDDRA)

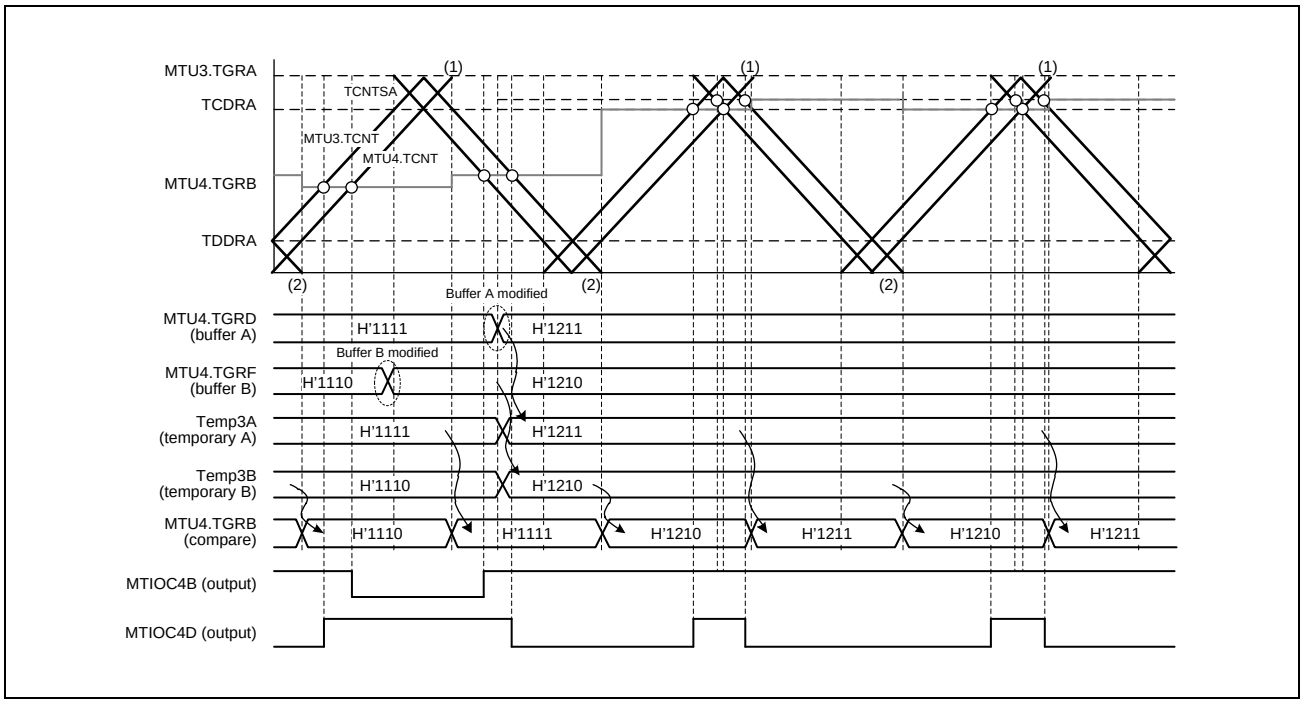

Figure 5.9-85 Example of Double Buffer Operation (Buffer Write Value is Greater than TCDRA)

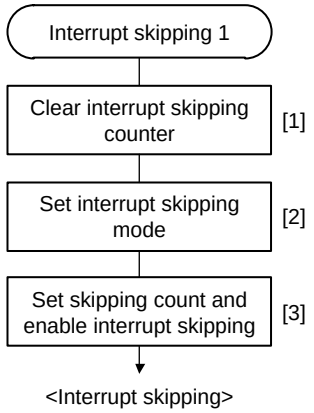
(3) Interrupt Skipping Function 1 in Complementary PWM Mode

Interrupts TGIA3 (TGIA6) (at the crest) and TCIV4 (TCIV7) (at the trough) in MTU3 and MTU4 (MTU6 and MTU7) can be skipped up to seven times by making settings in the TITCR1A (TITCR1B) register.



Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the TBTERA (TBTERB) register. For the linkage with buffer registers, refer to description (c), Buffer Transfer Control Linked with Interrupt Skipping, below.

A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the MTU4.TADCR (MTU7.TADCR) register. For the linkage with the A/D converter start request delaying function, refer to **5.9.3.9 A/D Converter Start Request Delaying Function**.

The TITCR1A (TITCR1B) register should be set while interrupt skipping function 1 is selected by setting the TITM bit in the timer interrupt skipping mode register (TITMRA or TITMRB) to 0, TGIA3 (TGIA6) interrupt requests are disabled by setting the MTU3.TIER (MTU6.TIER) register, TCIV4 (TCIV7) interrupt requests are disabled by setting the MTU4.TIER (MTU7.TIER) register, and a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN (T6AEN) and T4VEN (T7VEN) bits to 0 to clear the skipping counter.

(a) Example of Interrupt Skipping Function 1 Setting Procedure

Figure 5.9-86 shows an example of the interrupt skipping function 1 setting procedure. **Figure 5.9-87** shows the periods during which interrupt skipping count can be changed.

[1] Set bits T3AEN and T4VEN in the timer interrupt skipping set register 1 (TITCR1A) to 0 to clear the skipping counter.

[2] Set bit TITM in the timer interrupt skipping mode register (TITMRA) to 0 to select interrupt skipping function 1.

[3] Specify the interrupt skipping count within the range from 0 to 7 times in bits T3ACOR2 to T3ACOR0 and T4VCOR2 to T4VCOR0 in TITCR1A, and enable interrupt skipping through bits T3AEN and T4VEN.

Note: The setting of TITCR1A must be done while the TGIA3 and TCIV4 interrupt requests are disabled by the settings of MTU3.TIER and MTU4.TIER under the conditions in which a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN and T4VEN bits to 0 to clear the skipping counter.

Figure 5.9-86 Example of Interrupt Skipping Function 1 Setting Procedure

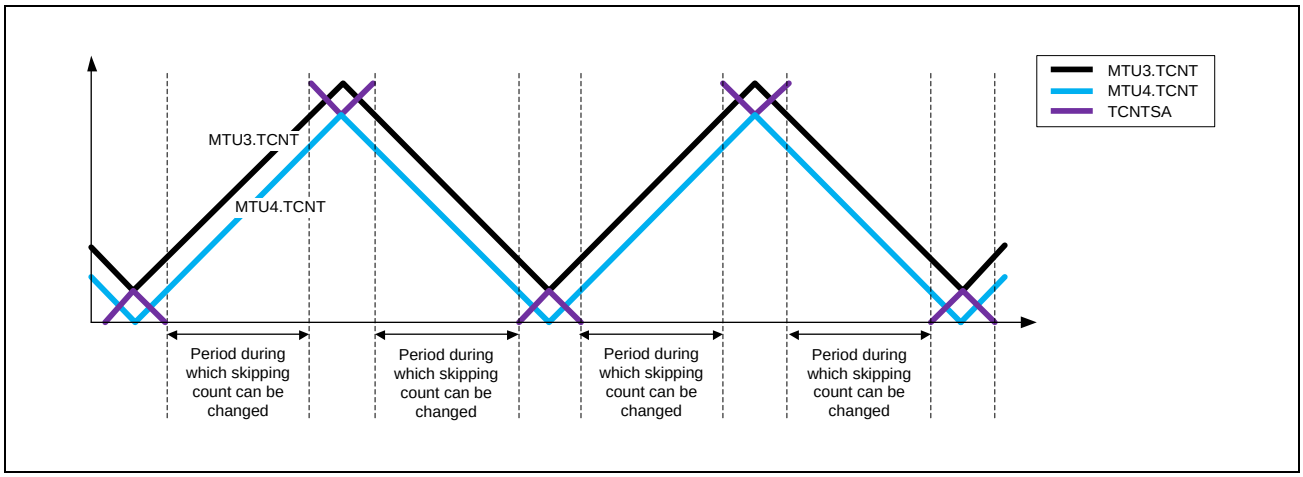


Figure 5.9-87 Periods during which Interrupt Skipping Count can be Changed

(b) Example of Interrupt Skipping Function 1

Figure 5.9-88 shows an example of TGIA3 (TGIA6) interrupt skipping in which the interrupt skipping count is set to three by the T3ACOR (T6ACOR) bits and the T3AEN (T6AEN) bit is set to 1 in the TITCR1A (TITCR1B) register.

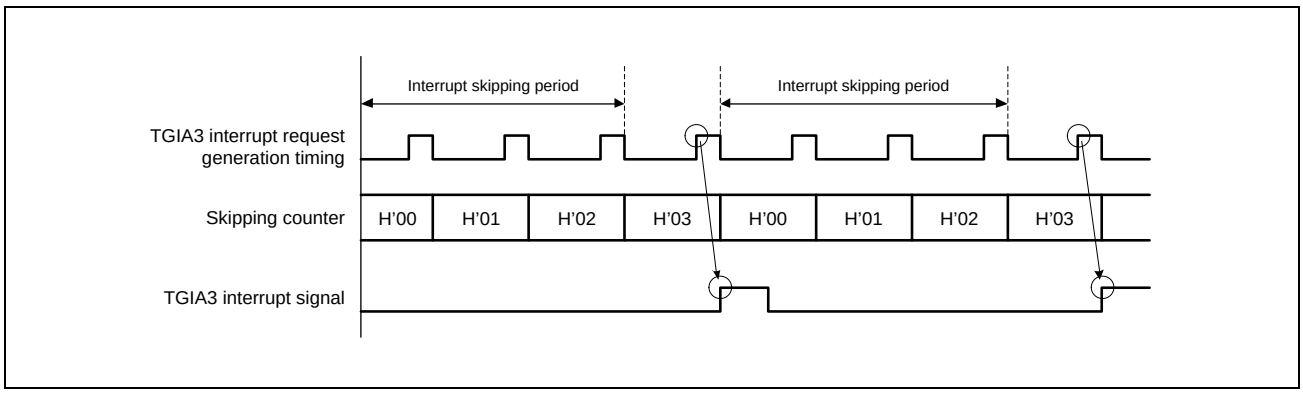

Figure 5.9-88 Example of Interrupt Skipping Function 1

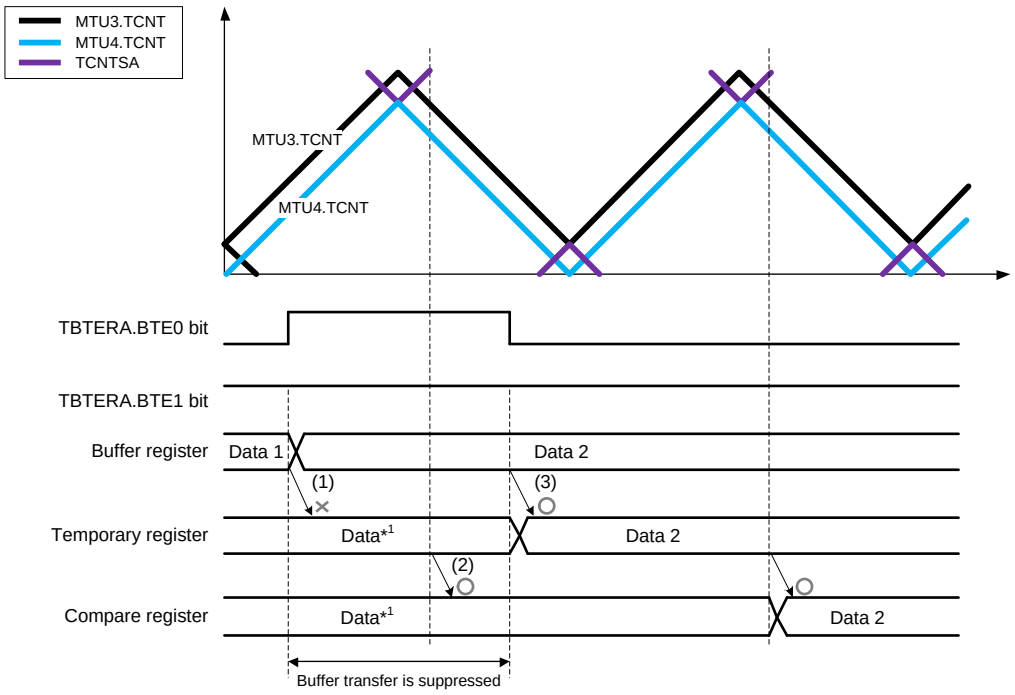
(c) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE[1:0] bits in the TBTERA (TBTERB) register.

Figure 5.9-89 shows an example of operation when buffer transfer is disabled (BTE[1:0] = 01b). While this setting is valid, data is not transferred from the buffer register to the temporary register.

Figure 5.9-90 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b). While this setting is valid, data is not transferred from the buffer register outside the buffer transfer-enabled period.



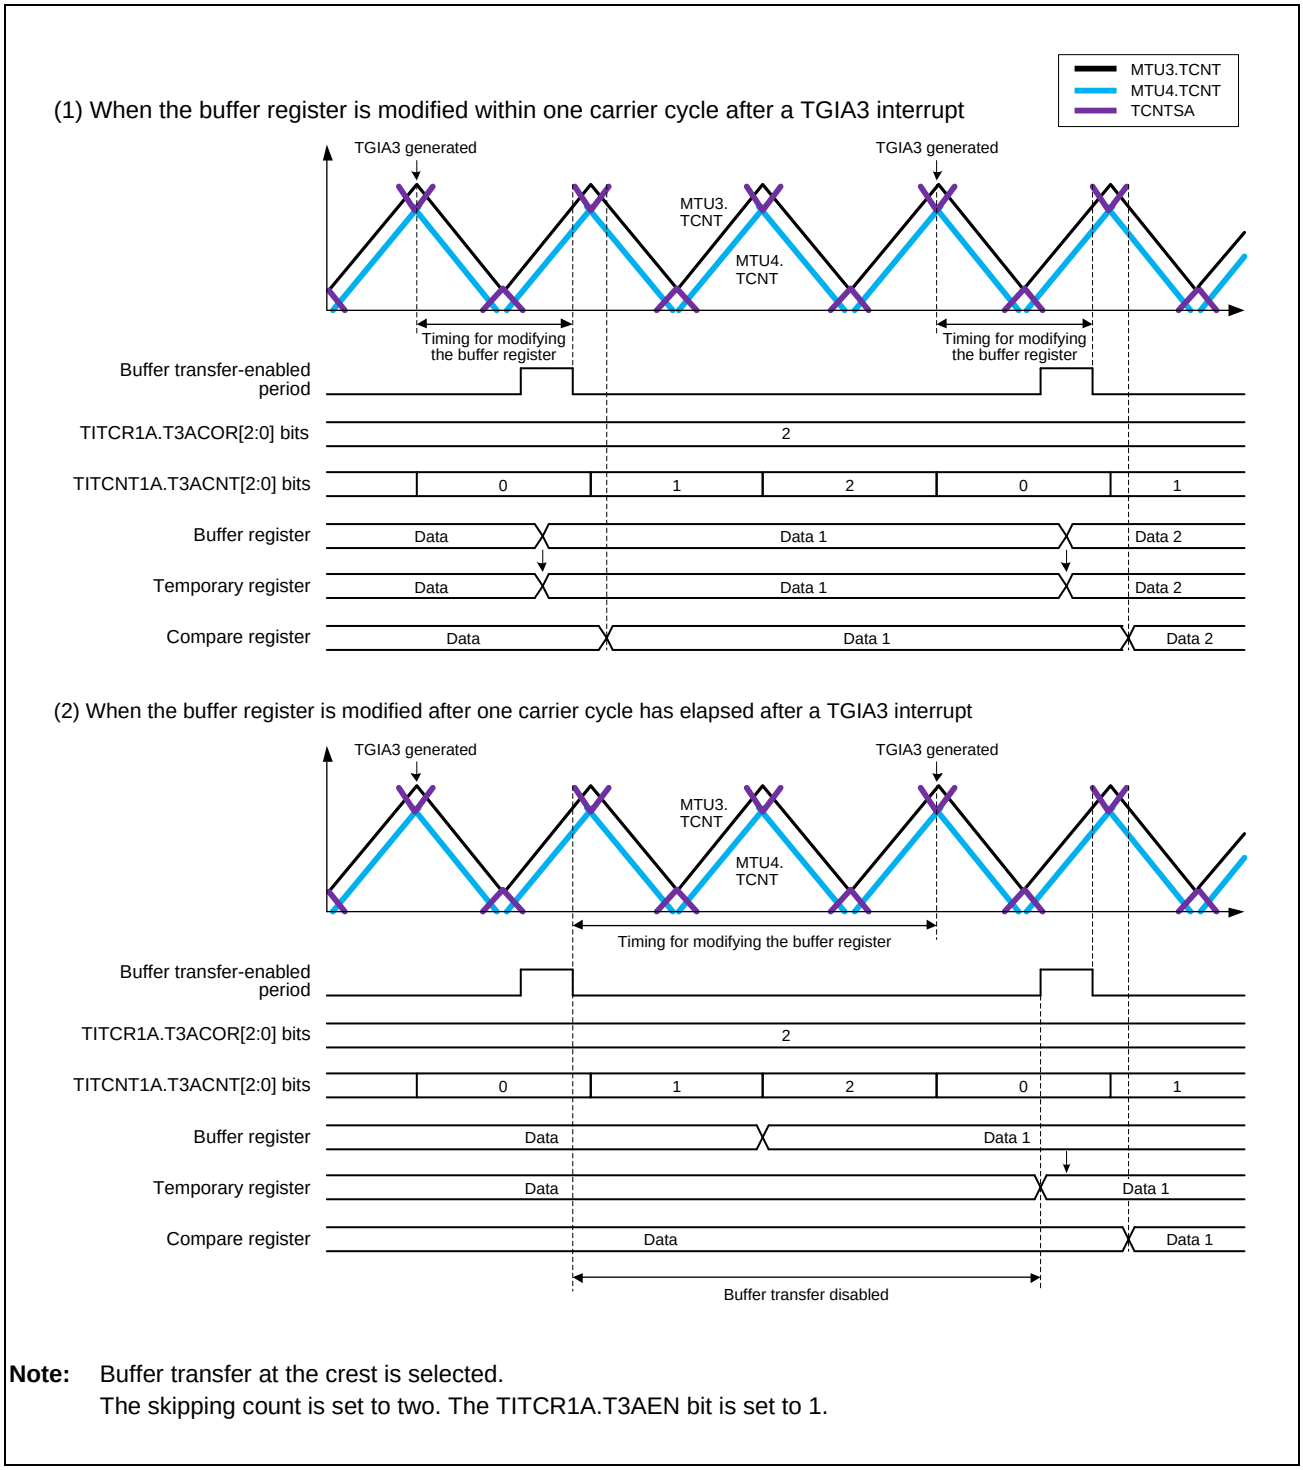
Note that the buffer transfer-enabled period differs depending on whether only the T3AEN (T6AEN) bit in the TITCR1A (TITCR1B) register is set to 1, only the T4VEN (T7VEN) bit in the TITCR1A (TITCR1B) register is set to 1, or both the T3AEN and T4VEN (T6AEN and T7VEN) bits are set to 1. **Figure 5.9-91** shows the relationship between the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in TITCR1A (TITCR1B) and buffer transfer-enabled period.

NOTE

This function must be used in combination with interrupt skipping function 1.

When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that buffer transfer is not linked with interrupt skipping (clear the BTE1 bit in TBTERA or TBTERB to 0).

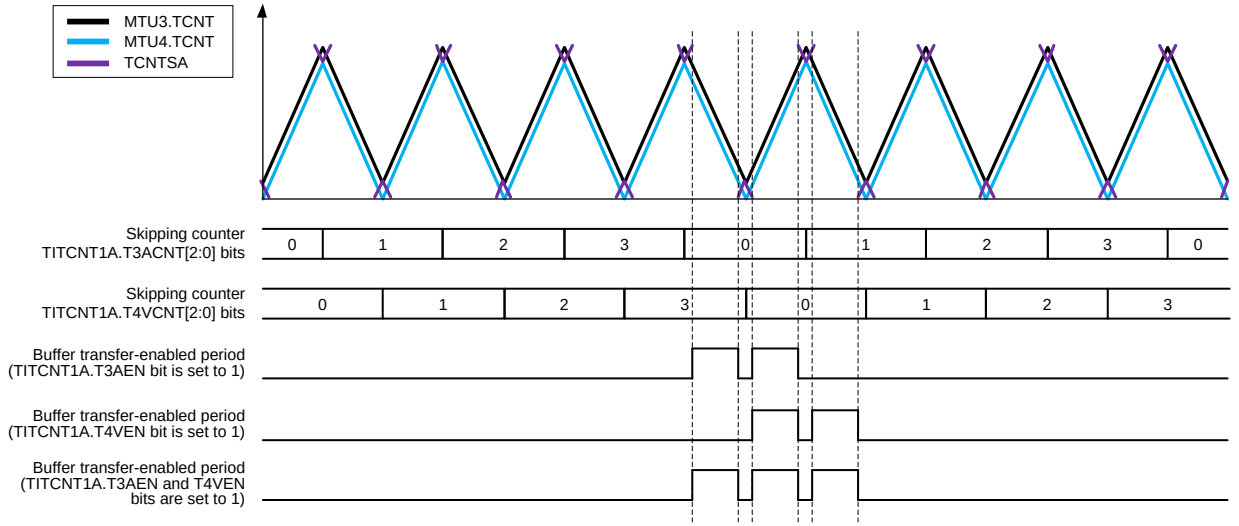
If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.



(1) No data is transferred from the buffer register to the temporary register in the buffer transfer-disabled period (bits BTE[1:0] in TBTERA are set to 01b).

(2) Data is transferred from the temporary register to the compare register even in the buffer transfer-disabled period.

(3) After buffer transfer is enabled, data is transferred from the buffer register to the temporary register.



Note 1. When buffer transfer at the crest is selected.

Figure 5.9-89 Example of Operation When Buffer Transfer is Disabled (BTE[1:0] = 01b)

Note: Buffer transfer at the crest is selected.
The skipping count is set to two. The TITCR1A.T3AEN bit is set to 1.

Figure 5.9-90 Example of Operation When Buffer Transfer is Linked with Interrupt Skipping (BTE[1:0] = 10b)

Note: The skipping count is set to three.
Buffer operation is set to transfer at the crest and trough.

Figure 5.9-91 Relationship between Bits T3AEN and T4VEN in TITCR1A and Buffer Transfer-Enabled Period

(4) Complementary PWM Mode Output Protection Functions

The following output protection functions are provided for complementary PWM mode.

(a) Register and Counter Miswrite Prevention Function

Access from the CPU to the mode registers, control registers, compare registers, and counters can be enabled or disabled by setting the RWE bit in the TRWERA (TRWERB) register. The applicable registers are some of the registers in MTU3, MTU4, MTU6, and MTU7 shown below:

MTU3.TCR, MTU4.TCR, MTU3.TCR2, MTU4.TCR2, MTU3.TMDR1, MTU4.TMDR1, MTU3.TIORH, MTU4.TIORH, MTU3.TIORL, MTU4.TIORL, MTU3.TIER, MTU4.TIER, MTU3.TCNT, MTU4.TCNT, MTU3.TGRA, MTU4.TGRA, MTU3.TGRB, MTU4.TGRB, MTU.TOERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA MTU6.TCR, MTU7.TCR, MTU6.TCR2, MTU7.TCR2, MTU6.TMDR1, MTU7.TMDR1, MTU6.TIORH, MTU7.TIORH, MTU6.TIORL, MTU7.TIORL, MTU6.TIER, MTU7.TIER, MTU6.TCNT, MTU7.TCNT, MTU6.TGRA, MTU7.TGRA, MTU6.TGRB, MTU7.TGRB, MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TCDRB, and MTU.TDDRB

47 registers in total

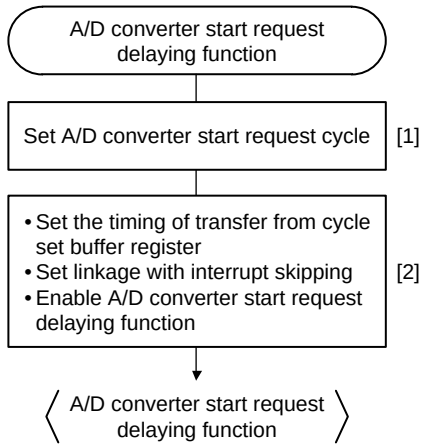
This function can disable CPU access to the mode registers, control registers, and counters to prevent miswriting due to CPU runaway. In the access-disabled state, the applicable registers are read as undefined and writing to these registers is ignored.

(b) Halting of PWM Output by External Signal

The PWM output pins of MTU0, MTU3, MTU4, MTU6, and MTU7 can be set to the high-impedance state automatically.

See **5.10 Port Output Enable 3 (POE3)**, for details.

5.9.3.9 A/D Converter Start Request Delaying Function



A/D converter start requests can be issued in MTU4 or MTU7 by making settings in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB).

The A/D converter start request delaying function compares MTU4.TCNT with MTU4.TADCORA or MTU4.TADCORB (MTU7.TCNT with MTU7.TADCORA or MTU7.TADCORB), and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN (TRG7AN or TRG7BN)).

A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be skipped in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the TADCR register in MTU4 (the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in the TADCR register in MTU7).

(1) Example of Procedure for Specifying A/D Converter Start Request Delaying Function

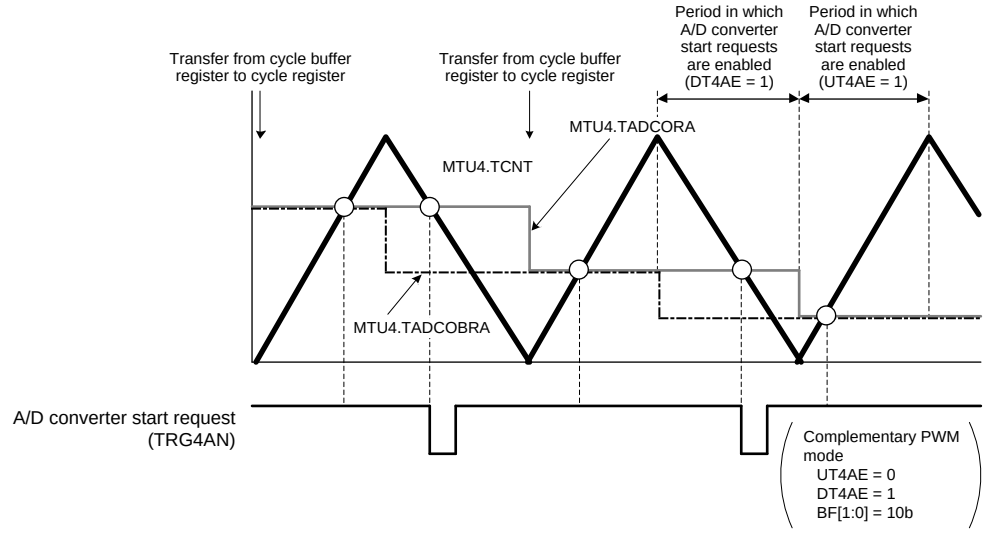
Figure 5.9-92 shows an example of procedure for specifying the A/D converter start request delaying function.

[1] Set the cycle in the timer A/D converter start request cycle buffer register (MTU4.TADCOBRA or MTU4.TADCOBRB) and timer A/D converter start request cycle register (MTU4.TADCORA or MTU4.TADCORB).
(When the timing of transfer from the cycle buffer register to cycle register is set to the trough, or both trough and crest in step [2] below, the same initial value must be specified in the cycle buffer register and cycle register because transfer is performed immediately after counting starts.)

[2] Use bits BF[1:0] in the timer A/D converter start request control register (TADCR in MTU4) to specify the timing of transfer from the timer A/D converter start request cycle buffer register to the A/D converter start request cycle register.
- Specify whether to link with interrupt skipping through bits ITA3AE, ITA4VE, ITB3AE, and ITB4VE.
- Use bits UT4AE, DT4AE, UT4BE, and DT4BE to enable A/D converter start requests (TRG4AN or TRG4BN).

Note 1. Set up TADCR in MTU4 while TCNT in MTU4 is stopped.

Note 2. Set bit BF1 of TADCR in MTU4 to 0 when complementary PWM mode is not selected.



Note 3. Set bits ITA3AE, ITA4VE, ITB3AE, ITB4VE, DT4AE, and DT4BE to 0 when complementary PWM mode is not selected.

Note 4. Set bits ITA3AE, ITA4VE, ITB3AE, and ITB4VE to 0 when interrupt skipping is disabled.

Figure 5.9-92 Example of Procedure for Specifying A/D Converter Start Request Delaying Function (MTU3 and MTU4)

(2) Basic Example of A/D Converter Start Request Delaying Function Operation

Figure 5.9-93 shows a basic example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when the trough of MTU4.TCNT (MTU7.TCNT) is specified for the buffer transfer timing and an A/D converter start request signal is output during MTU4.TCNT (MTU7.TCNT) down-counting.

Period in which A/D converter start requests are enabled (UT4AE = 1): 0 ≤ MTU4.TCNT ≤ TCDR – 1
Period in which A/D converter start requests are enabled (DT4AE = 1): TCDR ≥ MTU4.TCNT ≥ 1
UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Figure 5.9-93 Basic Example of A/D Converter Start Request Signal (TRG4AN) Operation

(3) Period in which A/D Converter Start Requests are Enabled

An A/D converter start request (TRG4AN or TRG4BN) can be issued when the TCNT counter value in MTU4 (MTU7) matches the value of the corresponding cycle set register (TADCORA or TADCORB) in MTU4 (MTU7) within the period specified by the UT4AE or UT4BE (UT7AE or UT7BE) bit of TADCR in MTU4 (MTU7).

When the UT4AE or UT4BE (UT7AE or UT7BE) bit is set to 1 in complementary PWM mode, issuing of AD converter start requests is enabled for the period of TCNT up-counting (0 ≤ TCNT ≤ TCDR - 1) in MTU4 (MTU7). When the DT4AE or DT4BE (DT7AE or DT7BE) bit is set to 1, issuing of AD converter start requests is enabled for the period of TCNT down-counting (TCDR ≥ TCNT ≥ 1) in MTU4 (MTU7) (**Figure 5.9-93**).

(4) Buffer Transfer

The data in the timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB) is updated by writing data to the timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF[1:0] bits in the MTU4.TADCR (MTU7.TADCR) register.

In complementary PWM mode, data is also transferred from the timer A/D converter start request cycle set buffer registers to the timer A/D converter start request cycle set registers when MTU4.TGRD (MTU7.TGRD) register is updated.

When using buffer transfer in complementary PWM mode, pay attention to the buffer transfer timing. For details, refer to **5.9.6.26 Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode**. When complementary PWM mode is not selected, be sure to clear the BF1 bit of the TADCR register in MTU4 or MTU7.

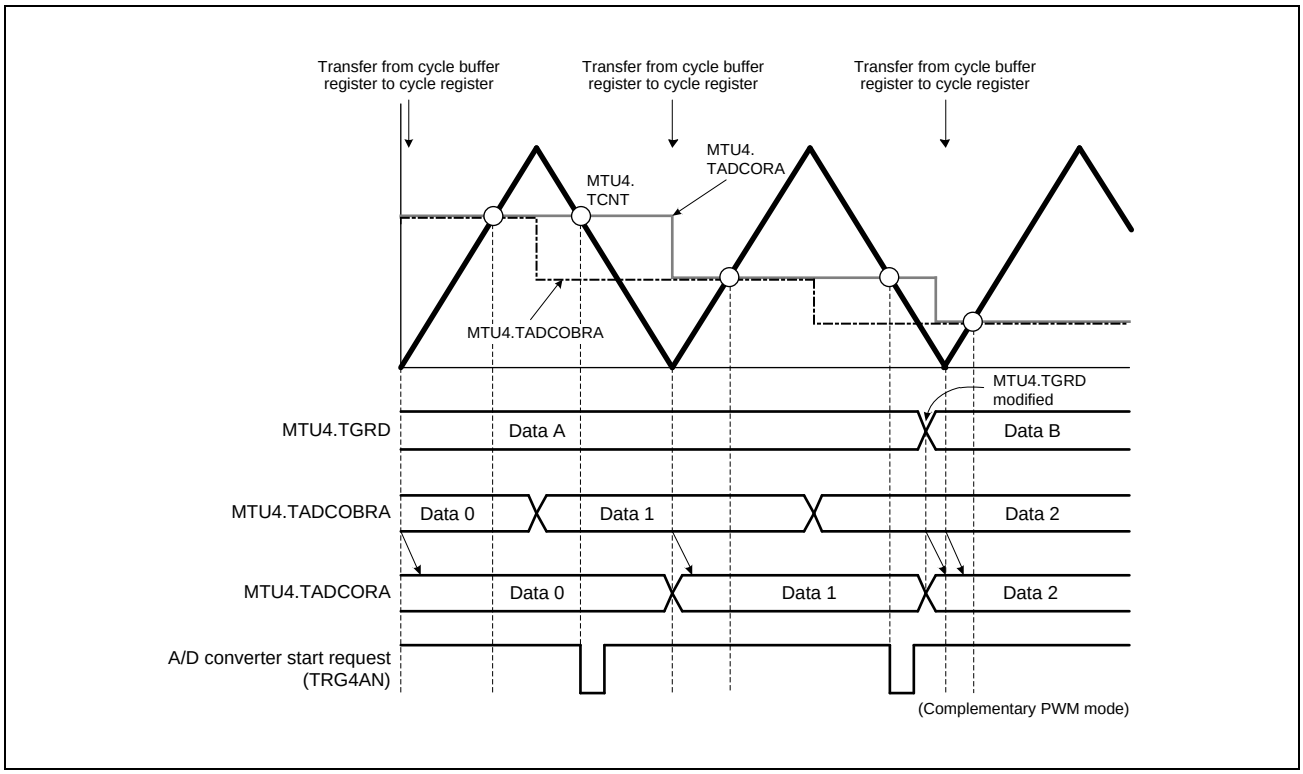


Figure 5.9-94 Example of A/D Converter Start Request Signal (TRG4AN) and Buffer Transfer Operation

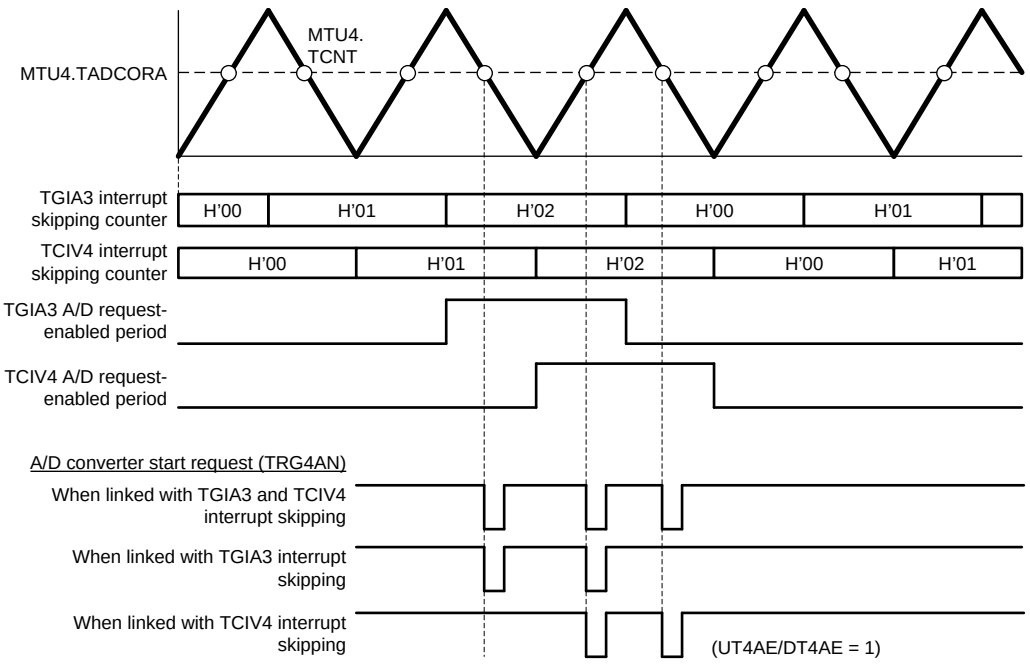
(5) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1

In complementary PWM mode, A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be issued in coordination with interrupt skipping 1 by setting the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits of the TADCR register in MTU4 (MTU7).

Figure 5.9-95 shows an example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and down-counting and A/D converter start requests are linked with interrupt skipping 1.

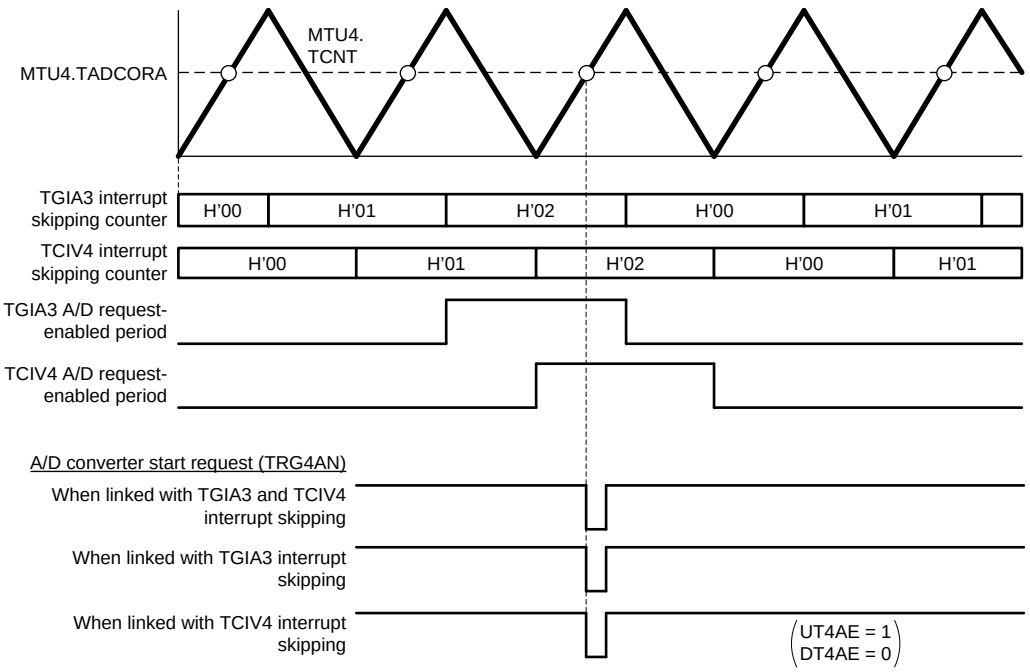
Figure 5.9-96 shows another example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and A/D converter start requests are linked with interrupt skipping 1.



When complementary PWM mode is not selected, A/D converter start request delaying function cannot be used in coordination with interrupt skipping 1; clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits of the TADCR register to 0 in MTU4 (MTU7).

NOTE

This function should be used in combination with interrupt skipping 1.



When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register (TITCR1A (TITCR1B)) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that A/D converter start requests are not linked with interrupt skipping 1 (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) to 0).

When this function is used, MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) should be set with the value ranging H'0002 to the value set in TCDRA minus 2 (value set in TCDRB minus 2).

Note: When the interrupt skipping count is set to two.

Figure 5.9-95 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE and DT4AE = 1)

Note: When the interrupt skipping count is set to two.

Figure 5.9-96 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE = 1, DT4AE = 0)

(6) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 2

By setting the TITM bit to 1 in the TITMRA (TITMRB) register, the counter starts down-counting from the value (0 to 7) set in the TRG4COR[2:0] (TRG7COR[2:0]) bits in TITCR2A (TITCR2B) register every time an A/D converter start trigger (TRG4AN or TRG4BN (TRG7AN or TRG7BN)) is generated. When the counter value reaches 0 and is reloaded, the TRG4AN and TRG4BN (TRG7AN and TRG7BN) interrupts become valid and an A/D converter start request signal (TRG4ABN (TRG7ABN)) is output.

This function is valid only when the A/D converter request delaying function is enabled.

(a) Example of Procedure for Setting Interrupt Skipping Function 2

Figure 5.9-97 shows an example of procedure for setting interrupt skipping function 2.

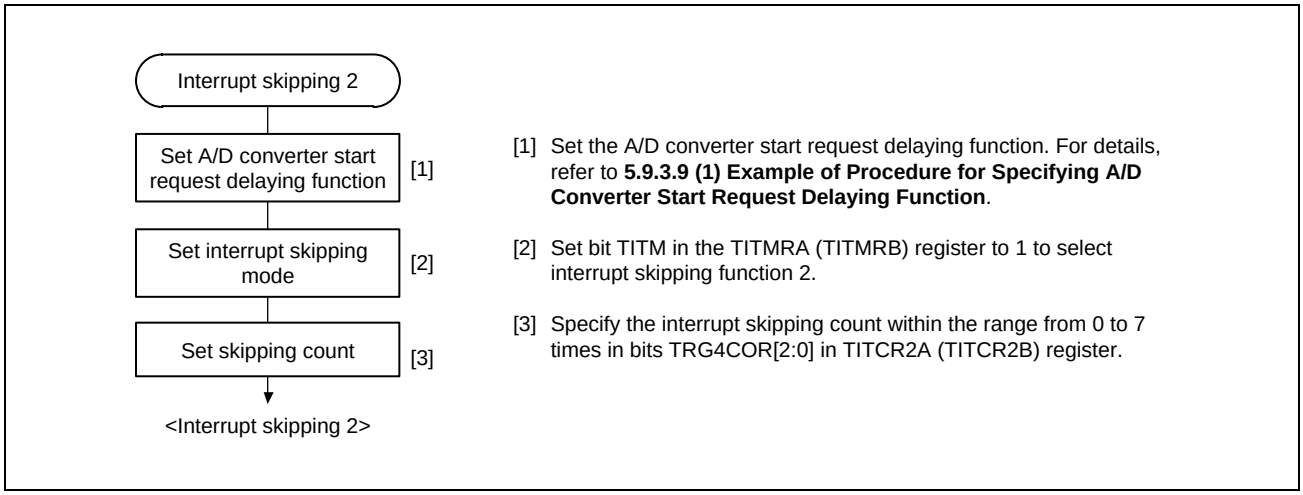


Figure 5.9-97 Example of Procedure for Setting Interrupt Skipping Function 2

(b) Example of Interrupt Skipping Function 2 Operation

Figure 5.9-98 shows an example of interrupt skipping 2 operation.

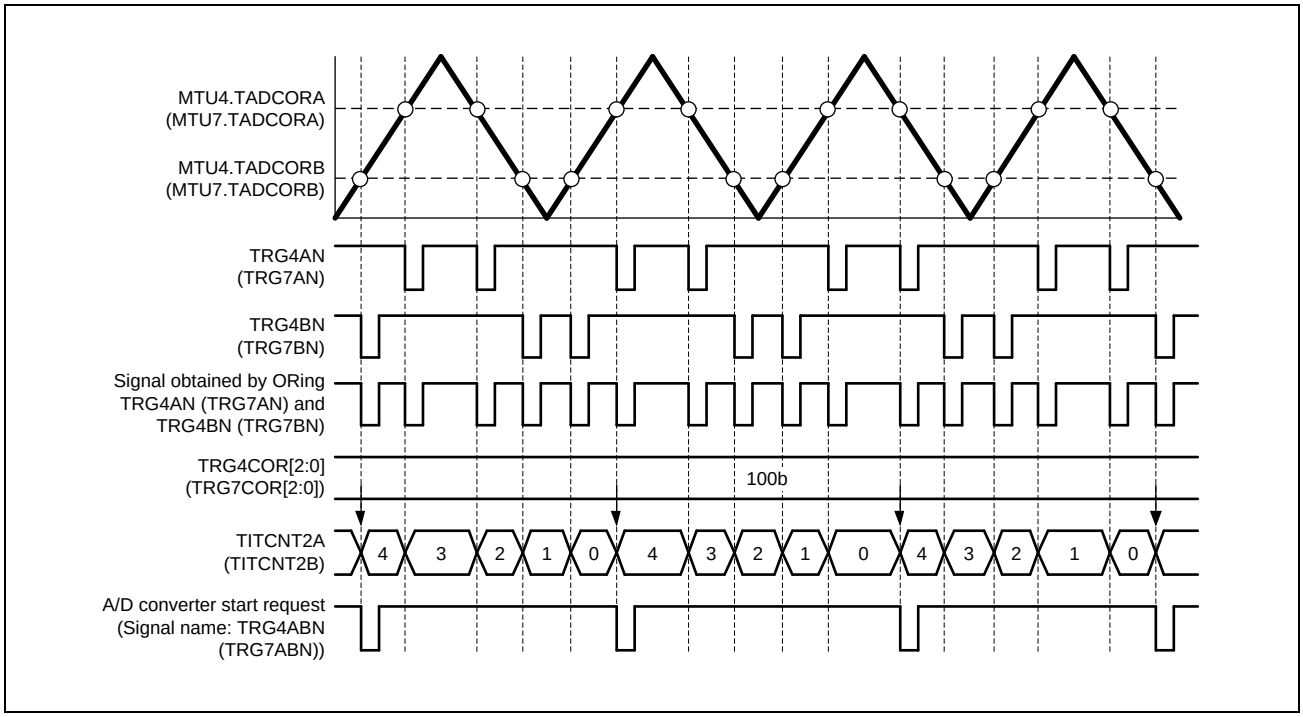

Figure 5.9-98 Example of Interrupt Skipping 2 Operation (Skipping Count is Set to Four)

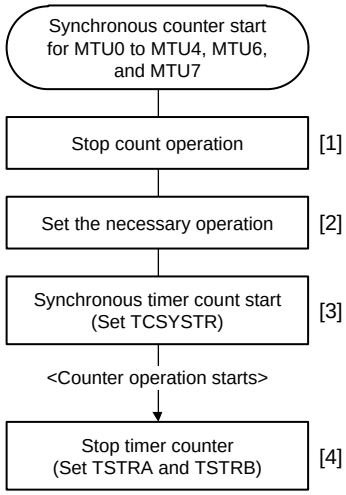


5.9.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7

(1) Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

The counters in MTU0 to MTU4, MTU6, and MTU7 can be started synchronously by making the TCSYSTR settings.

(a) Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

Figure 5.9-99 shows an example of the procedure for specifying synchronous counter start in MTU0 to MTU4, MTU6, and MTU7.

[1] Set TSTRA and TSTRB to stop the counters used for synchronous start operation.

[2] Specify the necessary operation with appropriate registers such as TCR, TMDR1, and TMDR2.

[3] In TCSYSTR, set the bits corresponding to the counters to be started synchronously to 1 at the same time. When TCSYSTR is set, TSTRA and TSTRB for the target timer counters are automatically set appropriately, the counters start synchronously, and TCSYSTR is automatically cleared.

[4] To stop a timer counter, clear the bit in TSTRA or TSTRB that corresponds to the counter to 0.

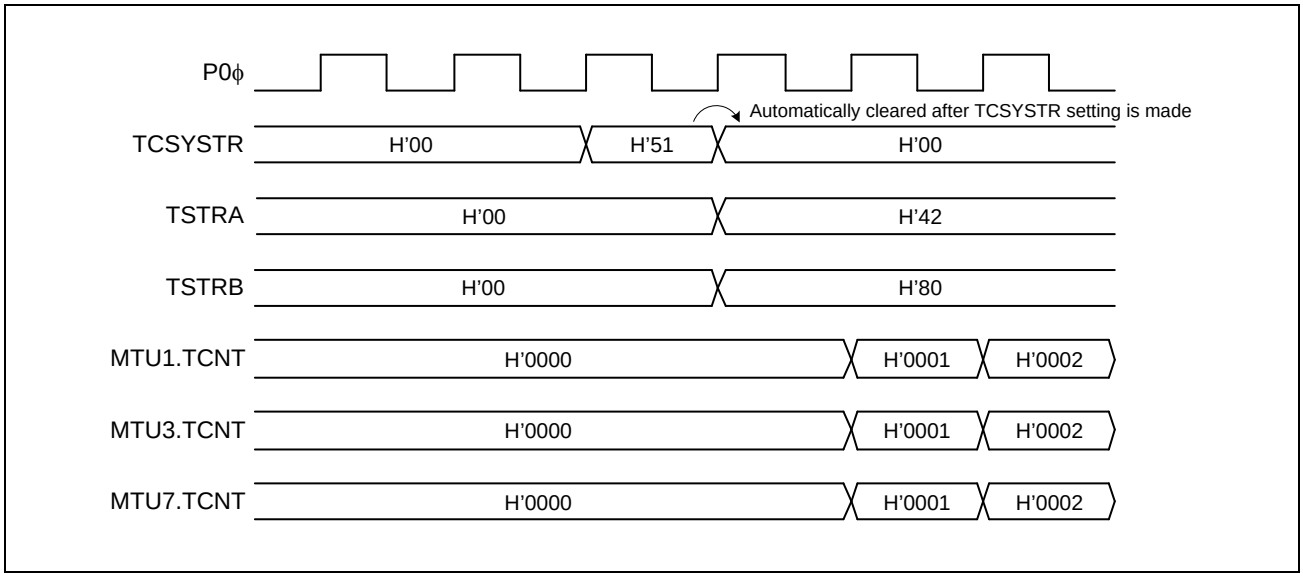
Note 1. Clearing a bit in TCSYSTR corresponding to an operating counter to 0 does not stop the counter.

Note 2. To start counters synchronously in reset-synchronized PWM mode or complementary PWM mode using MTU3 and MTU4 or MTU6 and MTU7, set the bits in TCSYSTR that correspond to MTU 3 to MTU4, MTU6, and MTU7 to 1 at the same time.

Figure 5.9-99 Example of Procedure for Specifying Synchronous Counter Start in MTU0 to MTU4, MTU6, and MTU7

(b) Examples of Synchronous Counter Start Operation

Figure 5.9-100 shows an example of the synchronous counter start operation in MTU0 to MTU4, MTU6, and MTU7.



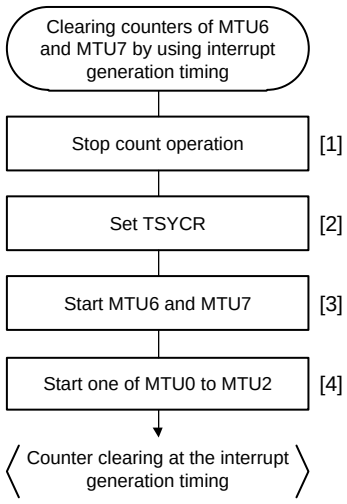


Figure 5.9-100 Example of Synchronous Counter Start Operation in MTU0 to MTU4, MTU6, and MTU7

(2) Synchronous Counter Clearing for MTU6 and MTU7

The counters in MTU6 and MTU7 can be cleared by the TGImn interrupt generation timing (m = A to D; n = 0 to 2) through the TSYCR setting.

(a) Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

Figure 5.9-101 shows an example of the procedure for specifying synchronous counter clearing in MTU6 and MTU7 by using the interrupt generation timing.

[1] Set TSTRA and TSTRB to stop the counters used for this function.

[2] Use TSYCR to specify the source to be used for the MTU6.TCNT and MTU7.TCN counter clearing.

[3] Start MTU6.TCNT or MTU7.TCNT.

[4] Start MTU0.TCNT, MTU1.TCNT, or MTU2.TCNT.

Note: The TSYCR setting is ignored while the counter is stopped. The setting becomes valid after MTU6.TCNT or MTU7.TCNT is started.

Figure 5.9-101 Example of Procedure for Specifying Synchronous Counter Clearing in MTU6 and MTU7

(b) Examples of Synchronous Counter Clearing in MTU6 and MTU7

Figure 5.9-102 and **Figure 5.9-103** show examples of synchronous counter clearing in MTU6 and MTU7 by using the interrupt generation timing.

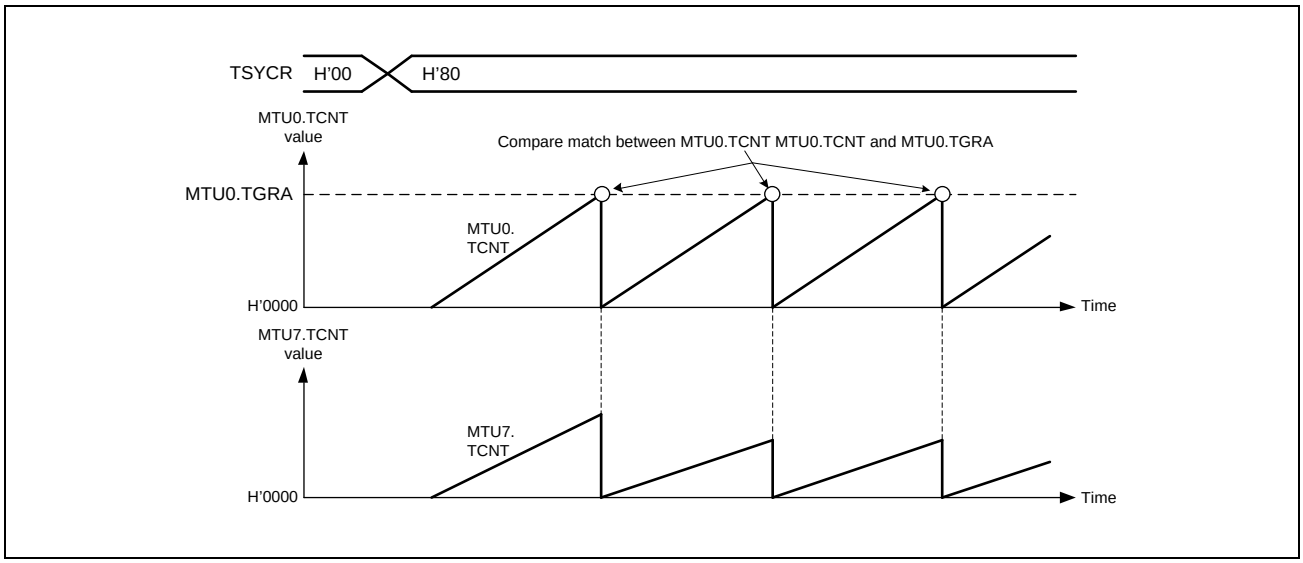

Figure 5.9-102 Example of Synchronous Counter Clearing in MTU6 and MTU7 (1)

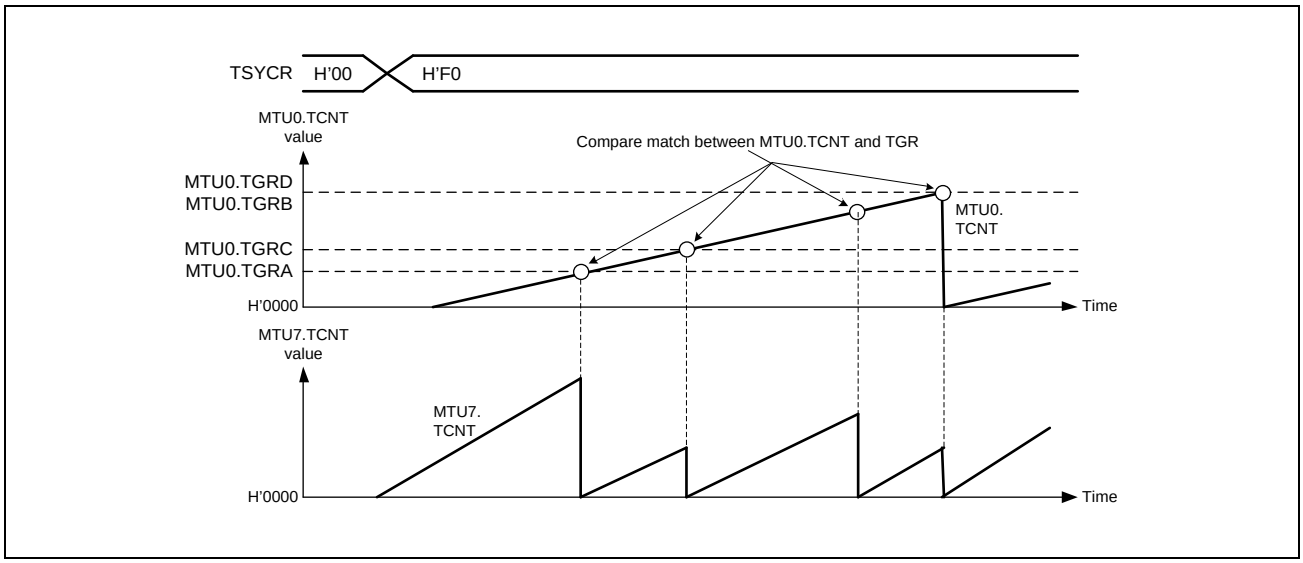

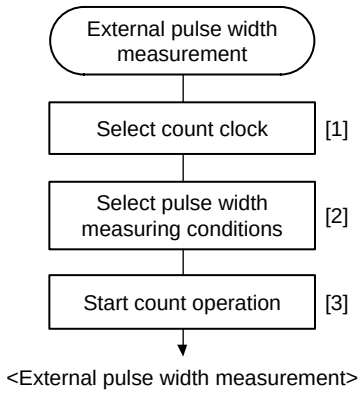

Figure 5.9-103 Example of Synchronous Counter Clearing in MTU6 and MTU7 (2)

5.9.3.11 External Pulse Width Measurement

The pulse widths of up to three external input lines can be measured in MTU5.

When the IOC[4:0] bits in MTU5.TIORU, MTU5.TIORV, MTU5.TIORW are set for pulse width measurement, the pulse width of the signal input to the MTIC5U, MTIC5V, and MTIC5W pins are measured. TCNTU, TCNTV, and TCNTW count up while the level specified by the IOC[4:0] bits is input.

Figure 5.9-104 shows an example of setting external pulse width measurement, and **Figure 5.9-105** an example of external pulse width measurement.

[1] Use the TPSC1 and TPSC0 bits in MTU5.TCRU, MTU5.TCRV, or MTU5.TCRW to select the count clock.

[2] In MTU5.TIORU, MTU5.TIORV, or MTU5.TIORW, select the high level or low level for the pulse width measuring condition.

[3] Set bit CSTU5, CSTV5, or CSTW5 in MTU5.TSTR to 1 to start count operation.

Note: When MTU6 and MTU7 are not operating in complementary PWM mode, note the following 1 to 3.
1. Set the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCMPCLR register to 0.
2. Set the TGIE5U, TGIE5V, and TGIE5W bits in MTU5.TIER to 0.
3. The TCNT value is not captured in the TGR register.

Figure 5.9-104 Example of External Pulse Width Measurement Setting Procedure

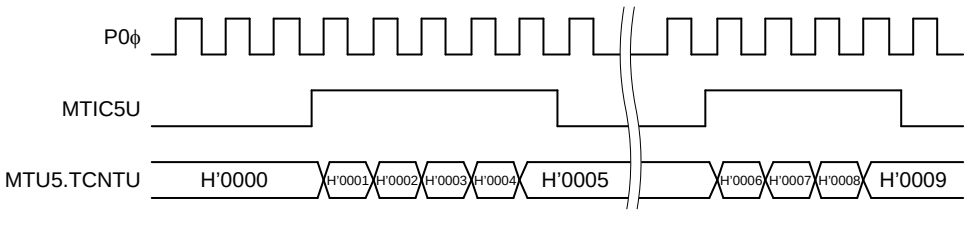

Figure 5.9-105 Example of External Pulse Width Measurement (Measuring High Pulse Width)

5.9.3.12 Dead Time Compensation

MTU5 to MTU7 can be used in combination to compensate for the delay in the dead time (the delay between complementary PWM output and inverter output).

Figure 5.9-106 shows an example of a motor control circuit in which the combination of MTU5 to MTU7 is used to compensate for the dead time delay.

The external pulse measurement function of MTU5 allows the specification of a correction to the duty cycle specified in the PWM output compare registers by measuring the delay between the complementary PWM output and inverter output. This can be used for dead time compensation for the PWM output waveform during complementary PWM operation of MTU6 and MTU7 (**Figure 5.9-107**).

Figure 5.9-108 shows the procedure for setting dead time compensation using MTU5 to MTU7. For details on MTU5 operation at this time, refer to **5.9.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode**.

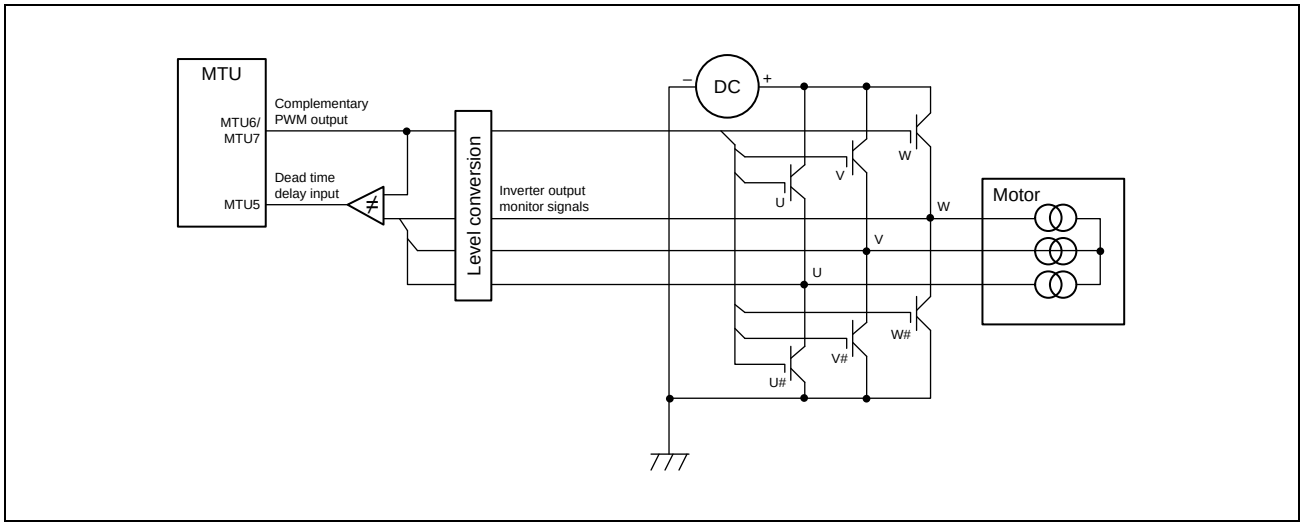

Figure 5.9-106 Motor Control Circuit Example

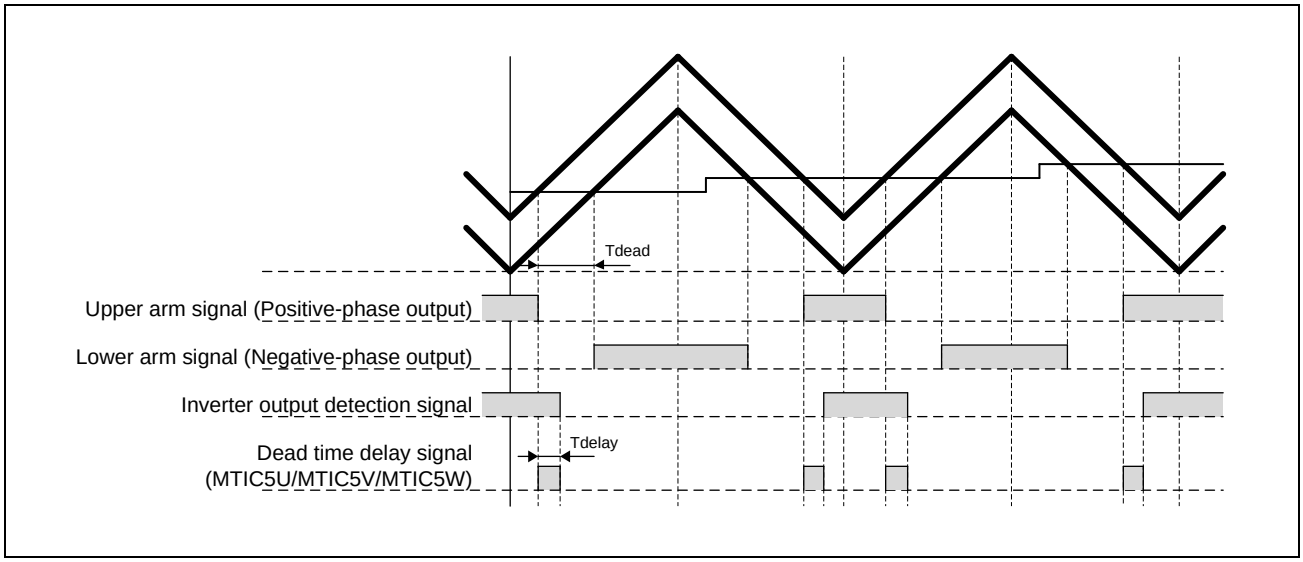

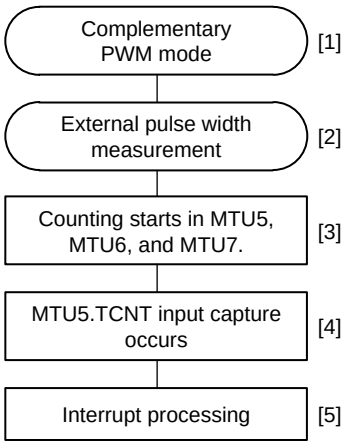

Figure 5.9-107 Delay in Dead Time in Complementary PWM Operation

(1) Example of Dead Time Compensation Setting Procedure

Figure 5.9-108 shows an example of dead time compensation setting procedure by using three counters in MTU5.

[1] Set MTU6 and MTU7 to complementary PWM mode. For details, refer to **5.9.3.8 Complementary PWM Mode**.

[2] Specify the external pulse width measurement function for the target TIOR in MTU5. For details, refer to **5.9.3.11 External Pulse Width Measurement**.

[3] Set bits CST6 and CST7 in TSTRB and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR to 1 to start count operation.

[4] When the capture condition specified in TIOR is satisfied, the MTU5.TCNT value is captured in MTU5.TGR.
To prevent the generation of the MTU5.TGIm5 interrupt (m = U, V, W) request under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

[5] For U-phase dead time compensation, when an interrupt is generated at the crest (TGIA6) or trough (TCIV7) in complementary PWM mode, read the MTU5.TGRU value, calculate the difference in time between MTU6.TGRB and MTU5.TGRU, and write the corrected value to MTU6.TGRD in the interrupt processing.
For the V phase and W phase, read the MTU5.TGRV and MTU5.TGRW values and write the corrected values to MTU7.TGRC and TGRD, respectively, in the same way as for U-phase compensation.
The MTU5.TCNT value should be cleared through the TCNTCMPCLR setting or by software.

Note: The port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports should be set up in advance.
As the interrupt flag is set under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

Figure 5.9-108 Example of Dead Time Compensation Setting Procedure

5.9.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode

The external pulse width measurement function of MTU5 can be used to transfer the values of TCNTU, TCNTV, and TCNTW to TGRU, TGRV, and TGRW at the crests, troughs, or both crests and troughs of the complementary PWM output when MTU6 and MTU7 are being used in complementary PWM mode. The type of transfer timing is specified in TIORU, TIORV, and TIORW. When the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCNPCLR register are set to 1, TCNTU, TCNTV, and TCNTW are cleared to H'0000 at the timing for transfer to TGRU, TGRV, and TGRW.

Note that the TCNTU, TCNTV, and TCNTW capture operation at the crest and/or trough of complementary PWM output in MTU5 is not available when MTU3 and MTU4 are used in complementary PWM mode.

Figure 5.9-109 shows an operation example in which TCNTU is used as a free-running counter without being cleared and the value is captured in TGRU at the crest and trough in complementary PWM mode.

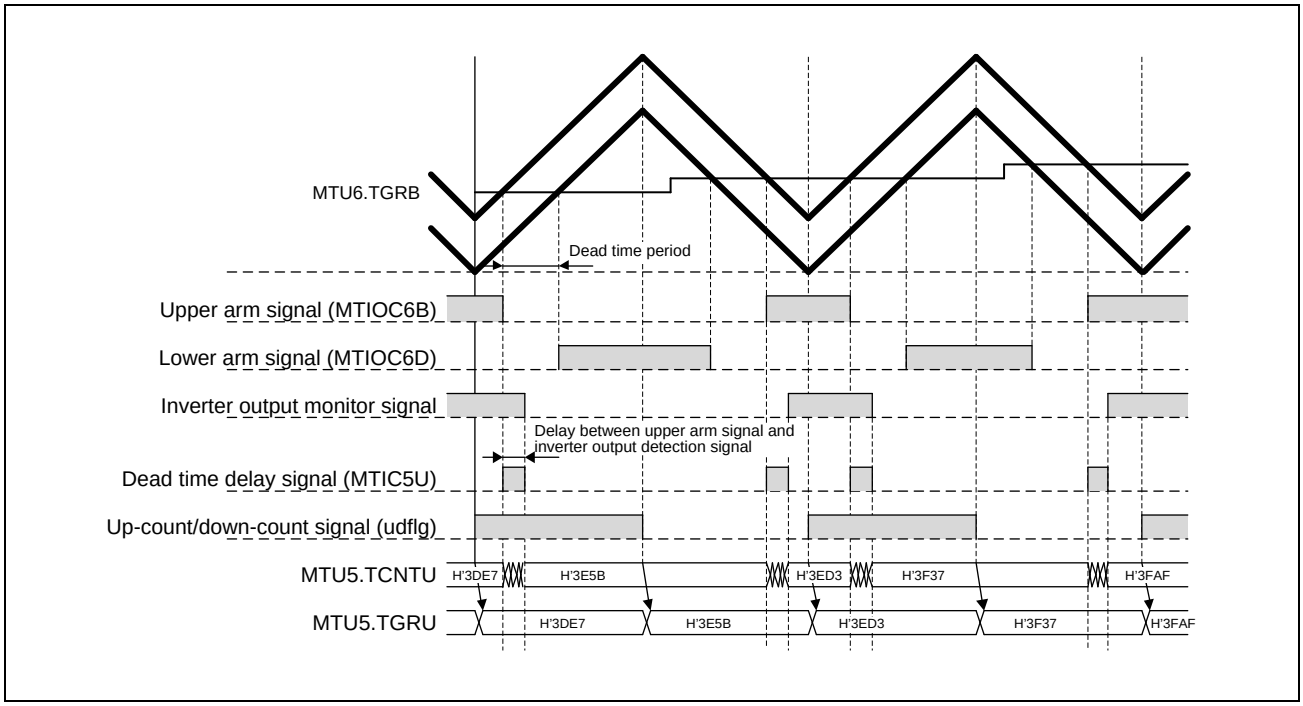

Figure 5.9-109 TCNTU Capture at Crest and Trough in Complementary PWM Operation

5.9.3.14 Noise Filter Function

The input capture input pins and external pulse input pins have a noise filter function.

Set the NFCRn register (n = 0 to 7, C) to enable or disable the noise filter function and set the sampling clock. The noise filter for each pin can be enabled or disabled individually, and the sampling clock can be set for each channel.

Figure 5.9-110 shows the timing of noise filtering.

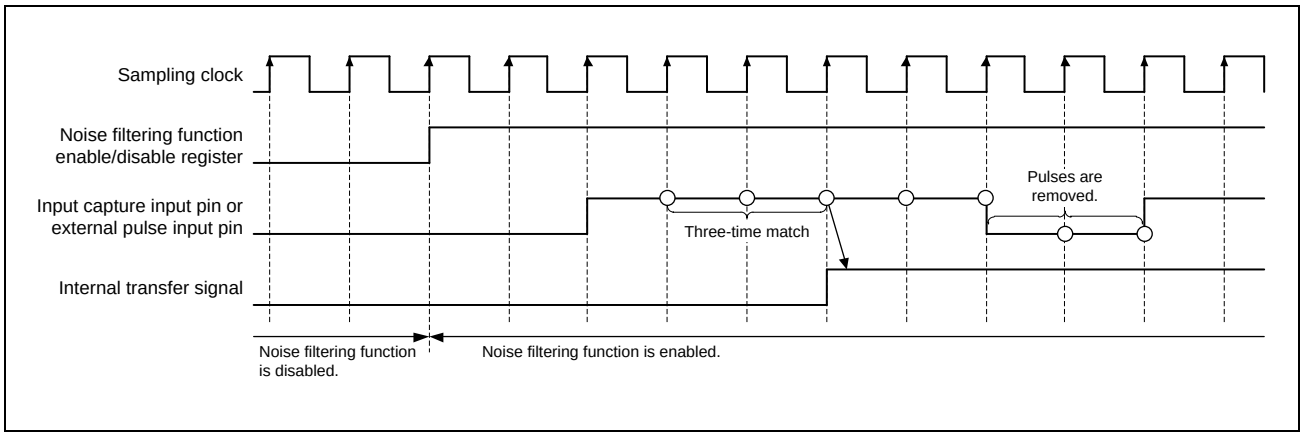

Figure 5.9-110 Timing of Noise Filtering

5.9.4 Interrupt Sources

5.9.4.1 Interrupt Sources and Priorities

There are three kinds of interrupt source; TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt source is generated, if the corresponding enable/disable bit in TIER is set to 1, an interrupt is requested.

Relative channel priorities can be changed by the interrupt controller; however the priority within a channel is fixed. For details, refer to **4.6 Interrupt Controller**. **Table 5.9-77** lists the MTU interrupt sources.

Table 5.9-77 MTU Interrupt Sources (1/2)

Channel	Name	Interrupt Source	DMAC Activation
MTU0	TGIA0	MTU0.TGRA input capture/compare match	Possible
	TGIB0	MTU0.TGRB input capture/compare match	Possible
	TGIC0	MTU0.TGRC input capture/compare match	Possible
	TGID0	MTU0.TGRD input capture/compare match	Possible
	TCIV0	MTU0.TCNT overflow	Not possible
	TGIE0	MTU0.TGRE compare match	Not possible
	TGIF0	MTU0.TGRF compare match	Not possible
MTU1	TGIA1	MTU1.TGRA input capture/compare match	Possible
	TGIB1	MTU1.TGRB input capture/compare match	Possible
	TCIV1	MTU1.TCNT overflow	Not possible
	TCIU1	MTU1.TCNT underflow	Not possible
MTU2	TGIA2	MTU2.TGRA input capture/compare match	Possible
	TGIB2	MTU2.TGRB input capture/compare match	Possible
	TCIV2	MTU2.TCNT overflow	Not possible
	TCIU2	MTU2.TCNT underflow	Not possible
MTU3	TGIA3	MTU3.TGRA input capture/compare match	Possible
	TGIB3	MTU3.TGRB input capture/compare match	Possible
	TGIC3	MTU3.TGRC input capture/compare match	Possible
	TGID3	MTU3.TGRD input capture/compare match	Possible
	TCIV3	MTU3.TCNT overflow	Not possible
MTU4	TGIA4	MTU4.TGRA input capture/compare match	Possible
	TGIB4	MTU4.TGRB input capture/compare match	Possible
	TGIC4	MTU4.TGRC input capture/compare match	Possible
	TGID4	MTU4.TGRD input capture/compare match	Possible
	TCIV4	MTU4.TCNT overflow/underflow*1	Possible
MTU5	TGIU5	MTU5.TGRU input capture/compare match	Possible
	TGIV5	MTU5.TGRV input capture/compare match	Possible
	TGIW5	MTU5.TGRW input capture/compare match	Possible
MTU6	TGIA6	MTU6.TGRA input capture/compare match	Possible
	TGIB6	MTU6.TGRB input capture/compare match	Possible
	TGIC6	MTU6.TGRC input capture/compare match	Possible
	TGID6	MTU6.TGRD input capture/compare match	Possible
	TCIV6	MTU6.TCNT overflow	Not possible

Table 5.9-77 MTU Interrupt Sources (2/2)

Channel	Name	Interrupt Source	DMAC Activation
MTU7	TGIA7	MTU7.TGRA input capture/compare match	Possible
	TGIB7	MTU7.TGRB input capture/compare match	Possible
	TGIC7	MTU7.TGRC input capture/compare match	Possible
	TGID7	MTU7.TGRD input capture/compare match	Possible
	TCIV7	MTU7.TCNT overflow/underflow*1	Possible
MTU8	TGIA8	MTU8.TGRA input capture/compare match	Possible
	TGIB8	MTU8.TGRB input capture/compare match	Possible
	TGIC8	MTU8.TGRC input capture/compare match	Possible
	TGID8	MTU8.TGRD input capture/compare match	Possible
	TCIV8	MTU8.TCNT overflow	Not possible

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

Note 1. The underflow interrupt source is valid only in complementary PWM mode.

(1) Input Capture/Compare Match Interrupt

If the TIER.TGIE bit is set to 1 when a TGR input capture/compare match occurs on a channel, an interrupt is requested. The MTU has 33 input capture/compare match interrupts (six for MTU0, four each for MTU3, MTU4, MTU6, MTU7, and MTU8, two each for MTU1 and MTU2, and three for MTU5).

(2) Overflow Interrupt

If the TIER.TCIEV bit is set to 1 when a TCNT overflow occurs on a channel, clearing an interrupt is requested. The MTU provides a total of eight overflow interrupts (one for each channel except MTU5).

In complementary PWM mode, an overflow interrupt is generated even when an underflow occurs in TCNT in MTU4 or MTU7.

(3) Underflow Interrupt

If the TIER.TCIEU bit is set to 1 when a TCNT underflow occurs on a channel, an interrupt is requested. The MTU has two underflow interrupts (one each for MTU1, and MTU2).

5.9.4.2 DMAC Activation

(1) DMAC Activation

The DMAC can be activated by the TGR input capture/compare match interrupt and the overflow interrupt in MTU4 and MTU7. For details, see **4.7 Direct Memory Access Controller**.

The MTU provides a total of 33 interrupts (input capture/compare match and overflow interrupts) that can be used as DMAC activation sources: four each for MTU0, MTU3, MTU6, and MTU8, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

5.9.4.3 A/D Converter Activation

The A/D converter can be activated by one of the following three methods in the MTU. **Table 5.9-78** shows the relationship between interrupt sources and A/D converter start request signals.

(1) A/D Converter Activation by TGRA Input Capture/Compare Match or at MTU4.TCNT (MTU7.TCNT) Trough in Complementary PWM Mode

The A/D converter can be activated by the occurrence of a TGRA input capture/compare match in each channel. In addition, if complementary PWM operation is performed while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1, the A/D converter can be activated at the trough of MTU4.TCNT (MTU7.TCNT) count (MTU4.TCNT (MTU7.TCNT) = H'0000).

A/D converter start request signal TRGAnN is issued to the A/D converter under either of the following conditions (n = 0 to 4, 6, or 7).

- When a TGRA input capture/compare match occurs on a channel while the TIER.TTG bit is set to 1
- When the MTU4.TCNT (MTU7.TCNT) count reaches the trough (MTU4.TCNT (MTU7.TCNT) = H'0000) during complementary PWM operation while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1

When either condition is satisfied, if A/D converter start signal TRGAnN from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(2) A/D Converter Activation by Compare Match between MTU0.TCNT and MTU0.TGRE

A/D converter start request signal TRG0N is issued to the A/D converter when a compare match occurs between MTU0.TCNT and MTU0.TGRE.

When a compare match occurs between MTU0.TCNT and MTU0.TGRE in MTU0 while the TTGE2 bit.TIER2 is set to 1, A/D converter start request TGR0N is issued to the A/D converter. If A/D converter start signal TRG0N from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(3) A/D Converter Activation by A/D Converter Start Request Delaying Function

The A/D converter can be activated by generating A/D converter start request signal TRG4AN or TRG4BN (TRG7AN or TRG7BN) when the MTU4.TCNT (MTU7.TCNT) count matches the MTU4.TADCORA or MTU4.TADCORB (MTU7.TADCORA or MTU7.TADCORB) value if the UT4AE, DT4AE, UT4BE, or DT4BE (UT7AE, DT7AE, UT7BE, or DT7BE) bit in the A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) is set to 1. For details, refer to **5.9.3.9 A/D Converter Start Request Delaying Function**.

A/D conversion will start when TRG4AN (TRG7AN) is generated if A/D converter start signal TRG4AN (TRG7AN) from the MTU is selected as the trigger in the A/D converter, when TRG4BN (TRG7BN) is generated if TRG4BN (TRG7BN) from the MTU is selected as the trigger in the A/D converter, or when TRG4ABN (TRG7ABN) is generated if TRG4ABN (TRG7ABN) from the MTU is selected as the trigger in the A/D converter.

Table 5.9-78 Interrupt Sources and A/D Converter Start Request Signals

Target Registers	Interrupt Source	A/D Converter Start Request Signal
MTU0.TGRA and MTU0.TCNT	Input capture/compare match	TRGA0N
MTU1.TGRA and MTU1.TCNT		TRGA1N
MTU2.TGRA and MTU2.TCNT		TRGA2N
MTU3.TGRA and MTU3.TCNT		TRGA3N
MTU4.TGRA and MTU4.TCNT*1		TRGA4N
MTU4.TCNT	MTU4.TCNT trough in complementary PWM mode	
MTU6.TGRA and MTU6.TCNT	Input capture/compare match	TRGA6N
MTU7.TGRA and MTU7.TCNT*1		TRGA7N
MTU7.TCNT	MTU7.TCNT trough in complementary PWM mode	
MTU0.TGRE and MTU0.TCNT	Compare match	TRG0N
MTU4.TADCORA and MTU4.TCNT		TRG4AN
MTU4.TADCORB and MTU4.TCNT		TRG4BN
MTU7.TADCORA and MTU7.TCNT		TRG7AN
MTU7.TADCORB and MTU7.TCNT		TRG7BN
MTU4.TADCORA and MTU4.TCNT, MTU4.TADCORB and MTU4.TCNT	Compare match (interrupt skipping function 2)	TRG4ABN
MTU7.TADCORA and MTU7.TCNT, MTU7.TADCORB and MTU7.TCNT		TRG7ABN

Note 1. Since PWM waveforms are generated in complementary PWM mode, MTU4.TGRA (MTU7.TGRA) compare match not only with MTU4.TCNT (MTU7.TCNT) but also with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) is detected. Accordingly, when compare match with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) occurs, TRGA4N (TRGA7N) is also generated.
When MTU3 and MTU 4 (MTU 6 and MTU7) are made to operate in complementary PWM mode for generating an A/D converter start request, use the A/D converter start request by compare match between MTU4.TCNT (MTU7.TCNT) and MTU4.TADCORA or TADCORB (MTU7.TADCORA or TADCORB).

5.9.5 Operation Timing

5.9.5.1 Input/Output Timing

(1) TCNT Count Timing

Figure 5.9-111 and **Figure 5.9-112** show the TCNT count timing in internal clock operation, **Figure 5.9-113** shows the TCNT count timing in external clock operation (normal mode), and **Figure 5.9-114** shows the TCNT count timing in external clock operation (phase counting mode).

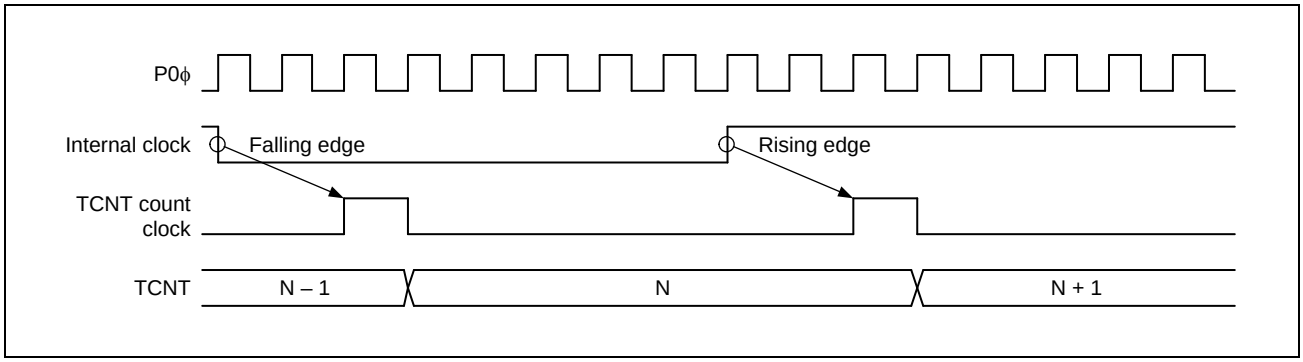

Figure 5.9-111 Count Timing in Internal Clock Operation (MTU0 to MTU4 and MTU6 to MTU8)

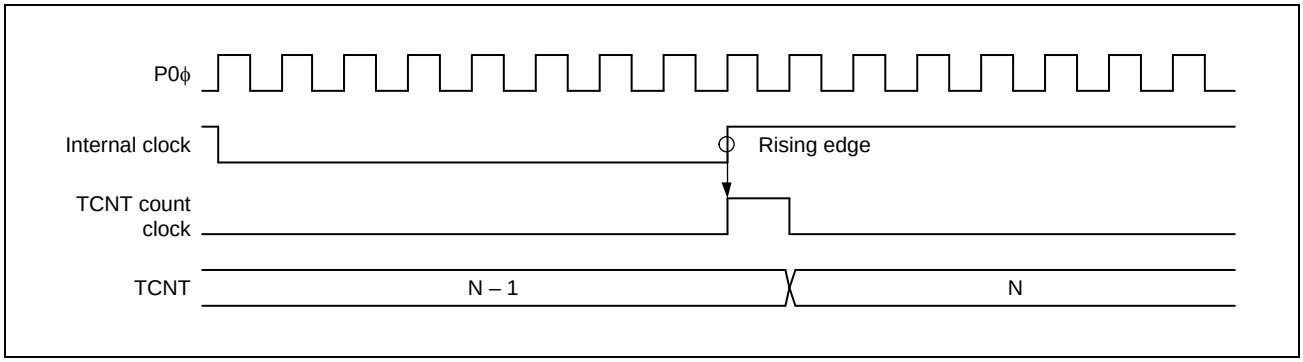

Figure 5.9-112 Count Timing in Internal Clock Operation (MTU5)

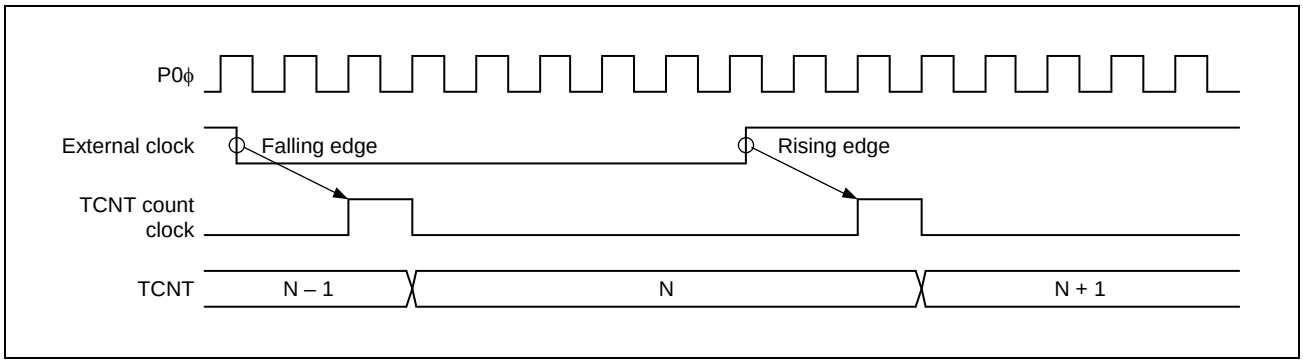

Figure 5.9-113 Count Timing in External Clock Operation (MTU0 to MTU4, MTU6 to MTU8)

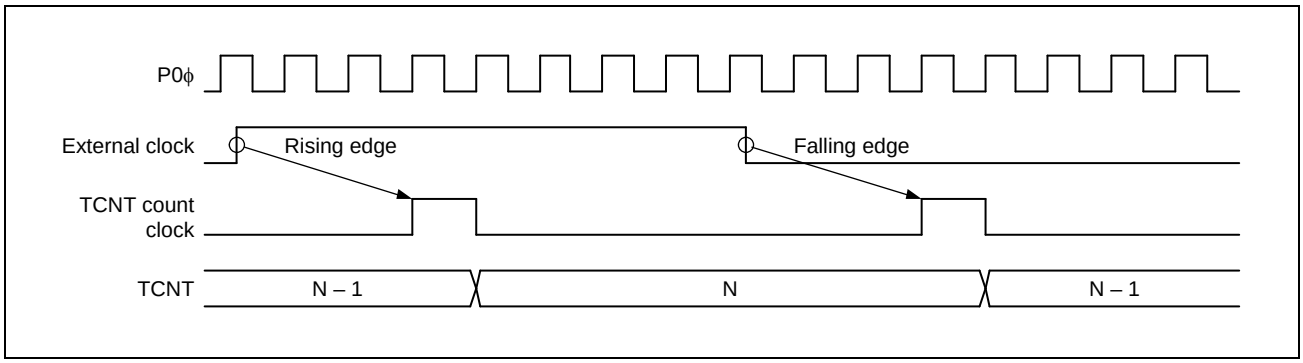

Figure 5.9-114 Count Timing in External Clock Operation (Phase Counting Mode)

(2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the value set in TIOR is output from MTIOCnm pin (n = 0 to 4, 6, 7, 8; m = A to D). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT count clock is generated.

Figure 5.9-115 shows the output compare output timing (normal mode or PWM mode) and **Figure 5.9-116** shows the output compare output timing (complementary PWM mode or reset-synchronized PWM mode).

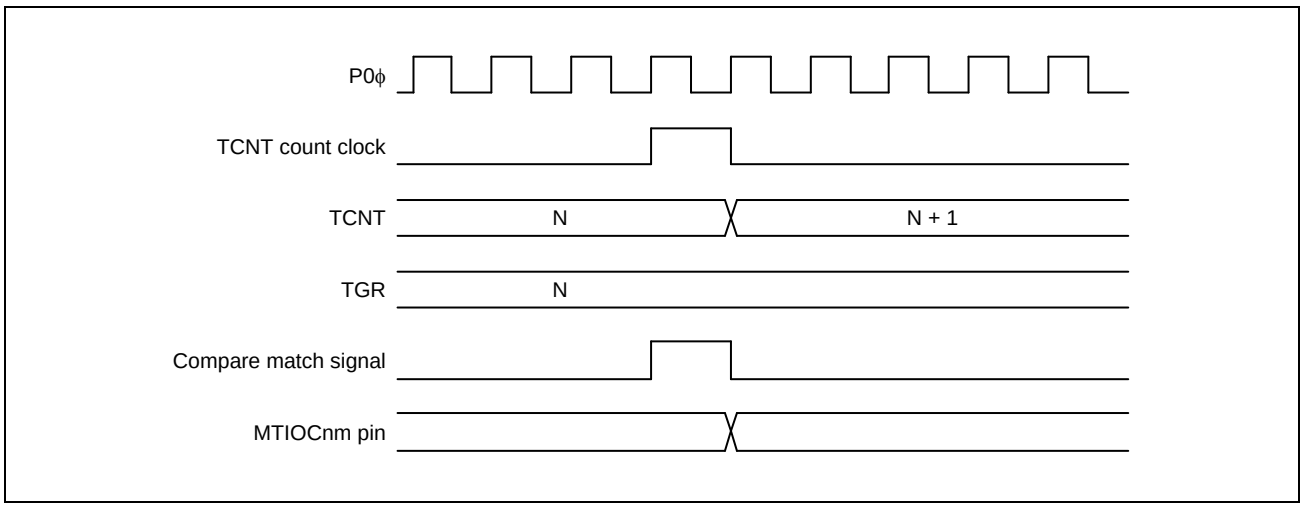

Figure 5.9-115 Output Compare Output Timing (Normal Mode or PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D)

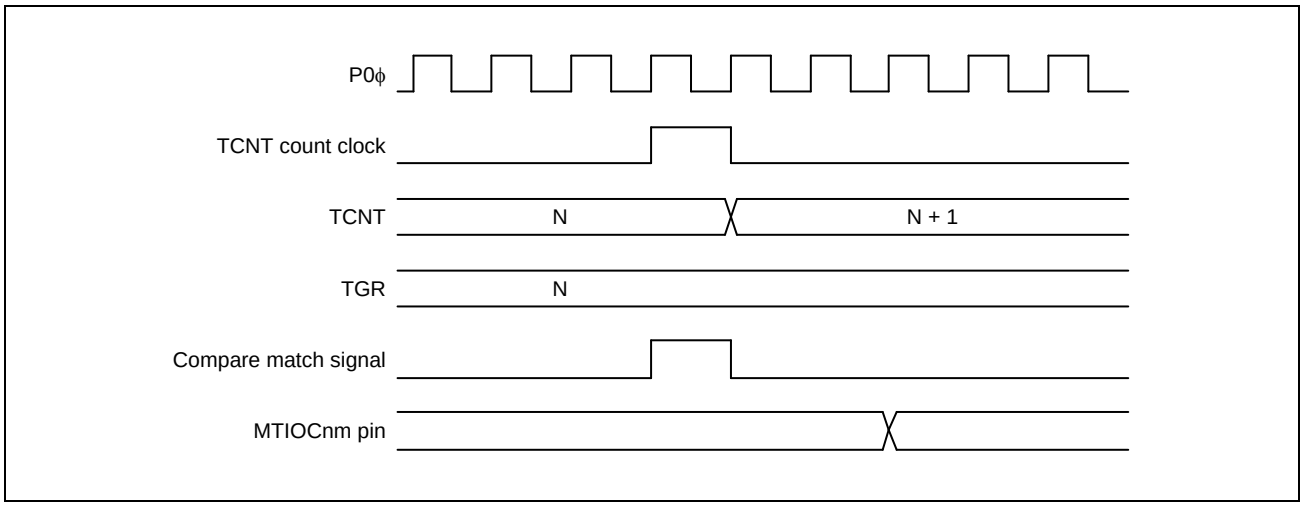

Figure 5.9-116 Output Compare Output Timing (Complementary PWM Mode or Reset-Synchronized PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D)

(3) Input Capture Signal Timing

Figure 5.9-117 shows the input capture signal timing.

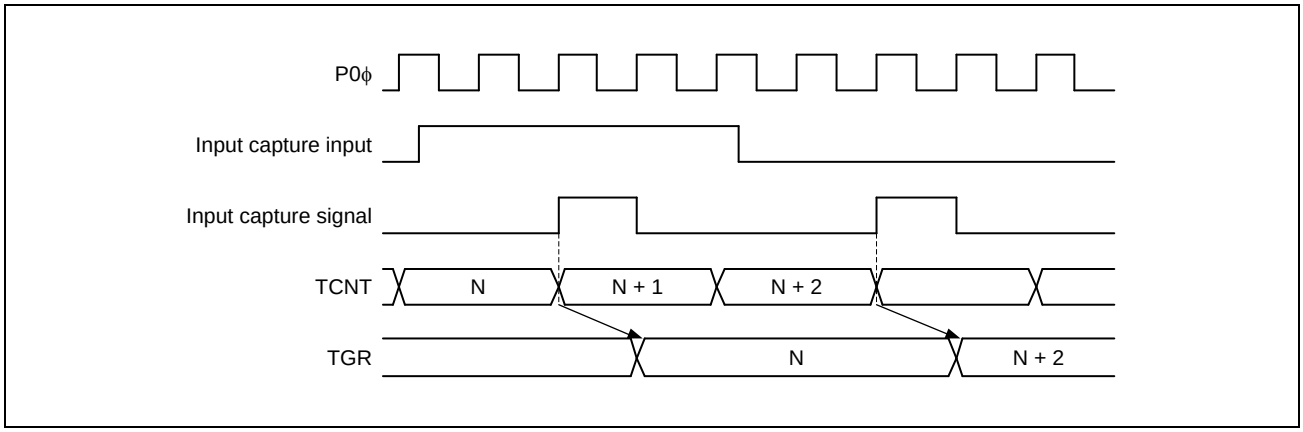

Figure 5.9-117 Input Capture Input Signal Timing

(4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 5.9-118 and **Figure 5.9-119** show the timing when counter clearing on compare match is specified, and **Figure 5.9-120** shows the timing when counter clearing on input capture is specified.

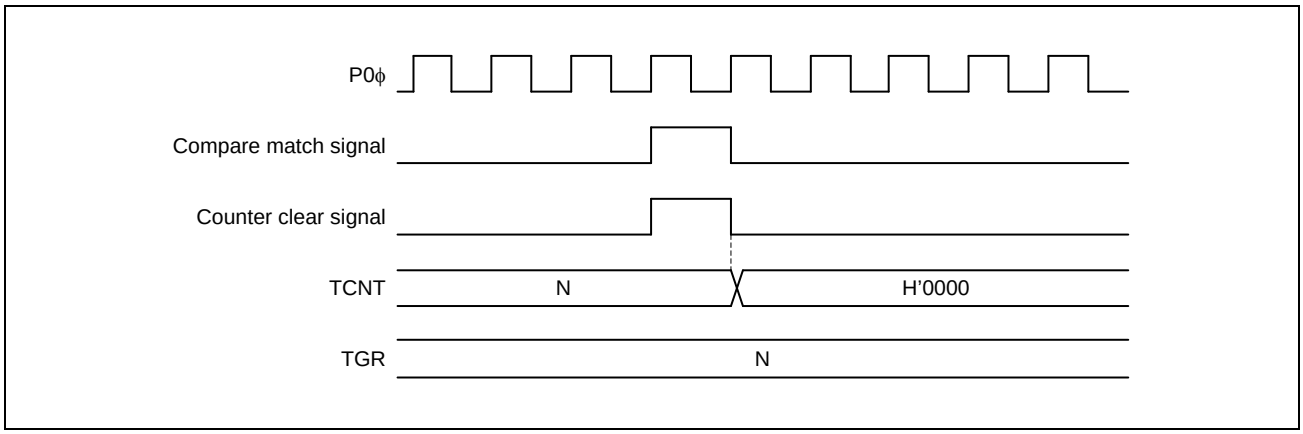

Figure 5.9-118 Counter Clear Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

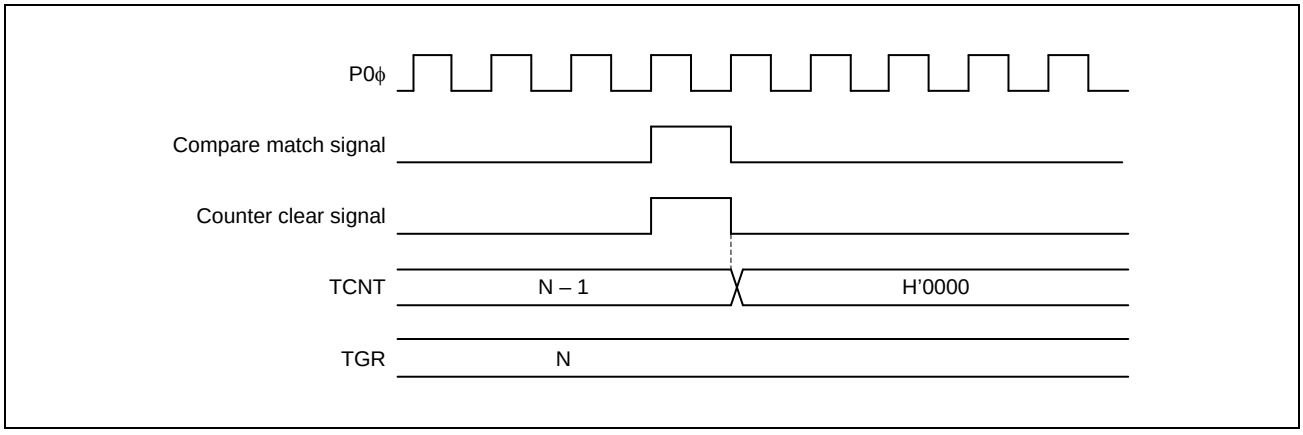

Figure 5.9-119 Counter Clear Timing (Compare Match) (MTU5)

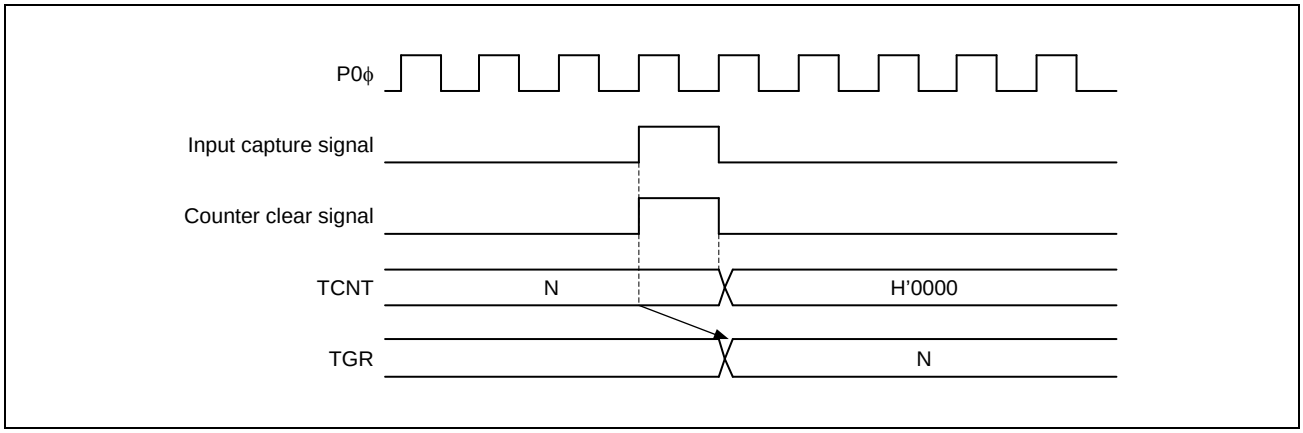

Figure 5.9-120 Counter Clear Timing (Input Capture) (MTU0 to MTU8)

(5) Buffer Operation Timing

Figure 5.9-121 to **Figure 5.9-123** show the timing in buffer operation.

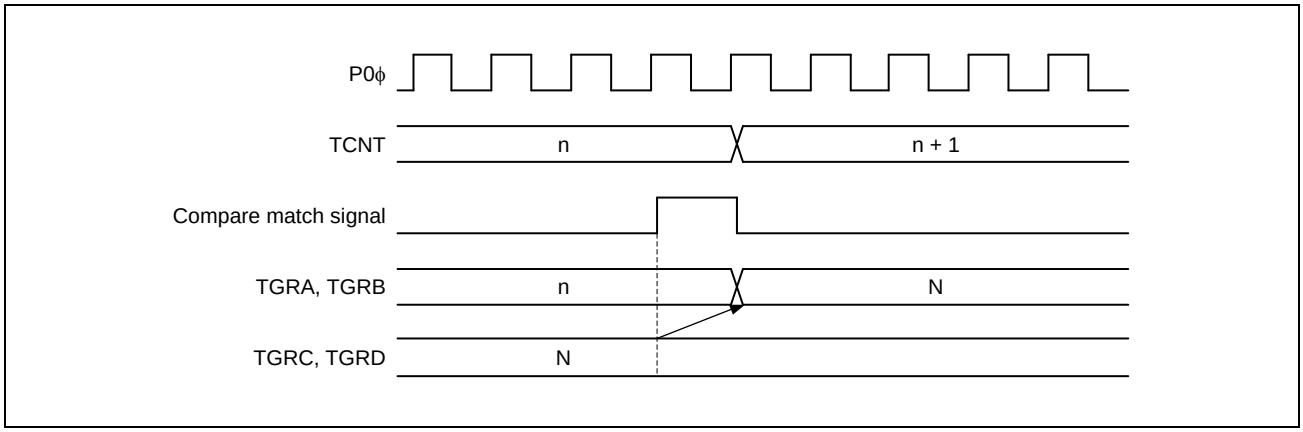

Figure 5.9-121 Buffer Operation Timing (Compare Match)

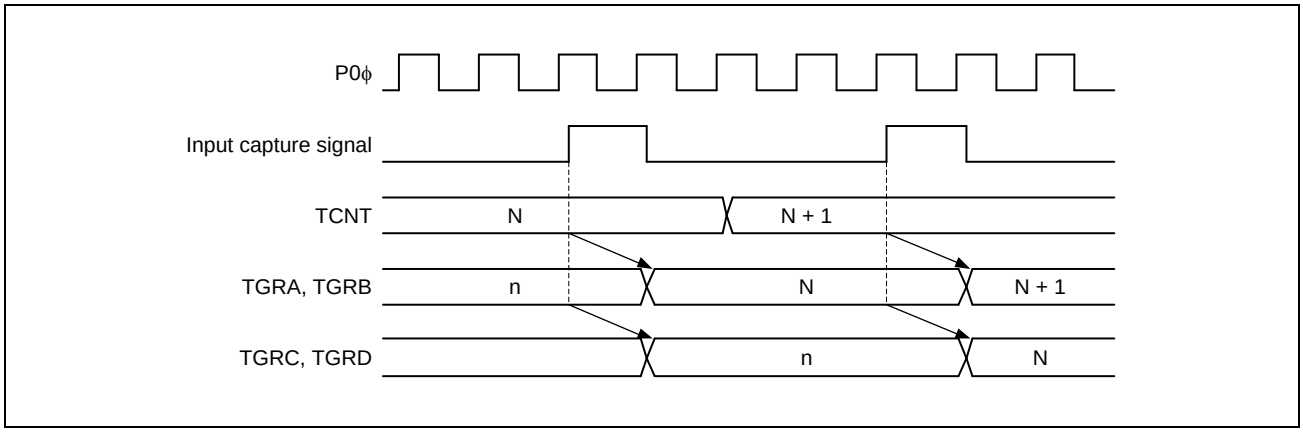

Figure 5.9-122 Buffer Operation Timing (Input Capture)

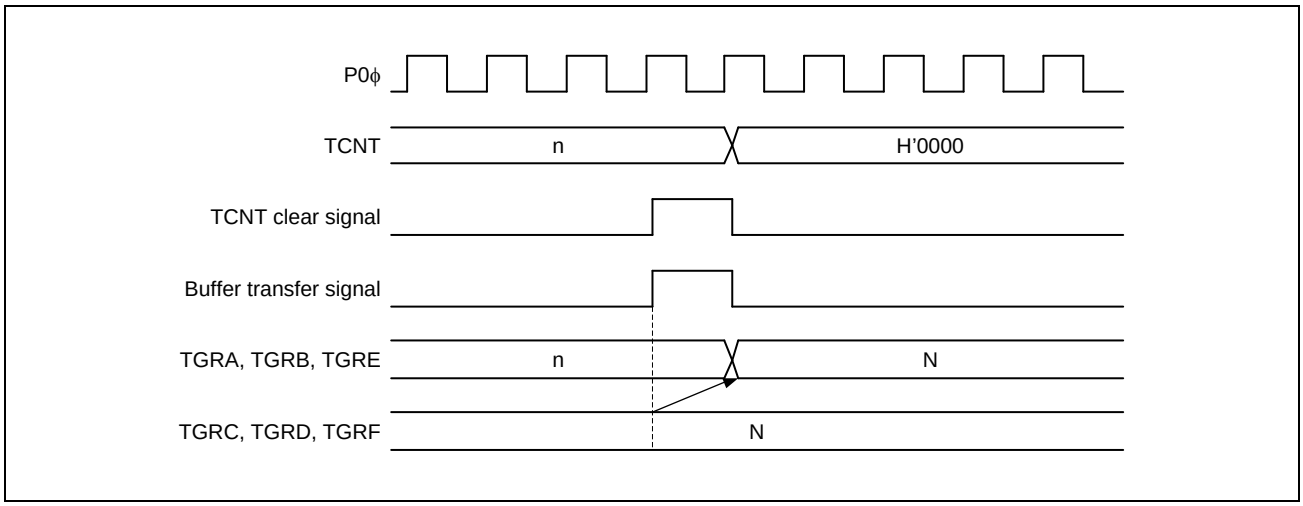

Figure 5.9-123 Buffer Operation Timing (When TCNT Cleared)

(6) Buffer Transfer Timing (Complementary PWM Mode)

Figure 5.9-124 to **Figure 5.9-126** show the buffer transfer timing in complementary PWM mode.

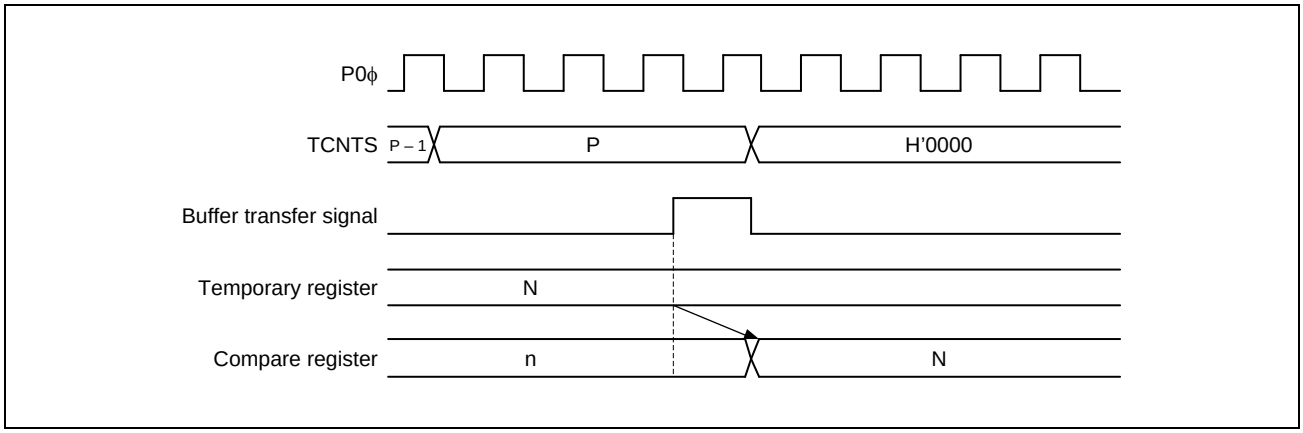

Figure 5.9-126 Transfer Timing from Temporary Register to Compare Register

5.9.5.2 Interrupt Signal Timing

(1) TGI Interrupt Timing by Compare Match

Figure 5.9-127 and **Figure 5.9-128** show the TGI interrupt request signal timing when a compare match occurs.

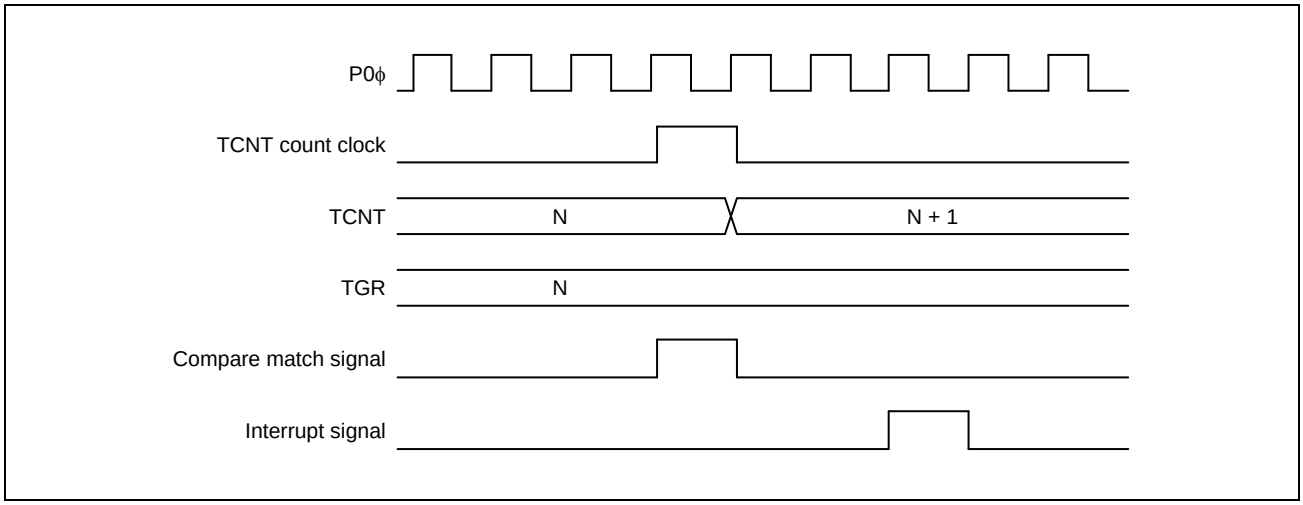

Figure 5.9-127 TGI Interrupt Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

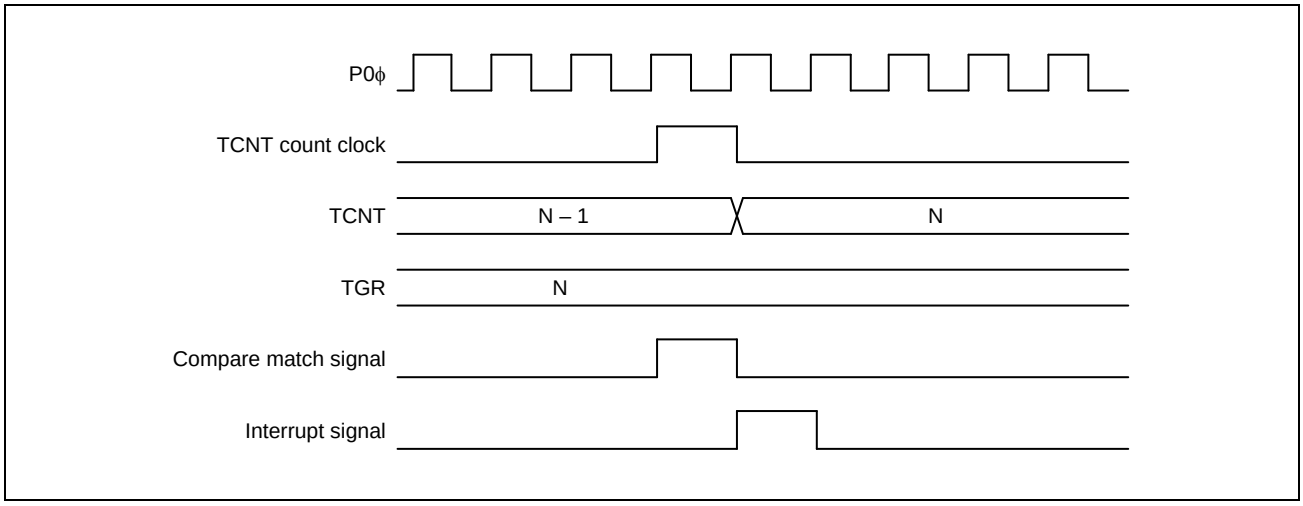

Figure 5.9-128 TGI Interrupt Timing (Compare Match) (MTU5)

(2) TGI Interrupt Timing by Input Capture

Figure 5.9-129 and **Figure 5.9-130** show the TGI interrupt request signal timing when an input capture occurs.

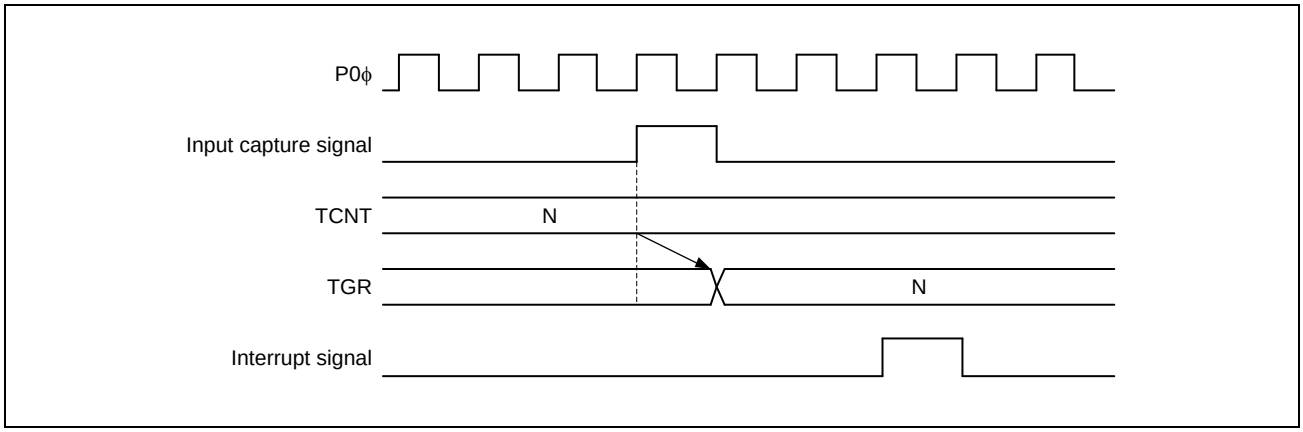

Figure 5.9-129 TGI Interrupt Timing (Input Capture) (MTU0 to MTU4 and MTU6 to MTU8)

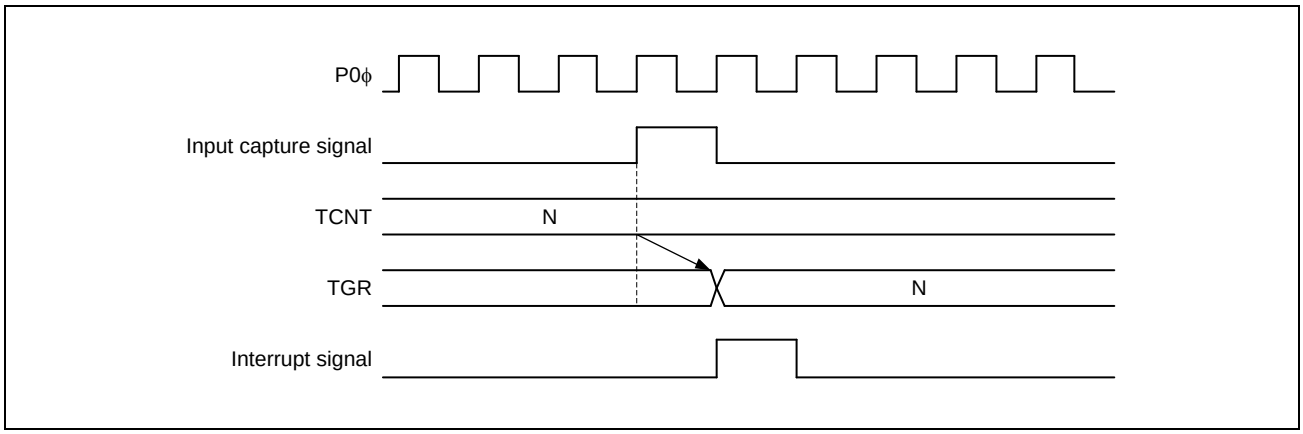

Figure 5.9-130 TGI Interrupt Timing (Input Capture) (MTU5)

(3) TCFV and TCFU Interrupt Timing

Figure 5.9-131 shows the TCIV interrupt request signal timing when an overflow is generated.

Figure 5.9-132 shows the TCIU interrupt request signal timing when an underflow is generated.

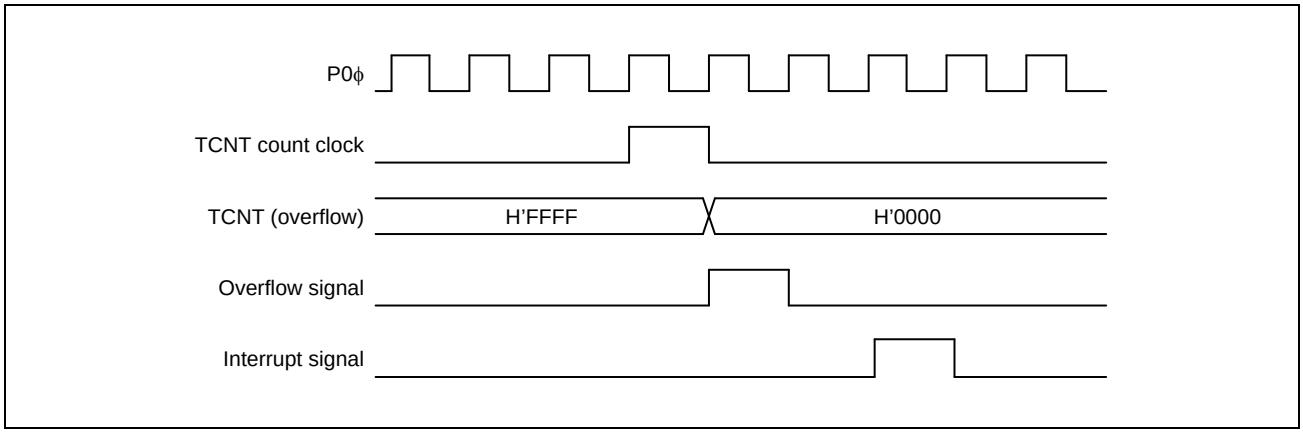

Figure 5.9-131 TCIV Interrupt Timing

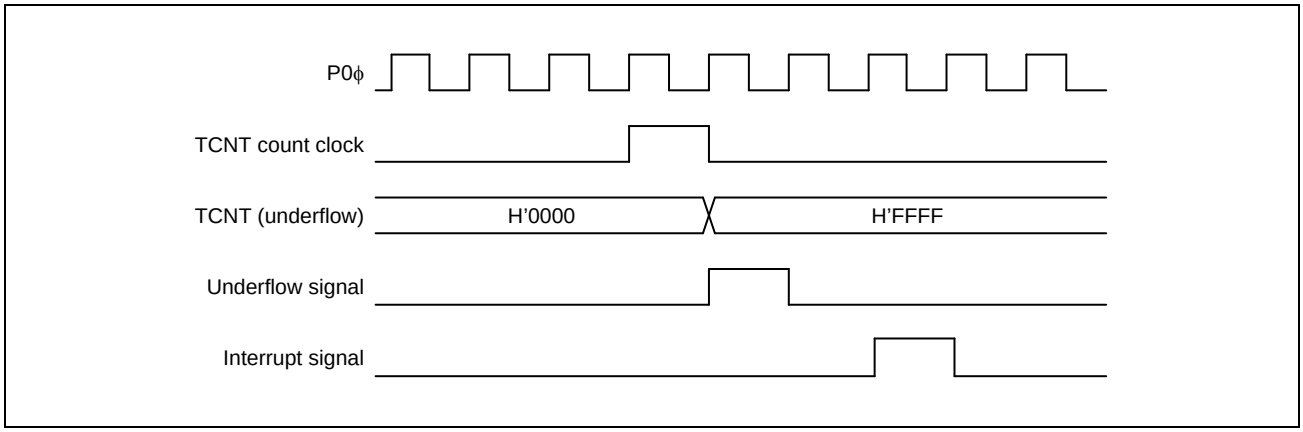

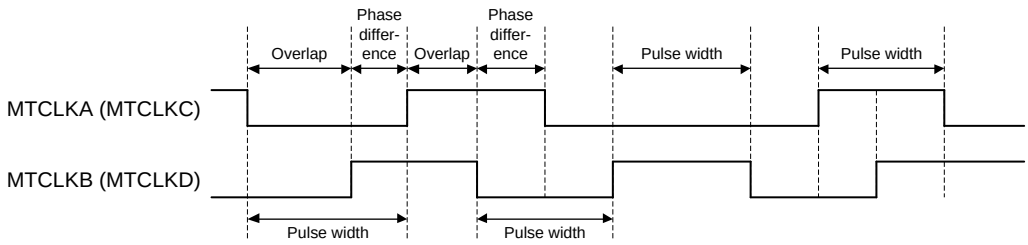

Figure 5.9-132 TCIU Interrupt Timing

5.9.6 Usage Note

5.9.6.1 Count Clock Restrictions

The count clock source pulse width must be at least three P0ϕ clock cycles for single-edge detection, and at least five P0ϕ clock cycles for both-edge detection. The MTU will not operate properly at narrower pulse widths.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least three P0ϕ clock cycles, and the pulse width must be at least 5 P0ϕ clock cycles. **Figure 5.9-133** shows the input clock conditions in phase counting mode.

Note: Phase difference and overlap: 3 P0ϕ clock cycles or more

Note: Pulse width: 5 P0ϕ clock cycles or more

Figure 5.9-133 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

5.9.6.2 Note on Cycle Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which TCNU updates the matched count value). Consequently, the actual counter frequency is given by the following formula:

- MTU0 to MTU4 and MTU6 to MTU8

$$f = \frac{CNTCLK}{N + 1}$$

- MTU5

$$f = \frac{CNTCLK}{N}$$

f: Counter frequency

CNTCLK: The count clock frequency set by TCR.TPSC[2:0] and TCR2.TPSC2[2:0]

N: TGR setting

5.9.6.3 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the TCNT write cycle, TCNT clearing takes precedence and TCNT write operation is not performed.

Figure 5.9-134 shows the timing in this case.

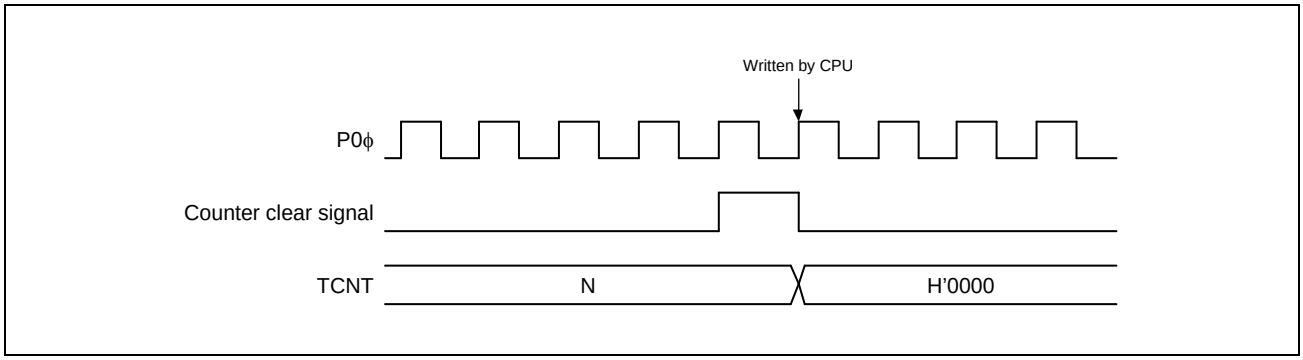

Figure 5.9-134 Contention between TCNT Write and Clear Operations

5.9.6.4 Contention between TCNT Write and Increment Operations

If incrementing occurs in a TCNT write cycle, TCNT write operation takes precedence and TCNT is not incremented.

Figure 5.9-135 shows the timing in this case.

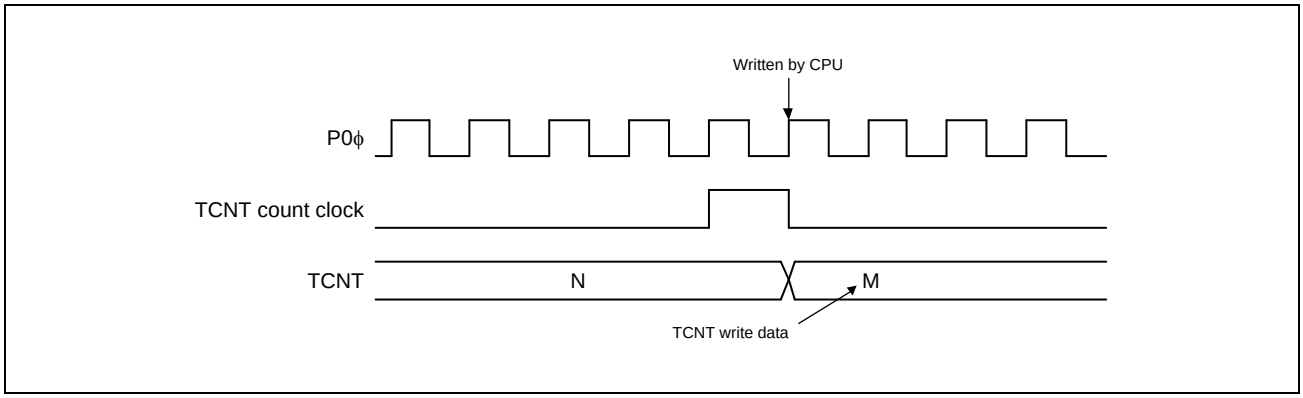

Figure 5.9-135 Contention between TCNT Write and Increment Operations

5.9.6.5 Contention between TGR Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, TGR write operation is executed and the compare match signal is also generated.

Figure 5.9-136 shows the timing in this case.

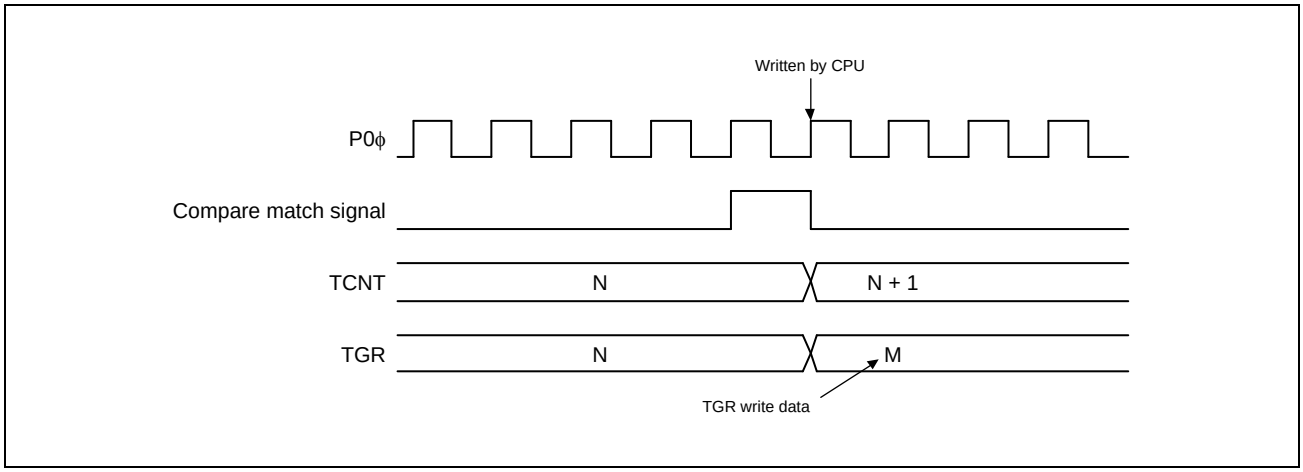

Figure 5.9-136 Contention between TGR Write Operation and Compare Match

5.9.6.6 Contention between Buffer Register Write Operation and Compare Match

If a compare match occurs in the T2 state in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 5.9-137 shows the timing in this case.

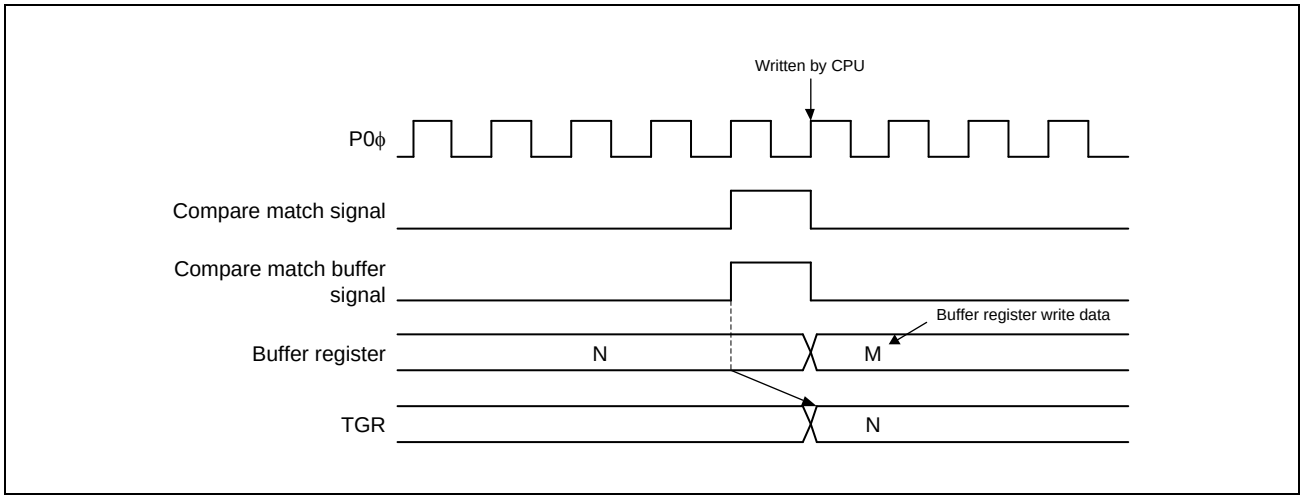

Figure 5.9-137 Contention between Buffer Register Write Operation and Compare Match

5.9.6.7 Contention between Buffer Register Write and TCNT Clear Operations

When the buffer transfer timing is set to the TCNT clear timing by the timer buffer transfer mode register (TBTM), if TCNT is cleared during the TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 5.9-138 shows the timing in this case.

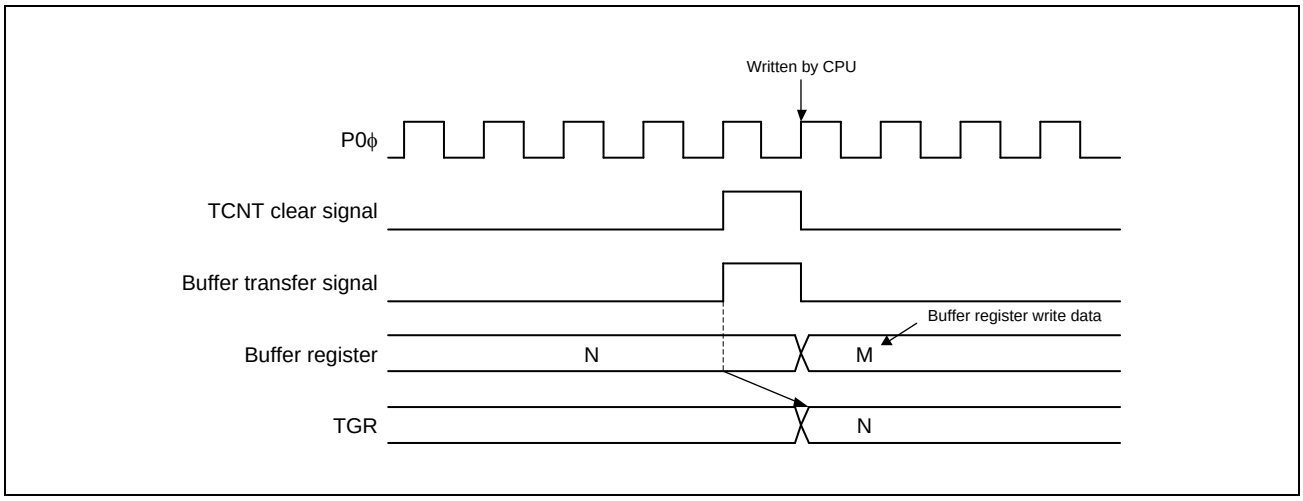

Figure 5.9-138 Contention between Buffer Register Write and TCNT Clear Operations

5.9.6.8 Contention between TGR Read Operation and Input Capture

If an input capture signal is generated in a TGR read cycle, the data before input capture transfer is read.

Figure 5.9-139 shows the timing in this case.

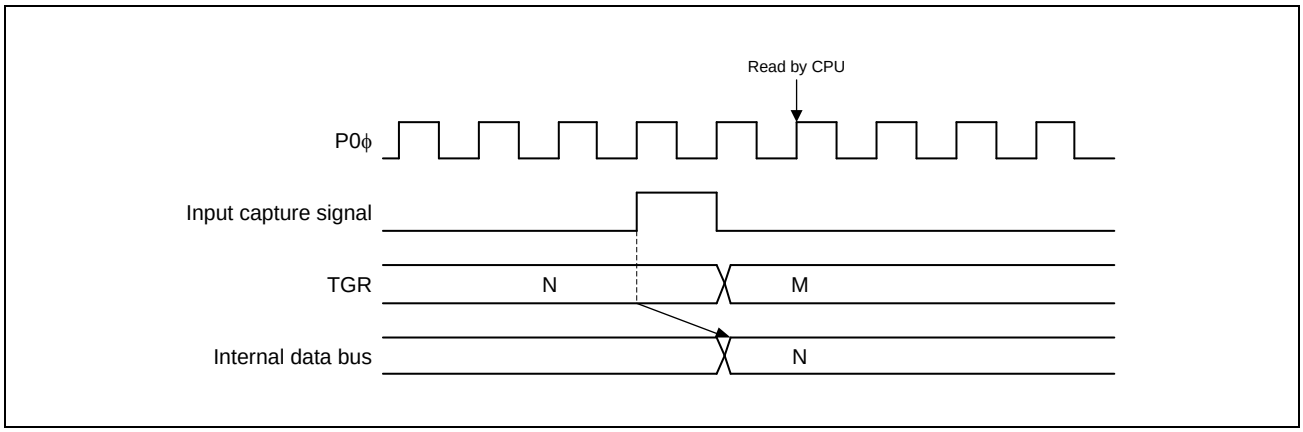

Figure 5.9-139 Contention between TGR Read Operation and Input Capture (MTU0 to MTU8)

5.9.6.9 Contention between TGR Write Operation and Input Capture

If an input capture signal is generated in the TGR write cycle, the input capture operation takes precedence and the TGR write operation is not performed in MTU0 to MTU4 and MTU6 to MTU8. In MTU5, the TGR write operation is performed and the input capture signal is generated.

Figure 5.9-140 and **Figure 5.9-141** show the timing in this case.

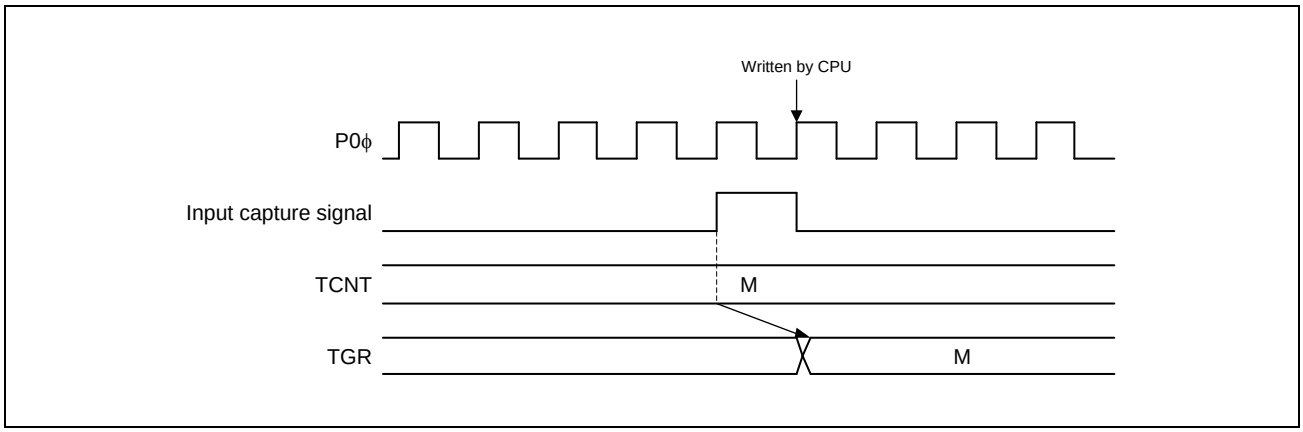

Figure 5.9-140 Contention between TGR Write Operation and Input Capture (MTU0 to MTU4 and MTU6 to MTU8)

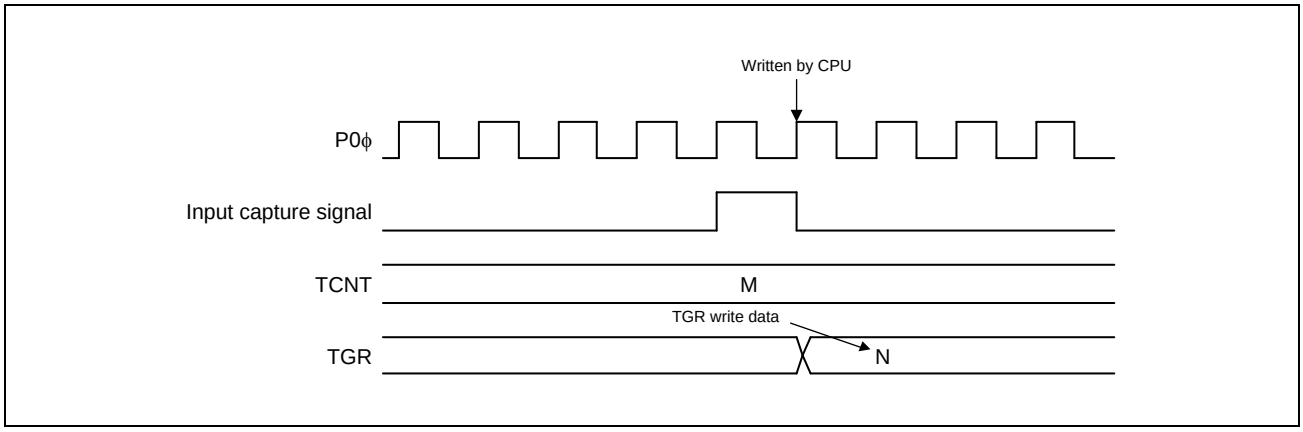

Figure 5.9-141 Contention between TGR Write Operation and Input Capture (MTU5)

5.9.6.10 Contention between Buffer Register Write Operation and Input Capture

If an input capture signal is generated in the buffer register write cycle, the buffer operation takes precedence and the buffer register write operation is not performed.

Figure 5.9-142 shows the timing in this case.

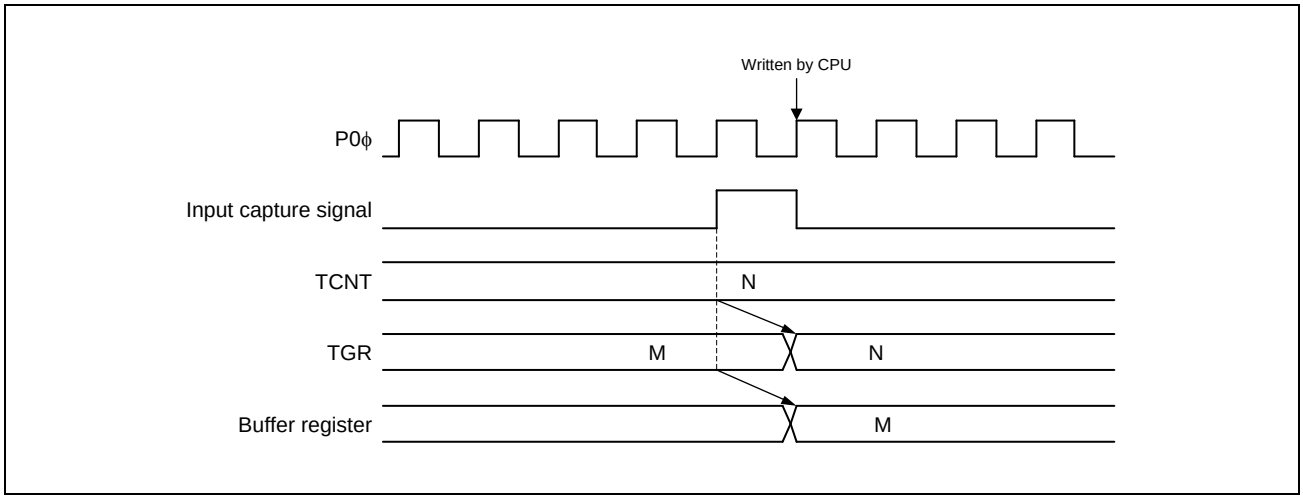

Figure 5.9-142 Contention between Buffer Register Write Operation and Input Capture

5.9.6.11 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

With timer counters TCNT in MTU1 and MTU2 cascaded, when a contention occurs between the counting by TCNT in MTU1 (a TCNT overflow/underflow in MTU2) and the writing to TCNT in MTU2, the TCNT write operation is performed in MTU2 and the TCNT count signal in MTU1 is disabled. In this case, if TGRA in MTU1 works as a compare match register and there is a match between the values of TGRA and TCNT in MTU1, a compare match signal is issued.

Furthermore, when the TCNT count clock in MTU1 is selected as the input capture source of MTU0, TGRA to TGRD in MTU0 work in input capture mode. In addition, when the TGRC compare match/input capture in MTU0 is selected as the input capture source of TGRB in MTU1, TGRB in MTU1 works in input capture mode.

Figure 5.9-143 shows the timing in this case.

When setting the TCNT clearing function in cascaded operation, be sure to synchronize MTU1 and MTU2.

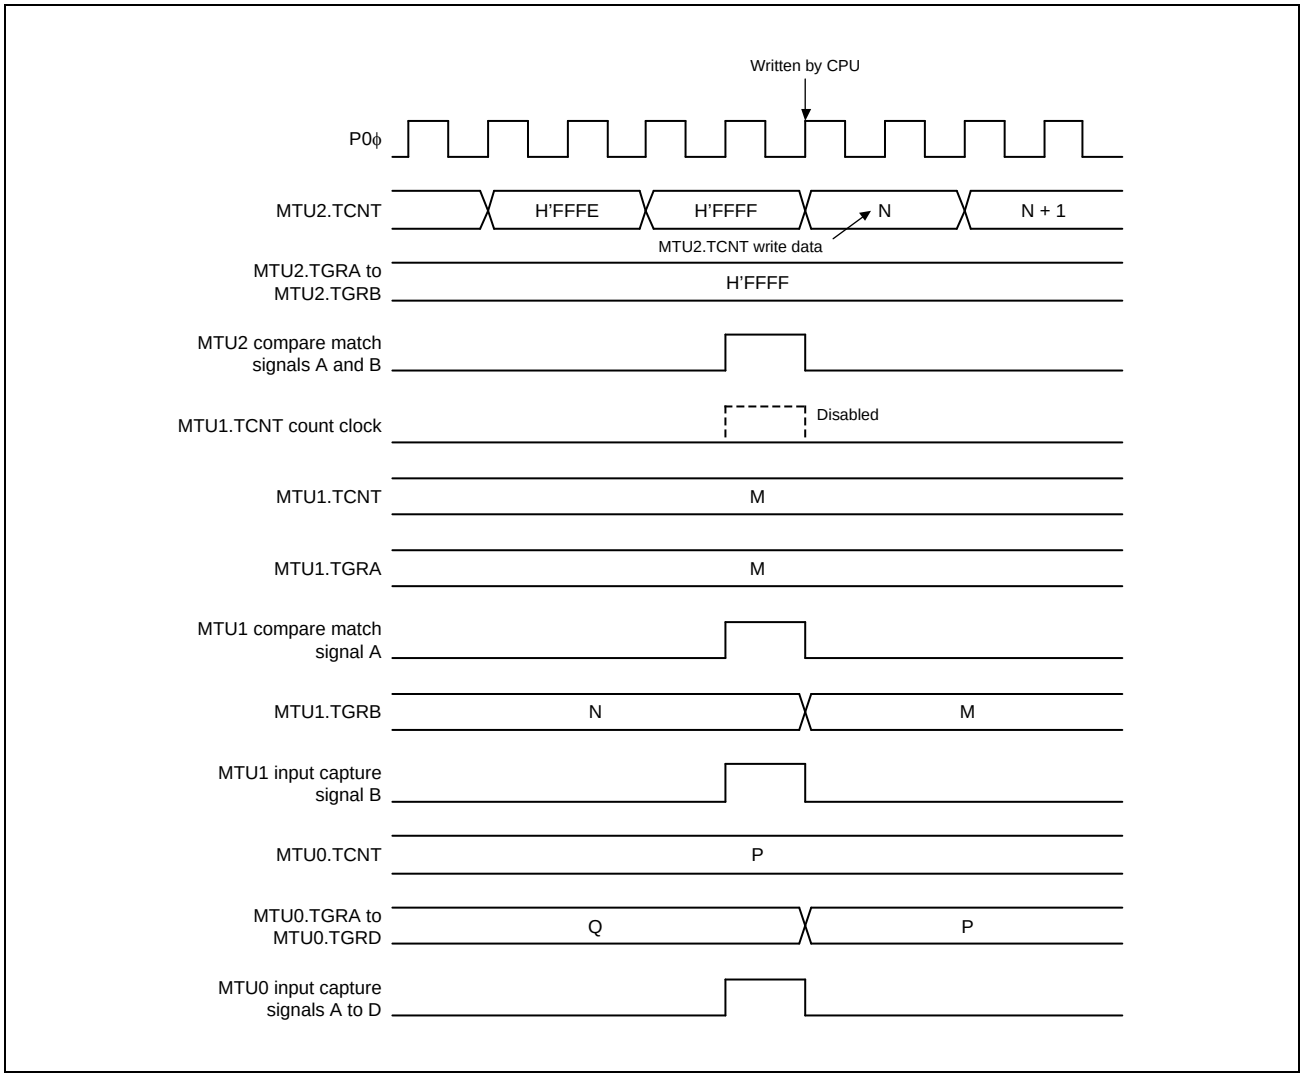

Figure 5.9-143 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

5.9.6.12 Counter Value When Count Operation is Stopped in Complementary PWM Mode

When counting operation in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) is stopped in complementary PWM mode, the MTU3.TCNT (MTU6.TCNT) value is set to the timer dead time register (TDDRA (TDDRB)) value and MTU4.TCNT (MTU7.TCNT) is set to H'0000.

When operation is restarted in complementary PWM mode, counting begins automatically from the initial setting state.

Figure 5.9-144 shows this operation.

When counting begins in another operating mode, be sure to make initial settings in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

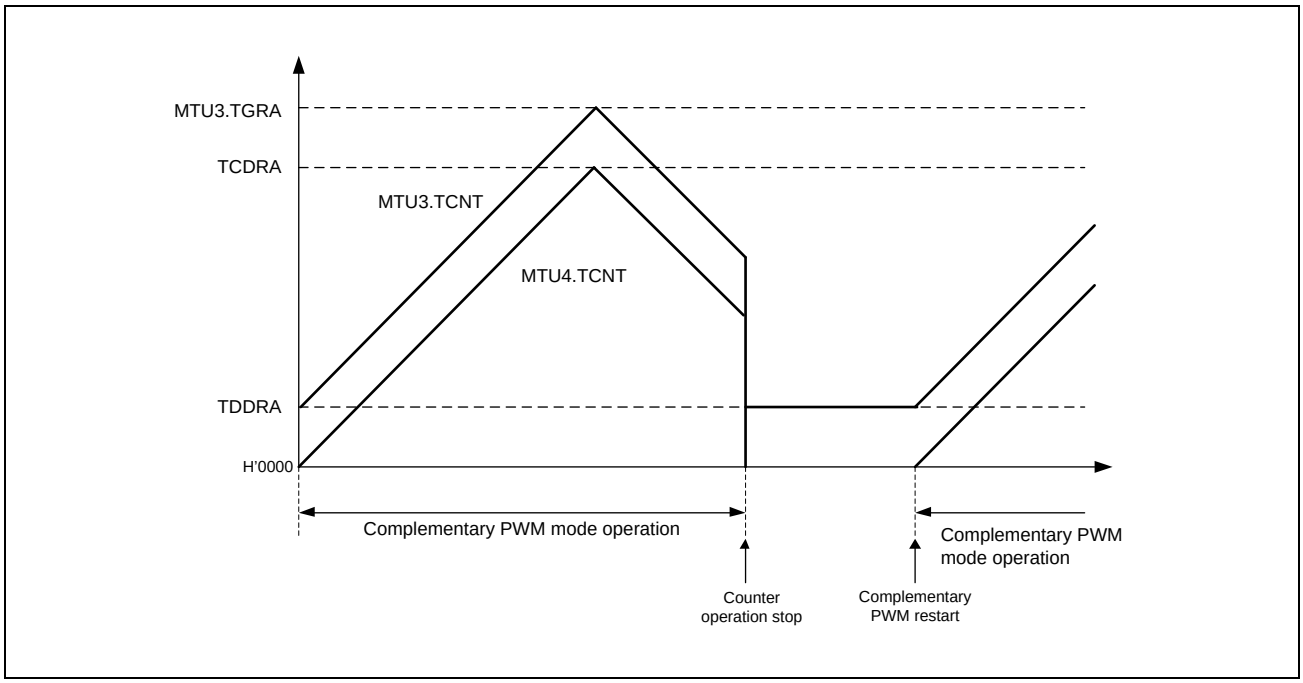

Figure 5.9-144 Counter Value When Stopped in Complementary PWM Mode

5.9.6.13 Buffer Operation Setting in Complementary PWM Mode

When modifying the PWM cycle set register (MTU3.TGRA or MTU6.TGRA), timer cycle data register (TCDRA or TCDRB), and duty set registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)) in complementary PWM mode, be sure to use buffer operation. In addition, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in bits BFA and BFB of MTU3.TMDR1 (MTU6.TMDR1). When the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA), and TCBRA (TCBRB) functions as a buffer register for TCDRA (TCDRB).

5.9.6.14 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

When setting buffer operation in reset-synchronized PWM mode, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In reset-synchronized PWM mode, buffer operation in MTU3 and MTU4 (or MTU 6 and MTU7) depends on the settings in the BFA and BFB bits of MTU3.TMDR1 (MTU6.TMDR1). For example, if the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA).

While the MTU3.TGRC (MTU6.TGRC) and MTU3.TGRD (MTU6.TGRD) are operating as buffer registers, a TGImn interrupt (m = C or D; n = 3, 4, 6, or 7) is not generated.

Figure 5.9-145 shows an example of MTU3.TGR (MTU6.TGR), MTU4.TGR (MTU7.TGR), MTIOC3 (MTIOC6), and MTIOC4 (MTIOC7) operation with the BFA and BFB bits in MTU3.TMDR1 (MTU6.TMDR1) set to 1 and the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) set to 0.

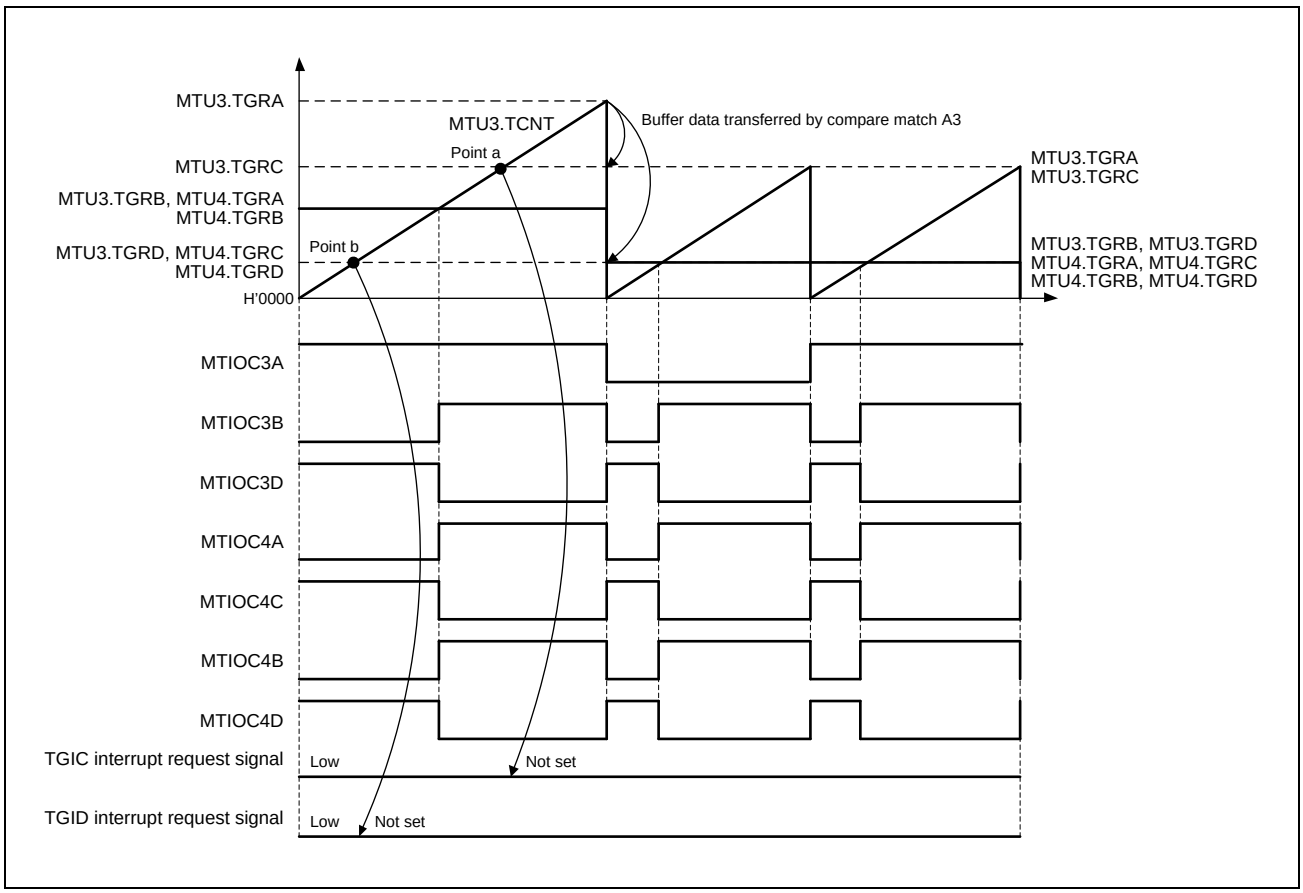

Figure 5.9-145 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

5.9.6.15 Overflow in Reset-Synchronized PWM Mode

After reset-synchronized PWM mode is selected, the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) start counting when the CST3 (CST6) bit of TSTRA (TSTRB) is set to 1. In this state, the TCNT count clock source and count edge in MTU4 (MTU7) are determined by the setting of TCR in MTU3 (MTU6).

In reset-synchronized PWM mode, with cycle register TGRA in MTU3 (MTU6) set to H’FFFF and the TGRA compare match in MTU3 (MTU6) selected as the counter clearing source, the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) count up to H’FFFF, then a compare match occurs with TGRA in MTU3 (MTU6), and the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) are both cleared. In this case, a TCIVn interrupt (n = 3, 4, 6, or 7) is not generated.

Figure 5.9-146 shows an example of the operation in reset-synchronized PWM mode with cycle register TGRA in MTU3 (MTU6) set to H’FFFF and the TGRA compare match in MTU3 (MTU6) specified for the counter clearing source.

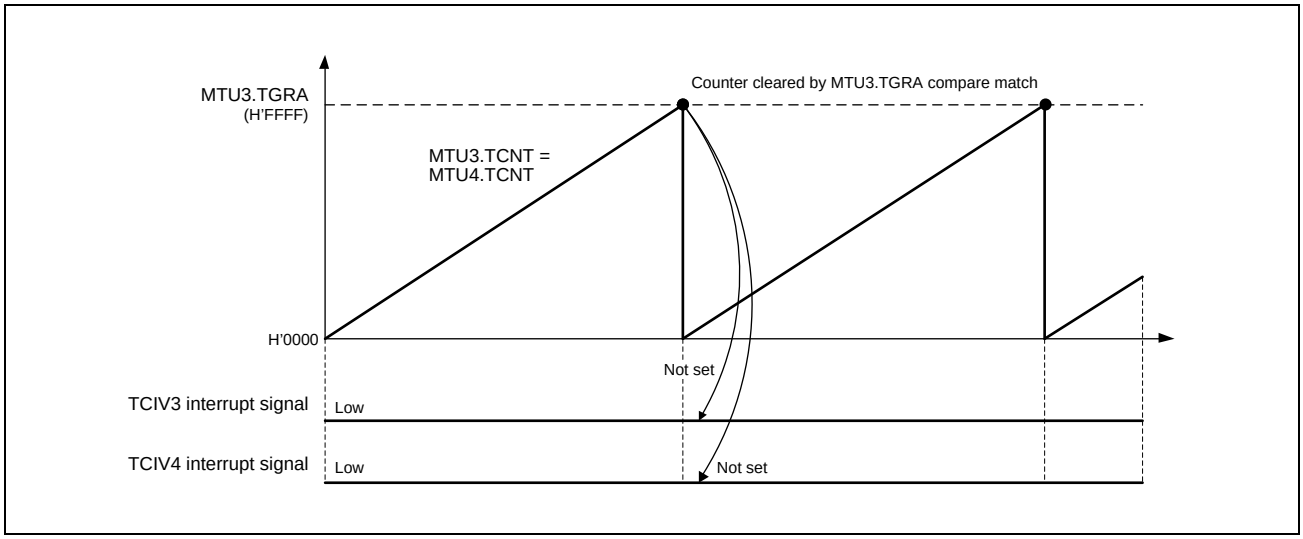

Figure 5.9-146 Overflow in Reset-Synchronized PWM Mode

5.9.6.16 Contention between Overflow/Underflow and Counter Clearing

If an overflow/underflow and counter clearing occur simultaneously, a TCIVn interrupt (n = 0 to 4 or 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is not generated and TCNT clearing takes precedence.

Figure 5.9-147 shows the operation timing when a TGR compare match is specified as the clearing source and TGR is set to H'FFFF.

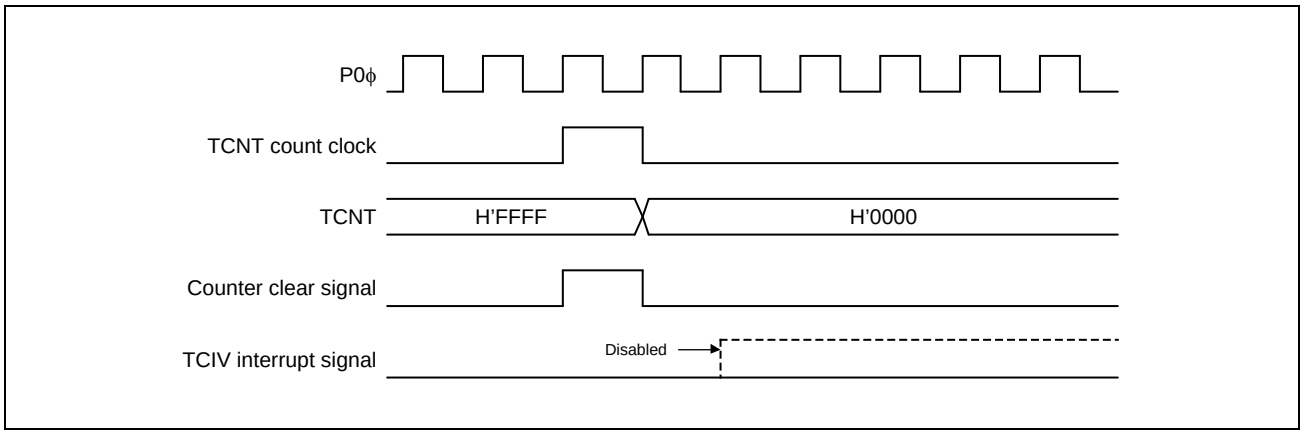

Figure 5.9-147 Contention between Overflow and Counter Clearing

5.9.6.17 Contention between TCNT Write Operation and Overflow/Underflow

If TCNT counts up or down in a TCNT write cycle and an overflow or an underflow occurs, the TCNT write operation takes precedence. A TCIVn interrupt (n = 0 to 4 or 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is not generated.

Figure 5.9-148 shows the operation timing when there is contention between TCNT write operation and overflow.

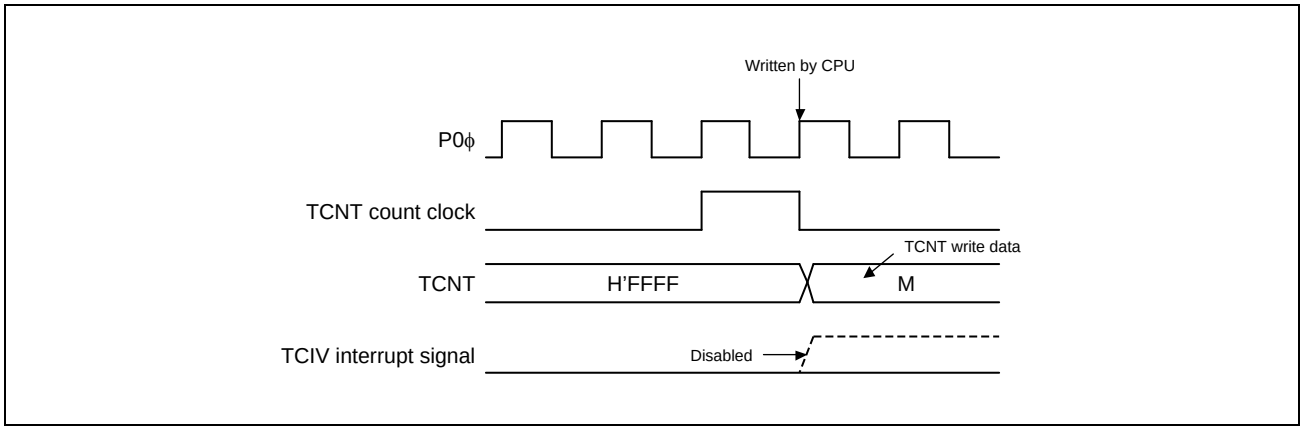

Figure 5.9-148 Contention between TCNT Write Operation and Overflow

5.9.6.18 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from normal mode or PWM mode 1 to reset-synchronized PWM mode in MTU3 and MTU4 (or MTU6 and MTU7), if the counter is stopped while the output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D) are held at a high level and then operation is started after a transition to reset-synchronized PWM mode, the initial pin output will not be correct.

When making a transition from normal mode to reset-synchronized PWM mode, write H'11 to MTU3.TIORH, MTU3.TIORL, MTU4.TIORH, and MTU4.TIORL (MTU6.TIORH, MTU6.TIORL, MTU7.TIORH, and MTU7.TIORL) to initialize the output pin state to a low level, then set the registers to the initial value (H'00) before making the mode transition.

When making a transition from PWM mode 1 to reset-synchronized PWM mode, switch to normal mode, initialize the output pin state to a low level, and then set the registers to the initial value (H'00) before making the transition to reset-synchronized PWM mode.

5.9.6.19 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When MTU3 and MTU4 (or MTU6 and MTU7) are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is determined by the OLSP and OLSN bits in the timer output control register (TOCR1A or TOCR1B). In complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to H'00. The output level in negative phase when the TDER bit in TDERA (TDERB) is set to 0 in complementary PWM mode (the dead time is not generated) does not depend on the setting of the OLSN bit in TOCR1A (TOCR1B). It is equivalent to the inverted level of positive phase output based on the setting of the OLSP bit in TOCR1A (TOCR1B).

5.9.6.20 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection

When timer counters 1 and 2 (MTU1.TCNT and MTU2.TCNT) operate as a 32-bit counter in cascade connection, the cascaded counter value cannot be captured successfully in some cases even if input-capture input is simultaneously done to MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B. This is because the input timing of MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B may not be the same when external input-capture signals input into MTU1.TCNT and MTU2.TCNT are taken in synchronization with the internal clock.

For example, MTU1.TCNT (the counter for upper 16 bits) does not capture the count-up value by an overflow from MTU2.TCNT (the counter for lower 16 bits) but captures the count value before the up-counting. In this case, the values of MTU1.TCNT = H'FFF1 and MTU2.TCNT = H'0000 should be transferred to MTU1.TGRA and MTU2.TGRA or to MTU1.TGRB and MTU2.TGRB, but the values of MTU1.TCNT = H'FFF0 and MTU2.TCNT = H'0000 are erroneously transferred.

The MTU has a function that allows simultaneous capture of MTU1.TCNT and MTU2.TCNT with a single input capture input. This function can be used to read the 32-bit counter such that MTU1.TCNT and MTU2.TCNT are captured at the same time. For details, see **5.9.2.11 Timer Input Capture Control Register (TICCR)**.

5.9.6.21 Interrupt-Skipping Function 2

When interrupt-skipping function 2 is in use and the difference between the values in MTU4.TADCORA and MTU4.TADCORB is small, correct counting of the number skipped may not be possible, in which case requests for A/D conversion will not be generated with the expected timing. The conditions listed below thus apply to these settings.

For MTU6 and MTU7, the same conditions apply to the settings of MTU7.TADCORA and MTU7.TADCORB.

(1) When the number skipped is zero for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least four.
- The interval of comparison for MTU4.TADCORA must be at least four cycles of P0ϕ clock (the updated value of MTU4.TADCORA is set to the previous value plus or minus at least four).
- The interval of comparison for MTU4.TADCORB must be at least four cycles of P0ϕ clock (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least four).

(2) When the number skipped is one or more for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least two.
- The interval of comparison for MTU4.TADCORB must be at least two cycles of P0ϕ (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least two).

5.9.6.22 Notes When Complementary PWM Mode Output Protection Function is Not Used

The complementary PWM mode output protection function is initially enabled. For details, refer to **5.10 Port Output Enable 3 (POE3)**.

5.9.6.23 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR)

Do not set TGRj (j = U, V, or W) in MTU5 to the value of the corresponding TCNTj in MTU5 plus one while counting by TCNTj in MTU5 is stopped. If such a setting is made, a compare match will be generated even though counting is stopped.

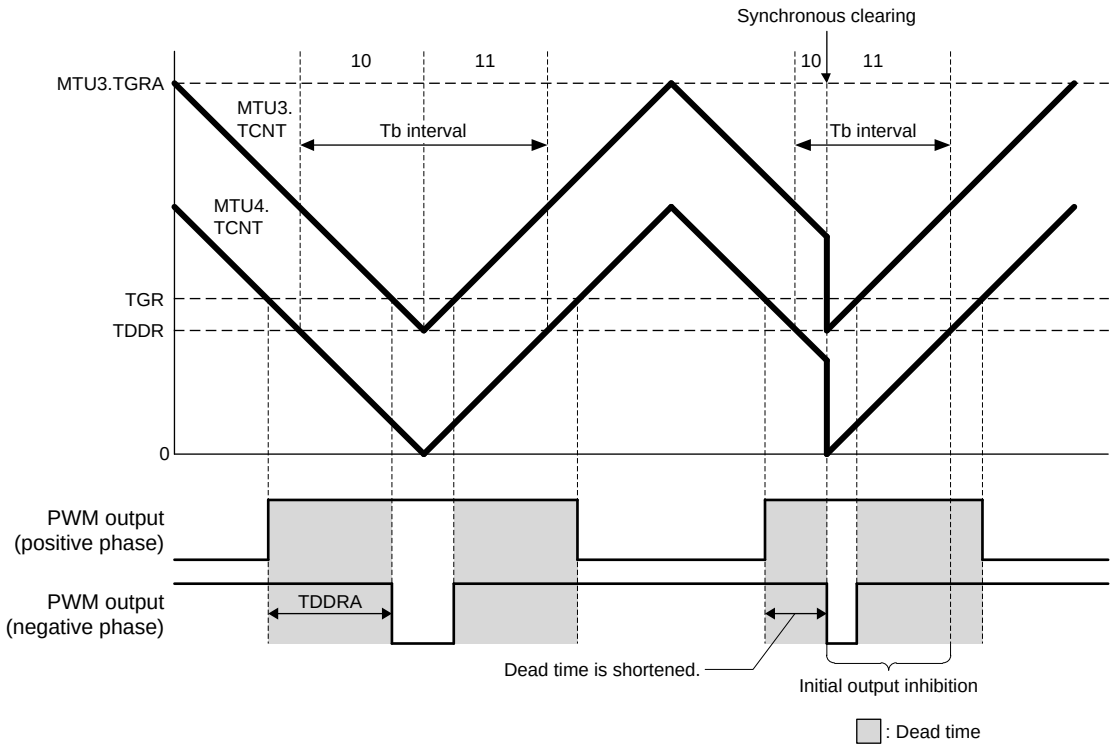
In this case, if the value of the compare match enable bit (TGIE5j bit of TIER in MTU5) is 1 (enabled), a compare match interrupt will also be generated. If the value of the timer compare match clear register is 1 (enabled), the TCNTj counter in MTU5 is automatically cleared to H’0000 when the compare match is generated, regardless of whether compare match interrupts are enabled or disabled.

5.9.6.24 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode

If control of the output waveform is enabled (the WRE bit of TWCRA or TWCRB is 1) at the time of synchronous counter clearing in complementary PWM mode, satisfaction of either condition 1 or 2 below has the following effects.

- Dead time on the PWM output pins is shortened (or disappears).
- The active level is output on the negative phase PWM output pins beyond the period for active-level output.

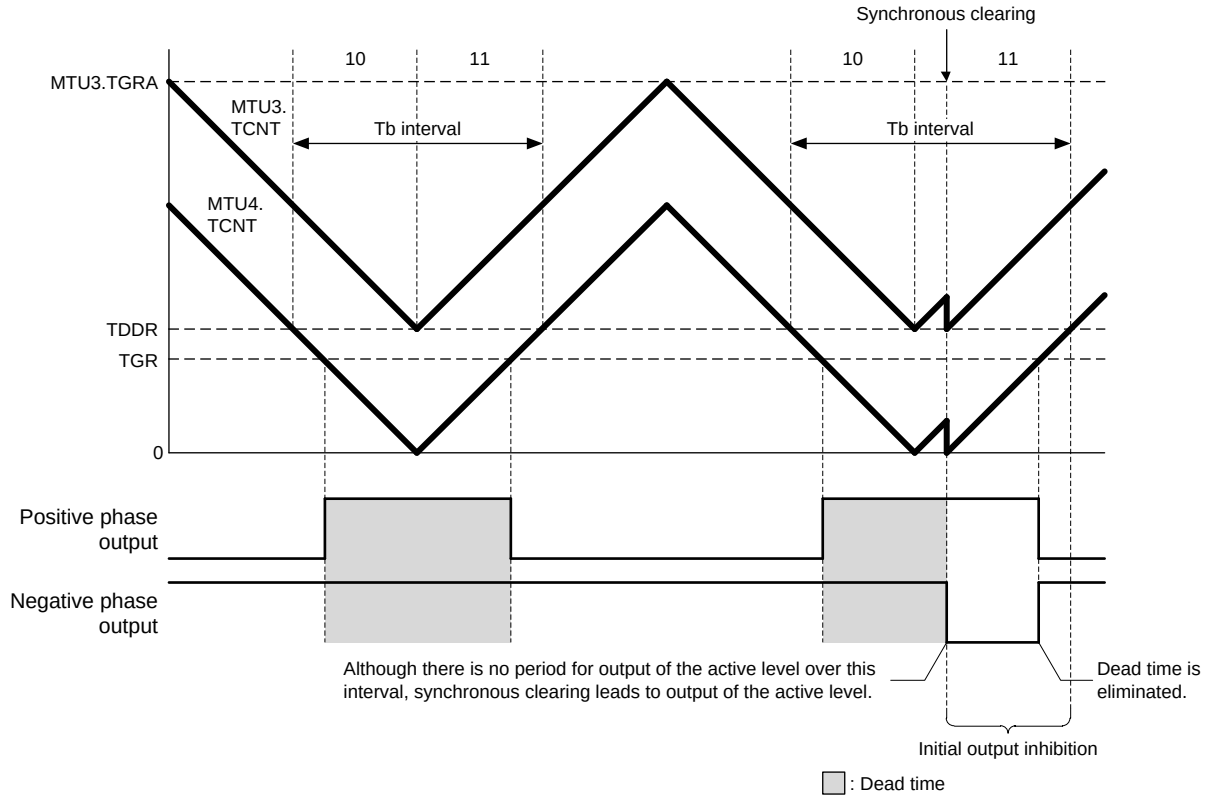
Condition 1:



In portion (10) of the initial output inhibition period in **Figure 5.9-149**, synchronous clearing occurs within the dead-time period for PWM output.

Condition 2:

In portions (10) and (11) of the initial output inhibition period in **Figure 5.9-150**, synchronous clearing occurs when any condition from among TGRB in MTU3 (MTU6) ≤ TDDR (TDDRB), TGRA in MTU4 (MTU7) ≤ TDDR (TDDRB), and TGRB in MTU4 (MTU7) ≤ TDDR (TDDRB) is satisfied.



The following method avoids the above phenomena.

Ensure that synchronous clearing proceeds with the value of each comparison register (TGRB in MTU3 (MTU6), TGRA in MTU4 (MTU7), and TGRB in MTU4 (MTU7)) set to at least double the value of the TDDRA register (TDDRB register).

Note: PWM output is active low.

Figure 5.9-149 Example of Synchronous Clearing (When Condition 1 Applies)

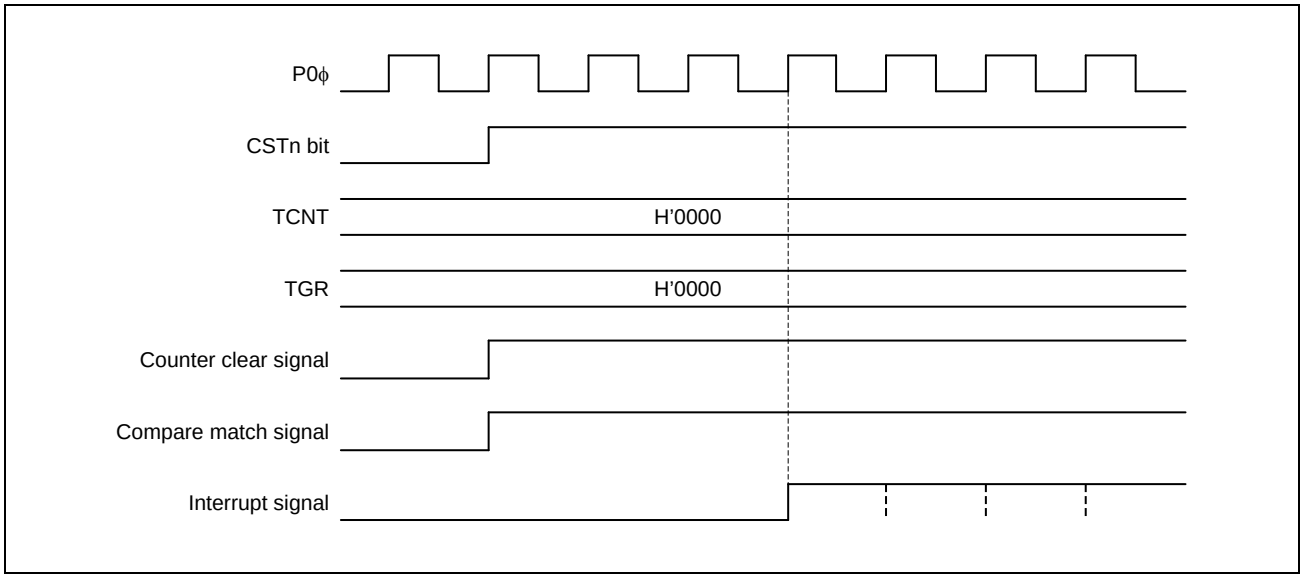
Note: PWM output is active low.

Figure 5.9-150 Example of Synchronous Clearing (When Condition 2 Applies)

5.9.6.25 Continuous Output of Interrupt Signal in Response to a Compare Match

When the TGR register is set to H'0000, the P0ϕ/1 clock is set as the count clock, and compare match is set as the trigger for clearing of the count clock, the value of the TCNT counter remains H'0000, and the interrupt signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle. Consequently, interrupts will not be detected in response to second and subsequent compare matches.

Figure 5.9-151 shows the timing for continuous output of the interrupt signal in response to a compare match.



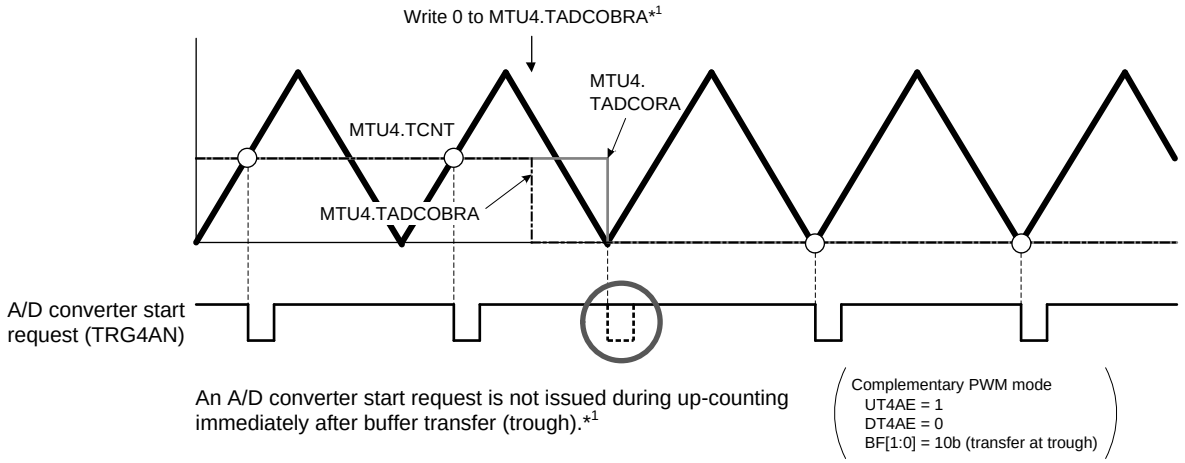


Figure 5.9-151 Continuous Output of Interrupt Signal in Response to a Compare Match

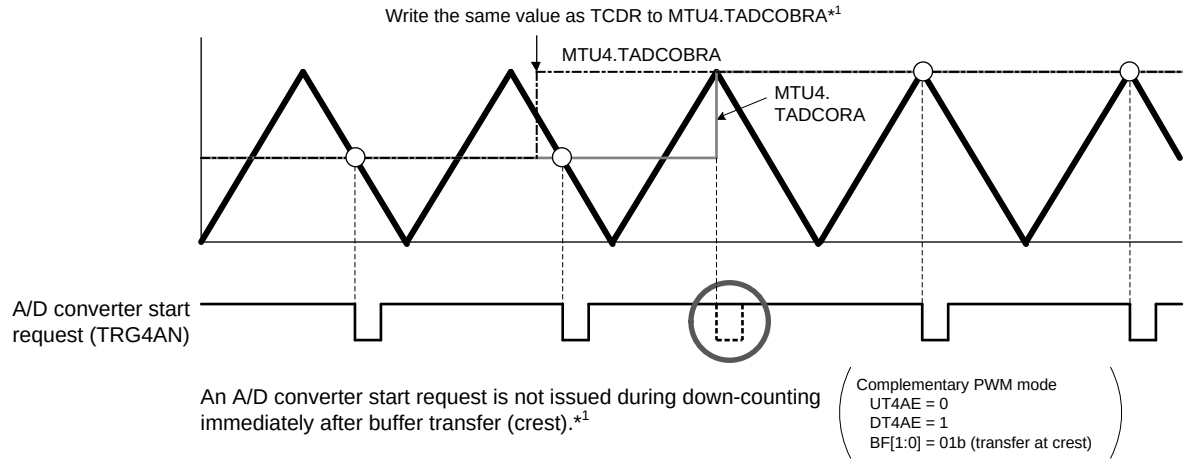
5.9.6.26 Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode



- When the TADCOBRA or TADCOBRB register in MTU4 (MTU7) is set to 0, the UT4AE or UT4BE (UT7AE or UT7BE) bit of TADCR in MTU4 (MTU7) is set to 1, and buffer transfer is performed at the trough of the value of the TCNT counter in MTU4 (MTU7), an A/D converter start request is not issued during up-counting immediately after the transfer (**Figure 5.9-152**).
- When the TADCOBRA or TADCOBRB register in MTU4 (MTU7) is set to the same value as that in the TCDR register, the DT4AE or DT4BE (DT7AE or DT7BE) bit of TADCR in MTU4 (MTU7) is set to 1, and buffer transfer is performed at the crest of the value of the TCNT counter in MTU4 (MTU7), an A/D converter start request is not issued during down-counting immediately after the transfer (**Figure 5.9-153**).
- When using A/D converter start requests in coordination with the interrupt skipping function, set up the TADCORA or TADCORB register in MTU4 (MTU7) so that the setting satisfies the condition "2 ≤ TADCORA or TADCORB in MTUn ≤ TCDR - 2" (n = 4 or 7).

Note: UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Note 1. An A/D converter start request is issued when TCDR - 1 ≥ MTU4.TADCOBRA/TADCOBRB ≥ 1 is written.

Figure 5.9-152 A/D Converter Start Request when TADCOBRA is Set to 0 in MTU4

Note: UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Note 1. An A/D converter start request is issued when TCDR - 1 ≥ MTU4.TADCOBRA/TADCOBRB ≥ 1 is written.

Figure 5.9-153 A/D Converter Start Request when TADCOBRA is Set to the Same Value as TCDR in MTU4

5.9.7 MTU Output Pin Initialization

5.9.7.1 Operating Modes

The MTU has the following six operating modes. Waveforms can be output in any of these modes.

- Normal mode (MTU0 to MTU4 and MTU6 to MTU8)
- PWM mode 1 (MTU0 to MTU4, MTU6, and MTU)
- PWM mode 2 (MTU0 to MTU2)
- Phase counting modes 1 to 5 (MTU1 and MTU2)
- Complementary PWM mode (MTU3, MTU4, MTU6, and MTU7)
- Reset-synchronized PWM mode (MTU3, MTU4, MTU6, and MTU7)

This section describes how to initialize the MTU output pins in each of these modes.

5.9.7.2 Operation in Case of Re-Setting Due to Error during Operation

If an error occurs during MTU operation, MTU output should be cut off by the system. The output can be cut off by allowing non-active level output from the pins by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports. MTU output can be disabled through TIOR settings. Complementary PWM output (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) should be specified through TOERA and TOERB settings. For PWM output pins, output can also be cut by hardware, using port output enable 3 (POE3). The pin initialization procedures for re-setting due to an error during operation and the procedures for restarting in a different mode after re-setting are described below.

The MTU has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Available mode transition combinations are shown in **Table 5.9-79**.

Table 5.9-79 Mode Transition Combinations

	Normal	PWM1	PWM2	PCM	CPWM	RPWM
Normal	(1)	(2)	(3)	(4)	(5)	(6)
PWM1	(7)	(8)	(9)	(10)	(11)	(12)
PWM2	(13)	(14)	(15)	(16)	Not available	Not available
PCM	(17)	(18)	(19)	(20)	Not available	Not available

RPWM	(26)	(27)	Not available	Not available	(28)	(29)

Note: Normal: Normal mode
PWM1: PWM mode 1
PWM2: PWM mode 2
PCM: Phase counting modes 1 to 5
CPWM: Complementary PWM mode
RPWM: Reset-synchronized PWM mode

5.9.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation

- When making a transition to a mode (Normal, PWM1, PWM2, or PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of TIOR setting.
- In PWM mode 1, waveforms are not output to the MTIOCnB and MTIOCnD pins (n = 3, 4, 6, or 7). If the MTIOCnB or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers. If the MTIOCnm output (n = 0 to 2 and m = A to D) is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, waveforms are not output to the corresponding MTIOCnC and MTIOCnD pins (n = 0, 3, 4, 6, or 7). If the MTIOCnC or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, waveforms are not output to the corresponding MTIOCnC and MTIOCnD pins (n = 0, 3, 4, 6, or 7). If the MTIOCnC or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- When making a transition to a mode (CPWM or RPWM) in which the pin output level is selected by the timer output control register (TOCR1A, TOCR2A, TOCR1B, or TOCR2B) setting, temporarily disable output in MTU3 and MTU4 (or MTU6 and MTU7) with the timer output master enable register (TOERA or TOERB). If the MTIOCnm output (n =3, 4, 6, or 7 and m = A to D) is selected as the function of pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports. Switch to normal mode, perform initialization with TIOR, restore TIOR to its initial value, then operate the MTU in accordance with the mode setting procedure (TOCR1A setting, TOCR2A setting, TMDR1 setting, and TOERA setting (TOCR1B setting, TOCR2B setting, TMDR1 setting, and TOERB setting)).

NOTE

Channel number is substituted for “n” indicated in this section.

Pin initialization procedures are described below for the numbered combinations in **Table 5.9-79**. The active level is assumed to be low.

(1) Operation When Error Occurs in Normal Mode and Operation is Restarted in Normal Mode

Figure 5.9-154 shows a case in which an error occurs in normal mode and operation is restarted in normal mode after re- setting.

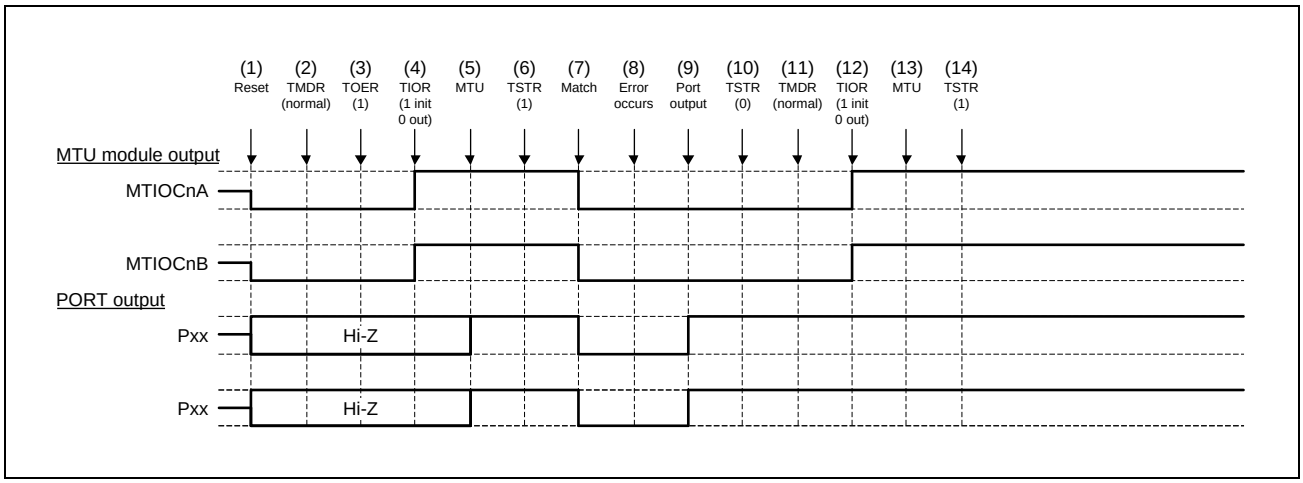

Figure 5.9-154 Error Occurrence in Normal Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) After a reset, the TMDR1 setting is for normal mode.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with TOERA (TOERB) before initializing the pins with TIOR.

(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(5) Set MTU output using the port mode control registers (PMCn) and port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB).

(11) This step is not necessary when restarting in normal mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(2) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1

Figure 5.9-155 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

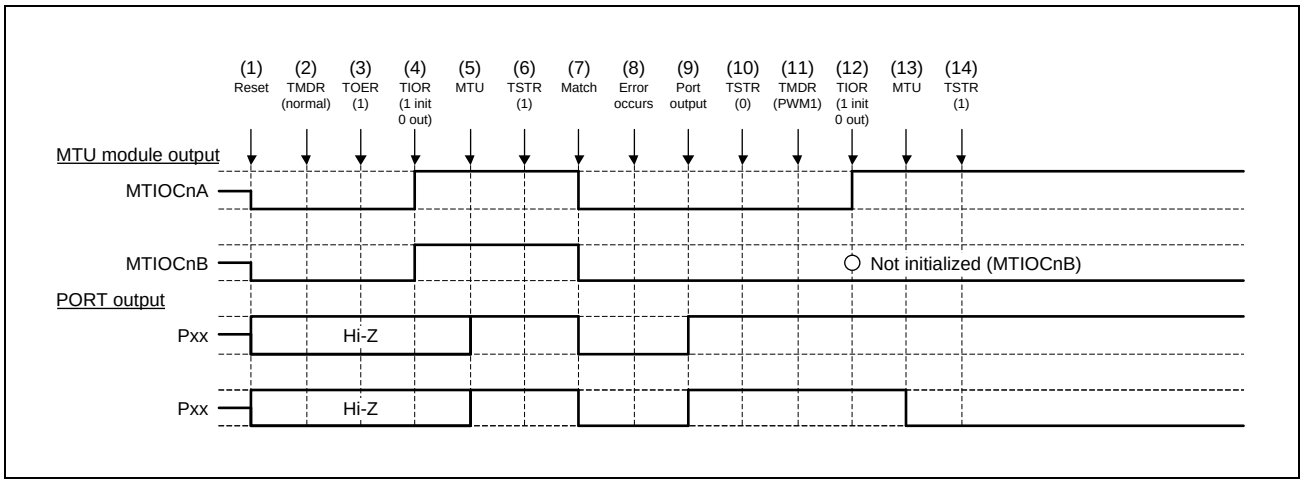

Figure 5.9-155 Error Occurrence in Normal Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 5.9-154**.

(11) Set PWM mode 1.

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(3) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2

Figure 5.9-156 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

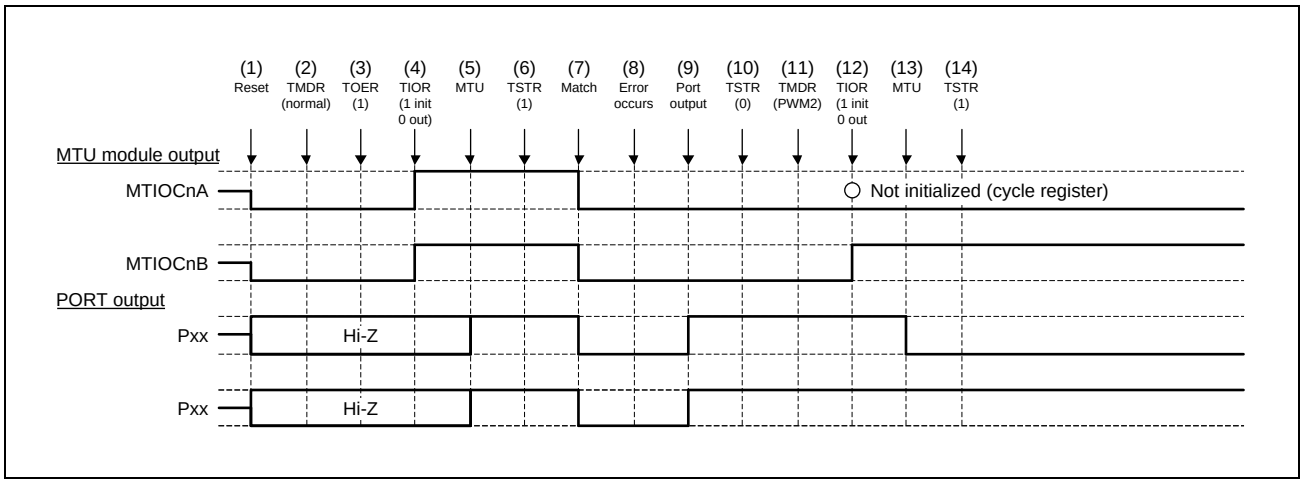

Figure 5.9-156 Error Occurrence in Normal Mode, Recovery in PWM Mode 2

(1) to (10) are the same as in **Figure 5.9-154**.

(11) Set PWM mode 2.

(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers. To output a specified level, set up the general output ports with the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

(4) Operation When Error Occurs in Normal Mode and Operation is Restarted in Phase Counting Mode

Figure 5.9-157 shows a case in which an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

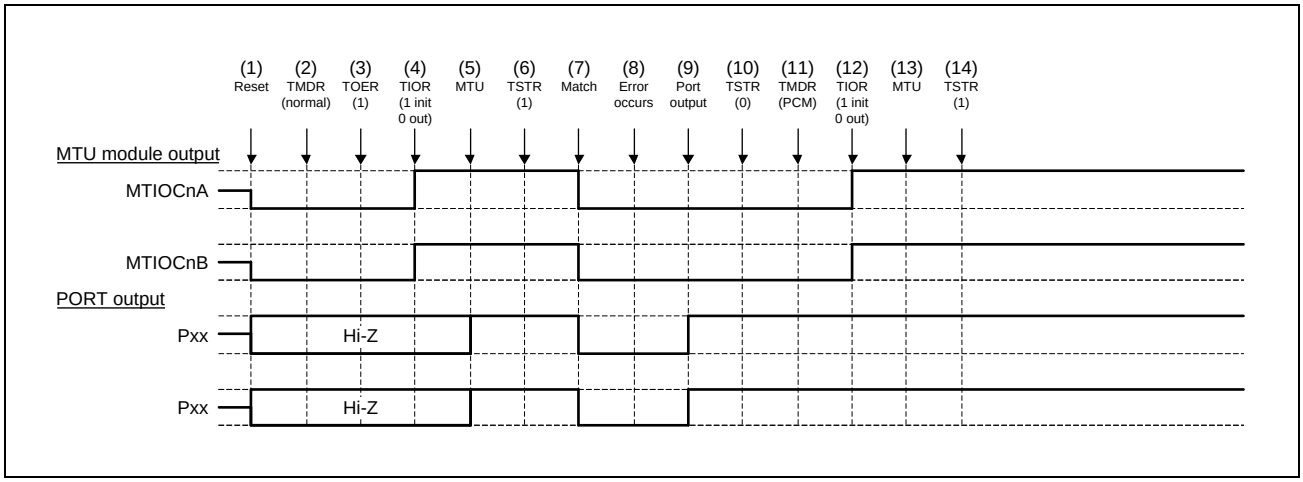

Figure 5.9-157 Error Occurrence in Normal Mode, Recovery in Phase Counting Mode

(1) to (10) are the same as in **Figure 5.9-154**.

(11) Set the phase counting mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

(5) Operation When Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode

Figure 5.9-158 shows a case in which an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

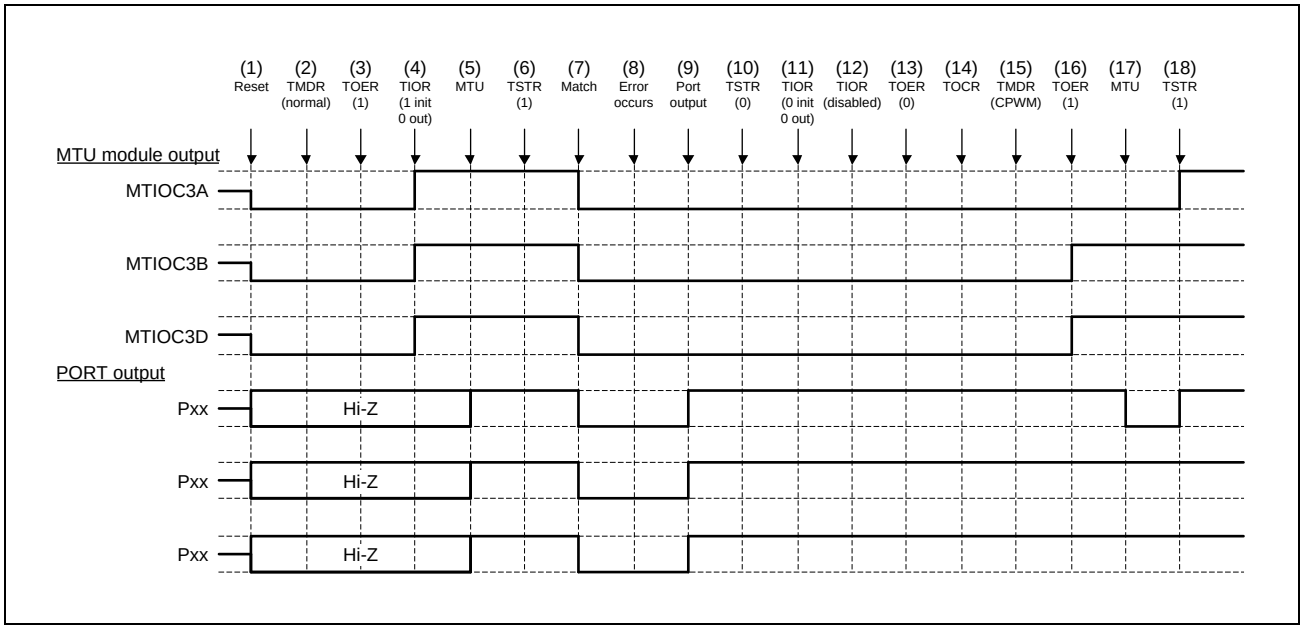

Figure 5.9-158 Error Occurrence in Normal Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 5.9-154**.

(11) Initialize the normal mode waveform generation section with TIOR.

(12) Disable operation of the normal mode waveform generation section with TIOR.

(13) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(14) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set complementary PWM mode.

(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(17) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(18) Restart operation by setting TSTRA (TSTRB).

(6) Operation When Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 5.9-159 shows a case in which an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

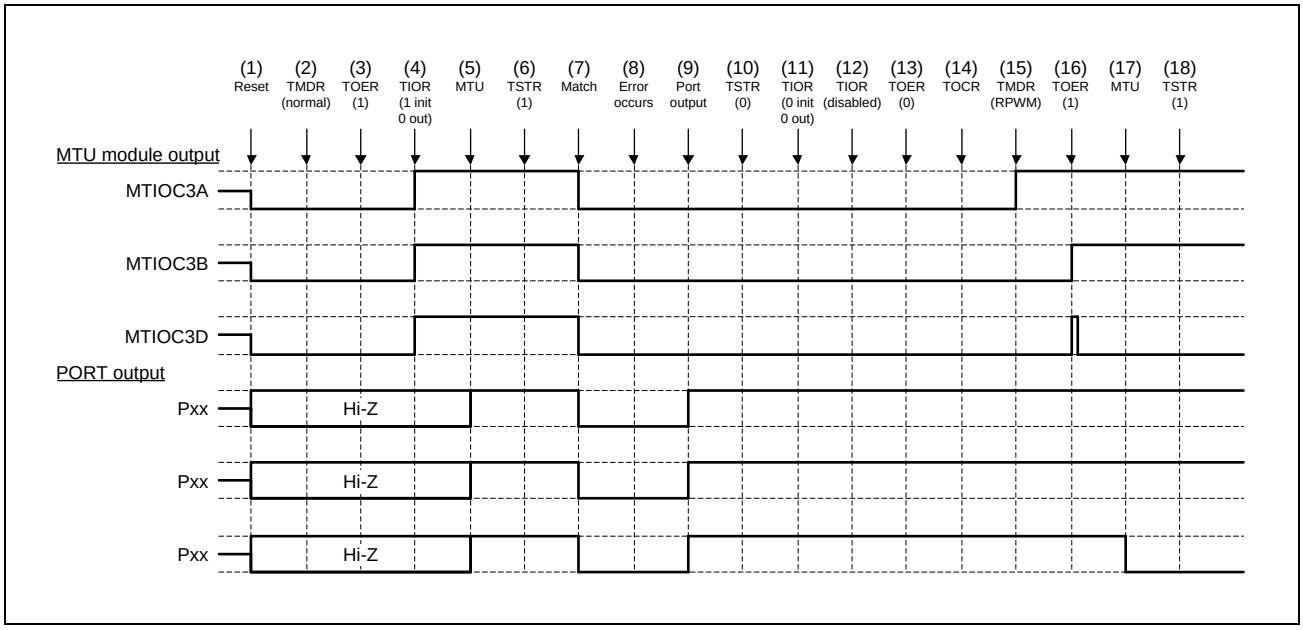

Figure 5.9-159 Error Occurrence in Normal Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (13) are the same as in **Figure 5.9-156**.

(14) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set reset-synchronized PWM mode.

(16) Enable output from MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(17) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(18) Restart operation by setting TSTRA (TSTRB).

(7) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode

Figure 5.9-160 shows a case in which an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

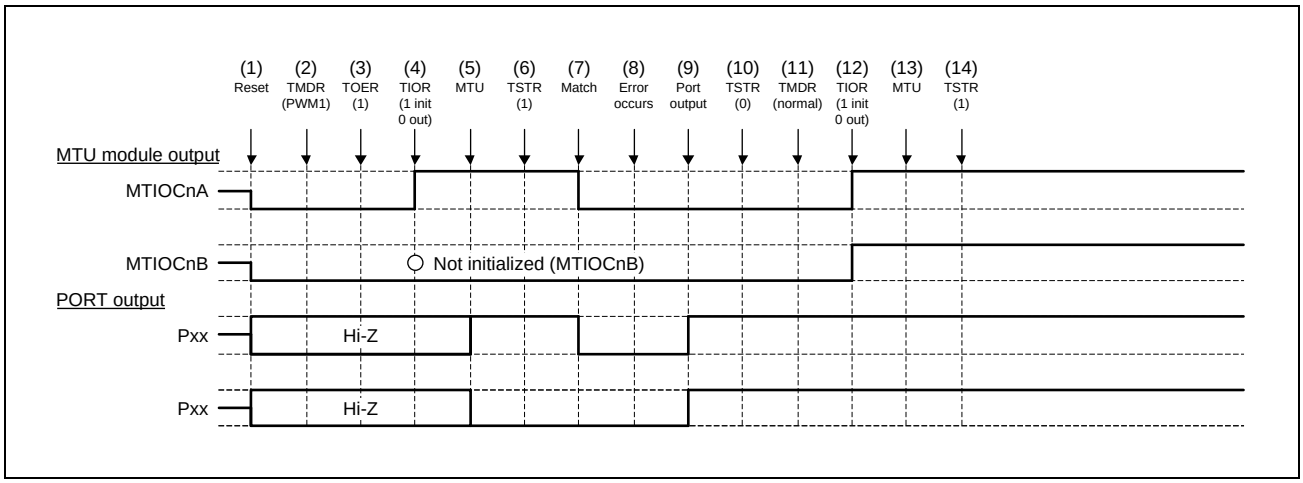

Figure 5.9-160 Error Occurrence in PWM Mode 1, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 1.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with TOERA (TOERB) before initializing the pins with TIOR.

(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 1, the MTIOCnB side is not initialized.)

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB).

(11) Set normal mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(8) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1

Figure 5.9-161 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

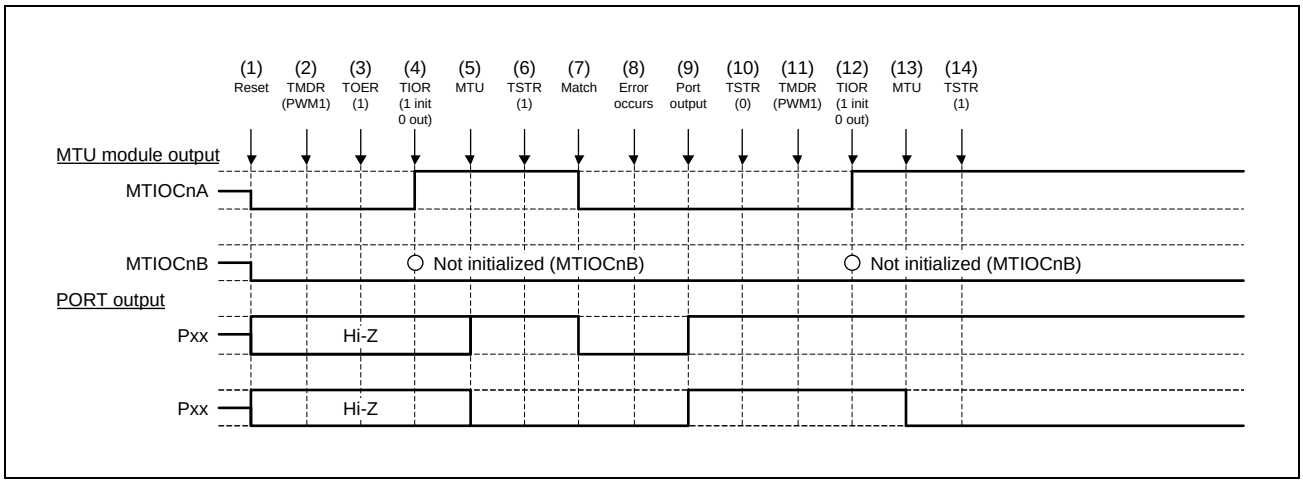

Figure 5.9-161 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 5.9-160**.

(11) This step is not necessary when restarting in PWM mode 1.

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(9) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2

Figure 5.9-162 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

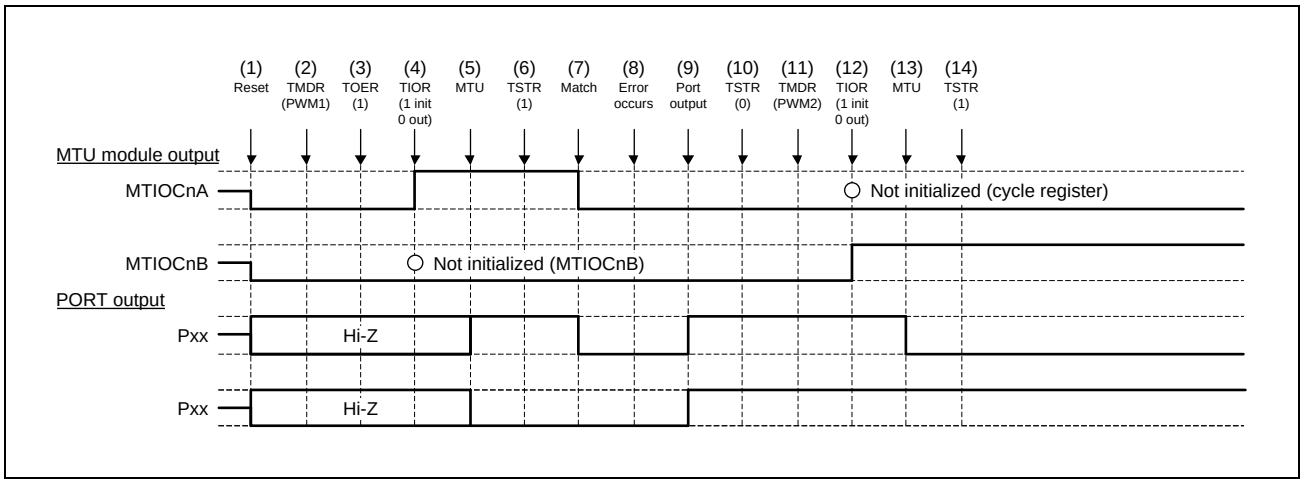

Figure 5.9-162 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 2

(1) to (10) are the same as in **Figure 5.9-160**.

(11) Set PWM mode 2.

(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

(10) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Phase Counting Mode

Figure 5.9-163 shows a case in which an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

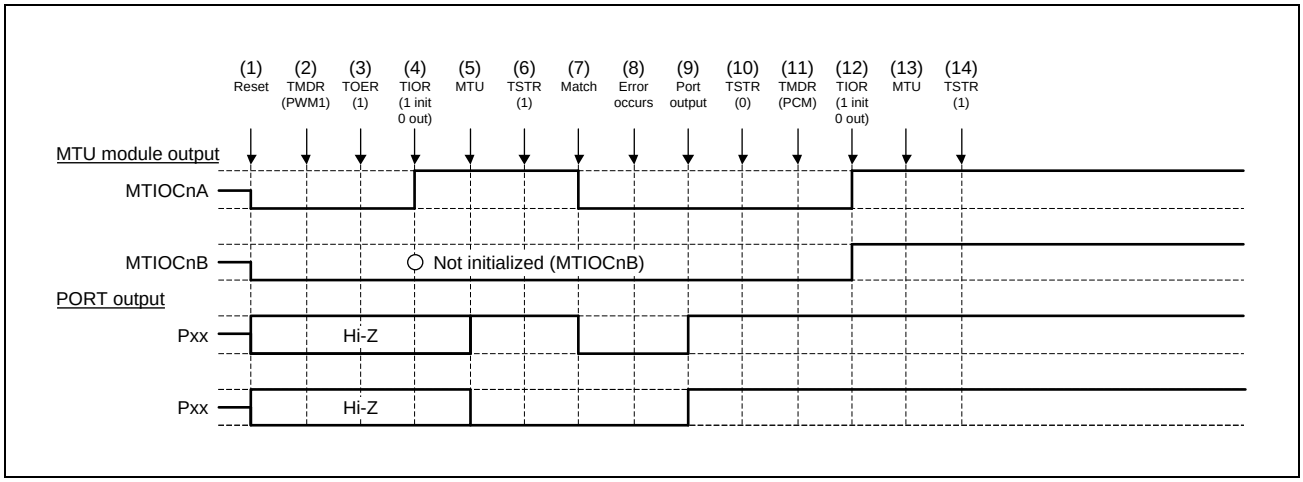

Figure 5.9-163 Error Occurrence in PWM Mode 1, Recovery in Phase Counting Mode

(1) to (10) are the same as in **Figure 5.9-160**.

(11) Set the phase counting mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

(11) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode

Figure 5.9-164 shows a case in which an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

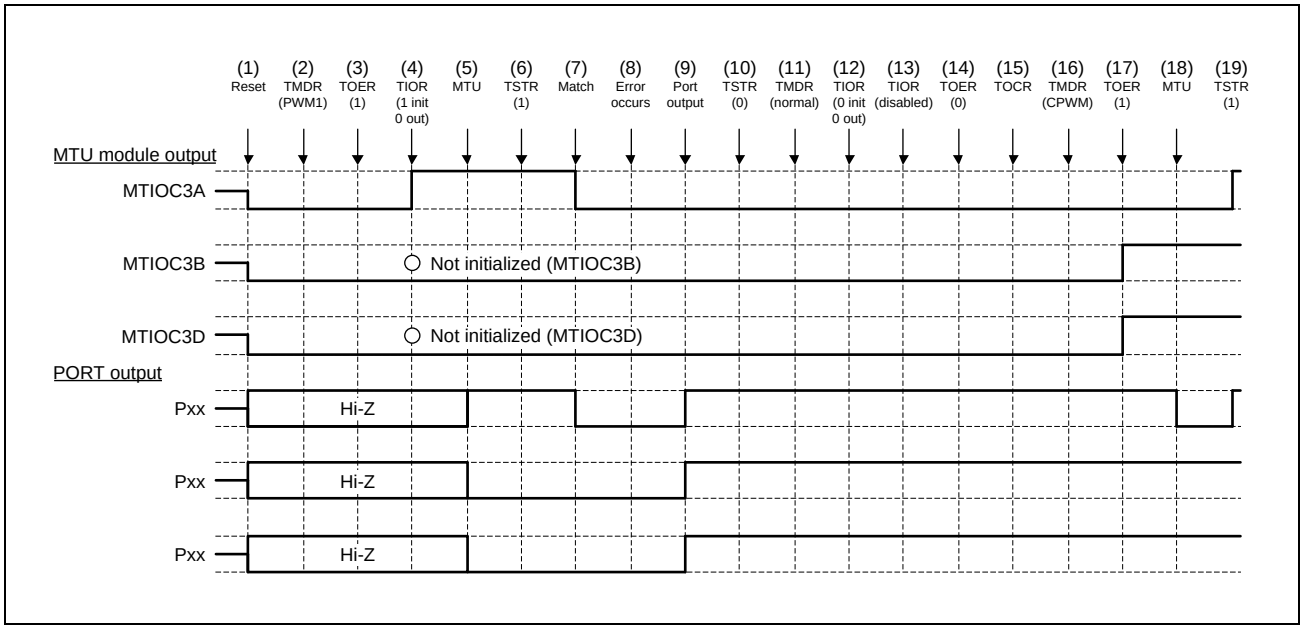

Figure 5.9-164 Error Occurrence in PWM Mode 1, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 5.9-160**.

(11) Set normal mode to initialize the normal mode waveform generation section.

(12) Initialize the PWM mode 1 waveform generation section with TIOR.

(13) Disable operation of the PWM mode 1 waveform generation section with TIOR

(14) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(15) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set complementary PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(18) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(19) Restart operation by setting TSTRA (TSTRB).

(12) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 5.9-165 shows a case in which an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

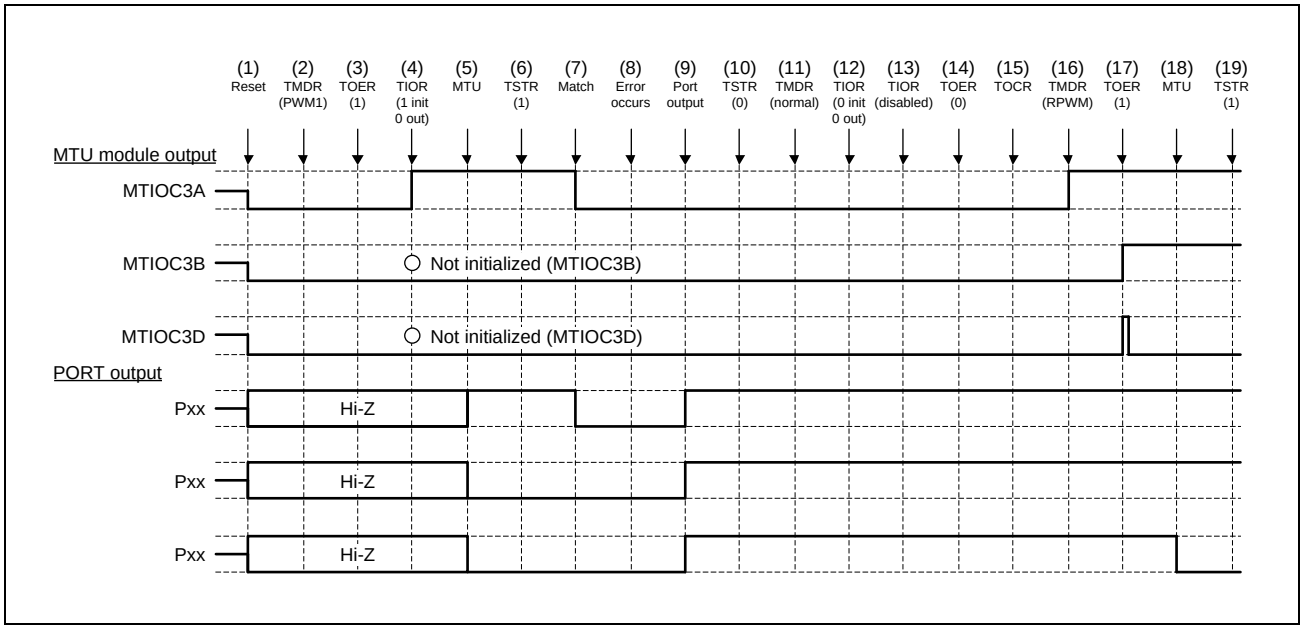

Figure 5.9-165 Error Occurrence in PWM Mode 1, Recovery in Reset-Synchronized PWM Mode

(1) to (14) are the same as in **Figure 5.9-164**.

(15) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set reset-synchronized PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(18) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(19) Restart operation by setting TSTRA (TSTRB).

(13) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode

Figure 5.9-166 shows a case in which an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

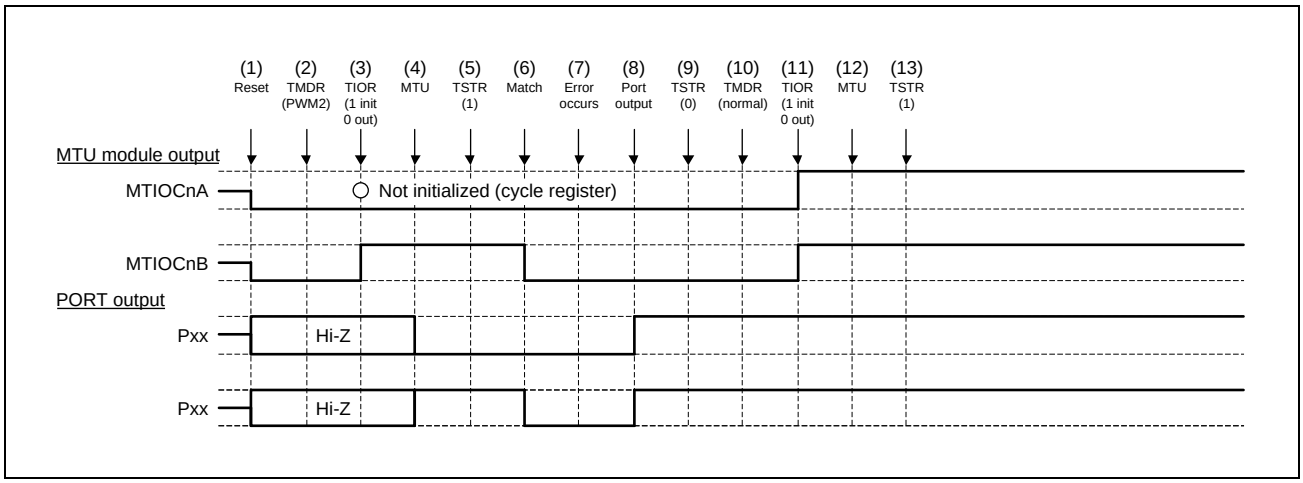

Figure 5.9-166 Error Occurrence in PWM Mode 2, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 2.

(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 2, the pins corresponding to the TGR registers used as cycle registers are not initialized. In the example, TGRA in MTUn is used as a cycle register.)

(4) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(5) Start count operation by setting TSTRA.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(9) Stop count operation by setting TSTRA.

(10) Set normal mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(14) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 1

Figure 5.9-167 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

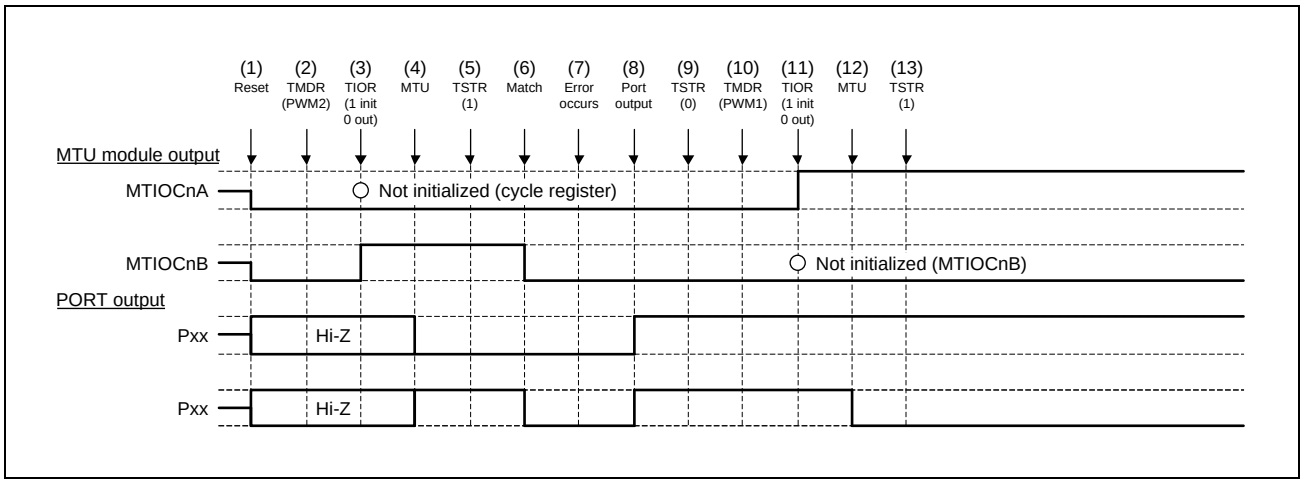

Figure 5.9-167 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 1

(1) to (9) are the same as in **Figure 5.9-166**.

(10) Set PWM mode 1.

(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(15) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2

Figure 5.9-168 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

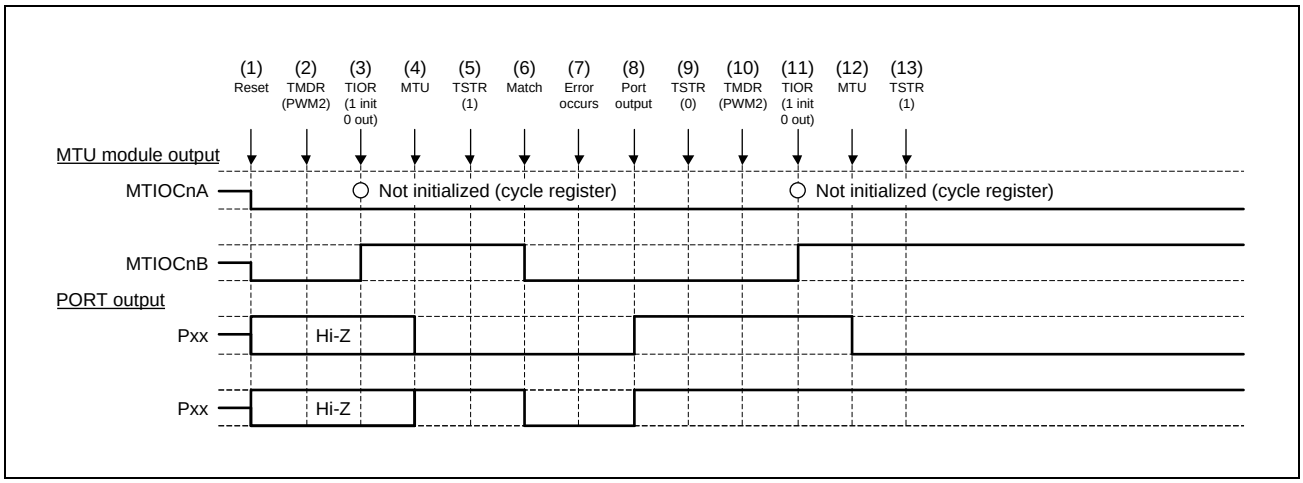

Figure 5.9-168 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 2

(1) to (9) are the same as in **Figure 5.9-166**.

(10) This step is not necessary when restarting in PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(16) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Phase Counting Mode

Figure 5.9-169 shows a case in which an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

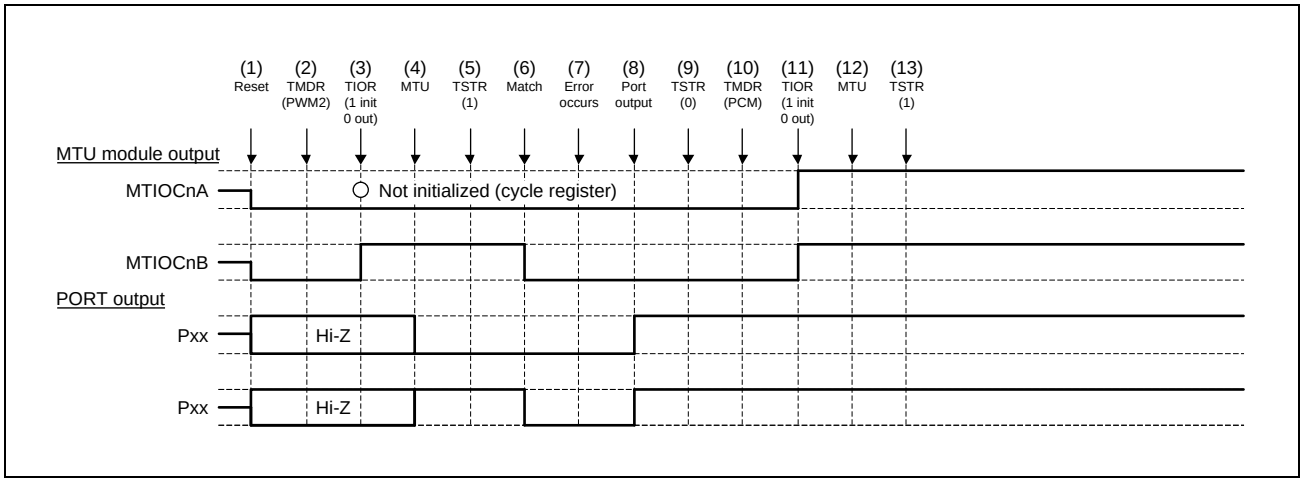

Figure 5.9-169 Error Occurrence in PWM Mode 2, Recovery in Phase Counting Mode

(1) to (9) are the same as in **Figure 5.9-166**.

(10) Set the phase counting mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(17) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Normal Mode

Figure 5.9-170 shows a case in which an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

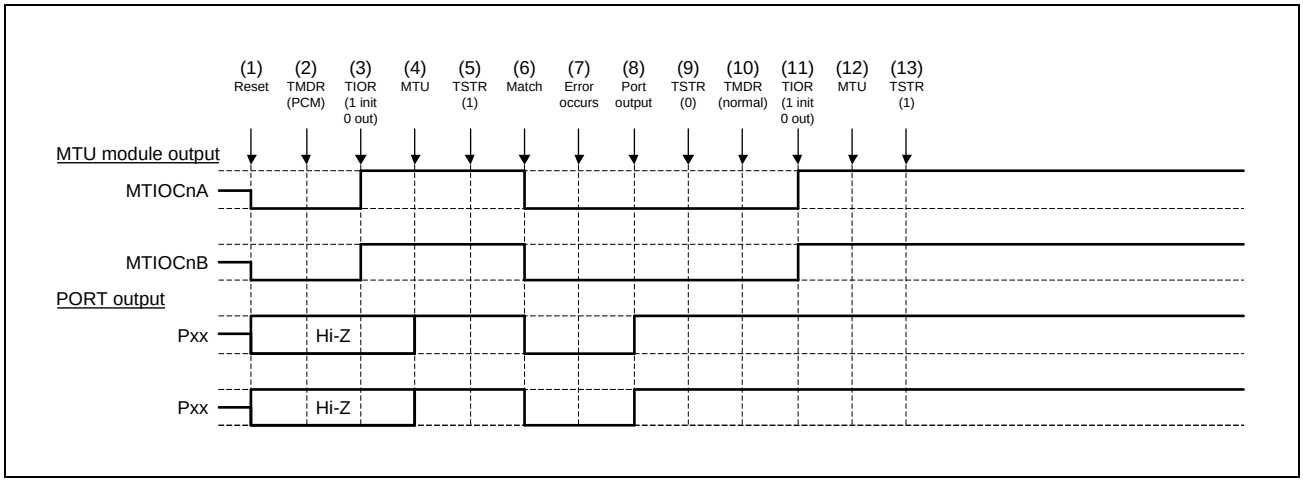

Figure 5.9-170 Error Occurrence in Phase Counting Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set phase counting mode.

(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(4) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(5) Start count operation by setting TSTRA.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(9) Stop count operation by setting TSTRA.

(10) Set normal mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(18) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 1

Figure 5.9-171 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

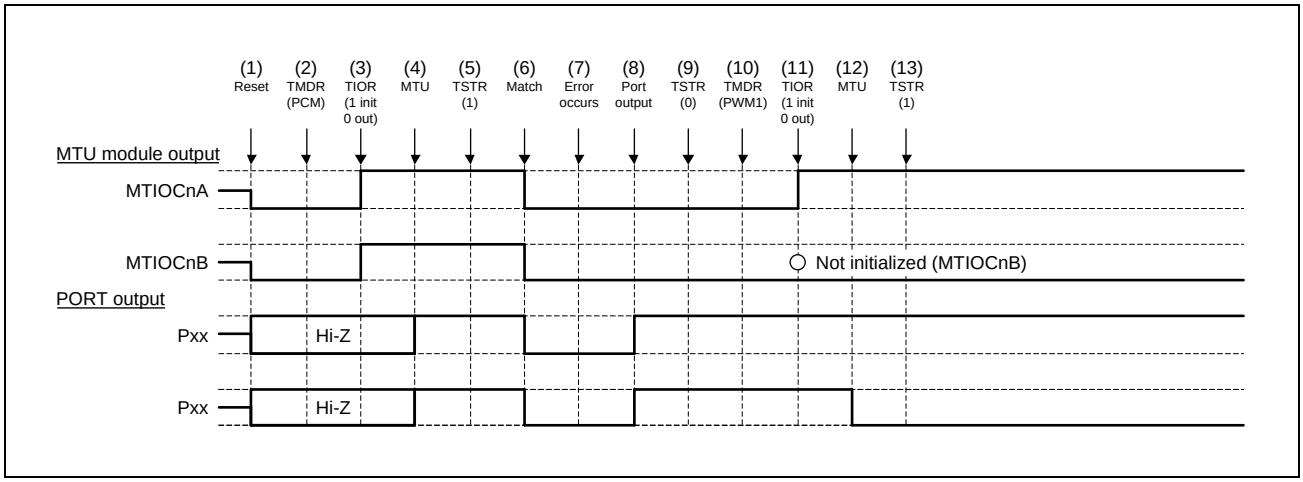

Figure 5.9-171 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 1

(1) to (9) are the same as in **Figure 5.9-170**.

(10) Set PWM mode 1.

(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(19) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2

Figure 5.9-172 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

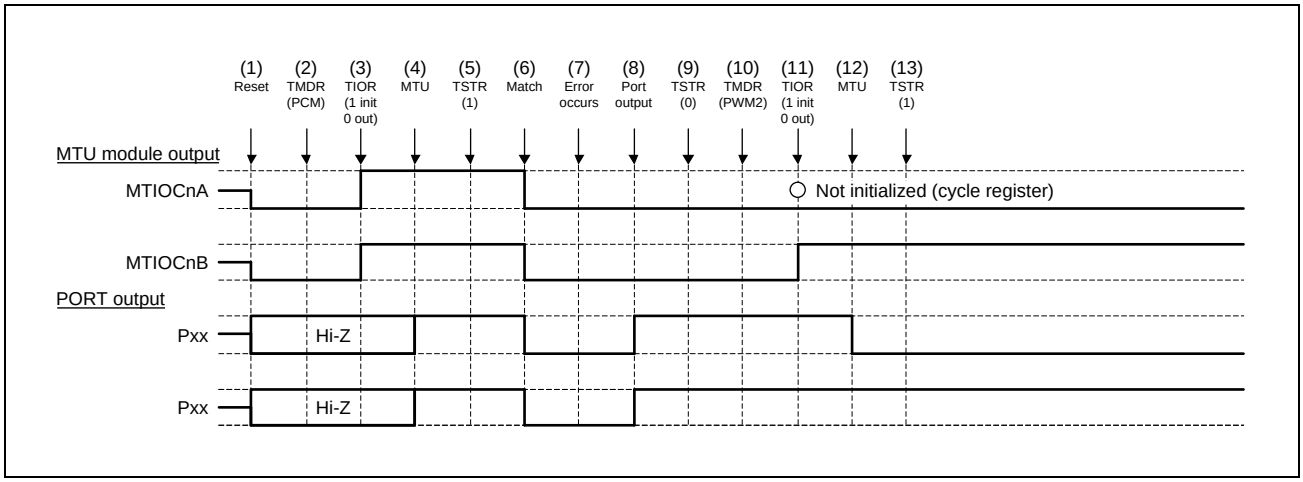

Figure 5.9-172 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 2

(1) to (9) are the same as in **Figure 5.9-170**.

(10) Set PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(20) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Phase Counting Mode

Figure 5.9-173 shows a case in which an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

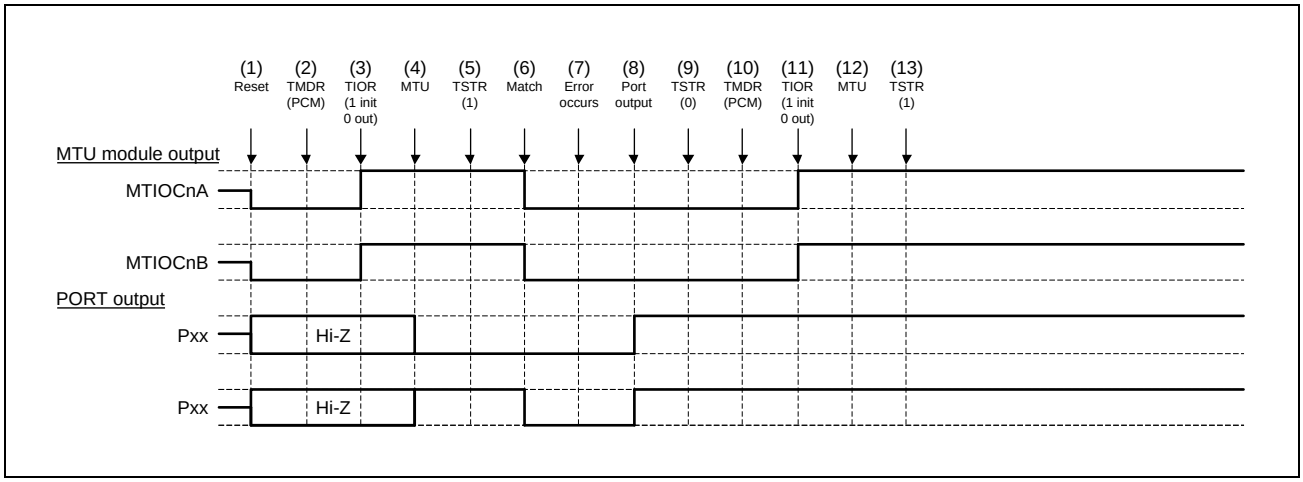

Figure 5.9-173 Error Occurrence in Phase Counting Mode, Recovery in Phase Counting Mode

(1) to (9) are the same as in **Figure 5.9-170**.

(10) This step is not necessary when restarting in phase counting mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(21) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode

Figure 5.9-174 shows a case in which an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

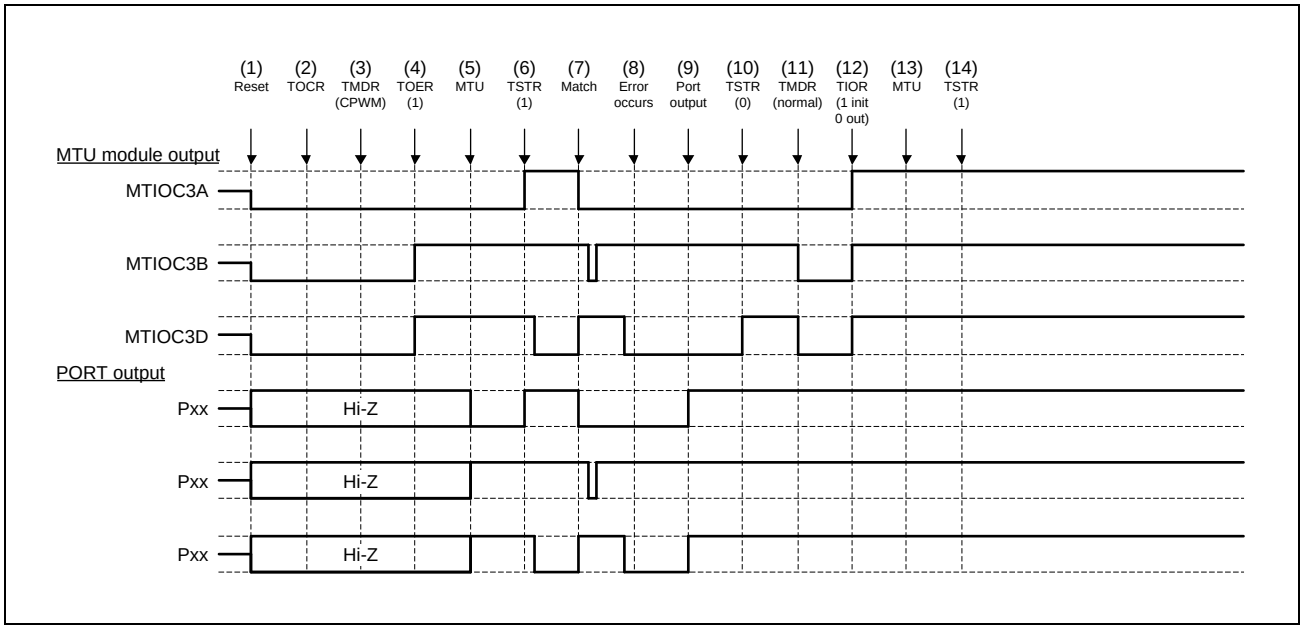

Figure 5.9-174 Error Occurrence in Complementary PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU3 output goes low and the ports enter high-impedance state.

(2) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set complementary PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) The complementary PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB). (MTU output becomes the initial complementary PWM output value).

(11) Set normal mode (MTU output goes low).

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(22) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1

Figure 5.9-175 shows a case in which an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

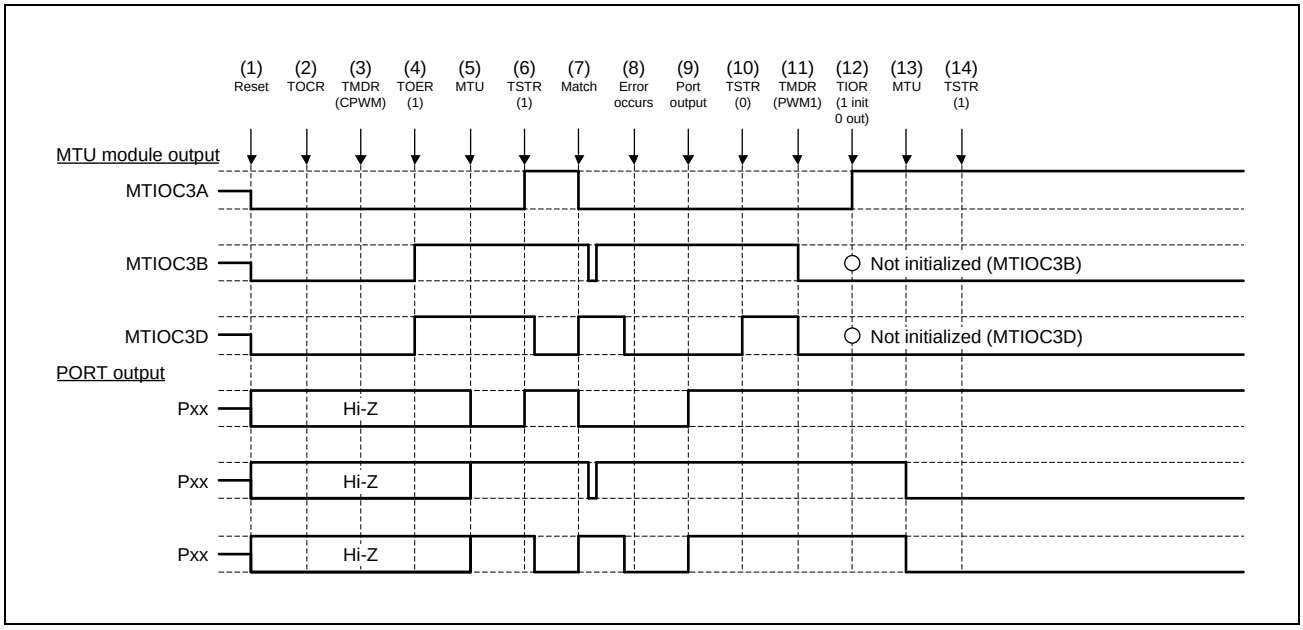

Figure 5.9-175 Error Occurrence in Complementary PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 5.9-174**.

(11) Set PWM mode 1 (MTU output goes low).

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(23) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 5.9-176 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the cycle and duty settings at the time of stopping the counter).

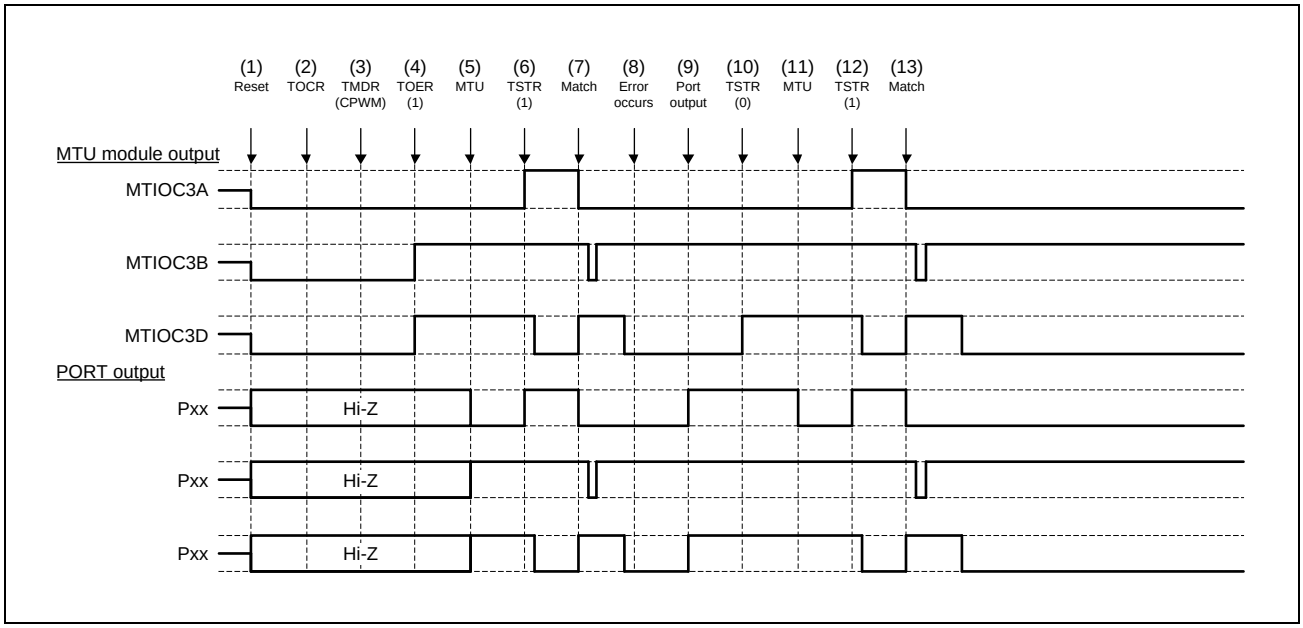

Figure 5.9-176 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (1)

(1) to (10) are the same as in **Figure 5.9-174**.

(11) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(12) Restart operation by setting TSTRA (TSTRB).

(13) The complementary PWM waveform is output on compare match occurrence.

(24) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings

Figure 5.9-177 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (operation is restarted using new cycle and duty ratio settings).

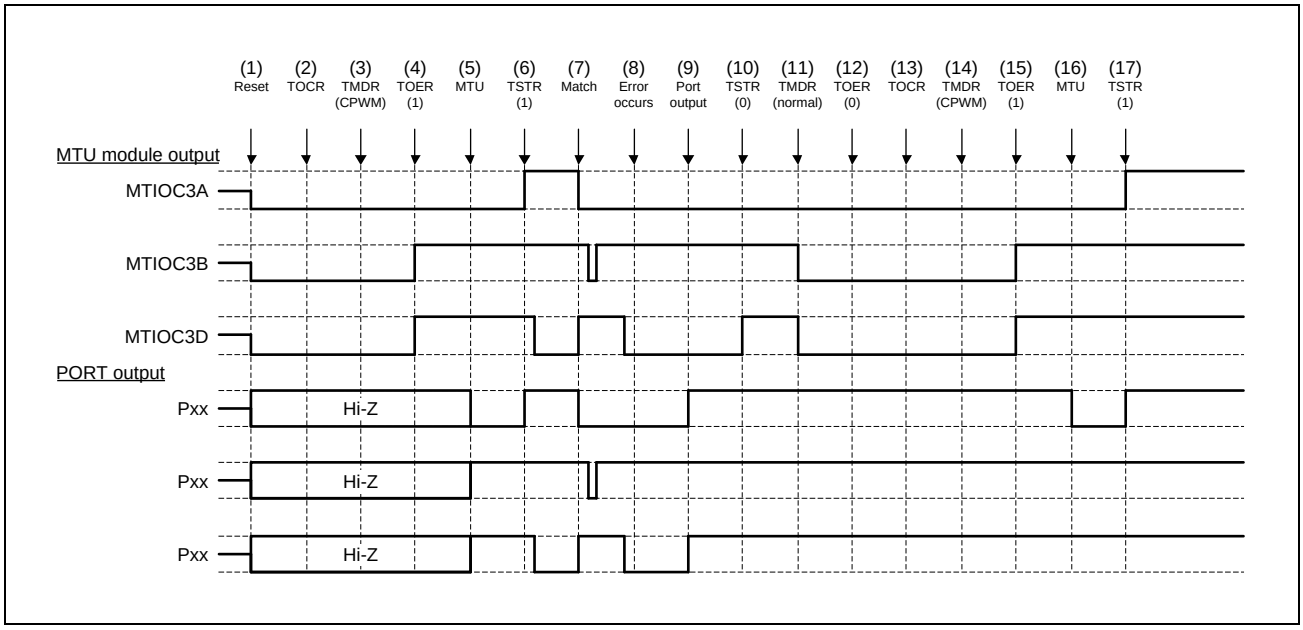

Figure 5.9-177 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (2)

(1) to (10) are the same as in **Figure 5.9-174**.

(11) Set normal mode and make new settings (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(13) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set complementary PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(16) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(17) Restart operation by setting TSTRA (TSTRB).

(25) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 5.9-178 shows a case in which an error occurs in complementary PWM mode and operation is restarted in reset- synchronized PWM mode after re-setting.

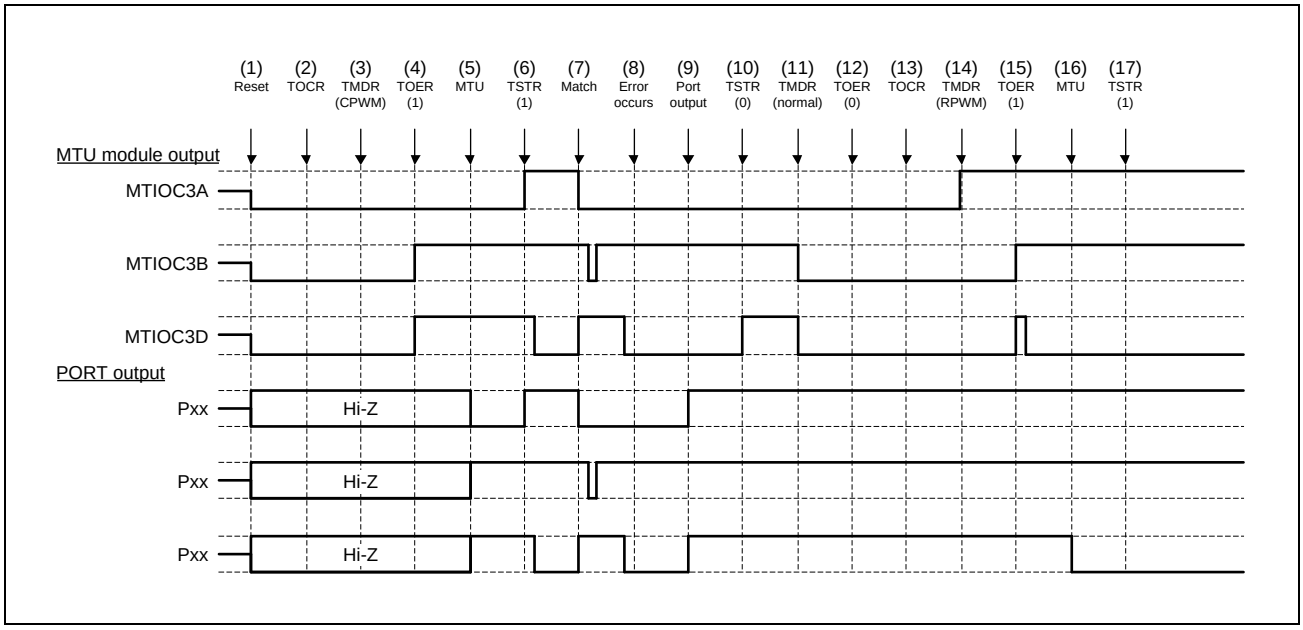

Figure 5.9-178 Error Occurrence in Complementary PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in **Figure 5.9-174**.

(11) Set normal mode (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(13) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set reset-synchronized PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(16) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(17) Restart operation by setting TSTRA (TSTRB).

(26) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode

Figure 5.9-179 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

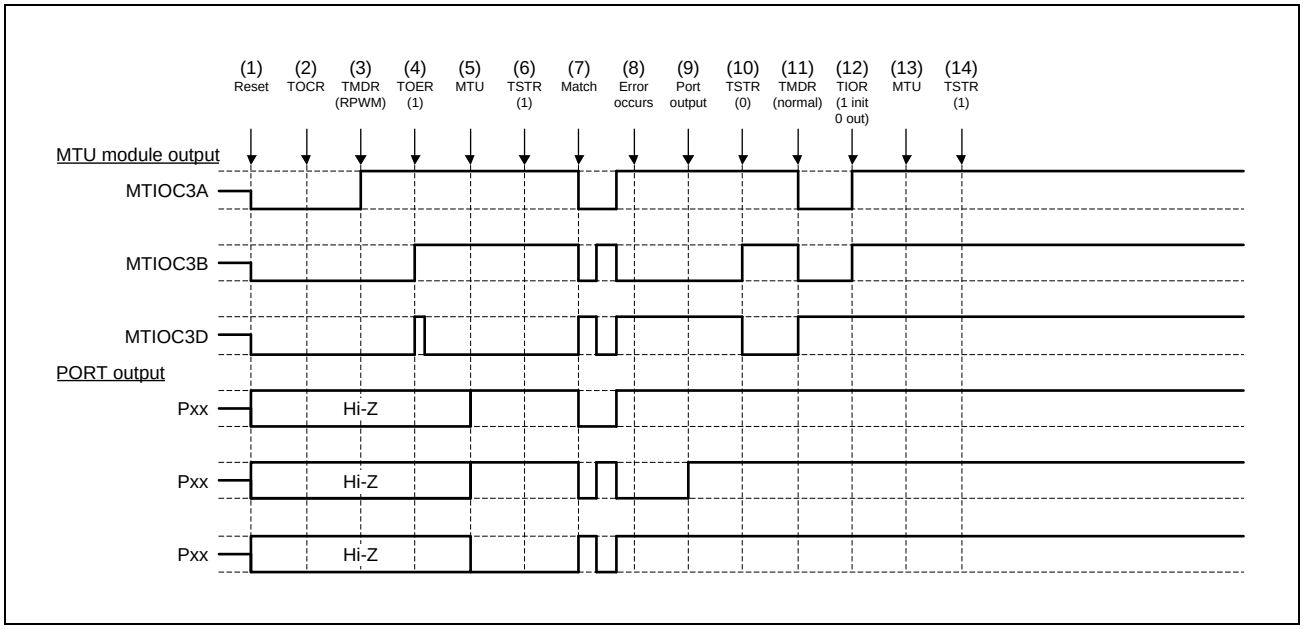

Figure 5.9-179 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set reset-synchronized PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) The reset-synchronized PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB). (MTU output becomes the initial reset-synchronized PWM output value.)

(11) Set normal mode (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(27) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1

Figure 5.9-180 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

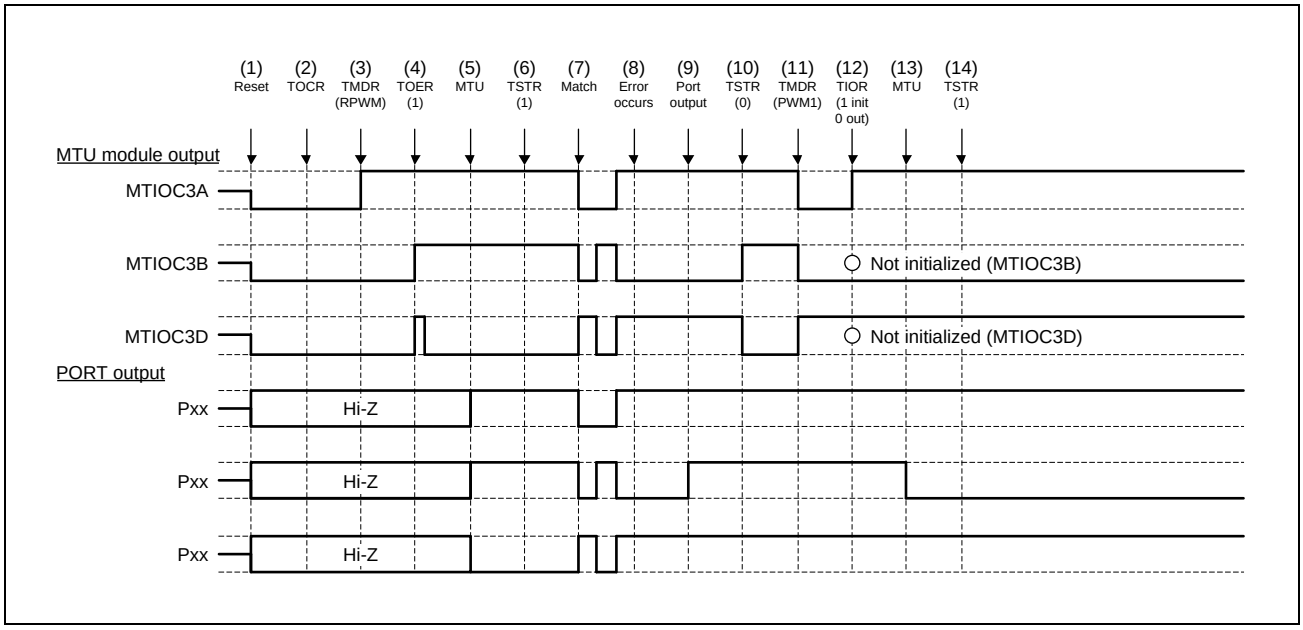

Figure 5.9-180 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 5.9-179**.

(11) Set PWM mode 1 (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(28) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 5.9-181 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

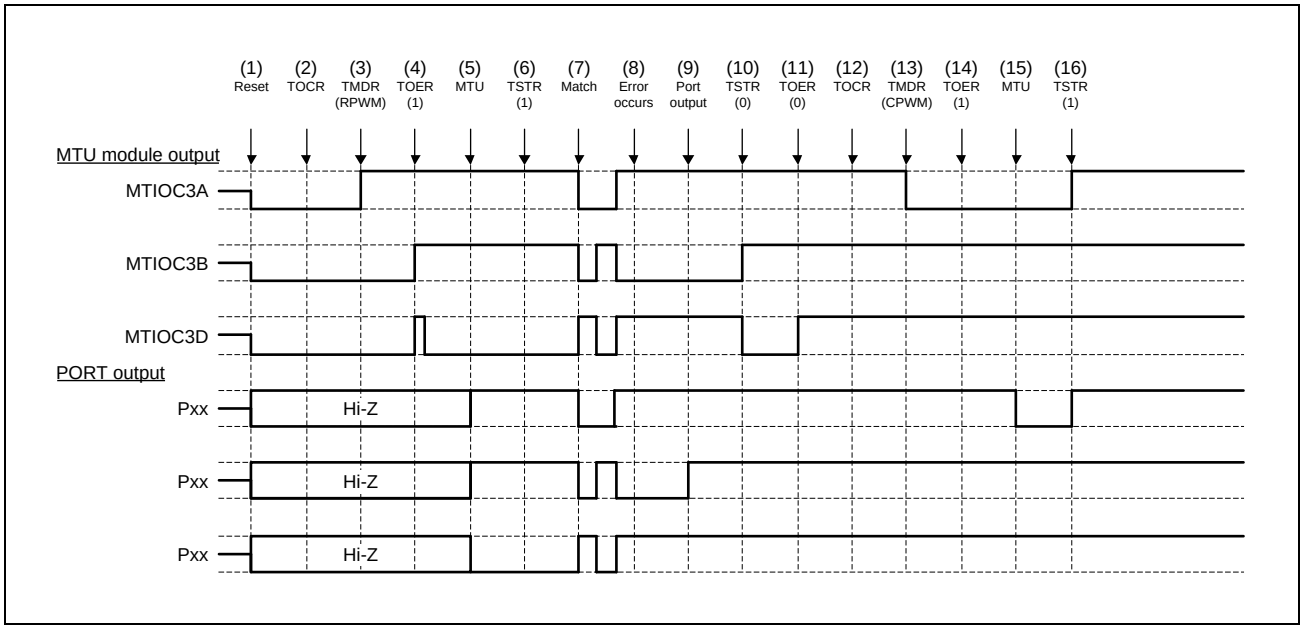

Figure 5.9-181 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 5.9-179**.

(11) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(12) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(13) Set complementary PWM mode (MTU cyclic output pin goes low).

(14) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(15) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(16) Restart operation by setting TSTRA (TSTRB).

(29) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 5.9-182 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

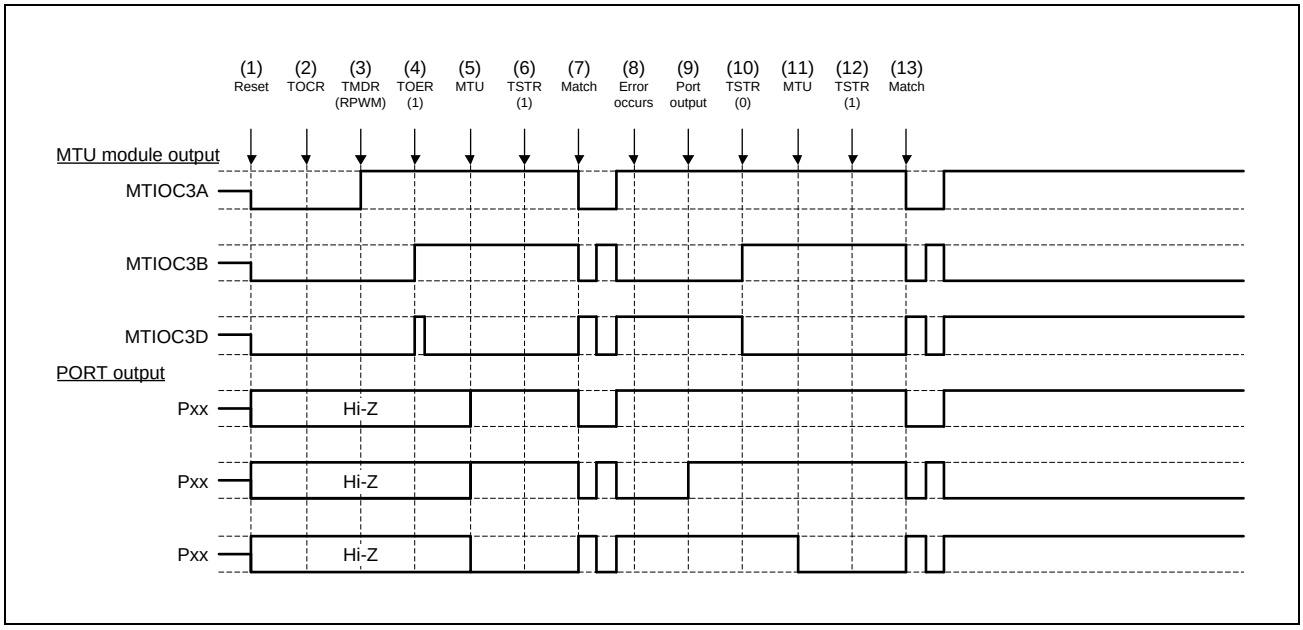

Figure 5.9-182 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in **Figure 5.9-179**.

(11) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

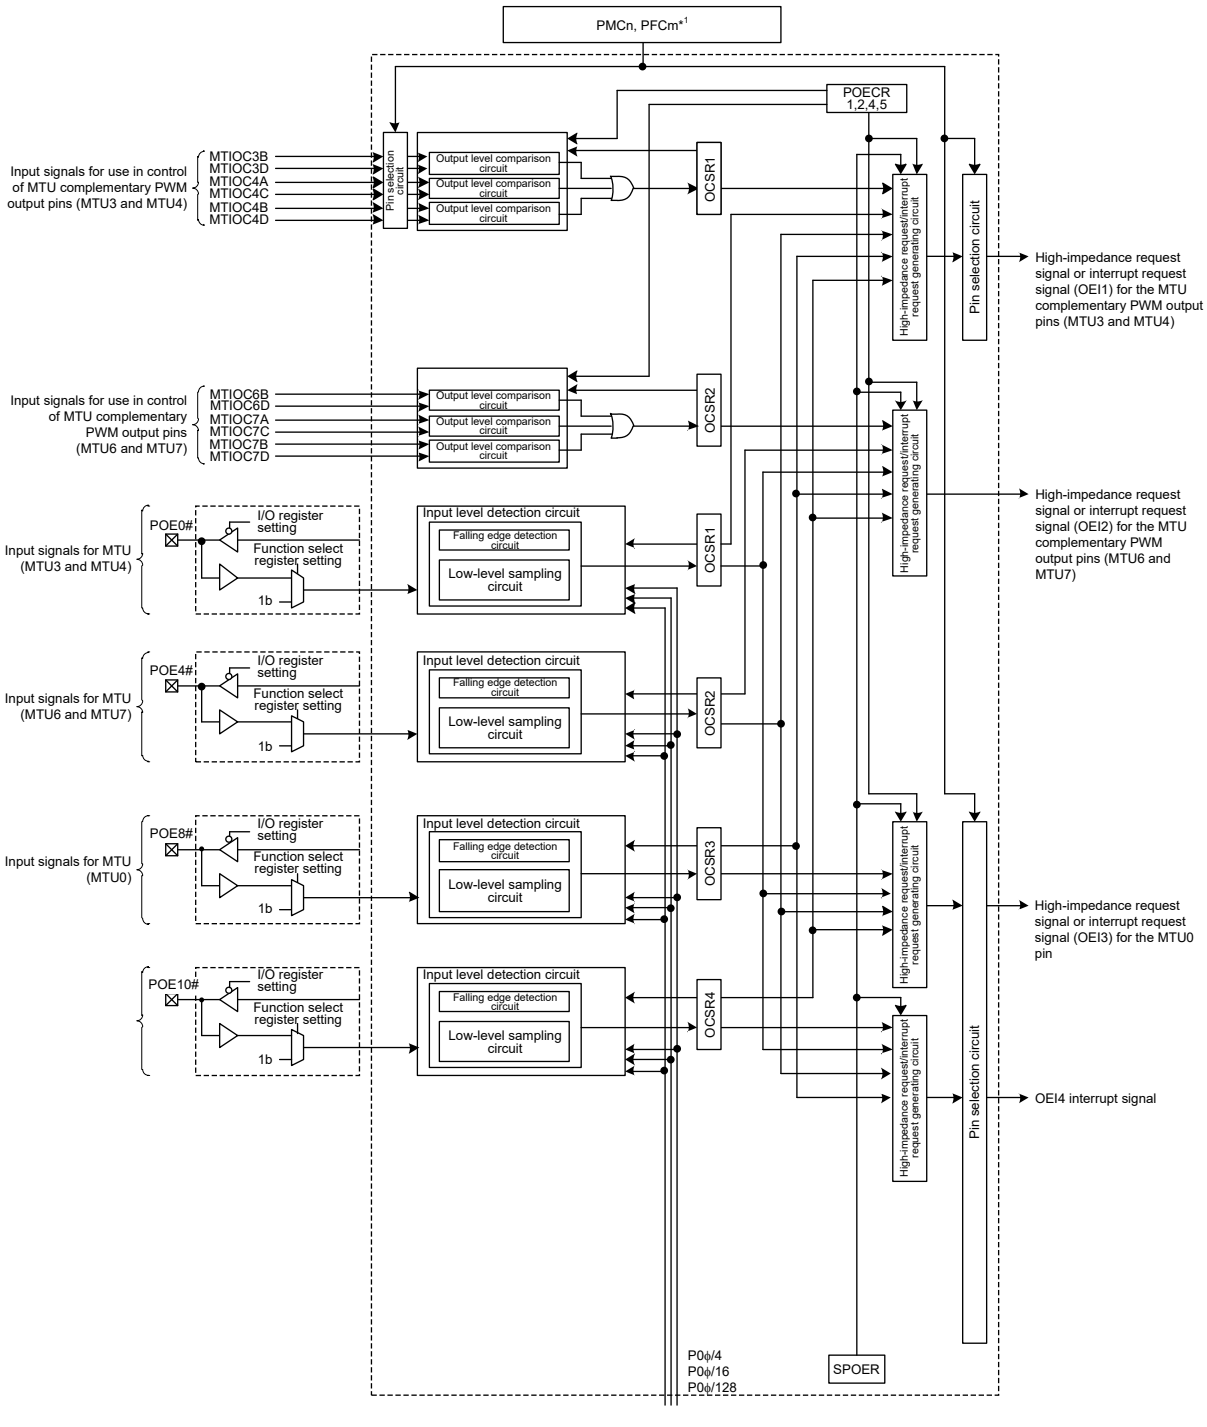
(12) Restart operation by setting TSTRA (TSTRB).

(13) The reset-synchronized PWM waveform is output on compare match occurrence.

SECTION 5 TIMER

5.10 Port Output Enable 3 (POE3)

The port output enable 3 (POE3) can be used to place output pins for the MTU3a in the high-impedance state in response to various conditions.



5.10.1 Overview

Table 5.10-1 lists the specifications of the POE3, and **Figure 5.10-1** shows a block diagram of the POE3.

Table 5.10-1 POE3 Specifications

Item	Description
Target pins to be placed in the high-impedance state	• MTU3a output pins MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D) MTU3 pin (MTIOC3B, MTIOC3D) MTU4 pin (MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) MTU6 pin (MTIOC6B, MTIOC6D) MTU7 pin (MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D)
Conditions for the high-impedance state	• Setting pins as inputs: setting the POE0#, POE4#, POE8#, or POE10# pins as inputs (falling edge or low- level sampling). • Short-circuits between output pins: A match (short circuit) between the output signal levels at the active level over one or more cycle on (the following combination of pins) 1: MTIOC3B and MTIOC3D 2: MTIOC4A and MTIOC4C 3: MTIOC4B and MTIOC4D 4: MTIOC6B and MTIOC6D 5: MTIOC7A and MTIOC7C 6: MTIOC7B and MTIOC7D • SPOER register setting being made
Function	• Each of the POE0#, POE4#, POE8#, and POE10# input pins can be set for falling edge, P0ϕ/4 × 16, P0ϕ/ 16 × 16, or P0ϕ/128 × 16 low-level sampling. • Pins for the MTU complementary PWM output, and MTU0 pin can be placed in high-impedance state by POE0#, POE4#, POE8#, and POE10# pin falling-edge or low-level sampling. • Pins for the MTU complementary PWM output can be placed in high-impedance state when output levels of the MTU complementary PWM output pins are compared and simultaneous active-level output continues for one cycle or more. • Pins for the MTU complementary PWM output, and MTU0 can be placed in the high-impedance state by modifying the settings of the SPOER register of POE3. • Interrupts can be generated by input-level sampling or output level comparison results.

The POE3 has input level detection circuits, pin selection circuits, output level comparison circuits, and a high-impedance request/interrupt request generating circuit as shown in **Figure 5.10-1**.

Note 1. Refer to **4.2 Pin Function Controller (PFC)**.

Figure 5.10-1 POE3 Block Diagram

Table 5.10-2 shows input/output pins to be used by the POE3.

Table 5.10-2 POE3 Input/Output Pins

Pin Name	Signal Name in This Section	Input/ Output	Functional Description
MTU_POE0#	POE0#	Input	Input pin for the request signal to place the MTU3 and MTU4 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU6, and MTU7 pins in the high-impedance state.
MTU_POE4#	POE4#	Input	Input pin for the request signal to place the MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU3, and MTU4 pins in the high-impedance state.
MTU_POE8#	POE8#	Input	Input pin for the request signal to place the pins for MTU0 in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state.
MTU_POE10#	POE10#	Input	In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output, and MTU0 pins in high-impedance state.

Table 5.10-3 shows output level comparisons with pin combinations.

Table 5.10-3 Pin Combinations

Pin Combination	I/O	Description
MTIOC3B and MTIOC3D	Output	The MTU3 and MTU4 pins for MTU complementary PWM output set in the M3SELR, M4SELR1, and M4SELR2 registers are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles of the POE3_CLKM_POE (P0ϕ). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. *Note 1.* The low level is output when the OLSP bit in TOCR1A of MTUn is 0 with the TOCS bit in TOCR1A of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2A of MTUn are 0 with the TOCS bit in TOCR1A of MTUn set to 1, or the high level is output when these bits are 1.
MTIOC4A and MTIOC4C	Output	
MTIOC4B and MTIOC4D	Output	
MTIOC6B and MTIOC6D	Output	The MTU6 and MTU7 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles of the POE3_CLKM_POE (P0ϕ). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. *Note 1.* The low level is output when the OLSP bit in TOCR1B of MTUn is 0 with the TOCS bit in TOCR1B of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2B of MTUn are 0 with the TOCS bit in TOCR1B of MTUn set to 1, or the high level is output when these bits are 1.
MTIOC7A and MTIOC7C	Output	
MTIOC7B and MTIOC7D	Output	

5.10.2 Register Descriptions

Table 5.10-4 shows the register configuration. The POE3 registers are initialized by a reset.

Base Address: H'0_1004_9800 (Cortex-A55 Address Space)
Base Address: H'4004_9800 (Cortex-M33 Address Space Secure)
Base Address: H'5004_9800 (Cortex-M33 Address Space Non-Secure)

Table 5.10-4 Register configuration

Register Name	Abbreviation	Offset Address	Access size
Input level control/status register 1	ICSR1	H'00	16
Output level control/status register 1	OCSR1	H'02	16
Input level control/status register 2	ICSR2	H'04	16
Output level control/status register 2	OCSR2	H'06	16
Input level control/status register 3	ICSR3	H'08	16
Software port output enable register	SPOER	H'0A	8
Port output enable control register 1	POECR1	H'0B	8
Port output enable control register 2	POECR2	H'0C	16
Port output enable control register 4	POECR4	H'10	16
Port output enable control register 5	POECR5	H'12	16
Input level control/status register 4	ICSR4	H'16	16

5.10.2.1 Input Level Control/Status Register 1 (ICSR1)

ICSR1 selects the input modes for the POE0# pins, controls the enable/disable of interrupts, and indicates status.

Address(es): H'1004_9800

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE0F	—	—	—	PIE1	—	—	—	—	—	—	POE0M[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/(W)*2	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	POE0M[1:0]	All 0	R/W*1	POE0 Mode Select b1 b0 0 0: Accepts a request on the falling edge of POE0# input. 0 1: Accepts a request when POE0# input has been sampled 16 times at Pϕ/4 clock pulses and all are low level. 1 0: Accepts a request when POE0# input has been sampled 16 times at Pϕ/16 clock pulses and all are low level. 1 1: Accepts a request when POE0# input has been sampled 16 times at Pϕ/128 clock pulses and all are low level.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	PIE1	0	R/W	Port Interrupt Enable 1 0: Interrupt requests disabled 1: Interrupt requests enabled
b11 to b9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b12	POE0F	0	R/(W)*2	POE0 Flag 0: Indicates that a high-impedance request has not been input to the POE0# pin. 1: Indicates that a high-impedance request has been input to the POE0# pin.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE0M[1:0] Bits (POE0 Mode Select)

These bits select the input mode of the POE0# pin.

PIE1 Bit (Port Interrupt Enable 1)

This bit enables or disables interrupt requests when any one of the POE0F bit of the ICSR1 is set to 1.

POE0F Flag (POE0 Flag)

This flag indicates that a high-impedance request has been input to the POE0# pin.

[Setting condition]

- When the input set by POE0M[1:0] occurs at the POE0# pin

[Clearing condition]

- By writing 0 to POE0F after reading POE0F = 1

5.10.2.2 Input Level Control/Status Register 2 (ICSR2)

ICSR2 selects the input mode for the POE4# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): H'1004_9804

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE4F	—	—	—	PIE2	—	—	—	—	—	—	POE4M[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/(W)*2	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	POE4M[1:0]	All 0	R/W*1	POE4 Mode Select b1 b0 0 0: Accepts a request on the falling edge of POE4# input 0 1: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level. 1 0: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level. 1 1: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	PIE2	0	R/W	Port Interrupt Enable 2 0: Interrupt requests disabled 1: Interrupt requests enabled
b11 to b9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b12	POE4F	0	R/(W)*2	POE4 Flag 0: Indicates that a high-impedance request has not been input to the POE4# pin. 1: Indicates that a high-impedance request has been input to the POE4# pin.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE4M[1:0] Bits (POE4 Mode Select)

These bits select the input mode of the POE4# pin.

PIE2 Bit (Port Interrupt Enable 2)

This bit enables or disables interrupt requests when the POE4F flag in ICSR2 is set to 1.

POE4F Flag (POE4 Flag)

This flag indicates that a high-impedance request has been input to the POE4# pin.

[Setting condition]

- When the input set by POE4M[1:0] occurs at the POE4# pin

[Clearing condition]

- By writing 0 to POE4F after reading POE4F = 1

5.10.2.3 Input Level Control/Status Register 3 (ICSR3)

ICSR3 selects the input mode for the POE8# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): H'1004_9808

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE8F	—	—	POE8E	PIE3	—	—	—	—	—	—	POE8M[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/(W)*2	R/W	R/W	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	POE8M[1:0]	All 0	R/W*1	POE8 Mode Select b1 b0 0 0: Accepts a request on the falling edge of POE8# input 0 1: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level. 1 0: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level. 1 1: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	PIE3	0	R/W	Port Interrupt Enable 3 0: Interrupt requests disabled 1: Interrupt requests enabled
b9	POE8E	0	R/W*1	POE8 High- Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b11, b10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b12	POE8F	0	R/(W)*2	POE8 Flag 0: Indicates that a high-impedance request has not been input to the POE8# pin. 1: Indicates that a high-impedance request has been input to the POE8# pin.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE8M[1:0] Bits (POE8 Mode Select)

These bits select the input mode of the POE8# pin.

PIE3 Bit (Port Interrupt Enable 3)

This bit enables or disables interrupt requests when the POE8F bit in ICSR3 is set to 1.

POE8E Bit (POE8 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE8F bit is set to 1.

POE8F Flag (POE8 Flag)

This flag indicates that a high-impedance request has been input to the POE8# pin.

[Setting condition]

- When the input set by POE8M[1:0] occurs at the POE8# pin

[Clearing condition]

- By writing 0 to POE8F after reading POE8F = 1

5.10.2.4 Input Level Control/Status Register 4 (ICSR4)

ICSR4 selects the POE10# pin input mode, controls the enable/disable of interrupts, and indicates status.

Address(es): H'1004_9816

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE10F	—	—	POE10E	PIE4	—	—	—	—	—	—	POE10M[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/(W)*2	R/W	R/W	R/W*1	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	POE10M[1:0]	All 0	R/W*1	POE10 Mode Select b1 b0 0 0: Accepts a request on the falling edge of POE10# input 0 1: Accepts a request when POE10# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level. 1 0: Accepts a request when POE10# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level. 1 1: Accepts a request when POE10# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	PIE4	0	R/W	Port Interrupt Enable 4 0: Interrupt requests disabled 1: Interrupt requests enabled
b9	POE10E	0	R/W*1	POE10 High- Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b11, b10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b12	POE10F	0	R/(W)*2	POE10 Flag 0: Indicates that a high-impedance request has not been input to the POE10# pin. 1: Indicates that a high-impedance request has been input to the POE10# pin.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE10M[1:0] Bits (POE10 Mode Select)

These bits select the input mode of the POE10# pin.

PIE4 Bit (Port Interrupt Enable 4)

This bit enables or disables interrupt requests when the POE10F bit is set to 1.

POE10E Bit (POE10 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE10F bit is set to 1.

POE10F Bit (POE10 Flag)

This flag indicates that a request for the high-impedance state has been input to the POE10# pin.

[Setting condition]

- When the input set by POE10M[1:0] occurs at the POE10# pin

[Clearing condition]

- By writing 0 to POE10F after reading POE10F = 1

5.10.2.5 Output Level Control/Status Register 1 (OCSR1)

OCSR1 controls the enable/disable of output level comparison and interrupts, and indicates status.

Address(es): H'1004_9802

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OSF1	—	—	—	—	—	OCE1	OIE1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/(W)*2	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b7 to b0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	OIE1	0	R/W	Output Short Interrupt Enable 1 0: Interrupt requests disabled 1: Interrupt requests enabled
b9	OCE1	0	R/W*1	Output Short High-Impedance Enable 1 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b14 to b10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b15	OSF1	0	R/(W)*2	Output Short Flag 1 0: Indicates that outputs have not simultaneously become an active level. 1: Indicates that outputs have simultaneously become an active level.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OIE1 Bit (Output Short Interrupt Enable 1)

This bit enables or disables interrupt requests when the OSF1 bit in OCSR1 is set to 1.

OCE1 Bit (Output Short High-Impedance Enable 1)

This bit specifies whether to place the pins in high-impedance state when the OSF1 bit in OCSR1 is set to 1.

OSF1 Flag (Output Short Flag 1)

This flag indicates that any one of the three pairs of two-phase MTU3 and MTU4 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF1 after reading OSF1 = 1

5.10.2.6 Output Level Control/Status Register 2 (OCSR2)

OCSR2 controls the enable/disable of output level comparison and interrupts, and indicates status.

Address(es): H'1004_9806

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OSF2	—	—	—	—	—	OCE2	OIE2	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/(W)*2	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b7 to b0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	OIE2	0	R/W	Output Short Interrupt Enable 2 0: Interrupt requests disabled 1: Interrupt requests enabled
b9	OCE2	0	R/W*1	Output Short High-Impedance Enable 2 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b14 to b10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b15	OSF2	0	R/(W)*2	Output Short Flag 2 0: Indicates that outputs have not simultaneously become an active level. 1: Indicates that outputs have simultaneously become an active level.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OIE2 Bit (Output Short Interrupt Enable 2)

This bit enables or disables interrupt requests when the OSF2 bit in OCSR2 is set to 1.

OCE2 Bit (Output Short High-Impedance Enable 2)

This bit specifies whether to place the pins in high-impedance state when the OSF2 bit in OCSR2 is set to 1.

OSF2 Flag (Output Short Flag 2)

This flag indicates that any one of the three pairs of two-phase MTU6 and MTU7 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF2 after reading OSF2 = 1

5.10.2.7 Software Port Output Enable Register (SPOER)

SPOER controls high-impedance state of the pins.

Address(es): H'1004_980A

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MTUCH0HIZ	MTUCH67HIZ	MTUCH34HIZ
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	MTUCH34HIZ	0	R/W	MTU3 or MTU4 Output High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b1	MTUCH67HIZ	0	R/W	MTU6 and MTU7 Output High- Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b2	MTUCH0HIZ	0	R/W	MTU0 Output High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

MTUCH34HIZ Bit (MTU3 or MTU4 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH34HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH34HIZ after reading MTUCH34HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

MTUCH67HIZ Bit (MTU6 and MTU7 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH67HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH67HIZ after reading MTUCH67HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

MTUCH0HIZ Bit (MTU0 Output High-Impedance Enable)

This bit specifies whether to place the MTU0 pins in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH0HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH0HIZ after reading MTUCH0HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

5.10.2.8 Port Output Enable Control Register 1 (POECR1)

POECR1 controls high-impedance state of the MTU0 pins.

Address(es): H'1004_980B

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MTU0DZE	MTU0CZE	MTU0BZE	MTU0AZE
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b0	MTU0AZE	0	R/W*1	MTIOC0A High-Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b1	MTU0BZE	0	R/W*1	MTIOC0B High-Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b2	MTU0CZE	0	R/W*1	MTIOC0C High-Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b3	MTU0DZE	0	R/W*1	MTIOC0D High-Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b7 to b4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

MTU0AZE Bit (MTIOC0A High-Impedance Enable)

This bit specifies whether to place the MTIOC0A output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0BZE Bit (MTIOC0B High-Impedance Enable)

This bit specifies whether to place the MTIOC0B output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0CZE Bit (MTIOC0C High-Impedance Enable)

This bit specifies whether to place the MTIOC0C output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0DZE Bit (MTIOC0D High-Impedance Enable)

This bit specifies whether to place the MTIOC0D output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

5.10.2.9 Port Output Enable Control Register 2 (POECR2)

POECR2 controls high-impedance state of the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7 pins).

Address(es): H'1004_980C

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Bit Name	Initial Value	R/W	Description
b0	MTU7BDZE	1	R/W*1	MTIOC7B/7D High-Impedance Enable*2 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b1	MTU7ACZE	1	R/W*1	MTIOC7A/7C High-Impedance Enable*2 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b2	MTU6BDZE	1	R/W*1	MTIOC6B/6D High-Impedance Enable*2 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	MTU4BDZE	1	R/W*1	MTIOC4B/4D High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b9	MTU4ACZE	1	R/W*1	MTIOC4A/4C High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b10	MTU3BDZE	1	R/W*1	MTIOC3B/3D High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b15 to b11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Set this bit to 0 when MTU6 or MTU7 is not used.

MTU7BDZE Bit (MTIOC7B/7D High-Impedance Enable)

This bit specifies whether to place the MTIOC7B output and MTIOC7D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU7ACZE Bit (MTIOC7A/7C High-Impedance Enable)

This bit specifies whether to place the MTIOC7A output and MTIOC7C output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU6BDZE Bit (MTIOC6B/6D High-Impedance Enable)

This bit specifies whether to place the MTIOC6B output and MTIOC6D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU4BDZE Bit (MTIOC4B/4D High-Impedance Enable)

This bit specifies whether to place the MTIOC4B output and MTIOC4D output for the MTU4 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

MTU4ACZE Bit (MTIOC4A/4C High-Impedance Enable)

This bit specifies whether to place the MTIOC4A output and MTIOC4C output for the MTU4 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

MTU3BDZE Bit (MTIOC3B/3D High-Impedance Enable)

This bit specifies whether to place the MTIOC3B output and MTIOC3D output for the MTU3 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

5.10.2.10 Port Output Enable Control Register 4 (POECR4)

The POECR4 is used to extend the control conditions of the high-impedance state for the MTU3, MTU4, MTU6, and MTU7 pins for the MTU complementary PWM output.

For details about the targets and conditions of high-impedance control, see **Figure 5.10-2**.

b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC2ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC3ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC4ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC1ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

IC3ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

IC4ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

5.10.2.11 Port Output Enable Control Register 5 (POECR5)

The POECR5 is used to extend the control conditions of the high-impedance for the MTU0 pin.

For details about the targets and conditions of high-impedance control, see **Figure 5.10-2**.

Address(es): H'1004_9812

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC1ADDMT0ZE Bit (MTU0 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC2ADDMT0ZE Bit (MTU0 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC4ADDMT0ZE Bit (MTU0 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

5.10.3 Operation

Table 5.10-5 shows the target pins for high-impedance control and conditions to place the pins in high-impedance state.

Table 5.10-5 Target Pins and Conditions for High-Impedance Control (1/2)

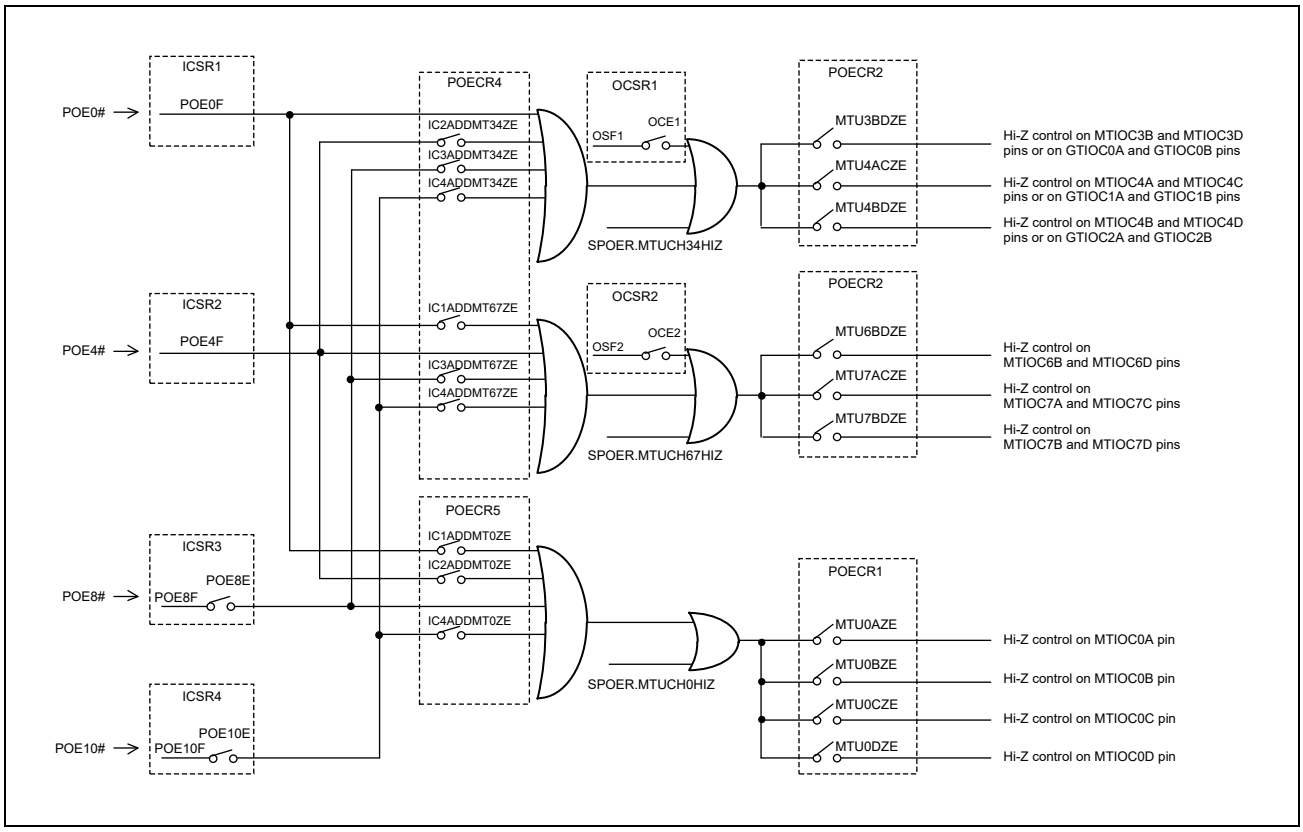

Figure 5.10-2 Target Pins and Conditions for High-Impedance Control

High-impedance requests to individual pins can be controlled by the settings in the POECR1 to POECR2 registers.

The following input pins can be added to high-impedance control conditions by the settings in the POECR4 to POECR5 registers: input pins other than the POE0# pin for the MTU3 and MTU4 pins; input pins other than the POE4# pin for the MTU6 and MTU7 pins; input pins other than the POE8# pin for the MTU0 pins.

For example, setting the IC2ADDMT34ZE bit in POECR4 to 1 outputs high-impedance requests to the MTU3 and MTU4 pins even when the POE4# input is detected.

High-impedance requests due to the detection of POE8# input or POE10# input can be controlled by the settings in the ICSR3 to ICSR4 registers. (The ICSR1 and ICSR2 registers do not control enabling or disabling of output of high-impedance requests.)

High-impedance requests to the MTU3, MTU4, MTU6, and MTU7 pins as the results of output level comparison can be controlled by the settings in the OCSR1 and OCSR2 registers.

5.10.3.1 MTU Pin Selection

In this LSI, each terminal function for MTU is assigned to multiple ports. **Table 5.10-6** shows the correspondence table of MTU terminal functions and compatible ports. The pin used as the MTU must be set separately in the general-purpose I/O port register. (Set by PMCn and PFCm registers of IO_TOP)

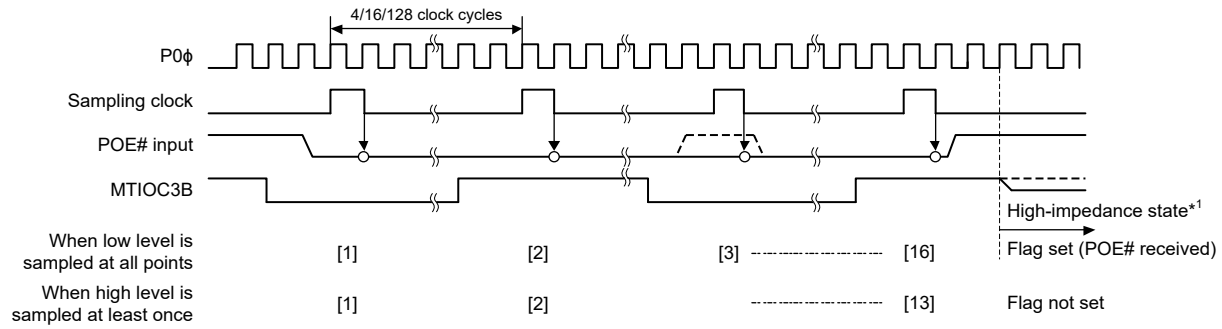
5.10.3.2 Input Level Detection Operation

If the input conditions set by ICSR1 to ICSR4 occur on the POE0#, POE4#, POE8#, and POE10# pins, the MTU3 and MTU4 or MTU6 and MTU7 pins for the MTU complementary PWM output, and MTU0 pin are placed in high-impedance state. Note however, that these pins are still placed in the high-impedance state even when the MTU functions are not selected for the pins.

(1) Falling Edge Detection

When a change from a high to low level is input to the POE0#, POE4#, POE8#, and POE10# pins, the pins for the MTU complementary PWM output, and pin functions multiplexed with the MTU0 pins are placed in high-impedance state.

Figure 5.10-3 shows a sample timing after the level changes in input to the POE0#, POE4#, POE8#, and POE10# pins until the respective pins enter high-impedance state.



Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 5.10-3 Falling Edge Detection

(2) Low-Level Detection

Figure 5.10-4 shows the low-level detection operation. Sixteen continuous low levels are sampled with the sampling clock selected by ICSR1 to ICSR4. If even one high level is detected during this interval, the low level is not accepted. The timing when pins for the MTU complementary PWM output, and MTU0 pins enter the high-impedance state after the sampling clock is input is the same in both falling-edge detection and in low-level detection.

Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 5.10-4 Low-Level Detection Operation

5.10.3.3 Output Level Compare Operation

Figure 5.10-5 shows an example of the output level compare operation for the combination of MTIOC3B and MTIOC3D. The operation is the same for the other pin combinations.

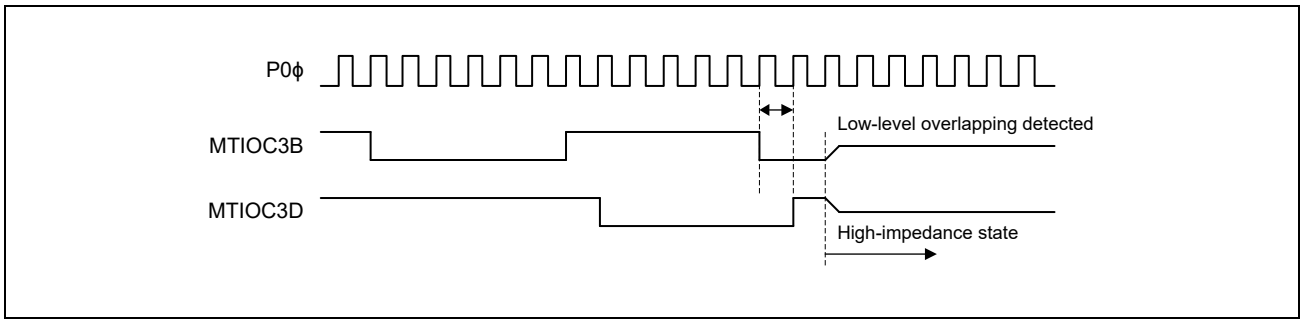


Figure 5.10-5 Output Level Compare Operation

5.10.3.4 High-Impedance Control Using Registers

The high-impedance state of the MTU pins (MTU0, MTU3, MTU4, MTU6, and MTU7) can be directly controlled by using the software port output enable register (SPOER).

For instance, setting the MTUCH34HIZ bit in SPOER to 1 places the MTU3 and MTU4 pins specified by the port output enable control register 2 (POECR2) in the high-impedance state.

The high-impedance state of other pins can also be controlled by setting the appropriate bits in SPOER.

5.10.3.5 Additional Functions for Controlling High-Impedance States

Settings in port enable registers 4 to 5 (POECR4 and POECR5) can add further high-impedance control conditions for the MTU complementary PWM output and MTU0 pins.

For instance, the settings listed below can be added as high-impedance control conditions for the MTU3 and MTU4 pins.

- Setting the IC2ADDMT34ZE bit in POECR4 to 1 adds the input level detection by the POE4#
- Setting the IC3ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE8#
- Setting the IC4ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE10# (ICSR4.POE10F)

The high-impedance state of other pins can also be controlled by setting the appropriate bits in the POECR4 and POECR5.

5.10.3.6 Release from High-Impedance State

MTU pins which have entered high-impedance state due to input-level detection can be released from the state either by returning them to their initial state with a reset, or by clearing all of the ICSR1.POE0F, ICSR2.POE4F, ICSR3.POE8F, and ICSR4.POE10F flags. However, note that when low-level sampling is selected with the ICSR1.POE0M[1:0], ICSR2.POE4M[1:0], ICSR3.POE8M[1:0], ICSR4.POE10M[1:0], and ICSR5.POE10M[1:0] bits, just writing 0 to a flag is ignored (the flag is not cleared); flags can be cleared by writing 0 to it only after a high level is input to the POE0#, POE4#, POE8#, and POE10# pins and is sampled.

MTU pins which have entered high-impedance state due to output level detection can be released from the state either by returning them to their initial state with a reset, or by clearing the OCSR1.OSF1 flag or the OCSR2.OSF2 flag.

5.10.4 POE3 Setting Procedure

Figure 5.10-6 shows the POE3 configuration procedure. As an example, high impedance control by comparing the output levels of the MTU 3 terminals (MTIOC3B / MTIOC3D) is shown. In **Figure 5.10-6**, select P32_1 for the MTIOC3B terminal and P36_1 for the MTIOC3D terminal.

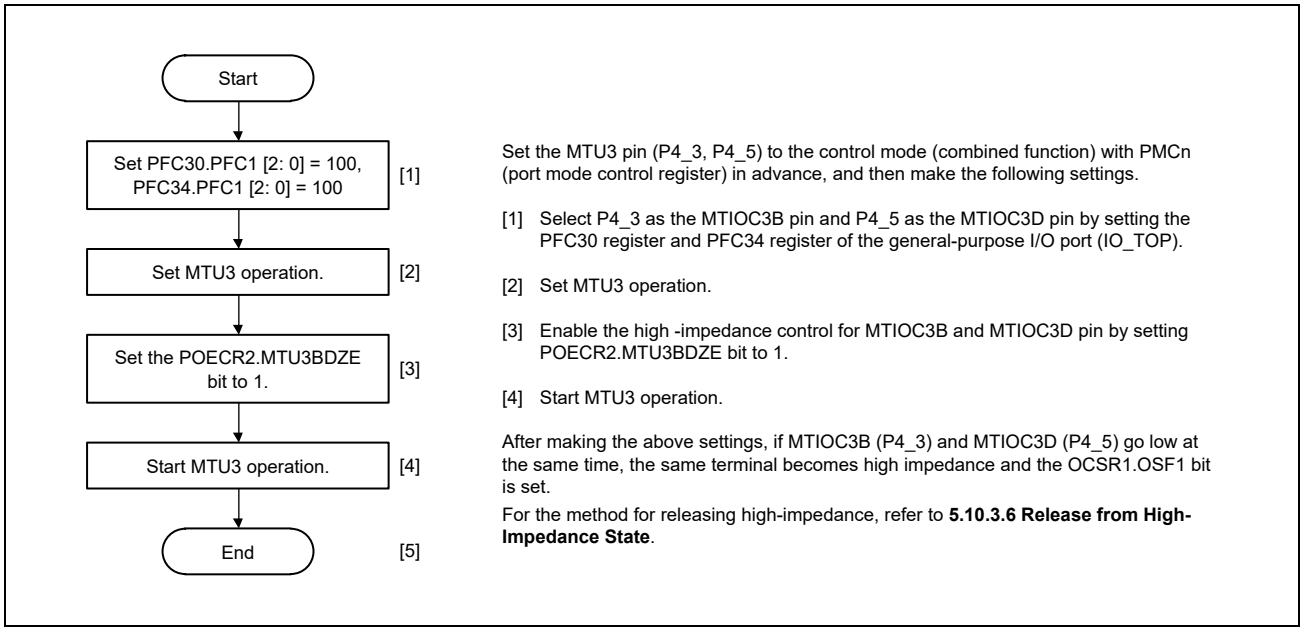

Figure 5.10-6 Procedure for Setting POE3

5.10.5 Interrupts

The POE3 issues a request to generate an interrupt when the specified condition is satisfied during input level detection or output level comparison. **Table 5.10-7** shows the interrupt sources and their conditions.

Table 5.10-7 Interrupt Sources and Conditions

Name	Interrupt Source	Interrupt Flag	Condition
OEI1	Output enable interrupt 1	POE0F and OSF1	PIE1•POE0F+OIE1•OSF1
OEI2	Output enable interrupt 2	POE4F and OSF2	PIE2•POE4F+OIE2•OSF2
OEI3	Output enable interrupt 3	POE8F	PIE3•POE8F
OEI4	Output enable interrupt 4	ICSR4.POE10F	PIE4•ICSR4.POE10F

5.10.6 Usage Notes

5.10.6.1 High-Impedance Control when MTU6 and MTU7 are not Used

When MTU6 and MTU7 are not to be used, set the POECR2.MTU6BDZE, MTU7ACZE, and MTU7BDZE bits to 0 to disable high-impedance control.

SECTION 6 HIGH-SPEED INTERFACE

6.1 High-Speed Interface Overview

This sections describes the High-Speed Interface unit of this LSI. For details, refer to the sections of each unit.

■ SD/MMC Host Interface (SD) (See 6.2)

This LSI equips 3ch of SD.

SD0 supports 8-bit bus and SD1/SD2 supports 4-bit bus MMC Interface.

■ Gigabit Ethernet Interface (GBETH) (See 6.3)

This LSI equips 2ch of GBETH. Conforms to the following standards.

- IEEE 802.3-2008 for Ethernet MAC, Reduced Gigabit Media Independent Interface (RGMII), and Reduced Media Independent Interface (RMII)

■ USB2.0 Interface (USB2) (See 6.5)

This LSI equips 2ch of USB2. Conforms to the following standards.

- Universal Serial Bus Specification Revision 2.0
- Supports On-The-Go (OTG) Function

■ PCI Express 2.0 Interface (PCIe) (See 6.6)

This LSI equips 1ch of PCIe. 1 unit × 1 lane usage is available.

Conforms to the following standards.

- PCI Express Base Specification 4.0 for Gen1 / Gen2

SECTION 6 HIGH-SPEED INTERFACE

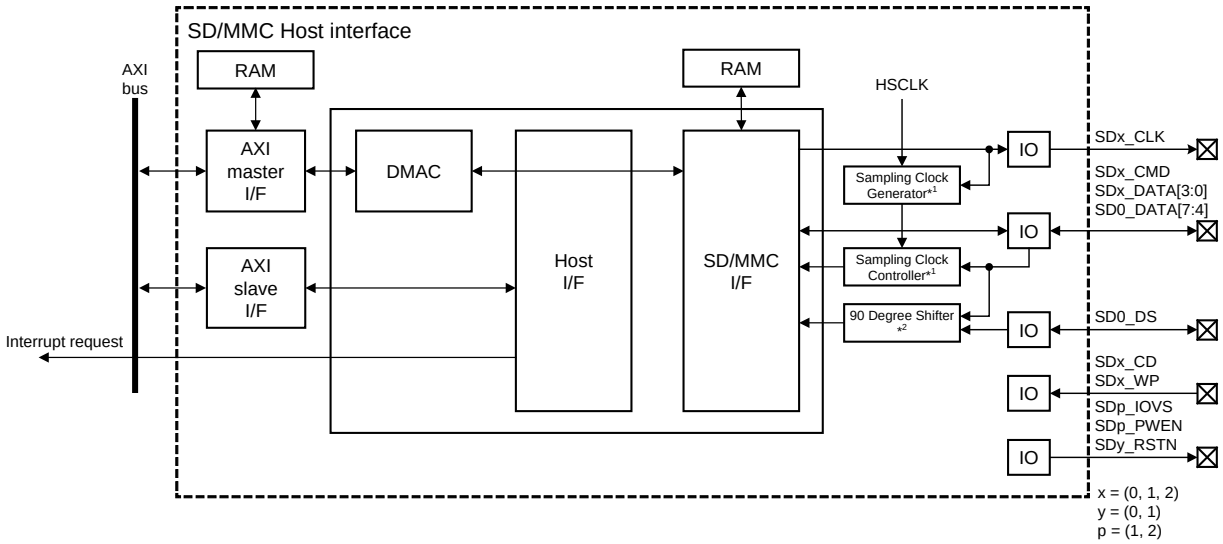
6.2 SD/MMC Host Interface (SD)

This section describes the functions of the SD/MMC host interface (SD).

CAUTION

Development of the SD host-related products needs the conclusion of the following agreement.

- "SD Host/Ancillary Product License Agreement (SD HALA)"



6.2.1 Overview

6.2.1.1 Features

- 3 channels
- Channel 0 supports SD and e-MMC (including HS400).
- Channel 1 supports SD and e-MMC (except for HS400).
- Channel 2 supports SD.
- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, SDR104, and DDR50 transfer modes supported
- SD clock (SD_CLK) frequency = (SDHI_x_IMCLK frequency/2)/2^n (n = 0 to 11) (x = 0 to 2) (except for HS400)
- SD clock (SD_CLK) frequency = SDHI_0_IMCLK frequency/2^n (n = 1 to 11) (for HS400)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 2
- Card detect function
- Write protect supported
- MMC interface (1-/4-/8-bit MMC bus)
- e-MMC device access supported
- Backward-compatible, high-speed, HS-DDR, and HS200 transfer modes supported
- HS400 transfer mode supported (only for Channel 0)
- High-priority interrupt (HPI) supported

6.2.1.2 Block Diagram

Figure 6.2-1 shows a block diagram of the SD/MMC host interface.

Note 1. Sampling Clock Generator/Controller shift SD_CLK for variable sampling in SDR104/HS200 mode.

Note 2. 90degree Shifter shift DS signal by 90degree for sampling in HS400 mode. DS signal and 90-degree shifter are supported only for channel0.

Figure 6.2-1 Block Diagram of SD/MMC Host Interface

6.2.1.3 External Pins

Figure 6.2-1 lists the input and output pins used by the interface. The operating voltage on the pins of the SD/MMC host interface is 3.3 V or 1.8 V.

Table 6.2-1 Pin Configuration

Pin Name	Signal Name in This Section	Input/Output	Functional Description
SDx_CLK*1	SDxCLK*1	Output	SD/MMC clock output
SDx_CMD*1	SDxCMD*1	I/O	SD/MMC command output, response input
SD0_DS	SD0DS	Input	Data Strobe (SD0 only)
SDx_DAT0*1	SDxDAT0*1	I/O	SD/MMC Data 0 [bit 0]
SDx_DAT1*1	SDxDAT1*1	I/O	SD/MMC Data 1 [bit 1], SDIO interrupt
SDx_DAT2*1	SDxDAT2*1	I/O	SD/MMC Data 2 [bit 2], read wait
SDx_DAT3*1	SDxDAT3*1	I/O	SD/MMC Data 3 [bit 3], card detection
SD0_DAT4*1	SD0DAT4*1	I/O	SD/MMC Data 4 [bit 4] (SD0 only)
SD0_DAT5*1	SD0DAT5*1	I/O	SD/MMC Data 5 [bit 5] (SD0 only)
SD0_DAT6*1	SD0DAT6*1	I/O	SD/MMC Data 6 [bit 6] (SD0 only)
SD0_DAT7*1	SD0DAT7*1	I/O	SD/MMC Data 7 [bit 7] (SD0 only)
SDx_CD*1	SDxCD*1	Input	SD/MMC card detection
SDx_WP*1	SDxWP*1	Input	SD/MMC write protection
SDy_RST#*2	SDyRSTN*2	Output	SD/MMC reset (SD0 and SD1 only)
SDp_PWEN*3	SDpPWEN*3	Output	SD power-enable signals to the power supply IC (SD1 and SD2 only)
SDp_IOVS*3	SDpIOVS*3	Output	SD IO voltage level signals to SD device (SD1 and SD2 only)

Note 1. x (= 0, 1, 2) is the channel number of the SD/MMC host interface. In this manual, those pins are referred to as SDDAT0, SDDAT1, …, SDDAT7.

Note 2. y (= 0, 1) is the channel number of SD/MMC host interface.

Note 3. p (= 1, 2), is the channel number of SD/MMC host interface.

6.2.2 SD Registers

The base addresses for each channel are as follows. The SD interface and MMC interface are switched by setting the command type register (SDm_SD_CMD).

Table 6.2-2 Register Base Address

Base Register Name	Unit Name	Base Address
<SD0_base>	SD0	0_11C0_0000h (51C0_0000h*1, 41C0_0000h*2)
<SD1_base>	SD1	0_11C1_0000h (51C1_0000h*1, 41C1_0000h*2)
<SD2_base>	SD2	0_11C2_0000h (51C2_0000h*1, 41C2_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

6.2.2.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Command Type Register	SDm_SD_CMD	0000_0000_0000_0000h	0000h	16, 32, 64
Reserve	-	-	0008h to 000Fh	-
Command Argument Register	SDm_SD_ARG	0000_0000_0000_0000h	0010h	16, 32, 64
Command Argument Register 1	SDm_SD_ARG1	0000_0000_0000_0000h	0018h	16, 32, 64
Data Stop Register	SDm_SD_STOP	0000_0000_0000_0000h	0020h	16, 32, 64
Block Count Register	SDm_SD_SECCNT	0000_0000_0000_0000h	0028h	16, 32, 64
SD Card Response Registers 10	SDm_SD_RSP10	0000_0000_0000_0000h	0030h	16, 32, 64
SD Card Response Registers 1	SDm_SD_RSP1	0000_0000_0000_0000h	0038h	16, 32, 64
SD Card Response Registers 32	SDm_SD_RSP32	0000_0000_0000_0000h	0040h	16, 32, 64
SD Card Response Registers 3	SDm_SD_RSP3	0000_0000_0000_0000h	0048h	16, 32, 64
SD Card Response Registers 54	SDm_SD_RSP54	0000_0000_0000_0000h	0050h	16, 32, 64
SD Card Response Registers 5	SDm_SD_RSP5	0000_0000_0000_0000h	0058h	16, 32, 64
SD Card Response Registers 76	SDm_SD_RSP76	0000_0000_0000_0000h	0060h	16, 32, 64
SD Card Response Registers 7	SDm_SD_RSP7	0000_0000_0000_0000h	0068h	16, 32, 64
SD Card Interrupt Flag Register 1	SDm_SD_INFO1	0000_0000_0000_0xx0h	0070h	16, 32, 64
SD Card Interrupt Flag Register 2	SDm_SD_INFO2	0000_0000_0000_20x0h	0078h	16, 32, 64
SD_INFO1 Interrupt Mask Register	SDm_SD_INFO1_MASK	0000_0000_0001_031Dh	0080h	16, 32, 64
SD_INFO2 Interrupt Mask Register	SDm_SD_INFO2_MASK	0000_0000_0000_8B7Fh	0088h	16, 32, 64

Reserve	-	-	0888h to 0FFFh	-

6.2.2.2 SD Register Description

The prefix (SDm_) of the register names is omitted in this and subsequent sections.

6.2.2.2.1 Command Type Register (SDm_SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.

For details on the SD_CMD setting, refer to **6.2.4.14 Example of SD_CMD Register Setting**.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0000h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

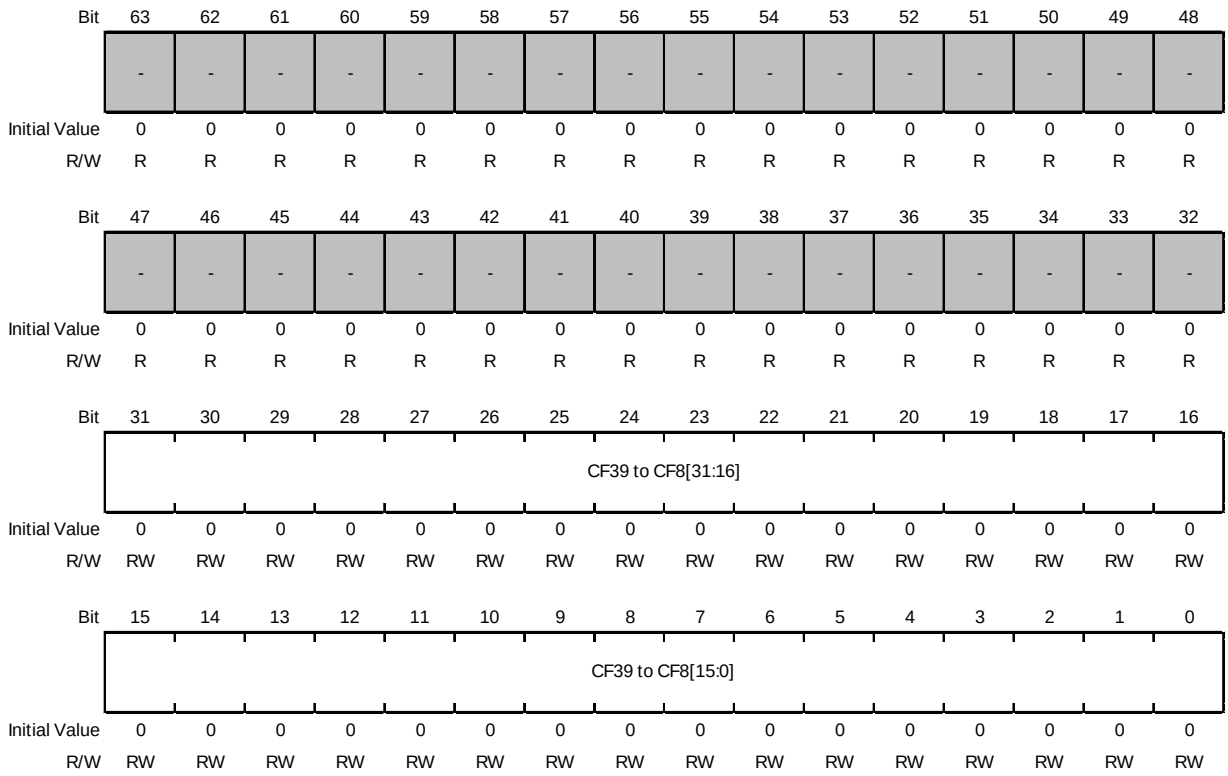
Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15, 14	MD7, MD6[1:0]	0h	RW	Multiple Block Transfer Mode (enabled at multiple block transfer) 00b: CMD12 is automatically issued at multiple block transfer. 01b: CMD12 is not automatically issued at multiple block transfer. 10b: Setting prohibited 11b: Setting prohibited
13	MD5	0h	RW	Single/Multiple Block Transfer (enabled when the command with data is handled) 0b: Single block transfer 1b: Multi block transfer
12	MD4	0h	RW	Write/Read Mode (enabled when the command with data is handled) 0b: Write (SD/MMC host interface -> SD card) 1b: Read (SD/MMC host interface <- SD card)
11	MD3	0h	RW	Data Mode (Command Type) 0b: Command without data transfer (bc, bcr, ac) 1b: Command with data transfer (adtc)

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	MD2 to MD0[2:0]	0h	RW	Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001b: Setting prohibited 010b: Setting prohibited 011b: Extended mode/No response 100b: Extended mode/R1, R5, R6, or R7 response from the SD card 101b: Extended mode/R1b response from the SD card 110b: Extended mode/R2 response from the SD card 111b: Extended mode/R3 or R4 response from the SD card Some commands cannot be used in normal mode. For details, see **Section 6.2.4.14**, Example of SD_CMD Register Setting to select mode/response type.
7, 6	C1, C0[1:0]	0h	RW	00b: CMD 01b: ACMD 10b: Setting prohibited 11b: Setting prohibited
5 to 0	CF45 to CF40[5:0]	0h	RW	Command Index These bits specify command format[45:40] (command index). [Examples] CMD6: SD_CMD[7:0] = 0000 0110b CMD18: SD_CMD[7:0] = 0001 0010b ACMD13: SD_CMD[7:0] = 0100 1101b



6.2.2.2.2 Command Argument Registers

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.

Note that the argument of CMD12 within command sequences is 0000 0000h regardless of the setting of SD_ARG.

(1) Command Argument Register (SDm_SD_ARG)

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0010h
Initial Value : 0000_0000_0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 0	CF39 to CF8[31:0]	0h	RW	Set command format[39:8] (argument).

(2) Command Argument Register 1 (SDm_SD_ARG1) (Mirror of SDm_SD_ARG[31:16])

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0018h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CF39 to CF24[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 0	CF39 to CF24[15:0]	0h	RW	Set command format[39:24] (argument).

6.2.2.2.3 Data Stop Register (SDm_SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0020h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	HPIMODE	HPICMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	SEC	-	-	-	-	-	-	-	STP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
18	-	0h*[1]	RW	Reserved The written value should always be 0b.
17	HPIMODE	0h*[1]	RW	HPI Mode Enable 0b: Disables HPI mode. 1b: Enables HPI mode.
16	HPICMD	0h*[1]	RW*[3]	HPI Command Issue When HPICMD is set to 1b while HPIMODE is 1b, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed. The timing with which this bit is set to 1b is as follows. - After reception of the response to CMD12 that was issued by setting the STP bit to 1b has been completed during the CMD6/CMD38 or CMD25 sequence. - After reception of the response to CMD24/CMD25 has been completed After HPICMD is set to 1b, do not write 0b to this bit while the CBSY bit in SD_INFO2 is 1b. Do not set this bit to 1b when the CBSY bit in SD_INFO2 is 0b.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
8	SEC	0h*1	RW	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multiple block transfer with the number of blocks which is set to SD_SECCNT. 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	STP	0h*1	RW	Stop - When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD/MMC host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. - When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. - When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. - When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. - When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set. - Set STP to 1 after the response end flag has been set. - Set STP to 0 after the response end flag has been set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 3. Only effective when 1 is written.

6.2.2.2.4 Block Count Register (SDm_SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0028h
Initial Value : 0000_0000_0000_0000h

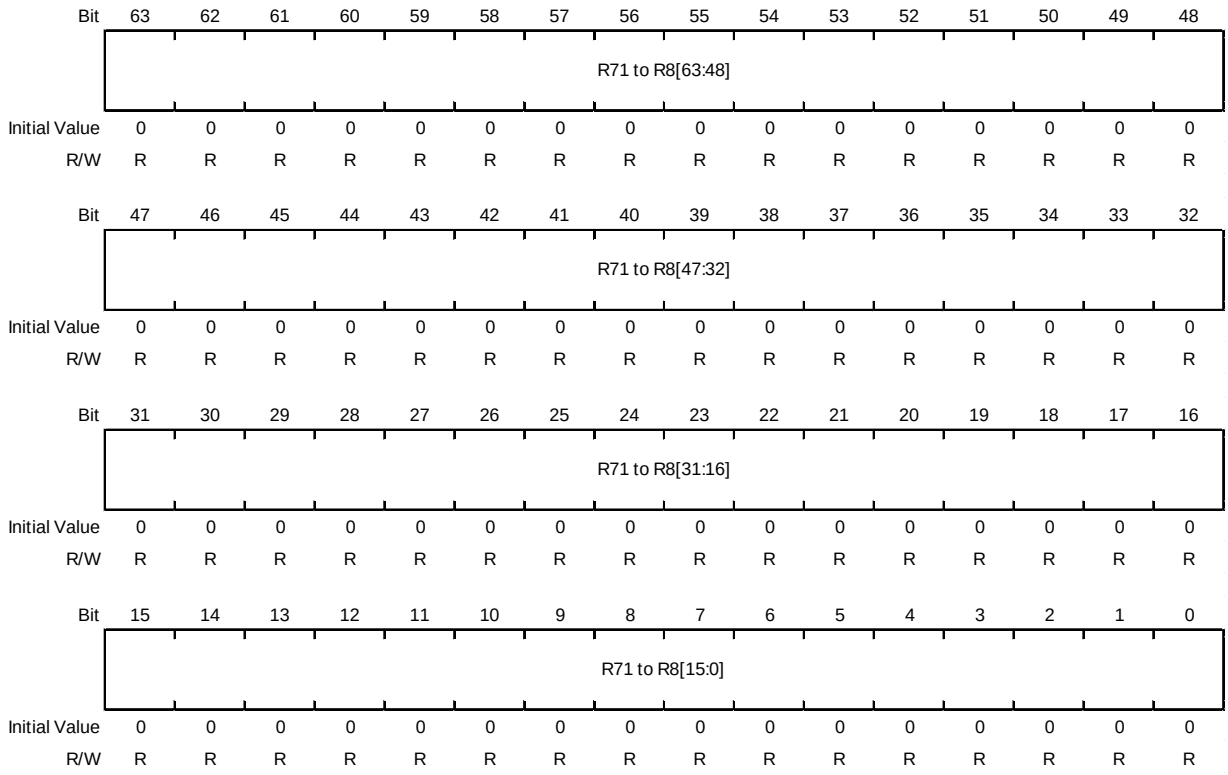
Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNT31 to CNT0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT31 to CNT0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 0	CNT31 to CNT0[31:0]	0h	RW	Number of Transfer Blocks*1 When 0000 0001h is set, the number of transfer blocks is 1. : When 0000 FFFFh is set, the number of transfer blocks is 65535. : When FFFF FFFFh is set, the number of transfer blocks is 4294967295. Do not set this register to 0000 0000h if multiple blocks are to be transferred.



Note 1. Do not change the value of these bits when the CBSY bit in SD_INFO2 is set to 1.

6.2.2.2.5 SD Card Response Registers

The SD card response registers (SD_RSP) hold the response from the SD card.

(1) SD Card Response Registers 10 (SDm_SD_RSP10)

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0030h
Initial Value : 0000_0000_0000_0000h

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	R71 to R8[63:0]	0h	R	Hold the response from the SD card

(2) SD Card Response Registers 1 (SDm_SD_RSP1) (Mirror of SD_RSP10[31:16])

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 0038h

Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	R39 to R24[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 0	R39 to R24[15:0]	0h	R	Hold the response from the SD card

(3) SD Card Response Registers 32 (SDm_SD_RSP32) (Mirror of SD_RSP10[63:32])

Offset Address : <SDm_base> + 0040h

Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
7 to 0	R127 to R120[7:0]	0h	R	Hold the response from the SD card

Table 6.2-3 lists the response types and corresponding SD_RSP registers.

Table 6.2-3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP10 SD_RSP54*1
R2[127:8]	SD_RSP54 and SD_RSP10
R3[39:8]	SD_RSP10
R4[39:8]	SD_RSP10
R5[39:8]	SD_RSP10
R6[39:8]	SD_RSP10
R7[39:8]	SD_RSP10

Note 1. The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

6.2.2.2.6 SD Card Interrupt Flag Register 1 (SDm_SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0b to the bit to be cleared and 1 to the other bits.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 0070h

Initial Value : 0000_0000_0000_0xx0h

R/W	R	R	R	R	R	R	RW	RW	R	R	R	RW	RW	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	HPIRES	0h*2	RW*1	Response Reception Completion [Setting condition] When reception of the response to CMD12 that was issued by setting the STP bit to 1b is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode. [Clearing condition] When 0b is written to HPIRES
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
10	INFO10	x	R	Indicates the SDDAT3 state. 0b: SDDAT3 is set to 0. 1b: SDDAT3 is set to 1.

Bit	Bit Name	Initial Value	R/W	Description
9	INFO9	0h	RW*1	SDDAT3 Card Insertion [Setting condition] After a change in SDDAT3 from 0 to 1, two cycles of 2 P1φ have elapsed with SDDAT3 held at 1. [Clearing condition] When 0b is written to INFO9
8	INFO8	0h	RW*1	SDDAT3 Card Removal [Setting condition] After a change in SDDAT3 from 1 to 0, two cycles of 2 P1φ have elapsed with SDDAT3 held at 0. [Clearing condition] When 0b is written to INFO8
7	INFO7	x	R	Write Protect Indicates the ISDWP state. 0b: ISDWP is set to 1. 1b: ISDWP is set to 0.
6	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	INFO5	x	R	Indicates the ISDCD state. 0b: Indicates that Mcycle has elapsed with ISDCD held at 1. 1b: Indicates that Mcycle has elapsed with ISDCD held at 0. Mcycle is set by bits 3 to 0 in SD_OPTION.
4	INFO4	0h	RW*1	ISDCD Card Insertion [Setting condition] After a change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held at 0. [Clearing condition] When 0b is written to INFO4 Mcycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0h	RW*1	ISDCD Card Removal [Setting condition] After a change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held at 1. [Clearing condition] When 0 is written to INFO3 Mcycle is set by bits 3 to 0 in SD_OPTION.
2	INFO2	0h*2	RW*1	Access End [Setting conditions] 1. When read access to the buffer is completed in the case of transfer for single block read 2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read 3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write 5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write 6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 7. When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed in the case of transfer for multiple block read 8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to 1 is completed in the case of transfer for multiple block write 9. When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed in the case of transfer for multiple block read 10. When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed in the case of transfer for multiple block write. In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2 When the access end bit is set to 1, the command sequence is terminated.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
0	INFO0	0h*2	RW*1	Response End [Setting conditions] 1. When the reception of the response is completed 2. When the transmission of the command not requiring a response is completed, 3. When receiving busy reception after R1b response 4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read 5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write, In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0 When issuing a command without data, the command sequence ends when the response end is set to 1.

x: Undefined value

Note 1. Only effective when 0b is written.

Note 2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

6.2.2.2.7 SD Card Interrupt Flag Register 2 (SDm_SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0b to the bit to be cleared and 1 to the other bits.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0078h
Initial Value : 0000_0000_0000_20x0h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

R/W	RW	R	R	R	RW	R	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15	ILA	0h*2	RW*1	Illegal Access Error [Setting conditions] 1. Writing of data to SD_CMD within a command sequence (CBSY=1) 2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000 1100b (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0h*2	R	Command Type Register Busy 0: A command sequence has been completed. 1: A command sequence is being executed.
13	SCLKDIVEN	1h*2	R	0: The SD bus (CMD, DAT) is busy. Do not attempt to write to the SD_CLK_CTRL register. 1: The SD bus (CMD, DAT) is not busy. When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence.
12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
11	-	0h	RW	Reserved The written value should always be 0b.
10	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
9	BWE	0h*2	RW*1	SD_BUF Write Enable 0b: Data cannot be written in SD_BUF0. 1b: Data can be written in SD_BUF0. [Setting conditions] 1. When SD_BUF is empty at single block transfer 2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing conditions] 1. When 0b is written to BWE 2. Writing of a block of data to SD_BUF by DMA transfer When data is written to SD_BUF0 by the CPU, clear BWE and then write the amount of data specified by SD_SIZE*3
8	BRE	0h*2	RW*1	SD_BUF Read Enable 0b: Data cannot be read from SD_BUF0. 1b: Data can be read from SD_BUF0. [Setting conditions] 1. When data set in SD_SIZE is stored in SD_BUF at single block transfer 2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing conditions] 1. When 0b is written to BRE 2. Reading of a block of data from SD_BUF by DMA transfer When data is read from SD_BUF0 by the CPU, clear BRE and then read the amount of data specified by SD_SIZE*3. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.
7	DAT0	x	R	SDDAT0 Indicates the SDDAT0 state. 0b: SDDAT0 is set to 0. 1b: SDDAT0 is set to 1. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0. While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped.
6	ERR6	0h*2	RW*1	Response Timeout [Setting condition] When a response is not received even after 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5) [Clearing condition] When 0b is written to ERR6 The command sequence is halted by a response timeout.*4
5	ERR5	0h*2	RW*1	SD_BUF Illegal Read Access [Setting conditions] 1. When SD_BUF is empty while SD_BUF0 is read 2. When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0b is written to ERR5
4	ERR4	0h*2	RW*1	SD_BUF Illegal Write Access [Setting conditions] 1. When data is written to SD_BUF0 while it is not in the data read/write command state 2. When data is written to SD_BUF0 while SD_BUF is full 3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length 4. When data is written to SD_BUF0 while the interface remains in a busy state for at least Ncycle after the CRC status [Clearing condition] When 0b is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
3	ERR3	0h*2	RW*1	Data Timeout (except response timeout) [Setting conditions] 1. After the reception of the R1b response, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 2. After the reception of the CRC status, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 3. After write data, the CRC status is not received even after Ncycle has elapsed. 4. After the read command, read data is not received even after Ncycle has elapsed. 5. After CMD12 has been issued within a command sequence, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 6. After the reception of read data, read data for the next block are not received even after Ncycle has elapsed. 7. After release of the read wait state, read data for the next block are not received even after Ncycle has elapsed. [Clearing condition] When 0b is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.
2	ERR2	0h*2	RW*1	END Error [Setting conditions] 1. When an error occurs in the response length (and the end bit has not been detected) 2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits) 3. When an error occurs in the CRC status length (and the end bit has not been detected) 4. An error in the length of a response to a command issued within a command sequence*5 (i.e. the end bit has not been detected) [Clearing condition] When 0b is written to ERR2 The command sequence is halted by the End error.*4
1	ERR1	0h*2	RW*1	CRC Error [Setting conditions] 1. When an error occurs in the CRC status (i.e. the received CRC status was not 010') 2. When a CRC error occurs in the read data 3. When a CRC error occurs in the response 4. A CRC error in the response to a command issued within a command sequence*5 [Clearing condition] When 0b is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0h*2	RW*1	CMD Error [Setting conditions] 1. The command index of the transmitted command differing from the command index of the received response 2. The command index of a command issued within a command sequence*5 differing from the command index of the received response [Clearing condition] When 0b is written to ERR0 The command sequence is halted by the CMD error.*4

x: Undefined value

Note 1. Only effective when 0b is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.

Note 4. After the C52PUB bit in SDIO_MODE has been set to 1b, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in **Figure 6.2-19** under **6.2.4.8 IO_RW_EXTENDED (CMD53/Multiple Block Read)** or in **Figure 6.2-22** under **6.2.4.9 IO_RW_EXTENDED (CMD53/Multiple Block Write)**.

Note 5. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1b, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1b.

6.2.2.2.8 SD_INFO1 Interrupt Mask Register (SDm_SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt.

When 0b is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

6.2.2.2.9 SD_INFO2 Interrupt Mask Register (SDm_SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt.

When 0b is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 0088h

Initial Value : 0000_0000_0000_8B7Fh

6.2.2.2.10 SD Clock Control Register (SDm_SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Access Size : 16/32/64 bits
Address : <SDm_base> + 0090h
Initial Value : 0000_0000_0000_0020h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

Bit	Bit Name	Initial Value	R/W	Description
63 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
18	-	0h	RW	Reserved The written value should always be 0b.
17 to 16	DIV9 to DIV8[1:0]	0h	RW	Refer to bit[7:0].
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
10	SDCLKSEL	0h	RW	OSDCLKSEL Port Control (optional) 0 : OSDCLKSEL=0 1 : OSDCLKSEL=1
9	SDCLKOFFEN	0h	RW	SD Clock (SDCLK) Output Automatic Control Enable 0b: Automatic control for SD clock (SDCLK) output is disabled. 1b: Automatic control for SD clock (SDCLK) output is enabled. This function of automatic control for SD clock (SDCLK) output causes SDCLK output only within a command sequence. The timing with which SDCLK output starts and stops is as follows. SDCLK output starts after writing to SD_CMD. SDCLK output stops when 8 cycles of SDCLK have elapsed after the end of the command sequence. In addition, SDCLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.

Bit	Bit Name	Initial Value	R/W	Description
8	SCLKEN	0h	RW	SD Clock (SDCLK) Output Control Enable 0b: SD clock (SDCLK) output is disabled. The SDCLK signal is fixed 0. 1b: SD clock (SDCLK) output is enabled.
7 to 0	DIV7 to DIV0[7:0]	20h	RW	SD Clock (SDCLK) 10 0000 0000b: (SDxφ/4)/2048 01 0000 0000b: (SDxφ/4)/1024 00 1000 0000b: (SDxφ/4)/512 00 0100 0000b: (SDxφ/4)/256 00 0010 0000b: (SDxφ/4)/128 00 0001 0000b: (SDxφ/4)/64 00 0000 1000b: (SDxφ/4)/32 00 0000 0100b: (SDxφ/4)/16 00 0000 0010b: (SDxφ/4)/8 00 0000 0001b: (SDxφ/4)/4 00 0000 0000b: (SDxφ/4)/2 00 1111 1111b: SDxφ/4 (x = 0, 1) DIV[9:8] are assigned to Bit[17:16]. Other settings are prohibited. In addition, in the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set DIV[9:0] to 00 1111 1111b.

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1b.

CAUTION

Notes on when setting the SD clock (SDCLK) to P1ϕ (DIV[9:0] = 00 1111 1111b)

When changing the setting of bits DIV[9:0] to 00 1111 1111b, or from 00 1111 1111b to other setting, perform the following processing before writing to SD_CMD.

1. Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)
2. Change the setting of bits DIV[9:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[9:0] at this time. The SCLKEN bit should retain the value 0.)
3. Set the SCLKEN bit to 1b by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also, when changing the setting of bits DIV[9:0] to 00 1111 1111b after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1b, perform this processing before writing to SD_CMD.

The following diagram show the clock line of the SD_CLK output. Here, the divider setting of the SD_CLK_CTRL is configured by the SD_CLR_CTRL register shown above. The setting for “1/2 Clock Divider” is configured by the SCC_HS400MODE2 register, and this bit is set to 1 only when the HS400 Mode is used. For the mode other than the HS400, 1/2 divided clock is provided for the SD_CLK_CTRL divider.

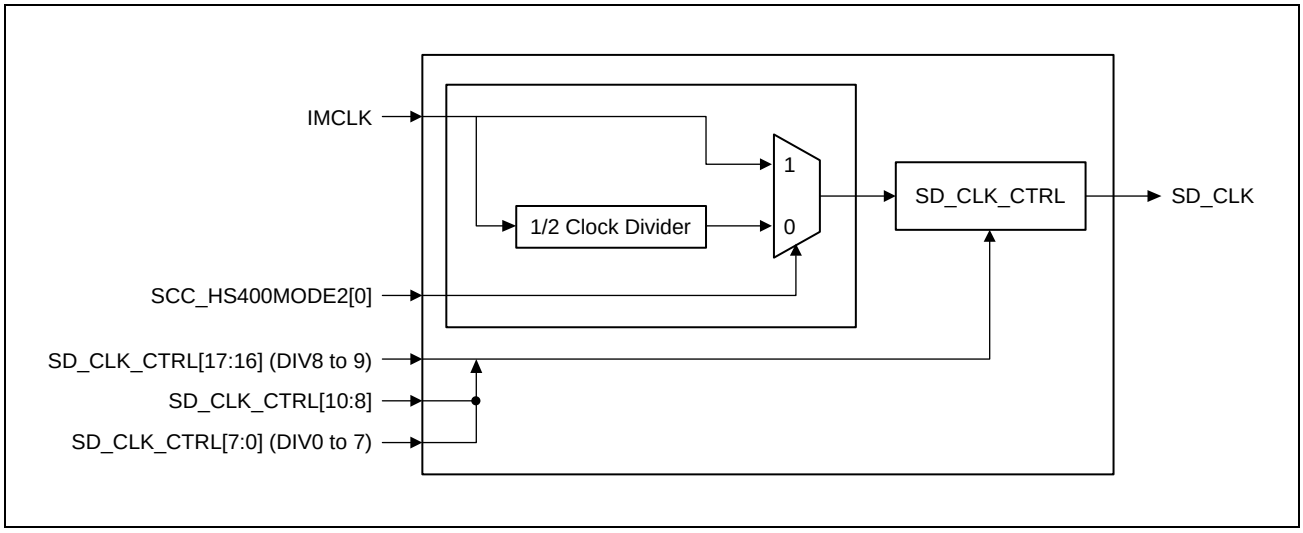

Figure 6.2-2 Functional Diagram of Clock Divider for SD_CLK

6.2.2.2.11 Transfer Data Length Register (SDm_SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 0098h

Initial Value : 0000_0000_0000_0200h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	LEN9 to LEN0[9:0]									
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
11 to 10	-	All 0	R	Reserved
9 to 0	LEN9 to LEN0[9:0]	200h	RW	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for single block transfer. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes.

Note 1. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1b.

6.2.2.2.12 SD Card Access Control Option Register (SDm_SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 00A0h
Initial Value : 0000_0000_0000_40EEh

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15	WIDTH	0h*1	RW	Bus width*2 {WIDTH,WIDTH8} = 01b: 8-bit width {WIDTH,WIDTH8} = 00b: 4-bit width {WIDTH,WIDTH8} = 10b or 11b: 1-bit width In the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set this bit to 1b. In the case of writing of one-byte block, 8-bit width cannot be specified for the bus width. Change the bus width to 4 bits or 1 bit before writing one-byte block.
14	-	1h	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
13	WIDTH8	0h*1	RW	Bus width*2 See the description of the WIDTH bit.
12 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	EXTOP	0h*1	RW	Timeout Mode Select 0b: Bits TOP27 to TOP24 specify the timeout count from SDCLK x 2^{13} to SDCLK x 2^{27}. 1b: Bits TOP27 to TOP24 specify the timeout count from SDCLK x 2^{14} to SDCLK x 2^{28}.
8	TOUTMASK	0h*1	RW	Timeout Mask 0b: Enables timeout. 1b: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.) If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	TOP27 to TOP24[3:0]	Eh*1	RW	Timeout Counter*2 0000b: SDCLK x 2^{13} 0001b: SDCLK x 2^{14} : 1101b: SDCLK x 2^{26} 1110b: SDCLK x 2^{27} 1111b: Setting prohibited
3 to 0	CTOP24 to CTOP21[3:0]	Eh*1	RW	Card Detect Time Counter 0000b: SDCLK x 2^{10} 0001b: SDCLK x 2^{11} : 1101b: SDCLK x 2^{23} 1110b: SDCLK x 2^{24} 1111b: Setting prohibited

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1b.

6.2.2.2.13 SD Error Status Register 1 (SDm_SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 00B0h

Initial Value : 0000_0000_xxxx_x000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 15	-	X	R	Reserved The read value is undefined. The written value should always be 0b.
14 to 12	E14 to E12[2:0]	2h*1	R	These bits hold the CRC status. (normal: 010)
11	E11	0h*1	R	Set to 1 when an error occurs in the CRC status.
10	E10	0h*1	R	Set to 1 when a CRC error occurs in the read data.
9	E9	0h*1	R	Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0h*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*2).
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	E5	0h*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected).
4	E4	0h*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits).
3	E3	0h*1	R	Set to 1 when an error occurs in the response length to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0h*1	R	Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*2).

Bit	Bit Name	Initial Value	R/W	Description
1	E1	0h*1	R	Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0h*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*2).

x: Undefined value

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1b, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1b.

6.2.2.2.14 SD Error Status Register 2 (SDm_SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 00B8h

Initial Value : 0000_0000_0000_0000h

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

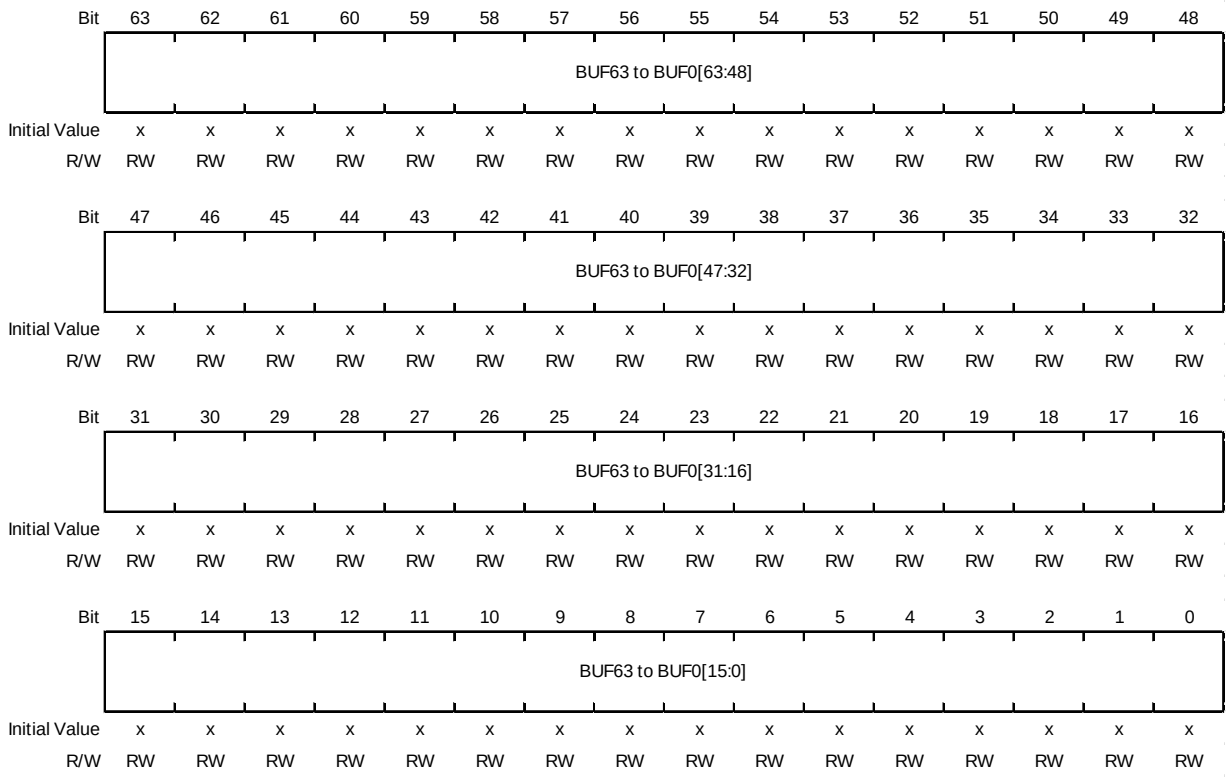
Bit	Bit Name	Initial Value	R/W	Description
63 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
6	E6	0h*1	R	Set to 1b when the interface remains in a busy state for at least Ncycle after the CRC status.
5	E5	0h*1	R	Set to 1b when the CRC status is not received even after Ncycle has elapsed after data writing.
4	E4	0h*1	R	Set to 1b when read data is not received even after Ncycle has elapsed after the command has been read. Set to 1b when read data for the next block are not received even after Ncycle has elapsed after the reception of read data. Set to 1b when read data for the next block are not received even after Ncycle has elapsed after release of the read wait state.
3	E3	0h*1	R	Set to 1b when the interface remains in a busy state for at least Ncycle after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0h*1	R	Set to 1b when the interface remains in a busy state for at least Ncycle after R1b response.
1	E1	0h*1	R	Set to 1b when the response to a command issued within a command sequence*2 is not received even after 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0h*1	R	Set to 1b when the response (other than a response to a command issued within a command sequence*2) is not received even after 640 cycles of SDCLK have elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.



Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1b, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1b.

6.2.2.2.15 SD Buffer Read/Write Register (SDm_SD_BUF0)

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 00C0h

Initial Value : xxxx_xxxx_xxxx_xxxxh

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	BUF63 to BUF0[63:0]	x	RW	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers (SD_BUF). When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock.

x: Undefined value

Note: When using the DMAC, the bus width should be fixed at 64 bits.

6.2.2.2.16 SDIO Mode Control Register (SDm_SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1b simultaneously.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 00D0h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	C52PUB	IOABT	-	-	-	-	-	RWREQ	-	IOMOD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	C52PUB	0h	RW	SDIO None Abort - When C52PUB is set to 1b in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty.C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1b while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1b. - When C52PUB and RWREQ are set to 1b in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1b while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1b. - If C52PUB is set to 1b in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. - Set SD_ARG before setting C52PUB to 1. - Set C52PUB to 1 after the response end flag has been set.

Bit	Bit Name	Initial Value	R/W	Description
8	IOABT	0h	RW	SDIO Abort - When IOABT is set to 1b in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1b, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. - When IOABT has been set to 1b during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. - When IOABT has been set to 1b during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. - When IOABT is set to 1b during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. - When IOABT is set to 1b after a command sequence has been completed, CMD52 is not issued and the access end flag is not set. - Set IOABT to 1 after the response end flag has been set. Set IOABT to 0 after the access end flag has been set.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2	RWREQ	0h	RW	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks. [Releasing the read wait state] (1) The read wait state is released when RWREQ is cleared to 0 in the read wait state. (2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. (3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag has been set.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	IOMOD	0h	RW	SDIO Mode*1 0b: Disables the SD/MMC host interface to receive SDIO interrupts from the SDIO card 1b: Enables the SD/MMC host interface to receive SDIO interrupts from the SDIO card

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1b.

6.2.2.2.17 SDIO Interrupt Flag Register (SDm_SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0b to the bit to be cleared and 1b to the other bits.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 00D8h
Initial Value : 0000_0000_0000_0000h

R/W	RW	RW	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15	EXWT	0h*2	RW*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0h*2	RW*1	[Setting conditions] 1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1b. 2. While C52PUB is set to 1b in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0b is written to EXPUB52
13 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2, 1	-	All 0*2	RW	Reserved The read value is undefined. The written value should always be 1b.
0	IOIRQ	0h*2	RW*1	[Setting condition] When an SDIO interrupt from the SDIO card is received while IOMOD in SDIO_MODE is set to 1b. [Clearing condition] When 0b is written to IOIRQ*3

Note 1. Only effective when 0b is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

6.2.2.2.18 SDIO_INFO1 Interrupt Mask Register (SDm_SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0b is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Access Size : 16, 32, 64 bits

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15, 14	UR7, UR6[1:0]	3h	R	Reserved These bits are always read as 1b. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
13, 12	UR5, UR4[1:0]	0h	R	Reserved These bits are always read as 0b. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 8	UR3 to UR0[3:0]	Eh	R	Version of Renesas' IP
7 to 0	IP7 to IP0[7:0]	10h	R	Version of introductory IP

6.2.2.2.22 Host Interface Mode Setting Register (SDm_HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0390h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	-	-	-	-	-	-	-	BUSWIDTH	-	-	-	-	-	-	ENDIAN	WMODE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8	BUSWIDTH	0h	RW	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0b: 16-bit access 1b: 32-bit access This bit is enabled while the WMODE bit is set to 1b.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	ENDIAN	0h	RW	SD_BUF0 data swap
0	WMODE	0h	RW	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0b: 64-bit access 1b: 16-bit or 32-bit access

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1b.

Note 2. When using the built-in DMAC of this module, fix the bus width to 64 bits.

6.2.2.2.23 SD Interface Mode Setting Register (SDm_SDIF_MODE)

The SD interface mode setting register specifies DDR mode.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 0398h

Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	NOCHKCR	-	-	-	-	-	-	-	DDR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	-	0h*1	RW	Reserved The written value should always be 0b.
8	NOCHKCR	0h*1	RW	CRC Check Mask (test command for MMC supported) Enables or disables checking of the CRC16 and CRC status. 0b: Enables the CRC check. 1b: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write)
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	DDR	0h*1	RW	DDR Mode Select*2 0b: Normal mode (default, high speed, or SDR) 1b: DDR mode Set this bit to 0b when the SD clock division ratio is specified as 1:1 (bits DIV[9:0] in SD_CLK_CTRL are set to 00_1111_1111b).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0b.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1b.

6.2.2.2.24 SD Status Register (SDm_SD_STATUS)

The effective bit of the SD status register controls the output value on the SDmPWEN, SDmIOVS and SD0RSTN pins.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 03C8h
Initial Value : 0000_0000_0000_0001h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SD_IOVS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SD_RST	SD_PWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	SD_IOVS	0h	RW	Controls the output value on SDmIOVS pin. 0b: The output value on the SDmIOVS pin is 0 (3.3 V). 1b: The output value on the SDmIOVS pin is 1 (1.8 V).
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	SD_RST	0h	RW	Controls the output value on the SD0RSTN pin. (SD0 only) 0b: The output value on the SD0RSTN pin is 0. 1b: The output value on the SD0RSTN pin is 1.
0	SD_PWEN	1h	RW	Controls the output value on the SDmPWEN pin. 0b: The ouptut value on the SDmPWEN pin is 0. 1b: The ouput value on the SDmPWEN pin is 1.

6.2.2.2.25 DMAC Transfer Mode Register (SDm_DM_CM_DTRAN_MODE)

The DMAC transfer mode register (DM_CM_DTRAN_MODE) sets the operation mode of the DMAC of this module.

Higher-order 32 bits (bit 63 to 32) are read-only and read as 0.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 0820h

Initial Value : 0000_0000_0000_0030h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
17, 16	CH_NUM[1:0]	0h	RW	DMAC channel selector 00b : SD downstream 01b : SD upstream Other settings are prohibited.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5, 4	BUS_WIDTH [1:0]	3h	RW	Bus width selector 11b: 64-bit Other settings are prohibited.
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

6.2.2.2.26 DMAC Transfer Control Register (SDm_DM_CM_DTRAN_CTRL)

The DMAC transfer control register (DM_CM_DTRAN_CTRL) controls DMAC operation of the module. Higher-order 32 bits (bit 63 to 32) are read-only and read as 0.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0828h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8	-	0h	RW	Reserved The written value should always be 0b.
7 to 1	-	All 0	R	Reserved
0	DM_START	0h	RW	DMAC Start Writing 1b to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started.

6.2.2.2.27 DMAC Reset Register (SDm_DM_CM_RST)

Higher-order 32 bits (bit 63 to 32) are read-only and read as 0b.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0830h
Initial Value : 0000_0000_FFFF_FFFFh

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 10	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
9	DTRANRST1	1h	RW	Software reset of DMAC channel 1 of the module 0b: Reset 1b: Reset released
8	DTRANRST0	1h	RW	Software reset of DMAC channel 0 of the module 0b: Reset 1b: Reset released
7 to 1	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
0	SEQRST	1h	RW	Software reset of the sequencer 0b: Reset 1b: Reset released

NOTE

Make sure there is no communication to the SD/MMC device before applying a software reset using this register.

6.2.2.2.28 DMAC Interrupt Register 1 (SDm_DM_CM_INFO1)

The DMAC interrupt register 1 (DM_CM_INFO1) indicates the status of the DMAC of the module and the sequencer. To clear a flag, write 0b to the bit to be cleared and 1b to the other bits.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0840h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	DTRANEND1	-	-	-	DTRANEND0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEQEND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20	DTRANEND1	0h*1	RW	DMAC Channel 1 Transfer End [Setting conditions] 1. When transfer of DMAC channel 1 is completed 2. When an error occurs on DMAC channel 1 [Clearing condition] When 0b is written to DTRANEND1
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	DTRANEND0	0h*2	RW	DMAC Channel 0 Transfer End [Setting conditions] 1. When transfer of DMAC channel 0 is completed 2. When an error occurs on DMAC channel 0 [Clearing condition] When 0b is written to DTRANEND0
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	SEQEND	0h*3	RW	Sequencer Operation End [Setting conditions] 1. When operation of the sequencer is completed 2. When a sequencer error occurs [Clearing condition] When 0b is written to SEQEND

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0b.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0b.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0b.

6.2.2.2.29 DM_CM_INFO1 Interrupt Mask Register (SDm_DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0848h
Initial Value : 0000_0000_FFFF_FFFFh

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 21	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
20	DTRANEND1_MASK	1h	RW	DTRANEND1 interrupt masked
19 to 17	-	All 1	RW	Reserved The written value should always be 1b.
16	DTRANEND0_MASK	1h	RW	DTRANEND0 interrupt masked
15 to 1	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
0	SEQEND_MASK	1h	RW	SEQEND interrupt masked

6.2.2.2.30 DMAC Interrupt Register 2 (SDm_DM_CM_INFO2)

The DMAC interrupt register 2 (DM_CM_INFO2) indicates the status of the DMAC of the module and the sequencer. To clear a flag, write 0b to the bit to be cleared and 1b to the other bits.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0850h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEQERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
19, 18	-	All 0	R	Reserved The written value should always be 0b.
17	DTRANERR1	0h*1	RW	DMAC Channel 1 Error [Setting condition] When an error occurs on DMAC channel 1 [Clearing condition] When 0b is written to DTRANERR1
16	DTRANERR0	0h*2	RW	DMAC Channel 0 Error [Setting condition] When an error occurs on DMAC channel 0 [Clearing condition] When 0b is written to DTRANERR0
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	SEQERR	0h*3	RW	Sequencer error [Setting condition] When a sequencer error occurs [Clearing condition] When 0b is written to SEQERR

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0b.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0b.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0b.

6.2.2.2.31 DM_CM_INFO2 Interrupt Mask Register (SDm_DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0b is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

Access Size : 16, 32, 64 bits

Offset Address : <SDm_base> + 0858h

Initial Value : 0000_0000_FFFF_FFFFh

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 20	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
19, 18	-	All 1	R	Reserved The written value should always be 1b.
17	DTRANERR1_MASK	1h	RW	DTRANERR1 interrupt masked
16	DTRANERR0_MASK	1h	RW	DTRANERR0 interrupt masked
15 to 1	-	All 1	R	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
0	SEQERR_MASK	1h	RW	SEQERR interrupt masked

6.2.2.2.32 DMAC Transfer Address Register (SDm_DM_DTRAN_ADDR)

The DMAC transfer address register (DM_DTRAN_ADDR) sets the transfer destination and source addresses for the DMAC of the module.

Access Size : 16, 32, 64 bits
Offset Address : <SDm_base> + 0880h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	DADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
	DADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DADDR[15:3]													-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	DADDR[63:3]	0h	RW	Destination address/Source address (8 byte unit) Note that the value of DM_DTRAN_ADDR(Lower 32bits) + transfer data length is less than or equal to 2^{32}.
2 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

6.2.3 Operation

6.2.3.1 SD Interface

6.2.3.1.1 SD data format

When data is read from the SD card, the procedure is as follows.

1. The SD/MMC host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see **Figure 6.2-3**, **Figure 6.2-4** and **Figure 6.2-6**.)
2. The receive data is stored in SD_BUF of the SD/MMC host interface. (SD_BUF store data: see **Figure 6.2-8**)
3. The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see **Table 6.2-4**)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See **Figure 6.2-8**)

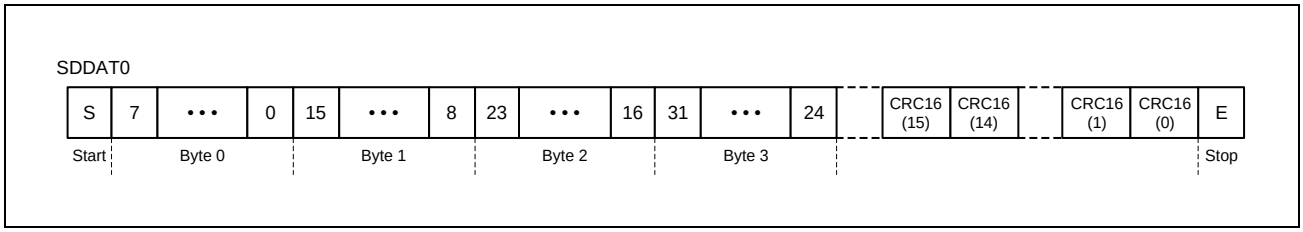

Figure 6.2-3 SDDAT in 1-Bit Width Mode

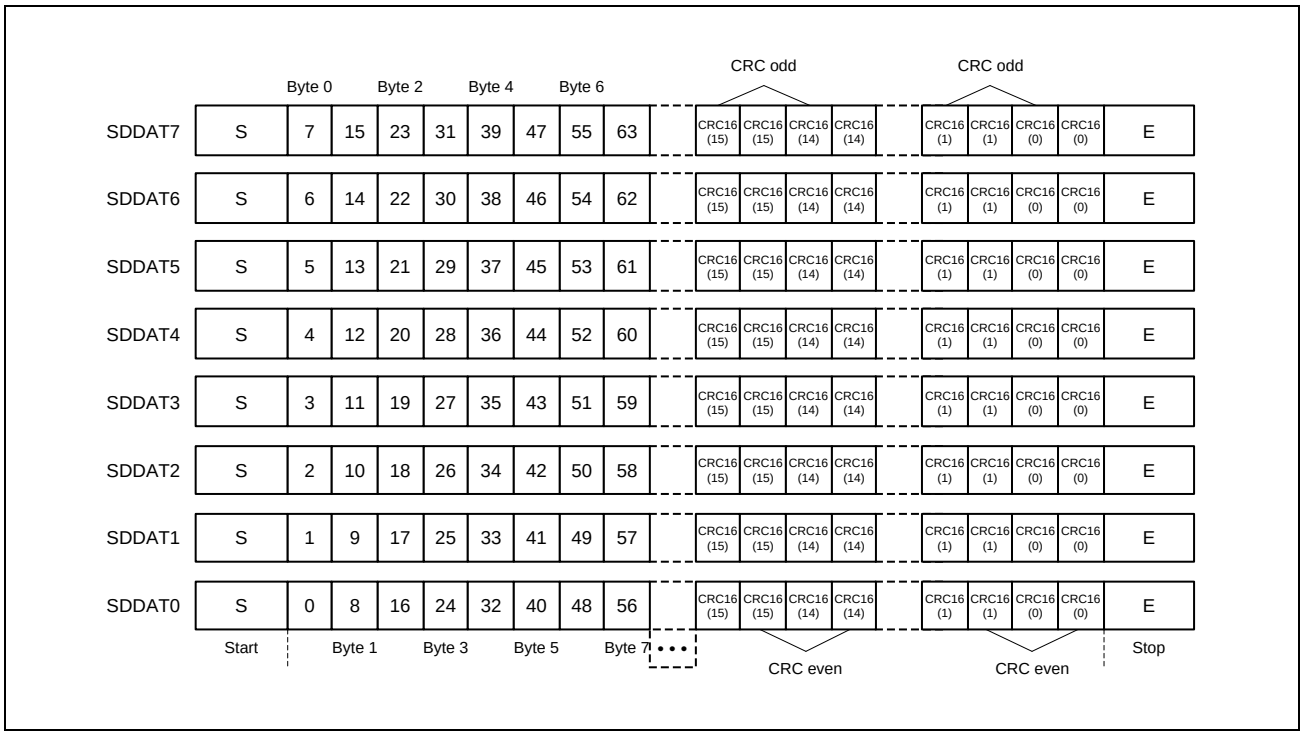

Figure 6.2-7 SDDAT in 8-Bit Width DDR Mode

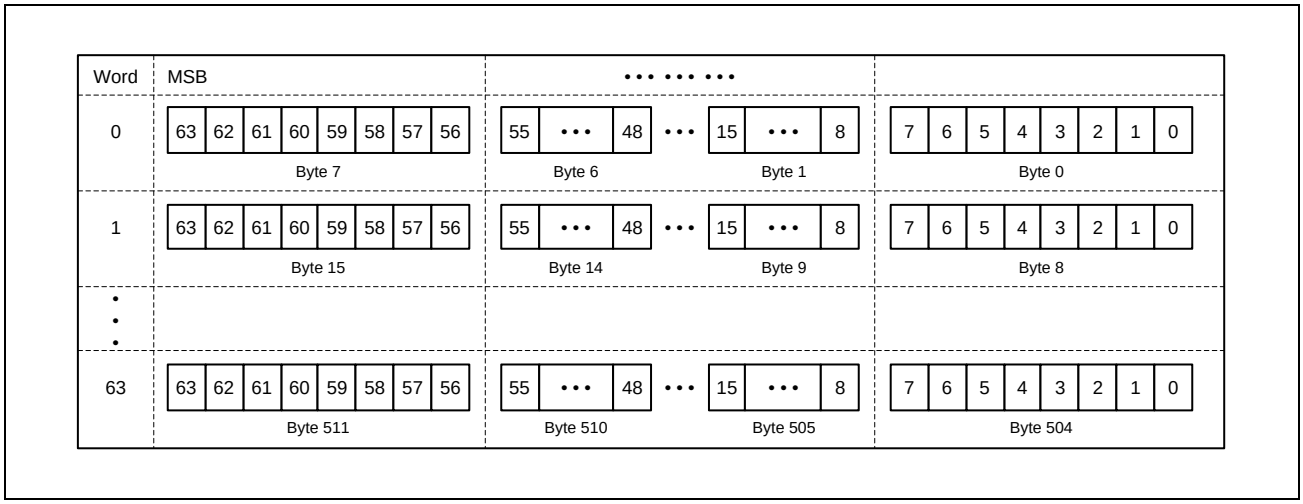

Figure 6.2-8 SD_BUF Store Data

Table 6.2-4 Reading from SD_BUF0

WMODE*1	BUSWIDTH*1	ENDIAN*1	Read Data*2
0	0	0	0123_4567_89AB_CDEFh
0	0	1	EFC_DAB8_9674_52301h
1	1	0	89AB_CDEFh (1st) 0123_4567h (2nd)
1	1	1	EFCD_AB89h (1st) 6745_2301h (2nd)
1	0	0	CDEFh (1st) 89ABh (2nd) 4567h (3rd) 0123h (4th)
1	0	1	EFCDh (1st) AB89h (2nd) 6745h (3rd) 2301h (4th)

Note 1. The name of a bit in HOST_MODE.

Note 2. When the data stored in SD_BUF is 0123_4567_89AB_CDEFh

6.2.3.1.2 Bus signal voltage switch Sequence

For changing the voltage of the SD bus signals to 1.8V, apply following procedures after checking that the SD card supports 1.8 V.

1. Issue CMD11
   Perform command sequence processing of CMD11.

2. Stopping the SD clock (a)
   Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop*1 the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0b.

Note 1. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

3. Checking the value of SDDAT
   Check that the DAT0 bit in the SD_INFO2 register is 0.

4. Change the supply voltage of the host device
   Change the voltage of SD bus signals, by setting 1 to SD_IOVS bits of SD_STATUS register. For changing the setting of SD_IOVS, the register setting for the IO-cell is required. Refer to the user manual of PFC module for the detail.

5. Starting supply of the SD clock (b)
   Wait at least 5ms after the SD clock has been stopped (step 2 above), and set the SCLKEN bit in the SD_CLK_CTRL register to 1 and supply SD clock. The SDCLKOFFEN bit must be 0.

6. Checking the value of SDDAT
   Wait at least 1ms after supplying the SD clock (step 5 above), and check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

6.2.3.2 Card Detect/Write Protect

For using the Card Detect and Write Protect functions, the IMCLK2 clock must be provided to this module. In case of only Card Detect/Write Protect function is required, the IMCLK2 is required but the IMCLK can be stopped for reducing the power consumption. For example, in case of the SD card is not yet inserted to the slot and waiting for the card insertion by Card Detect function, only the IMCLK2 is required and IMCLK can be stopped. In case of data transfer is performed, both IMCLK and IMCLK2 should be provided to this module.

6.2.3.2.1 Card detect

The SD/MMC host interface has two types of card detect functions as described in the following.

(1) Card detect with ISDCD

Figure 6.2-9 shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

[Card insertion]

ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

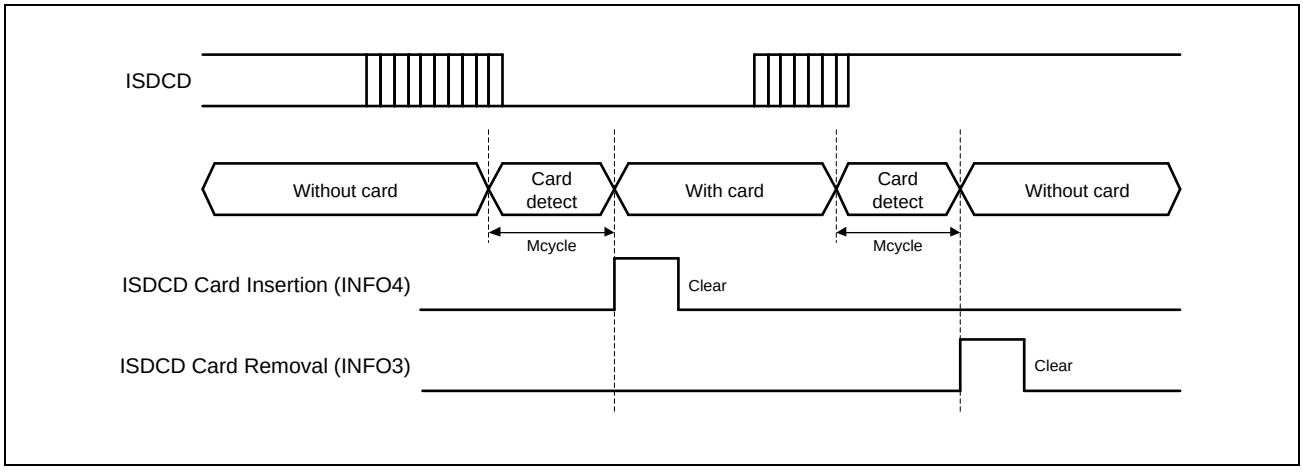

Figure 6.2-9 Example of Card Detect with ISDCD

(2) SD card detect with SDDAT3

Figure 6.2-10 shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

[Card insertion]

When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

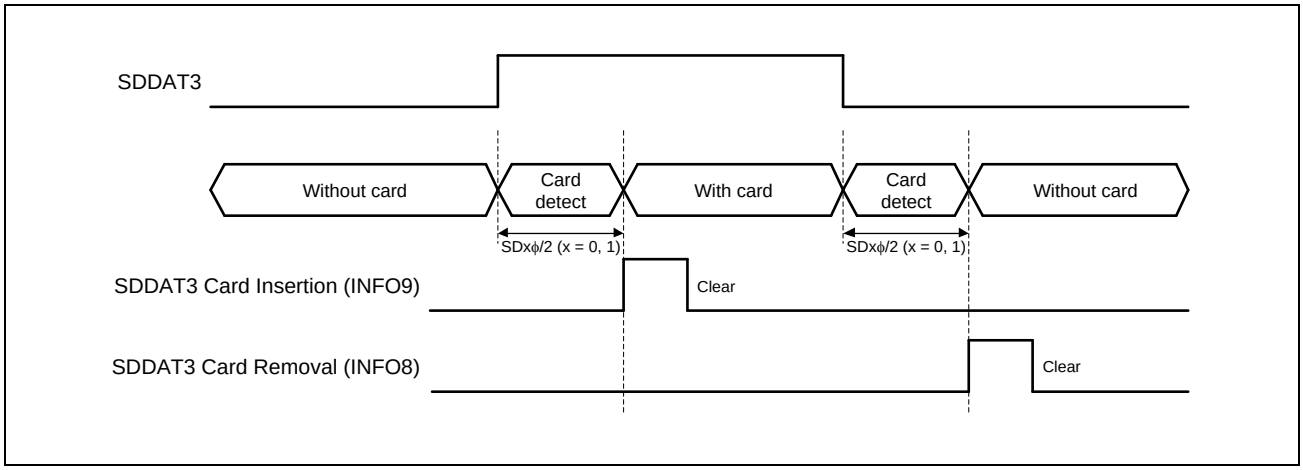

Figure 6.2-10 SD Card Detect with SDDAT3

6.2.3.2.2 Write protect

The SD/MMC host interface has two types of write protect functions.

(1) Write protect with ISDWP

ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

(2) Write protect with command

The card’s internal write protection and the card lock/unlock operation are realized by the command.

6.2.3.3 Interrupt Request

6.2.3.3.1 Interrupt request

The SD/MMC host interface has the interrupt requests shown in **Table 6.2-5** shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0b to the bit to be cleared and 1b to the other bits.

Table 6.2-5 Interrupt Request

	Interrupt Flag Register		Interrupt Mask Register	
Interrupt Request	Register Name	Bit Name	Register Name	Bit Name
Card access interrupt*1	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt*2	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt*1	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3
DMAC interrupt*1	DM_CM_INFO1	DTRANEND1	DM_CM_INFO1_MASK	DTRANEND1_MASK
		DTRANEND0		DTRANEND0_MASK
		SEQEND		SEQEND_MASK
	DM_CM_INFO2	DTRANERR1	DM_CM_INFO2_MASK	DTARERR1_MASK
		DTRANERR0		DTARERR0_MASK
		SEQERR		SEQERR_MASK

Note 1. Interrupt signal “OXMNIRQ” is asserted.

Note 2. Interrupt signal both “OXMNIRQ” and “OXASIOIRQ” are asserted.

6.2.3.4 Communications Errors and Timeouts

1) Communications errors and timeouts

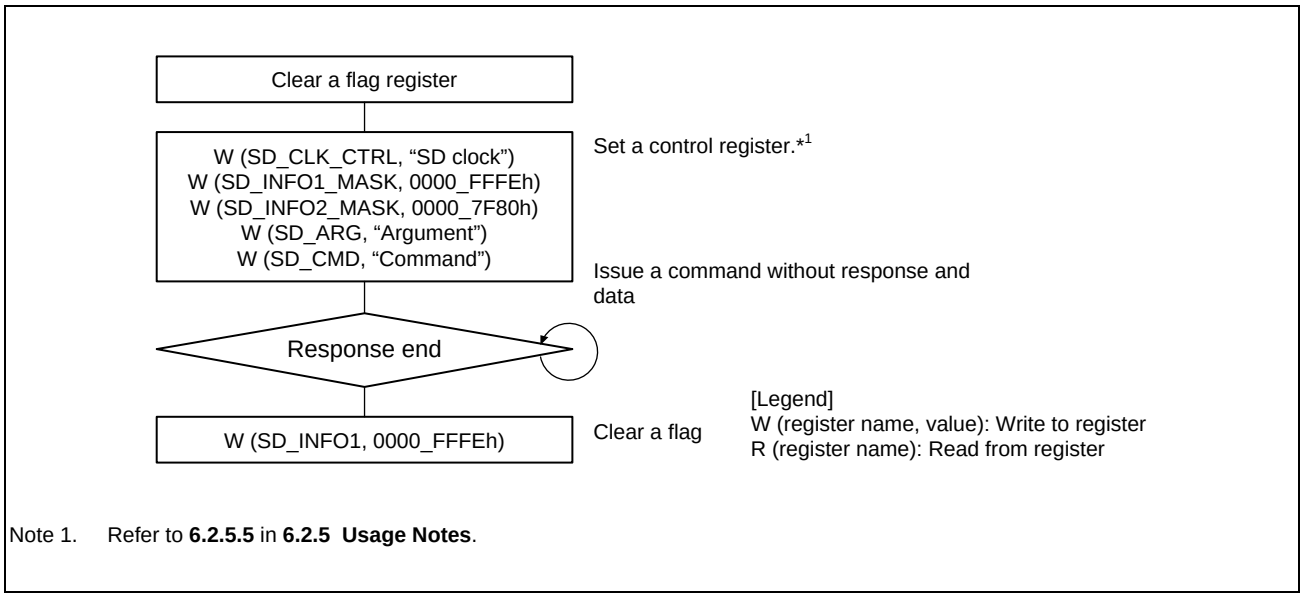
Table 6.2-6 and **Table 6.2-7** show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 6.2-6 Communications Errors

Communication Error	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence)
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 6.2-7 Timeouts

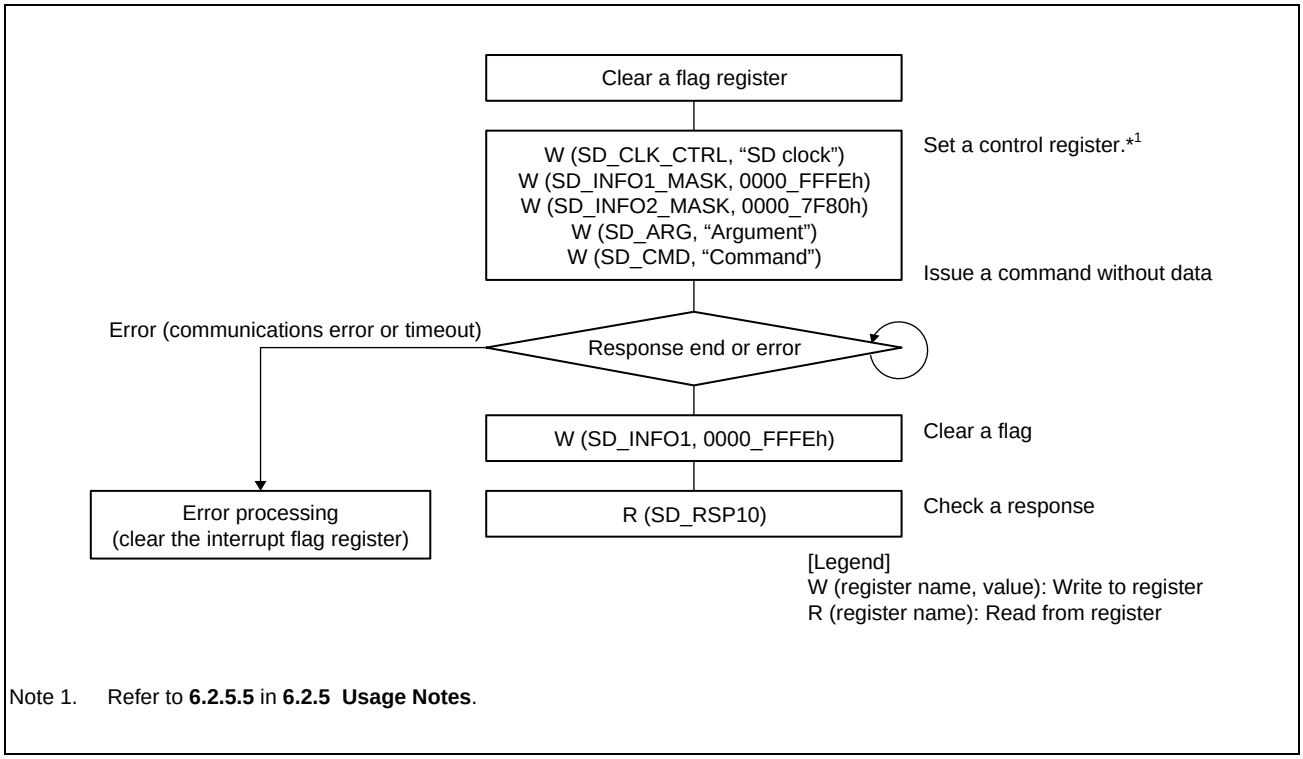
Timeout	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received even after 640 cycles of SDCLK have elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received even after 640 cycles of SDCLK have elapsed
Data timeout (other than response timeout)		ERR3		E6	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after the CRC status
				E5	When the CRC status is not received even after Ncycle*1 has elapsed after data writing
				E4	When read data are not received even after Ncycle*1 has elapsed after read command
					When read data for the next block are not received even after Ncycle*1 has elapsed after the reception of read data
					When read data for the next block are not received even after Ncycle*1 has elapsed after release of the read wait state
				E3	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after CMD12 has been issued within a command sequence
				E2	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after R1b response



Note 1. Ncycle is set by bit 7 to bit 4 in SD_OPTION.

6.2.4 Usage Example

6.2.4.1 Command without Data Transfer



6.2.4.1.1 Flowchart

Figure 6.2-11 and **Figure 6.2-12** show flowchart examples.

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-11 Flow Example of Command without Response and Data

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-12 Flow Example of Command without Data

6.2.4.1.2 Operation for command without data transfer

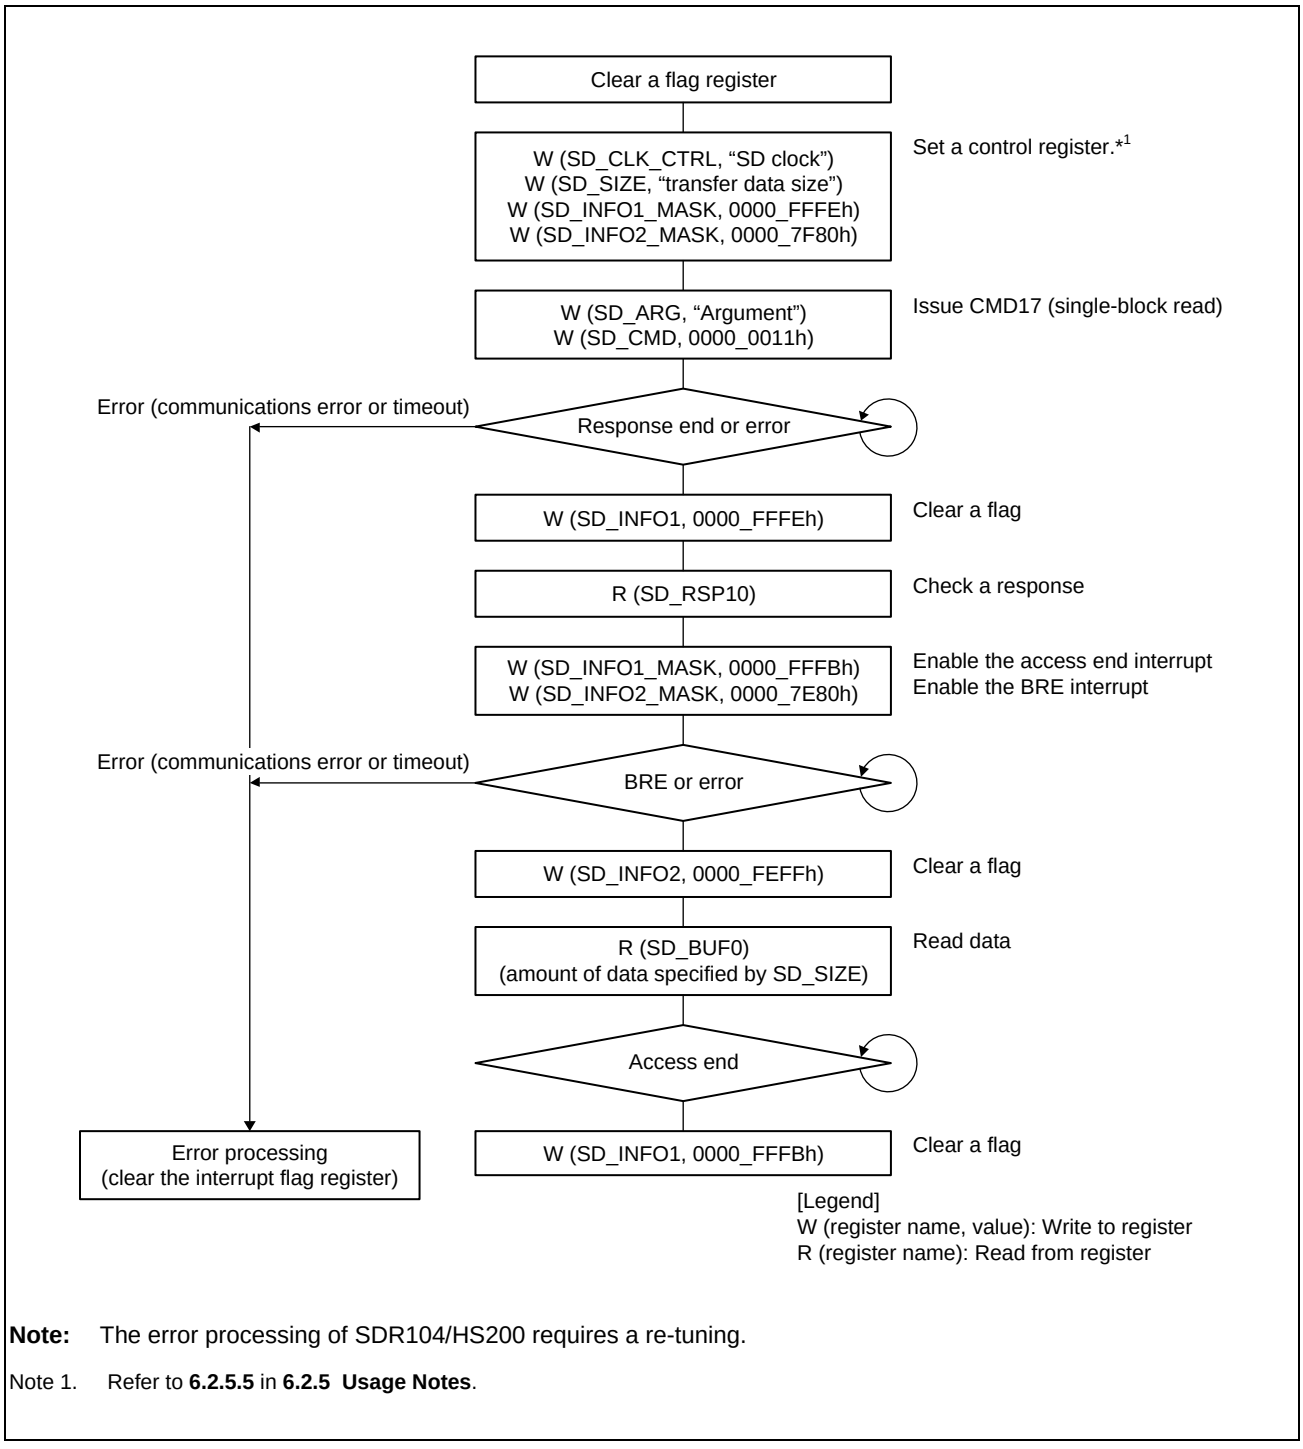
The legend below is used for description of register read/write.

— W (register name, value): Write to register

— R (register name): Read from register

The operation is described as below.

(1) Command without response and data



1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

(2) Command without data

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5. Read a response from SD_RSP10.
   Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.2 Single Block Read

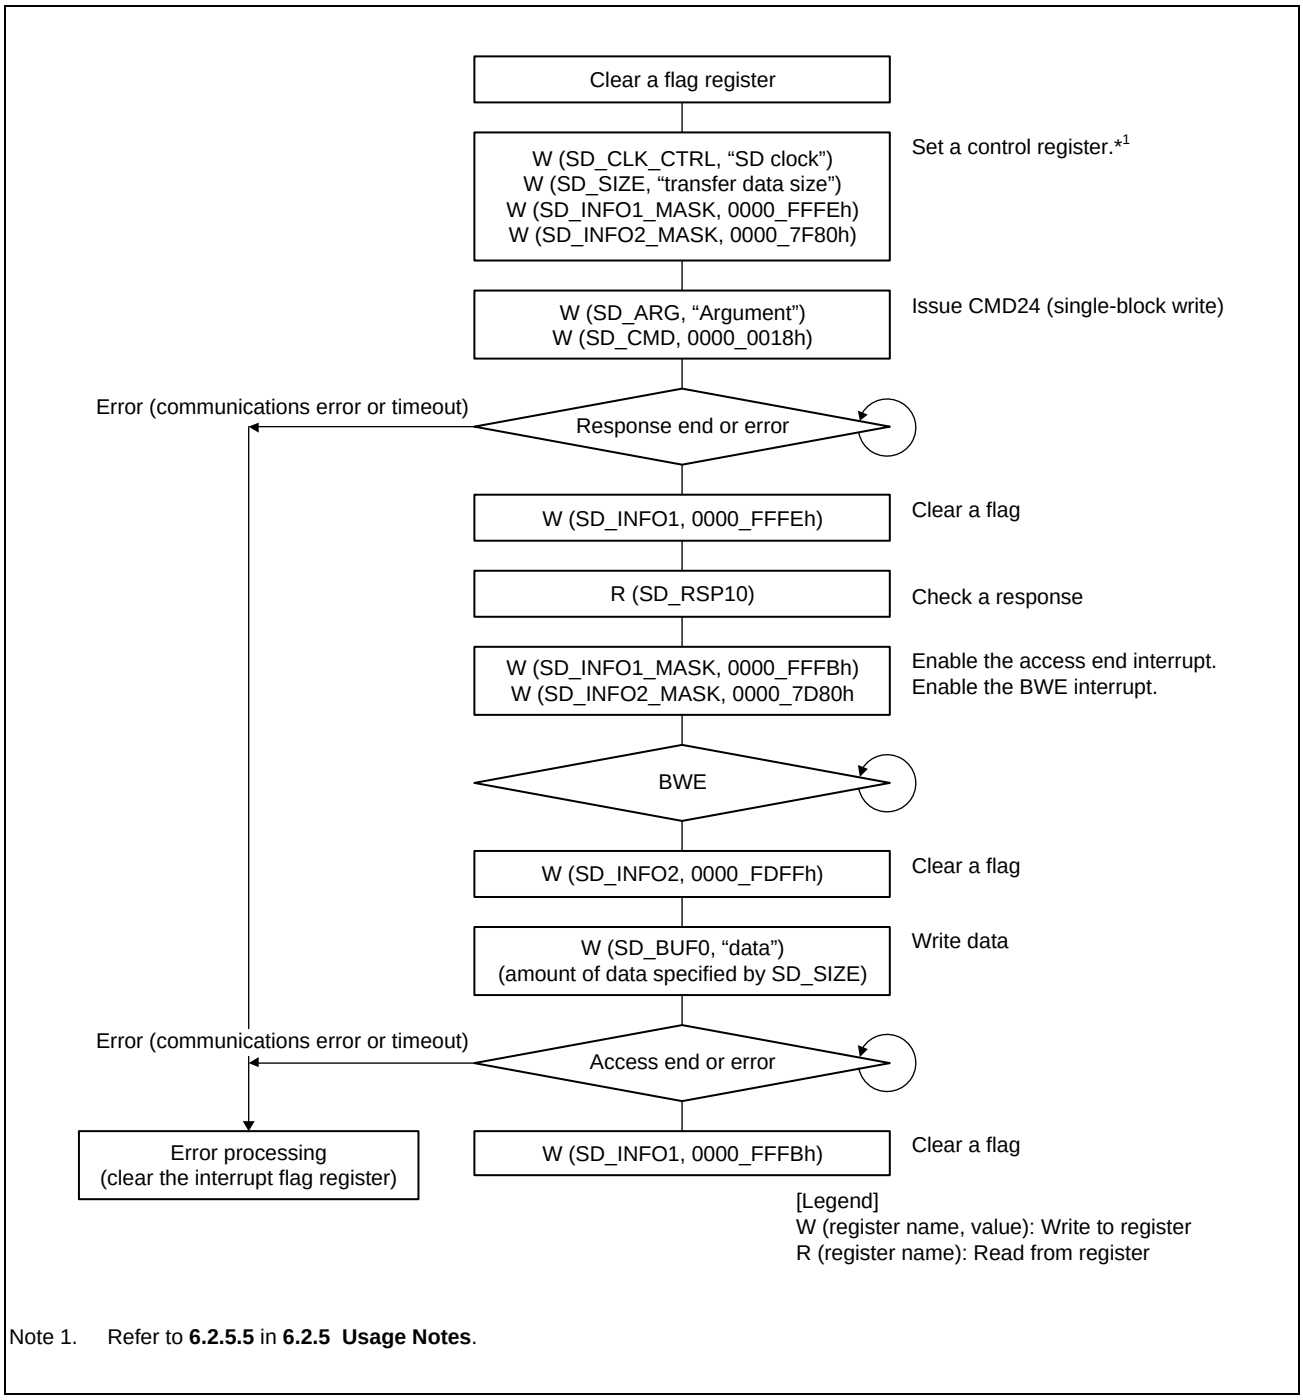
6.2.4.2.1 Flowchart

Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-13 Single Block Read Flowchart Example

6.2.4.2.2 Operation for single block read



The operation of single block read is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD17)
   Set CMD17 Argument in SD_ARG and write 0000_0011h to SD_CMD.
   Accordingly, CMD17 is issued, and the single block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data receive from SD card and data read
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7E80h to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
   However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6. Operation complete
   When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

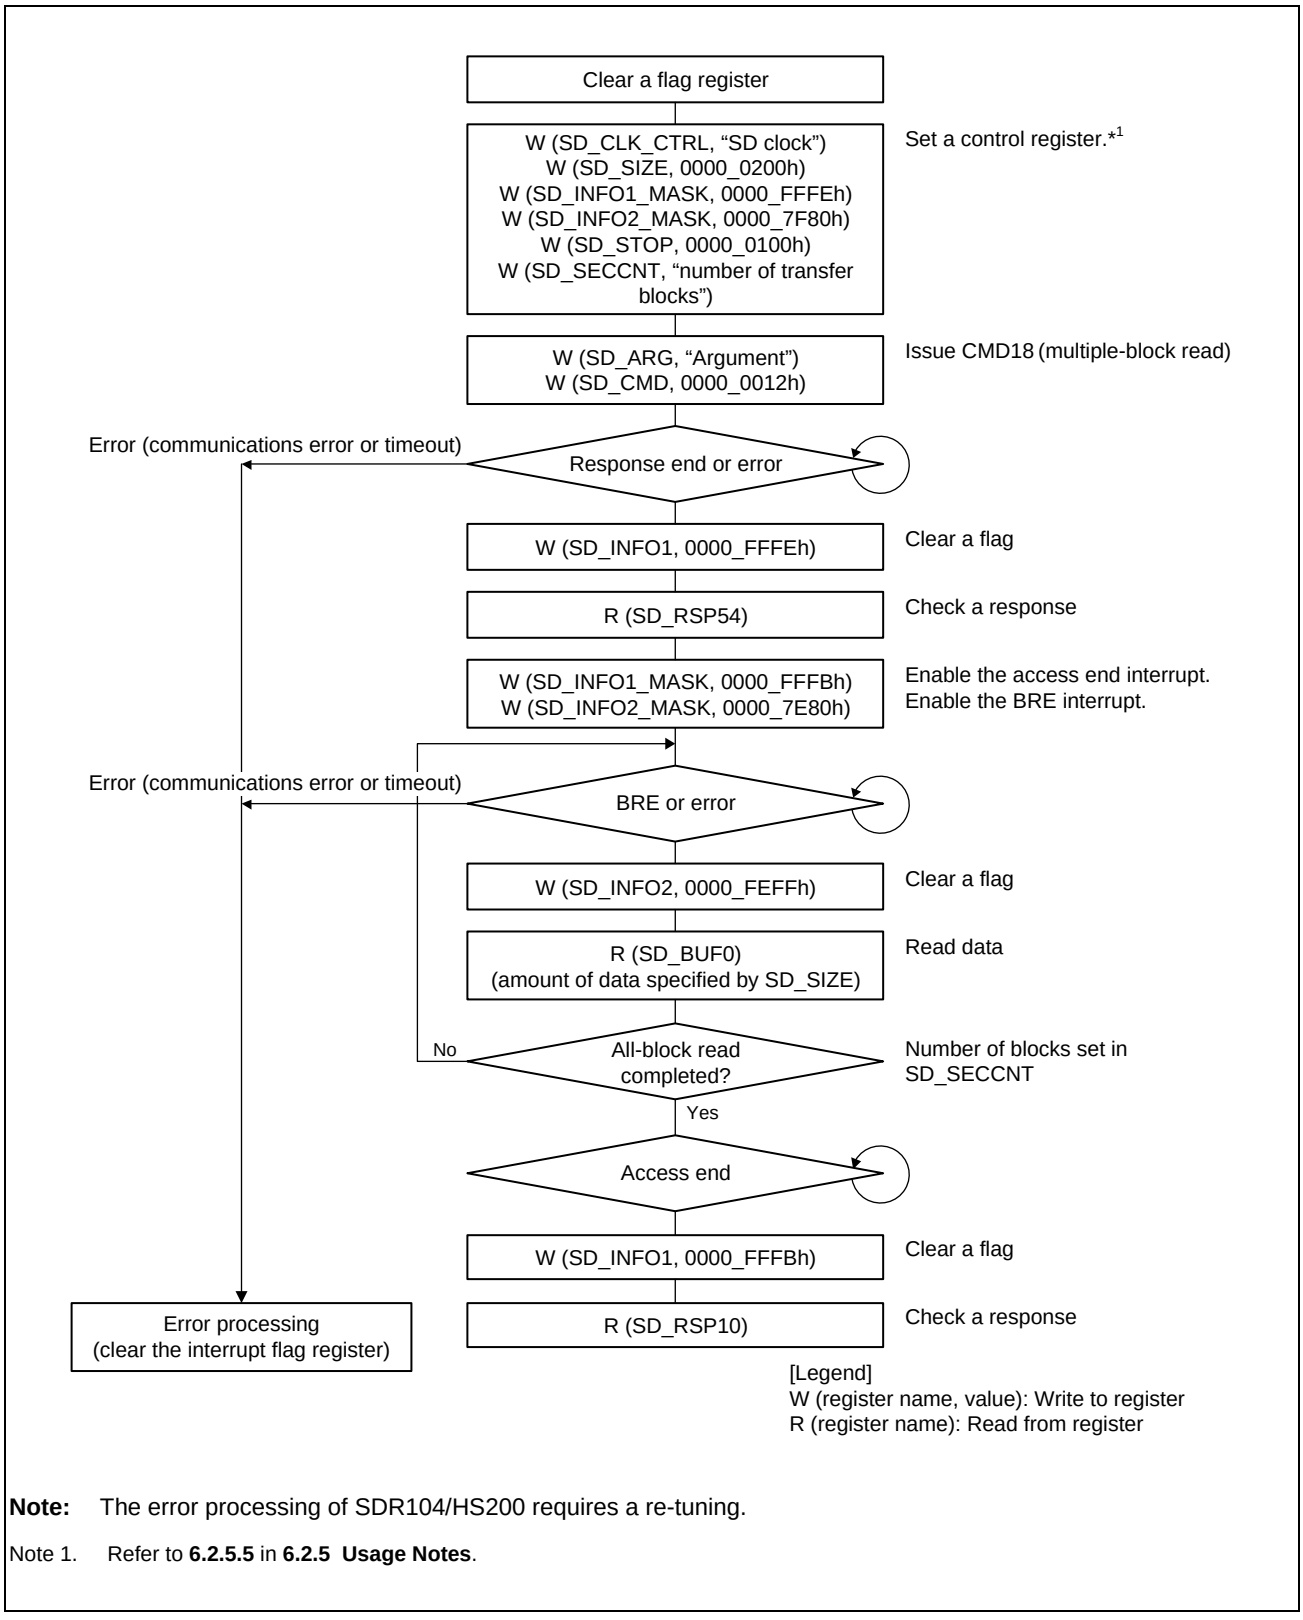
6.2.4.3 Single Block Write

6.2.4.3.1 Flowchart

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-14 Single Block Write Flowchart Example

6.2.4.3.2 Operation for single block write



The operation of single block write is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write 0000_0018h to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6. Operation complete
   When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.4 Multiple Block Read

6.2.4.4.1 Flowchart

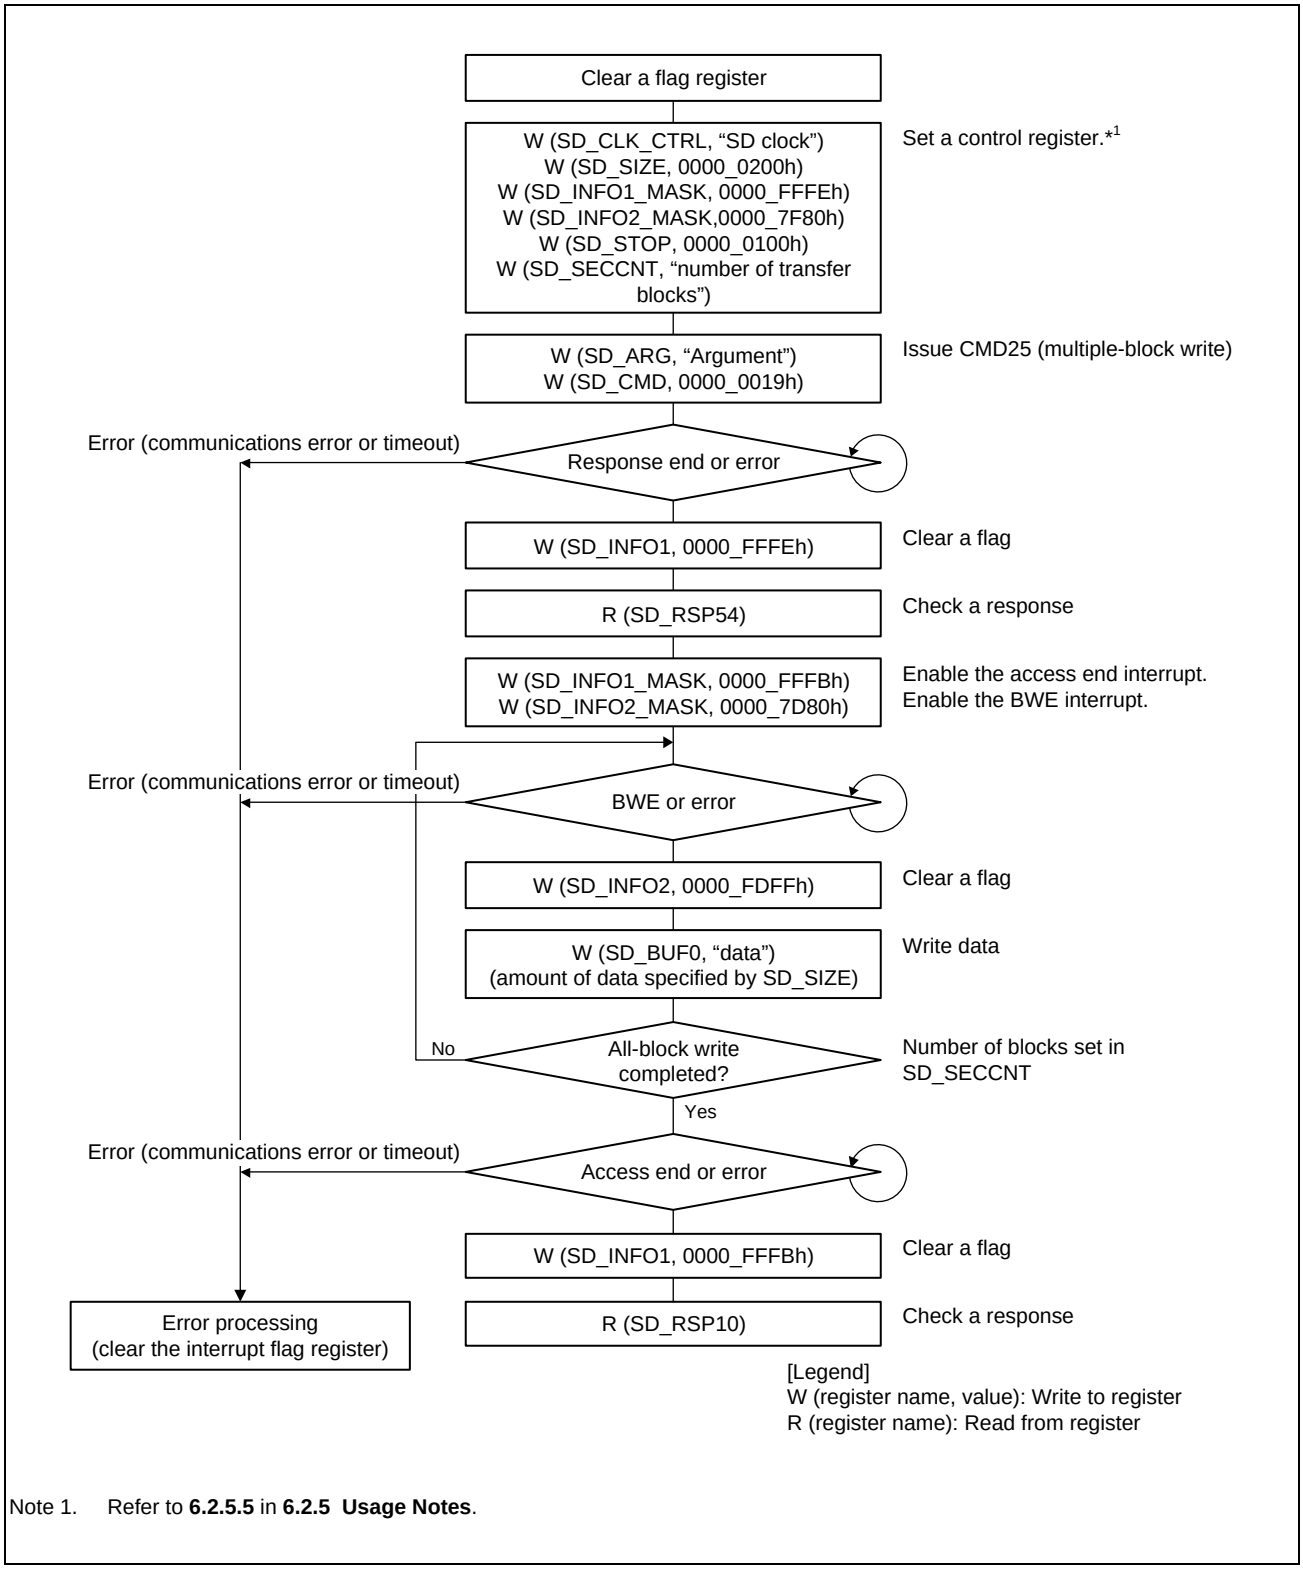
Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-15 Multiple Block Read Flowchart Example

6.2.4.4.2 Operation for multiple block read

The operation of multiple block read is described below.



1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD18)
   Set CMD18 Argument in SD_ARG and write 0000_0012h to SD_CMD.
   Accordingly, CMD18 is issued, and the multiple block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data receive from SD card and data read
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7E80h to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to 000_0000h.
6. Operation complete
   When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.5 Multiple Block Write (when Using Internal Timer)

6.2.4.5.1 Flowchart

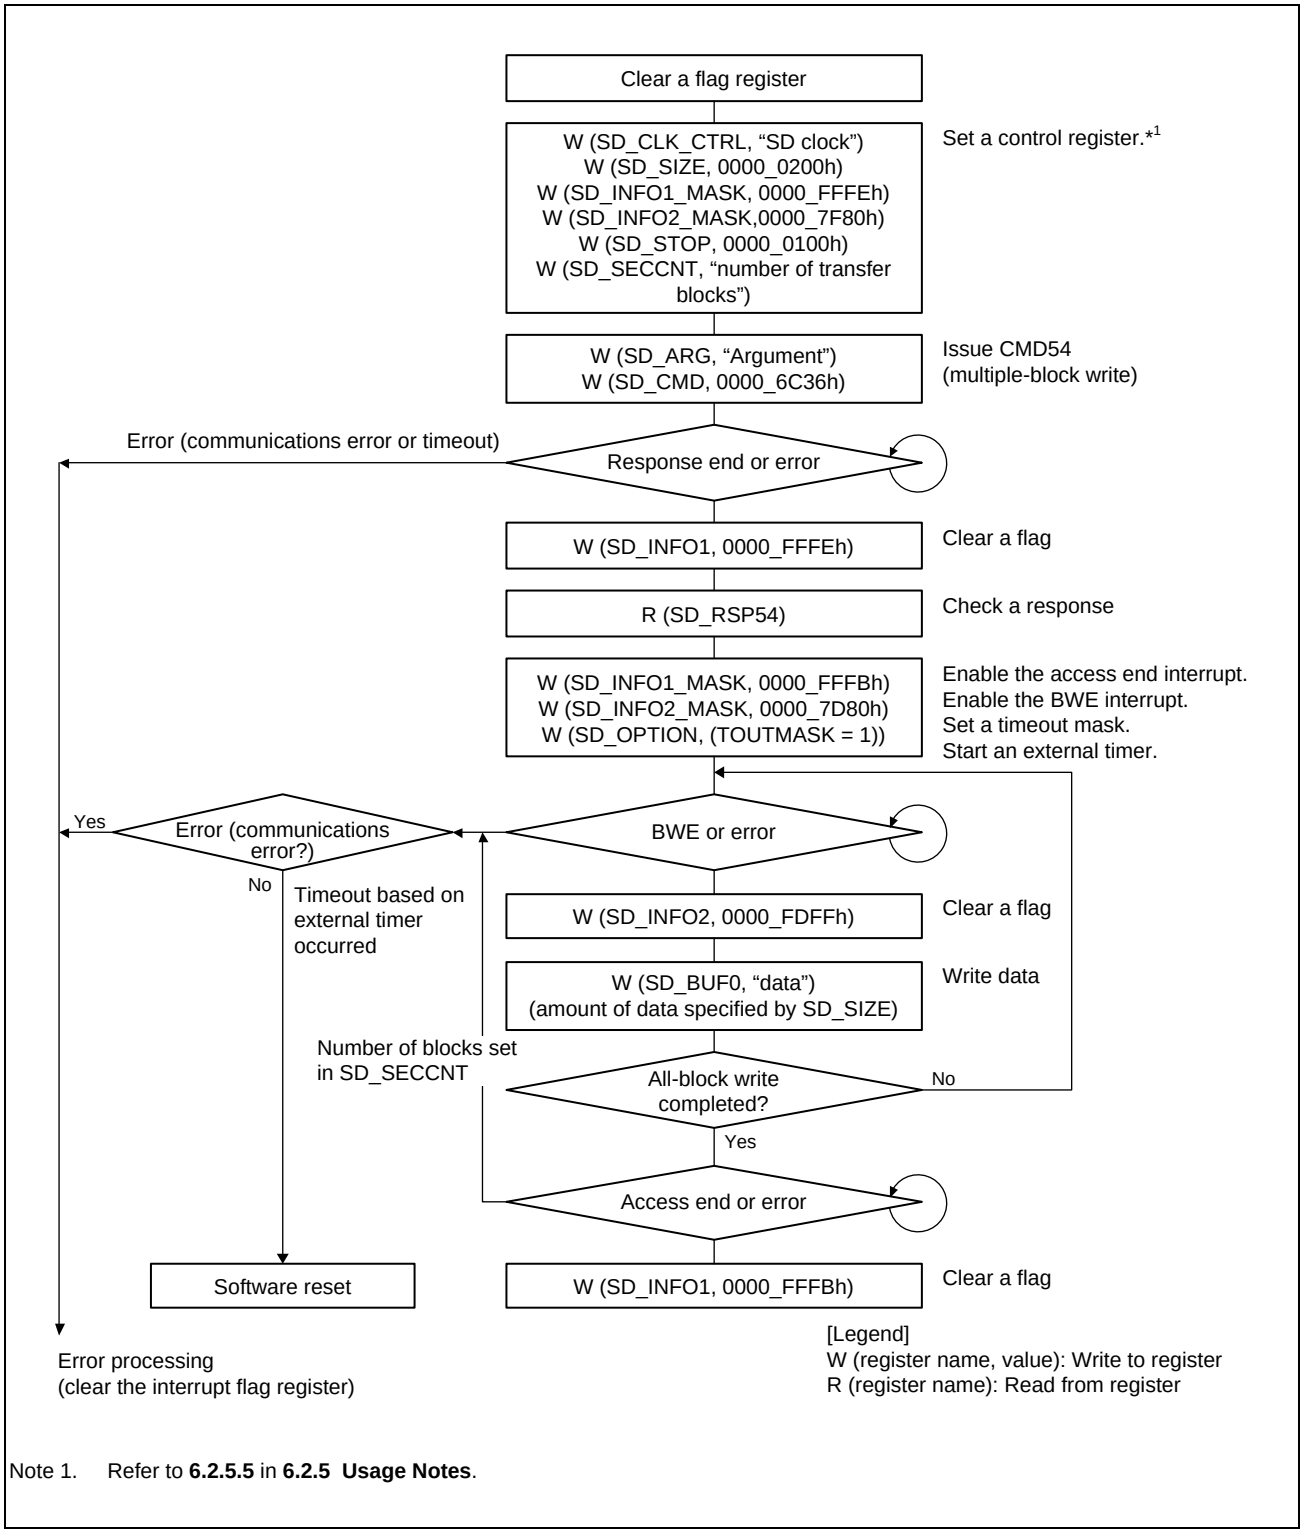
Figure 6.2-16 shows the flowchart when using an internal timer.

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-16 Multiple Block Write Flowchart Example (when Using Internal Timer)

6.2.4.5.2 Operation for multiple block write

The operation of multiple block write is described below.



1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write 0000_0019h to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to 0000_0000h.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.6 Multiple Block Write (when Using External Timer)

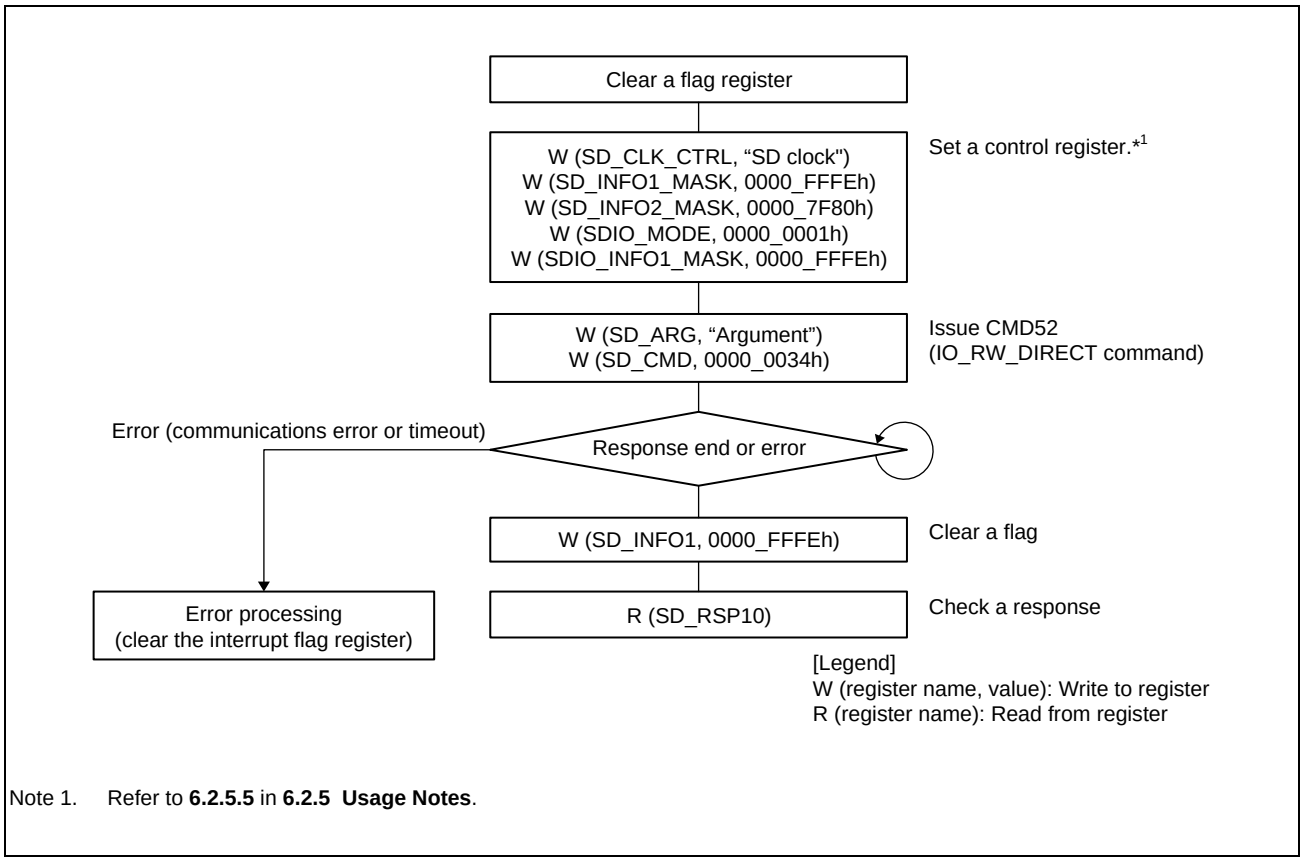
6.2.4.6.1 Flowchart

The flowchart when using an external timer instead of an internal timer of this module is shown below.

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-17 Multiple Block Write Flowchart Example (when Using External Timer)

6.2.4.6.2 Operation for multiple block write



The operation of multiple block write is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD54)
   Set CMD54 Argument in SD_ARG and write 0000_6C36h to SD_CMD.
   Accordingly, CMD54 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.
   When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 register is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

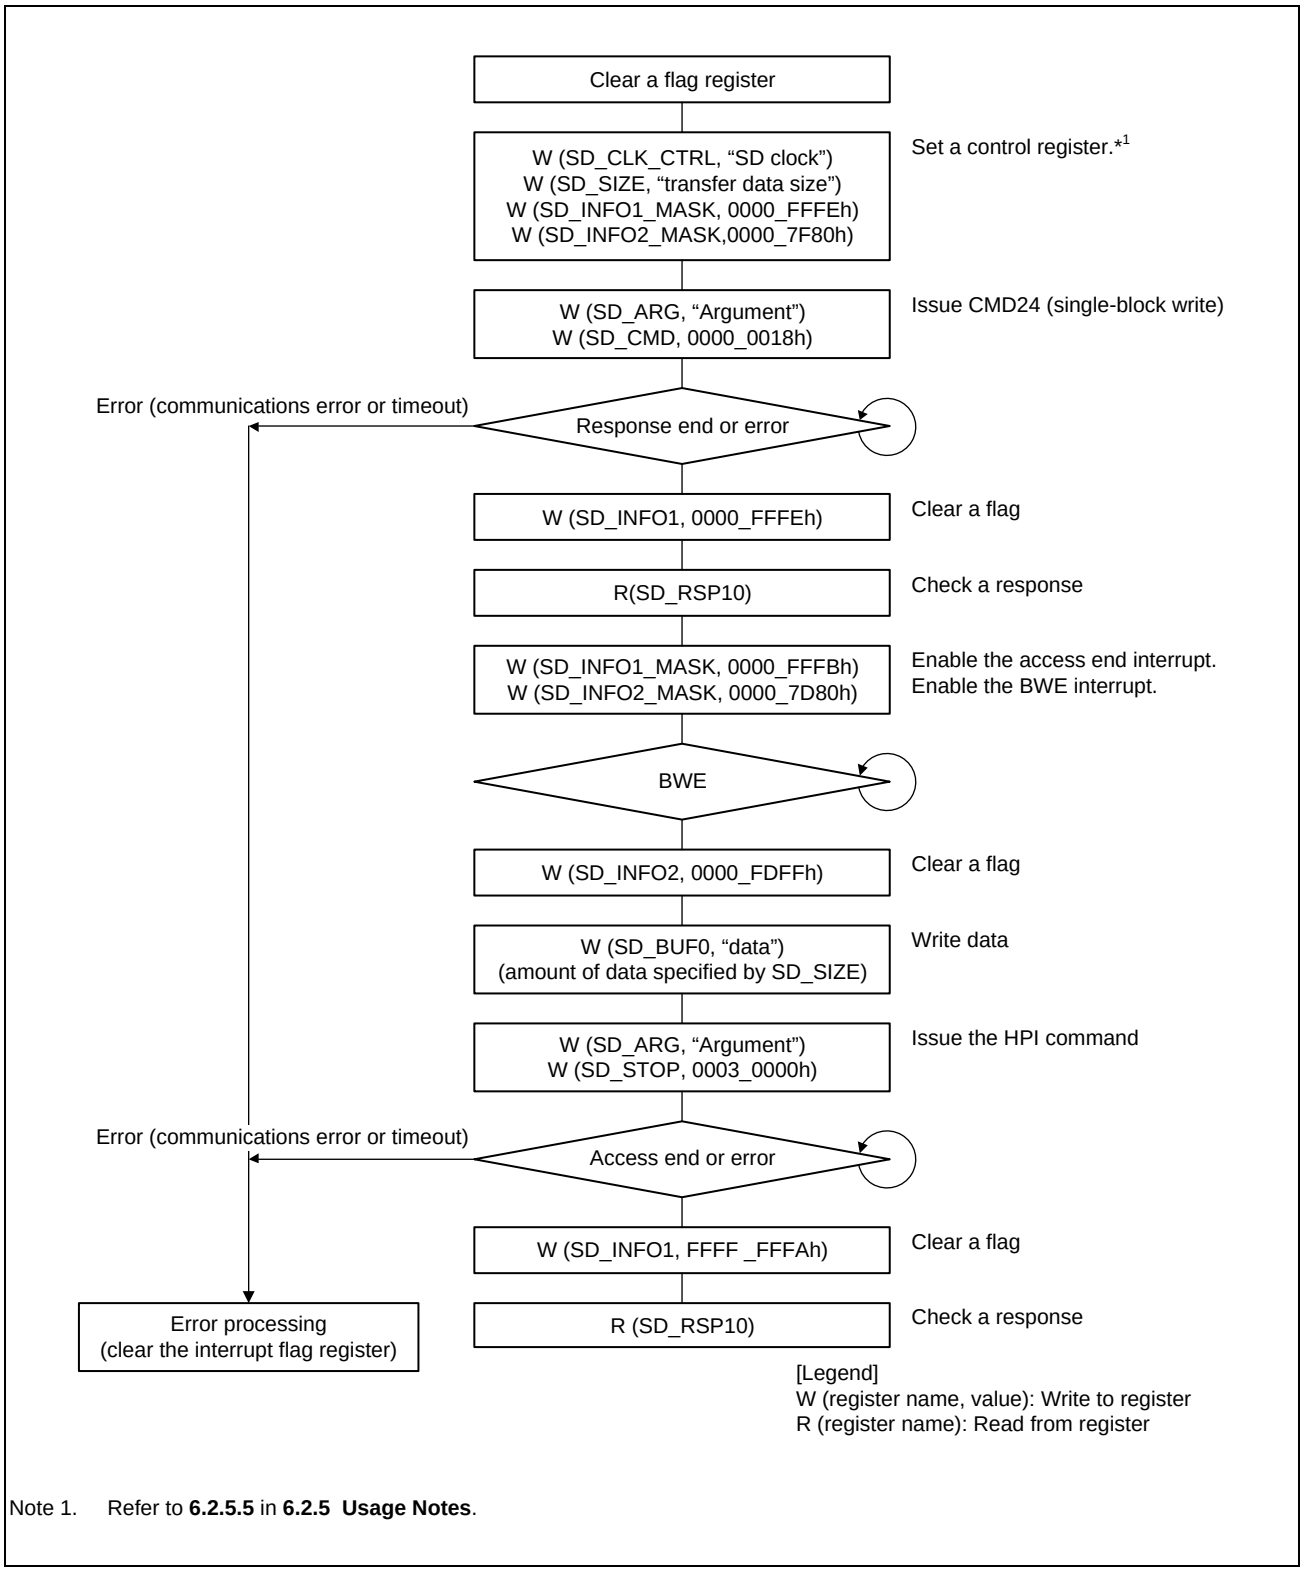
6.2.4.11 High-Priority Interrupt (without Data Transfer)

6.2.4.11.1 Flowchart

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-27 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

6.2.4.11.2 Operation for high-priority interrupt without data transfer



The operation of the high-priority interrupt (HPI) without data transfer is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set the CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5. Read the response from SD_RSP10.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

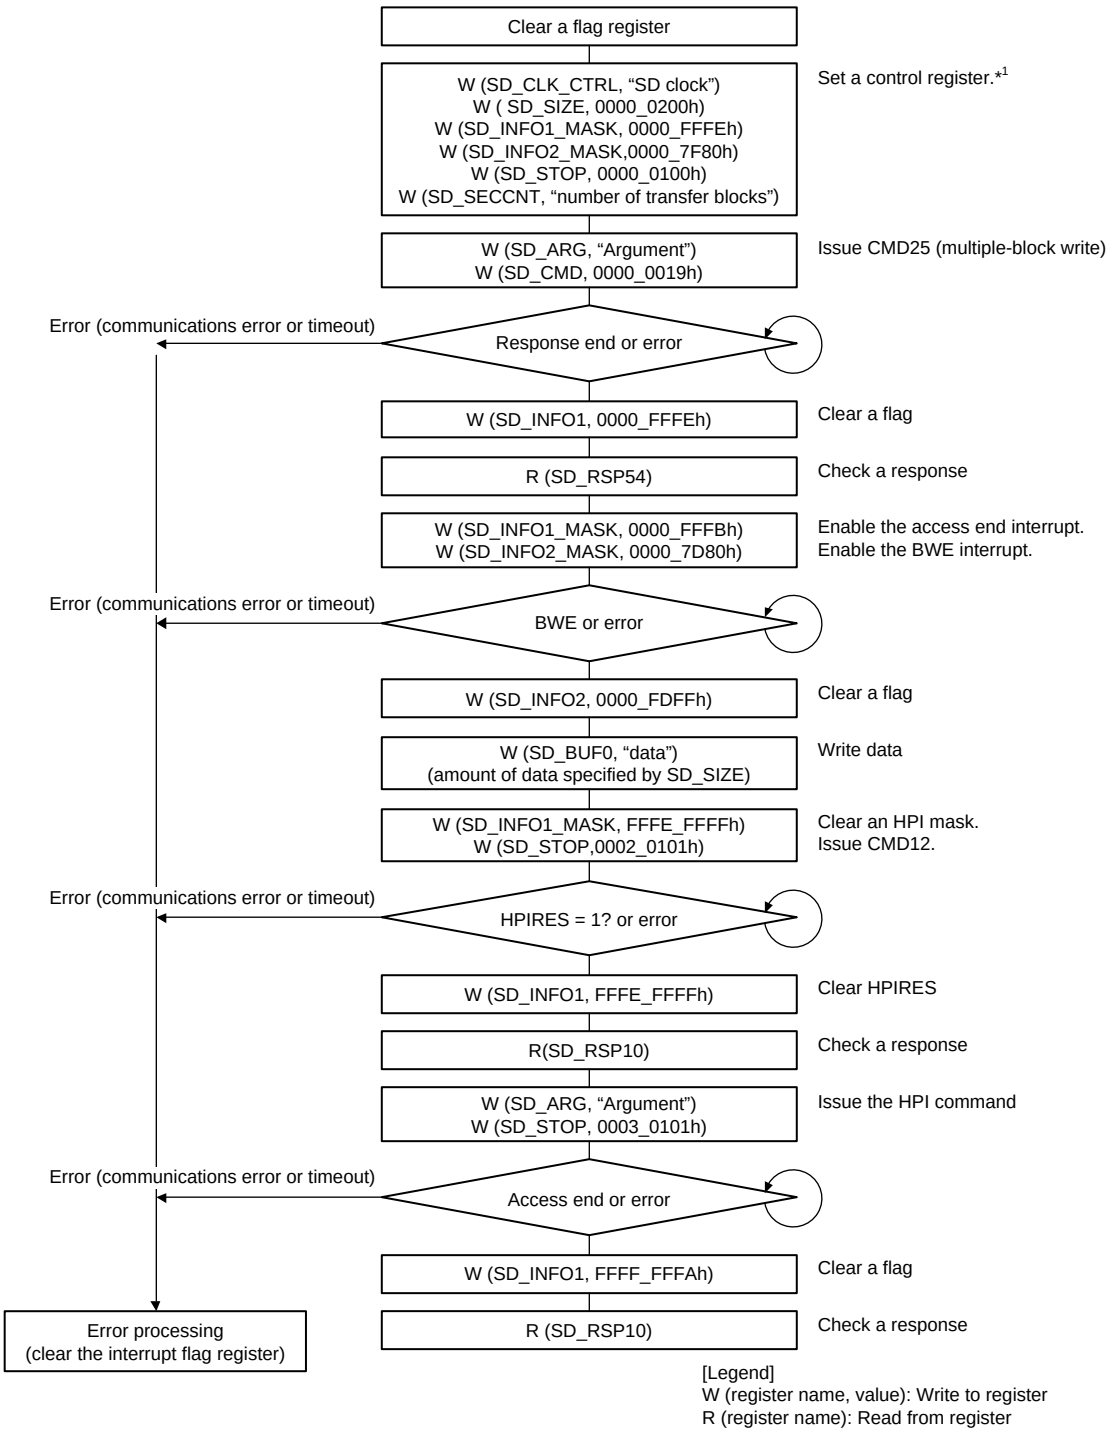
6.2.4.12 High-Priority Interrupt (at Single Block Write)

6.2.4.12.1 Flowchart

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-28 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

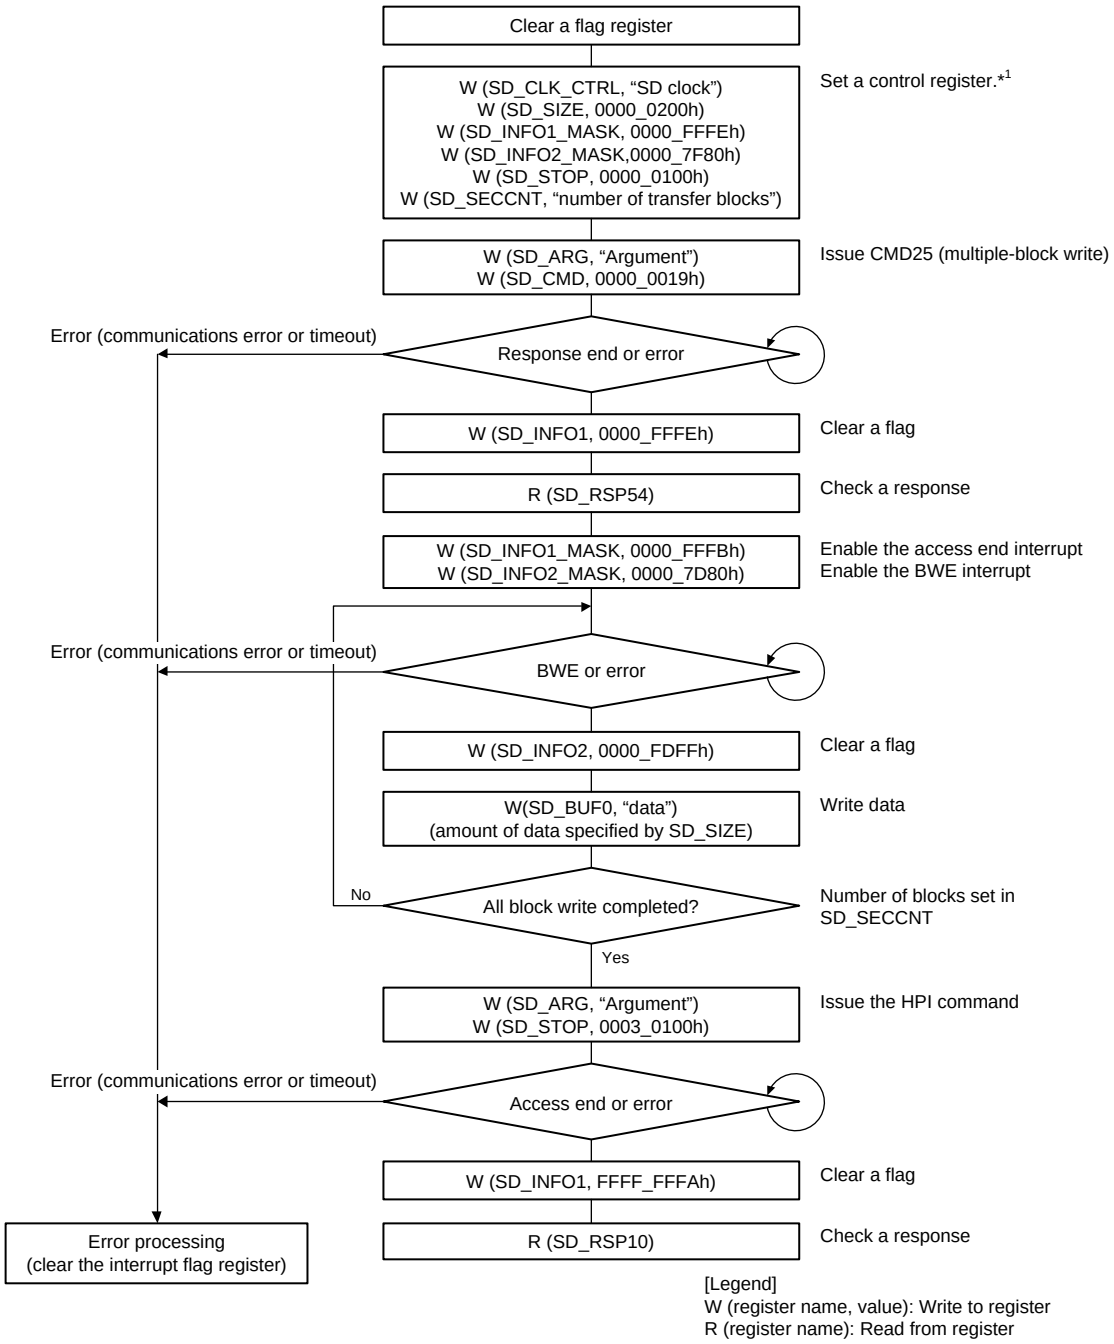
6.2.4.12.2 Operation for HPI at single block write



The operation of HPI at single block write is described below.

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write 0000_0018h to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).



6.2.4.13 High-Priority Interrupt (at Multiple Block Write)

6.2.4.13.1 Flowchart

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-29 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)

Note 1. Refer to **6.2.5.5** in **6.2.5 Usage Notes**.

Figure 6.2-30 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

6.2.4.13.2 Operation for HPI at multiple block transfer

The operation of HPI at multiple block write is described below.

(1) When not all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write 0000_0019h to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Command issue (CMD12)
   Write FFFE_FFFFh to SD_INFO1_MASK to enable the HPIRES interrupt. Write 0002_0101h to SD_STOP, which causes CMD12 to be issued.
7. Response check
   When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8. HPI command issue (CMD25)
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

(2) When all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag registers. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write 0000_0019h to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write 0000_FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000_7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

6.2.4.14 Example of SD_CMD Register Setting

Table 6.2-8 lists the example of SD_CMD (SD interface) register setting.

Table 6.2-8 Example of SD_CMD Register Setting (SD) (1/2)

Type	Command	Example of SD_CMD Register Setting	Remark
CMD	CMD0	0000_0000h	
	CMD2	0000_0002h	
	CMD3	0000_0003h	
	CMD4	0000_0004h	
	CMD5	0000_0705h or 0000_0005h	
	CMD6	0000_1C06h or 0000_0006h	
	CMD7	0000_0007h	When the card is placed in the deselected state, the response timeout flag will be set since there is no response.
	CMD8	0000_0408h or 0000_0008h	
	CMD9	0000_0009h	
	CMD10	0000_000Ah	
	CMD11	0000_040Bh or 0000_000Bh	
	CMD12	0000_000Ch	
	CMD13	0000_000Dh	
	CMD15	0000_000Fh	
	CMD16	0000_0010h	
	CMD17	0000_0011h	
	CMD18	0000_0012h	With auto CMD12 enabled (other than in SDR104 mode)
		0000_7C12h	With auto CMD12 disabled (only in SDR104 mode)
	CMD19	0000_1C13h or 0000_0013h	
	CMD20	0000_0514h or 0000_0014h	
	CMD23	0000_0417h or 0000_0017h	
	CMD24	0000_0018h	
	CMD25	0000_0019h	With auto CMD12 enabled (other than in SDR104 mode)
		0000_6C19h	With auto CMD12 disabled (only in SDR104 mode)

6.2.5 Usage Notes

6.2.5.1 SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

6.2.5.2 Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

1) When receiving one or two blocks of data, use single block reading.
2) Read the response to CMD18 from SD_RSP54.

[Mechanism of incorrect reading]

Figure 6.2-31 shows the processing flows of SD/MMC host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of **Figure 6.2-31**, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

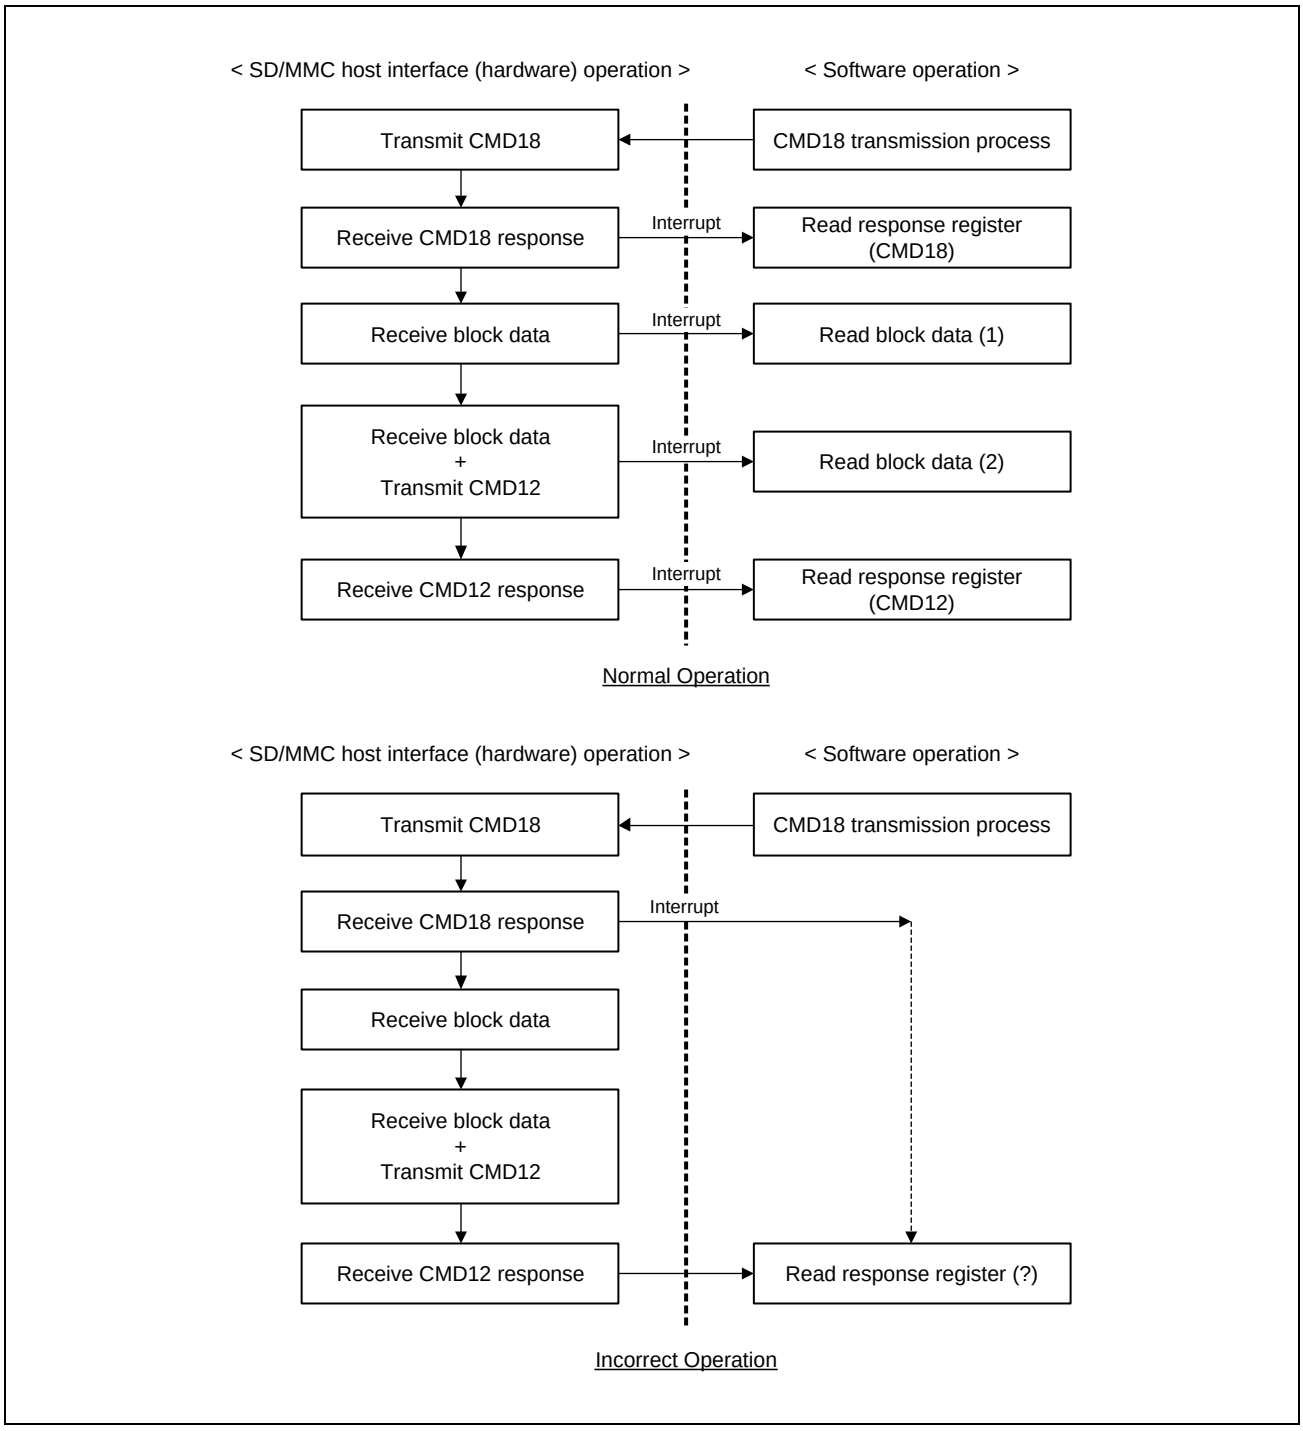

Figure 6.2-31 Flowcharts for Multiple Block Read Operation (Two Blocks)

6.2.5.3 Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

6.2.5.4 Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

6.2.5.5 Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

6.2.5.6 Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.
5. MMC open ended multiple block read is not supported.

6.2.5.7 STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

6.2.6 Sampling Clock Controller (SCC)

6.2.6.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/ SDR104 and MMC HS200. When this module is used with the LSI, SD UHS-I/SDR104 and MMC HS200 can be supported.

6.2.6.2 SCC Block Diagram

Figure 6.2-32 shows a block diagram of the sampling clock controller.

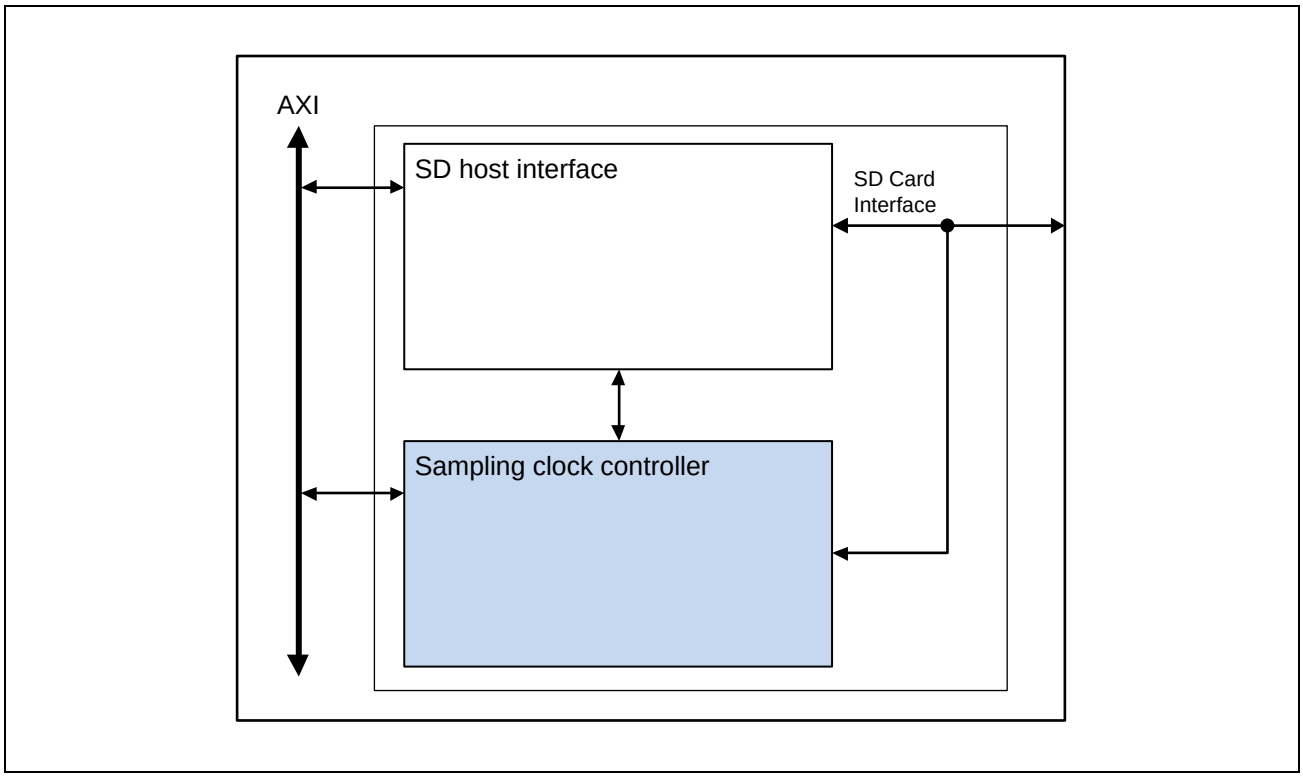

Figure 6.2-32 Block Diagram of the Sampling Clock Controller

6.2.7 SCC Registers

6.2.7.1 List of Registers

The registers are listed below.

The SCC registers are listed below. Regarding the base addresses of the following registers, refer to **6.2.2 SD Registers**.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Initial Setting Register	SDm_SCC_DTCNTL	0000_0000_0008_0000h	1000h	32, 64
Sampling Clock Position Setting Register	SDm_SCC_TAPSET	0000_0000_0000_0000h	1008h	32, 64
Hardware Adjustment Register 1	SDm_SCC_DT2FF	0000_0000_0000_0502h	1010h	32, 64
Sampling Clock Selection Register	SDm_SCC_CKSEL	0000_0000_0000_0000h	1018h	32, 64
Sampling Clock Position Correction Register	SDm_SCC_RVSCNTL	0000_0000_0000_0000h	1020h	32, 64
Sampling Clock Position Correction Request Register	SDm_SCC_RVSREQ	0000_0000_0000_0000h	1028h	32, 64
Sampling data comparison register	SDm_SCC_SMPCMP	0000_0000_0000_0000h	1030h	32/64
HS400 mode register 1	SDm_SCC_HS400MODE1	0000_0000_0000_0000h	1038h	32/64
Hardware adjustment register 2	SDm_SCC_HWADJ2	0000_0000_0000_01FFh	1040h	32/64
Reserve	-	-	1048h to 104Fh	-
Hardware adjustment register 3	SDm_SCC_HWADJ3	0000_0000_0000_0000h	1050h	32/64
Reserve	-	-	1058h to 107Fh	-
HS400 mode register 2	SDm_SCC_HS400MODE2	0000_0000_0000_0000h	1080h	32/64
Hardware adjustment register 4	SDm_SCC_HWADJ4	0000_0000_0000_0099h	1088h	32/64

6.2.7.2 SCC Register Descriptions

6.2.7.2.1 Initial Setting Register (SDm_SCC_DTCNTL)

Access Size : 32, 64 bits

Offset Address : <SDm_base> + 1000h

Initial Value : 0000_0000_0008_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAPSEL7 to TAPSEL0[7:0]								-	-	-	-	-	-	RVSW	RVSEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 8	TAPSEL7 to TAPSEL0[7:0]	0h	R	SCC Sampling Clock Position Display Displays the SCC sampling clock position selected by hardware. After RVSEN has been set to 1b, the value may differ from that of TAPSET.
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	RVSW	0h	RW	This bit is read as 0b. The write value should be 1b.
0	RVSEN	0h	RW	SCC Sampling Clock Position Correction Enable 0b: SCC sampling clock position correction is disabled. 1b: SCC sampling clock position correction is enabled. When RVSEN is set to 1b after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD/MMC host interface. However, when RVSERR is 1b, this module does not correct the SCC sampling clock position. While tuning is being performed, set RVSEN to 0. When this controller is used with an SDIO device which asserts SDIO interrupt, set RVSEN to 0.

6.2.7.2.5 Sampling Clock Position Correction Request Register (SDm_SCC_RVSREQ)

Access Size : 32, 64 bits

Offset Address : <SDm_base> + 1028h

Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2	RVSERR	0h	RW	SCC Sampling Clock Position Correction Error 0b: There is no correction error. 1b: There is a correction error. - If this bit is set to 1b after a command sequence, write 0b to this bit and perform tuning again. - Ignore this bit while tuning is being performed. - Writing 1 to this bit is disabled and writing 0b to this bit is only enabled. [Note] When HS400 mode is enabled, ignore this bit's value.
1	REQTAPUP	0h	RW	SCC Sampling Clock Position Positive Direction Correction Request 0b: There is no correction request. 1b: There is a correction request. - If this bit is set to 1b after a command sequence, write 0b to this bit and rewrite TAPSET in the positive direction (when TAPSEL = TAPNUM-1, set 0 to TAPSET). - When RVSEN is 1b, this bit is disabled (this bit is not set to 1). - Writing 1b to this bit is disabled and writing 0b to this bit is only enabled. [Note] When HS400 mode is enabled, ignore this bit's value. See the Description of SCC_SMPCMP.CMPNGU.
0	REQTAPDWN	0h	RW	SCC Sampling Clock Position Negative Direction Correction Request 0b: There is no correction request. 1b: There is a correction request. - If this bit is set to 1b after a command sequence, write 0b to this bit and rewrite TAPSET in the negative direction (when TAPSEL = 0, set TAPNUM-1 to TAPSET). - When RVSEN is 1b, this bit is disabled (this bit is not set to 1b). - Writing 1b to this bit is disabled and writing 0b to this bit is only enabled. [Note] When HS400 mode is enabled, ignore this bit's value. See the Description of SCC_SMPCMP.CMPNGD.

6.2.7.2.6 Hardware Adjustment Register 1 (SDm_SCC_DT2FF)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Access Size : 32/64 bits

Address : <SDm_base> + 1010h

Initial Value : 0000_0000_0000_0502h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15 to 8	DT2NE[7:0]	5h	RW	Hardware Adjustment 2 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set 8'h03 to this bit, make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.
7 to 0	DT2NS[7:0]	2h	RW	Hardware Adjustment 1 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set 8'h00 to this bit., make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.

6.2.7.2.7 Sampling Data Comparison Register (SDm_SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the previous TAP and the subsequent TAP.

Access Size : 32/64 bits
Address : <SDm_base> + 1030h
Initial Value : 0000_0000_0000_0000h

Bit	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

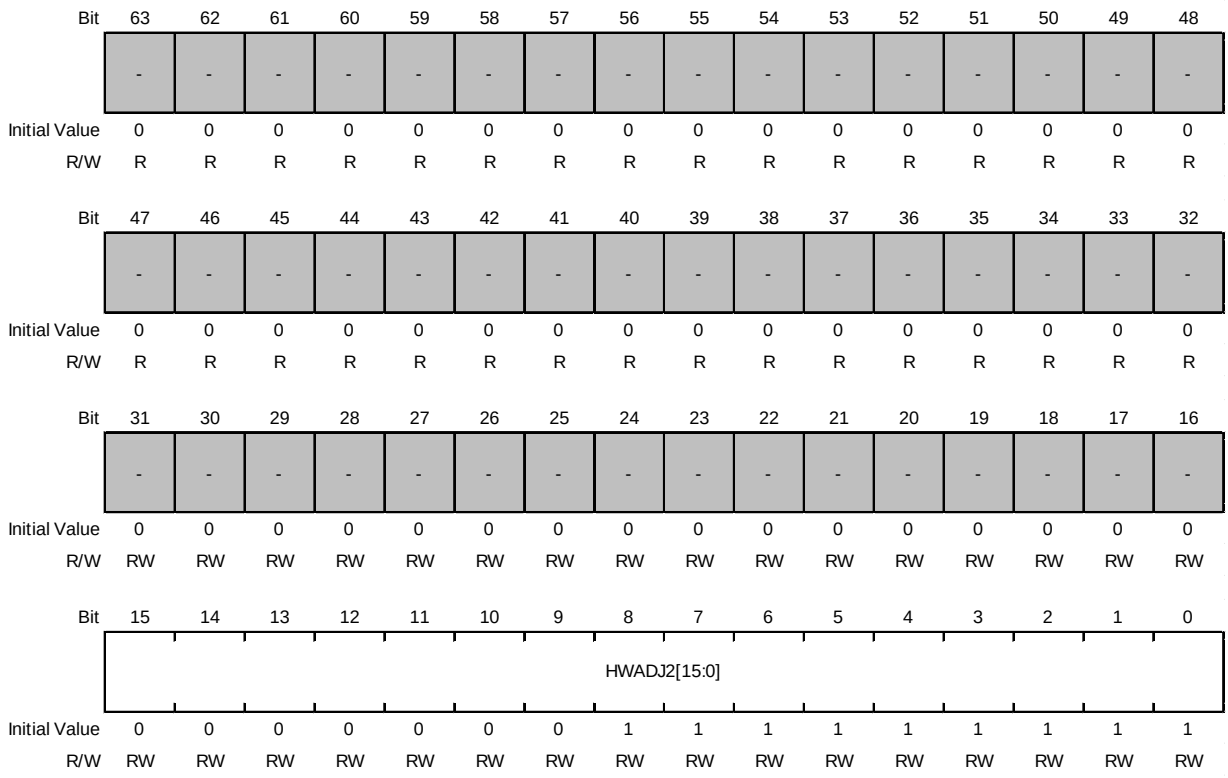
	TMPOUT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW



Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31	HS400EN	0h	RW	Set this bit to 1 to select operation of this module in HS400 mode. 0: Disables HS400 mode. 1: Enables HS400 mode. [Note] Write 0 to this bit when : 1) After terminating the transfer by CMD12 in HS400 mode. 2) Error occurs during HS400 transfer (for performing Error recovery)
30	HS400ENHSTRB	0h	RW	HS400 Enhanced Strobe Mode Select. 0: Set this bit to 0 to disable HS400 Enhanced strobe function of Host. In this case, user needs to perform tuning process to capture CMD-Response in HS400 mode. 1: Set this bit to 1 to enable HS400 Enhanced strobe function of Host. Host will use Data strobe to capture CMD-Response, CRC-Response, DATA Out (read data from card). User does not need to perform tuning process. Note: This bit is not cleared when doing soft-reset (SOFT_RST.SDRST). User needs to write 0 to this bit after soft-reset. If not, Host only accepts response when there is Data strobe.
29 to 16	-	0h	RW	Reserved bits. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	TMPOUT[15:0]	0h	RW	Hardware adjustment 3 When using the delay tuning mechanism, set the following values. When TAPNUM = 8, set 0000h to these bits. When operating with other than SDR104 / HS200, this register adjusts the clock delay of the Flip Flop that latches the received data from the outside of the chip. For this LSI, set 0000h when transferring at 3.3V, and set 0001h when transferring at 1.8 V.

6.2.7.2.9 Hardware adjustment register 2 (SDm_SCC_HWADJ2)

Access Size : 32/64 bits

Address : <SDm_base> + 1040h

Initial Value : 0000_0000_0000_01FFh

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
31 to 16	-	0h	RW	Reserved bits The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	HWADJ2[15:0]	1FFh	RW	Hardware Adjustment. For 1.8V operation, specify 00FFh. For 3.3V operation, specify 3FFFh.

6.2.7.2.10 Hardware adjustment register 3 (SDm_SCC_HWADJ3)

Access Size : 32/64 bits

Address : <SDm_base> + 1050h

Initial Value : 0000_0000_0000_0000h

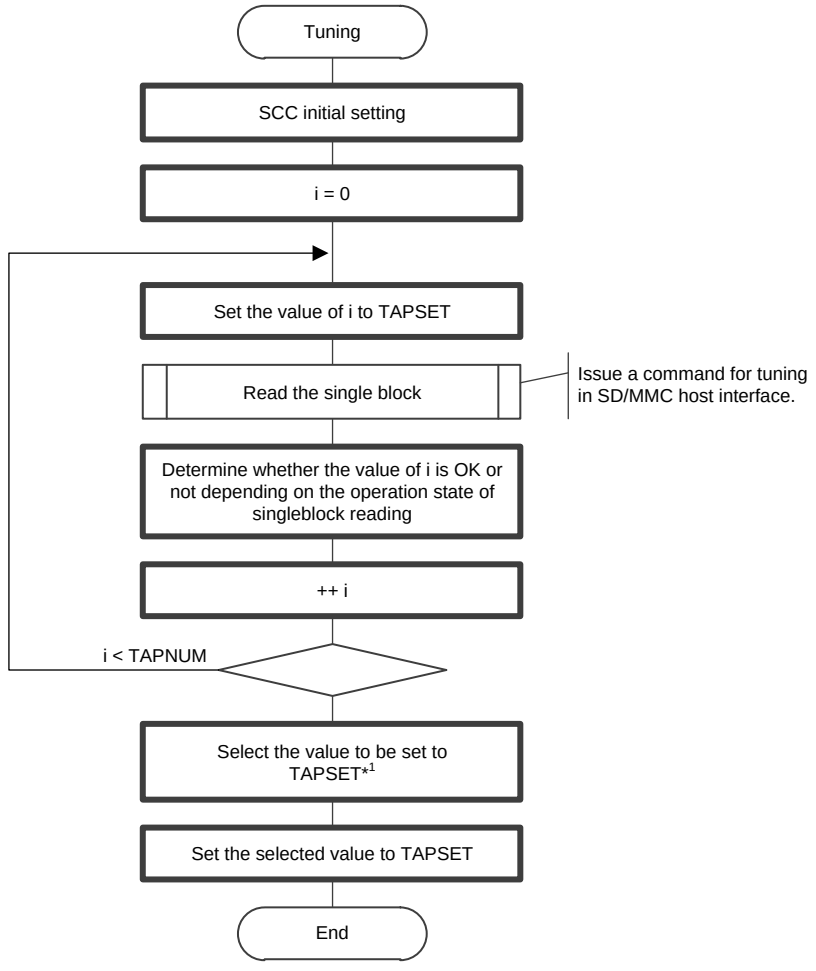
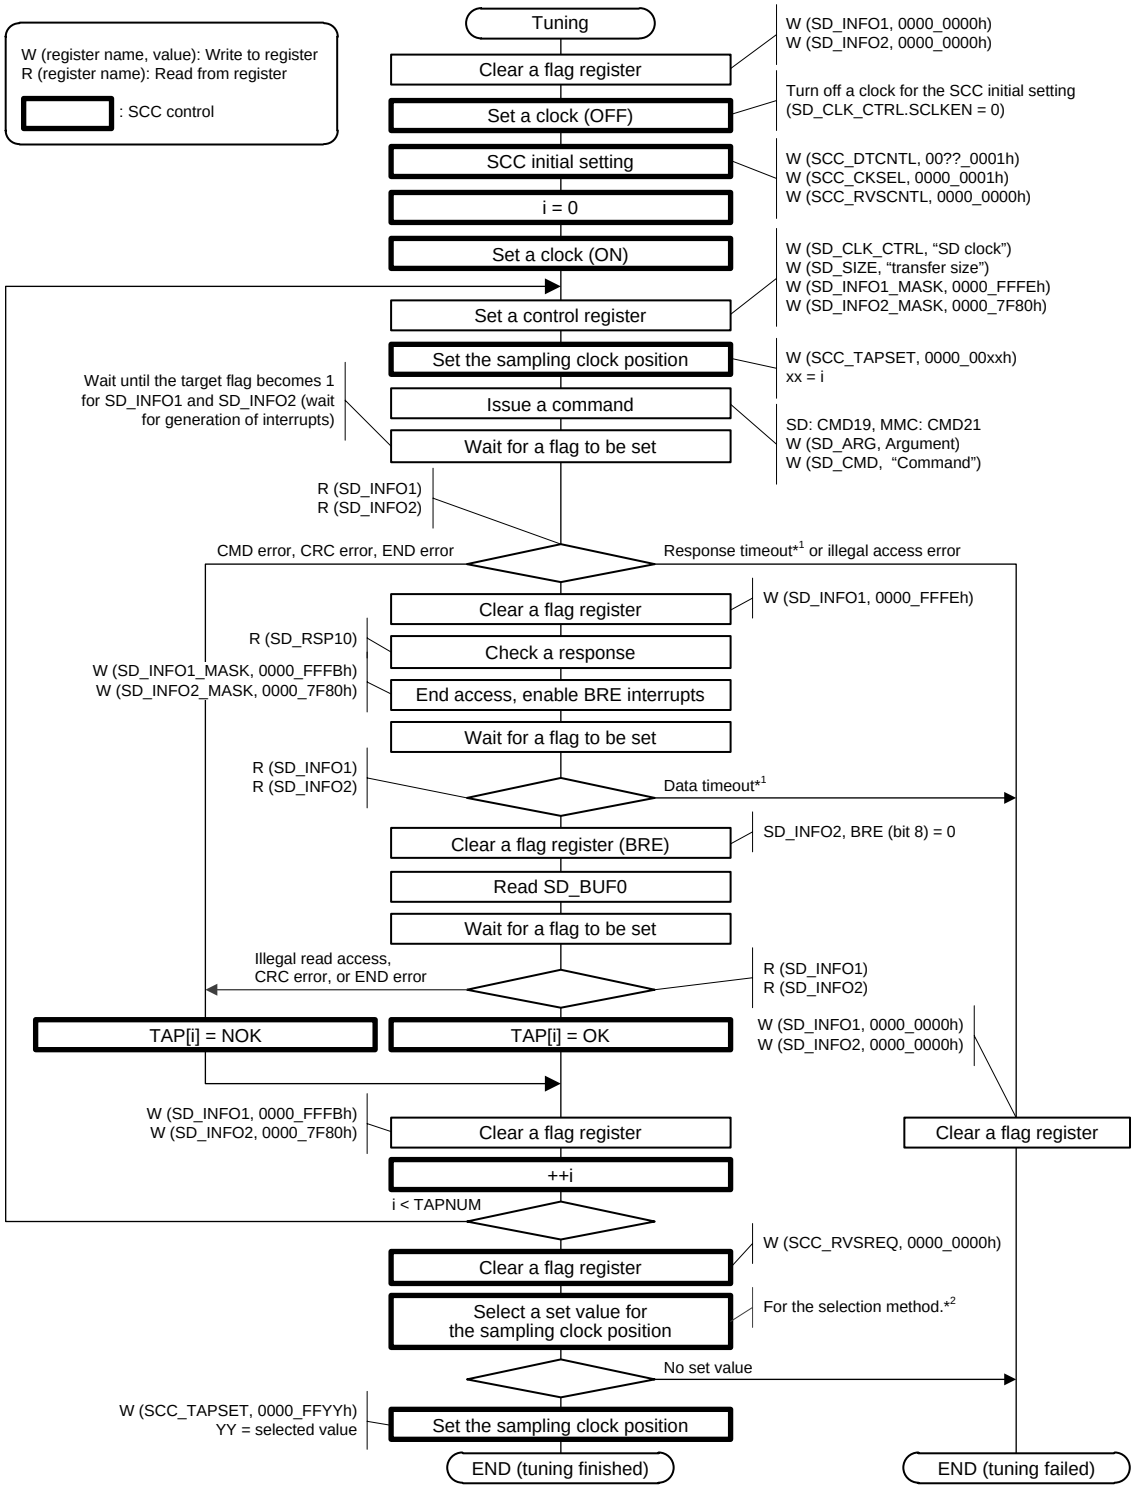
15 to 0	HWADJ4[15:0]	99h	RW	Hardware Adjustment Specify 0000h to this register.



6.2.8 Usage Example of SCC

6.2.8.1 Tuning

SCC is tuned by using operation of single-block reading.



As shown in **Figure 6.2-33**, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.

Figure 6.2-34 and **Table 6.2-10** show the detailed tuning flow and how to select the sampling clock position (example when TAPNUM = 8).

Note 1. See the example shown in **Table 6.2-10**.

Figure 6.2-33 Example of Tuning Flow (Outline)

Note 1. When all of TAP[i] are "NOK".

Note 2. See **Table 6.2-10**.

Figure 6.2-34 Example of Tuning Flow (Detailed)

Table 6.2-10 Example of How to Select the Sampling Clock Position (when TAPNUM = 8)

Item	i	Case 1	Case 2	Case 3	Case 4	Case 5*1
TAP[i]	0	NOK	OK	NOK	OK	OK
	1	OK	OK	NOK	NOK	OK
	2	OK	NOK	OK	NOK	OK
	3	OK(←)	NOK	OK	NOK	OK
	4	OK	NOK	NOK	NOK	OK
	5	OK	OK	NOK	OK	OK
	6	NOK	OK	NOK	OK(←)	OK
Max. value→	7	NOK	OK(←)	NOK	OK	OK
	(0)	NOK	OK	NOK	OK	OK
	(1)	OK	OK	NOK	NOK	OK
	(2)	OK	NOK	OK	NOK	OK
	(3)	OK	NOK	OK	NOK	OK
	(4)	OK	NOK	NOK	NOK	OK
	(5)	OK	OK	NOK	OK	OK
	(6)	NOK	OK	NOK	OK	OK
	(7)	NOK	OK	NOK	OK	OK
Selected value		i = 3	i = 7	Fail	i = 6 or 7	i = 0 to 7

Remarks: (←): Example of selection, (x): repeated display of index x of TAP[x]

(a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.

(b) The sampling clock position is repeated from 0 after the maximum value (TAPNUM-1). In case 2 above, that position is continued in the order of 5 → 6 → 7 → 0 → 1.

Note 1. If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data. Change point of the data can be found in the value of SCC_SMPCMP register. Usage example is **6.2.8.3 Change point of the input data**.

6.2.8.2 Sampling Clock Position Correction after Tuning

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

6.2.8.2.1 Manual correction of the sampling clock position

Figure 6.2-35 shows the flow of manual correction of the sampling clock position. **Table 6.2-11** shows set values determined when correction is required (when TAPNUM = 8).

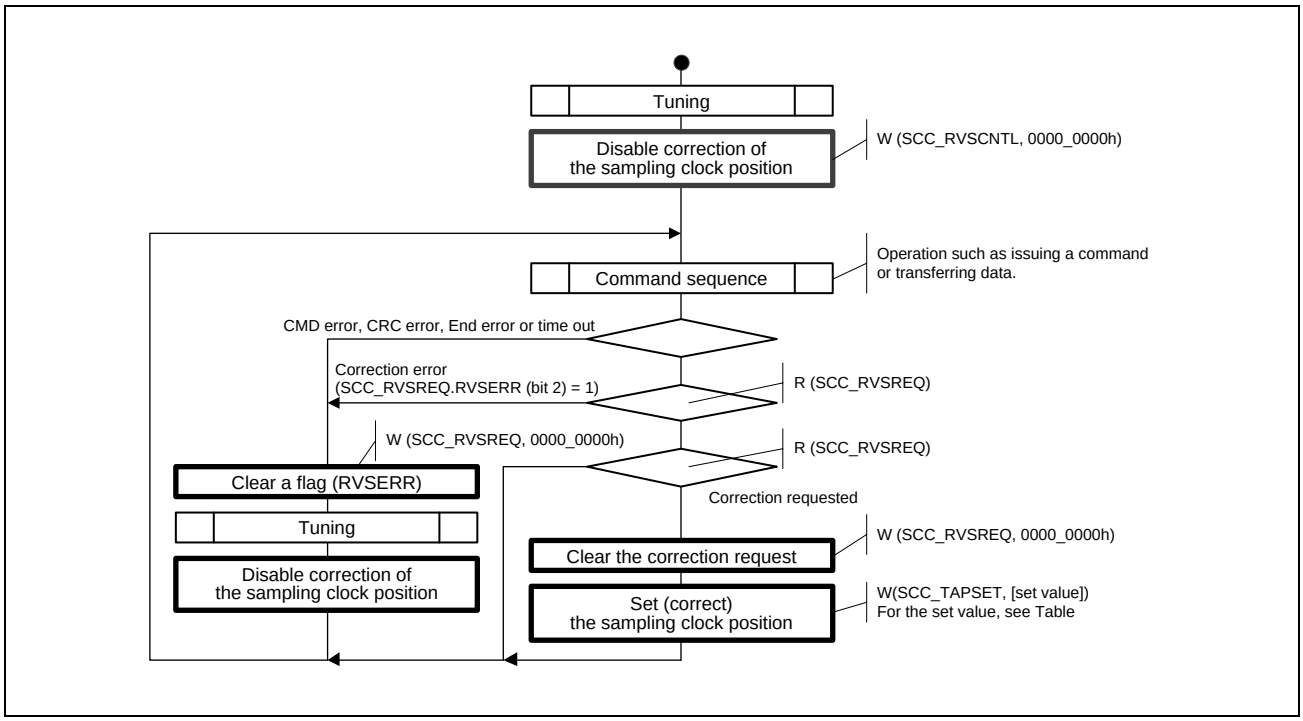


Figure 6.2-35 Flow of Manual Correction of the Sampling Clock Position (Example)

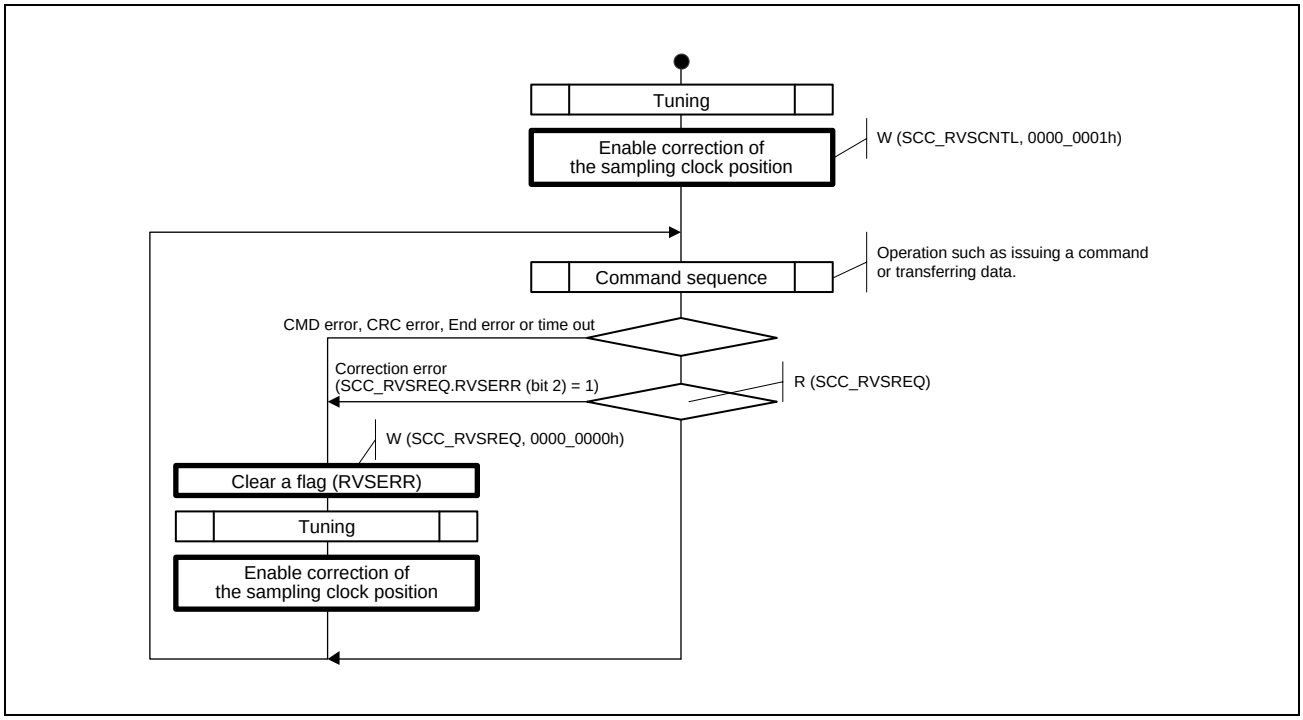
Table 6.2-11 Set Values for TAPSET when Correction is Required (when TAPNUM = 8)

No.	Current value of TAPSET	Value set to TAPSET when REQTAPUP = 1	Value set to TAPSET when REQTAPDWN = 1
1	0	1	7
2	1	2	0
3	2	3	1
4	3	4	2
5	4	5	3
6	5	6	4
7	6	7	5
8	7	0	6

Note: As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

6.2.8.2.2 Automatic correction of the sampling clock position

Figure 6.2-36 shows the flow of automatic correction of the sampling clock position.



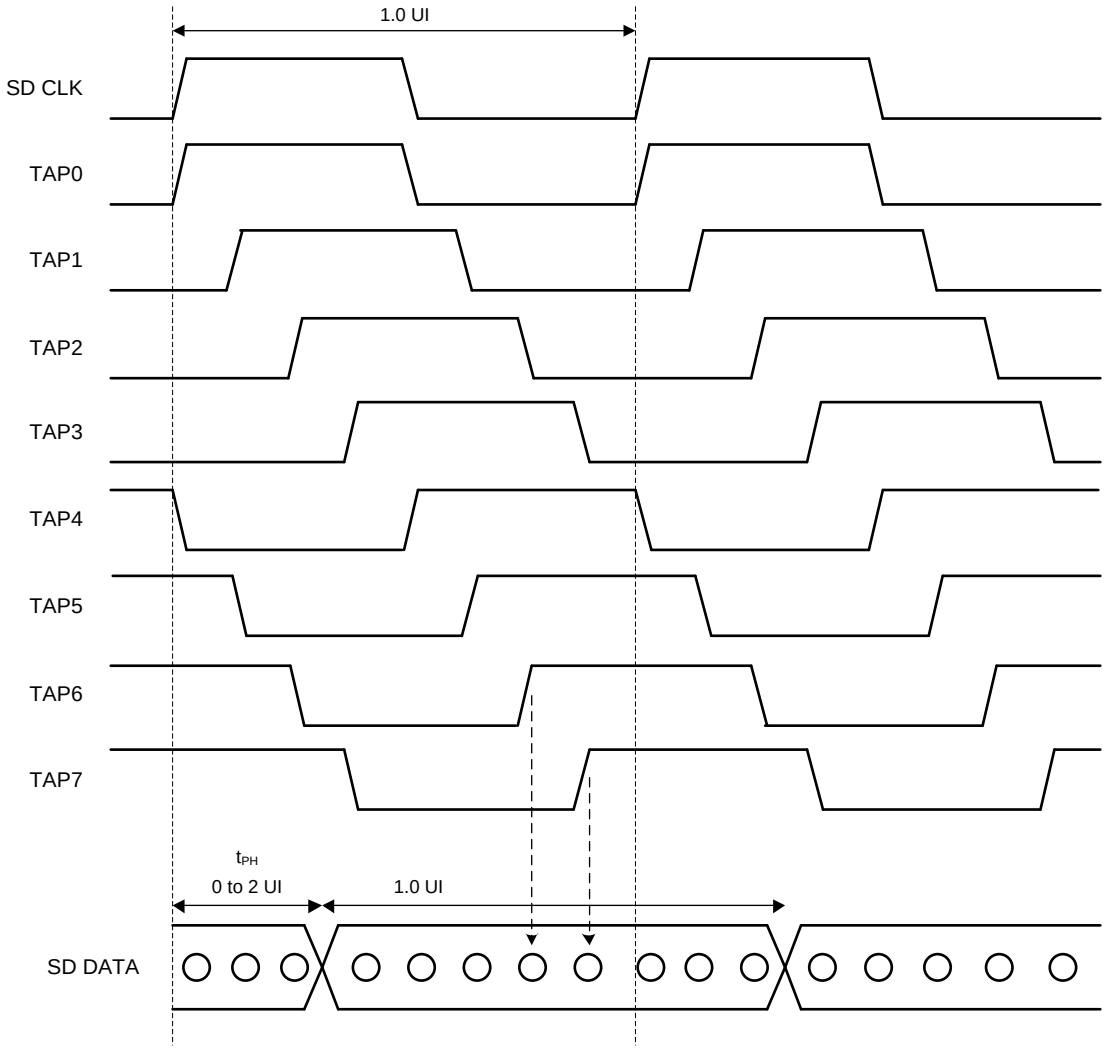


Figure 6.2-36 Flow of Automatic Correction of the Sampling Clock Position (Example)

6.2.8.3 Change point of the input data

Tuning is capture the data by the TAP clock selected. However, also captures the data by the previous TAP clock and the subsequent TAP clock at the same time. This result is reflected in the sampling data comparison register (SCC_SMPCMP). Point of mismatch before and after the selected TAP clock is the changing point of the data. In this example, it is desirable to set the TAP clock as TAP6 or TAP7.

Note: After recognizing the changing point of the input data, need to set the TAP clock.

Figure 6.2-37 Example: All Taps are OK

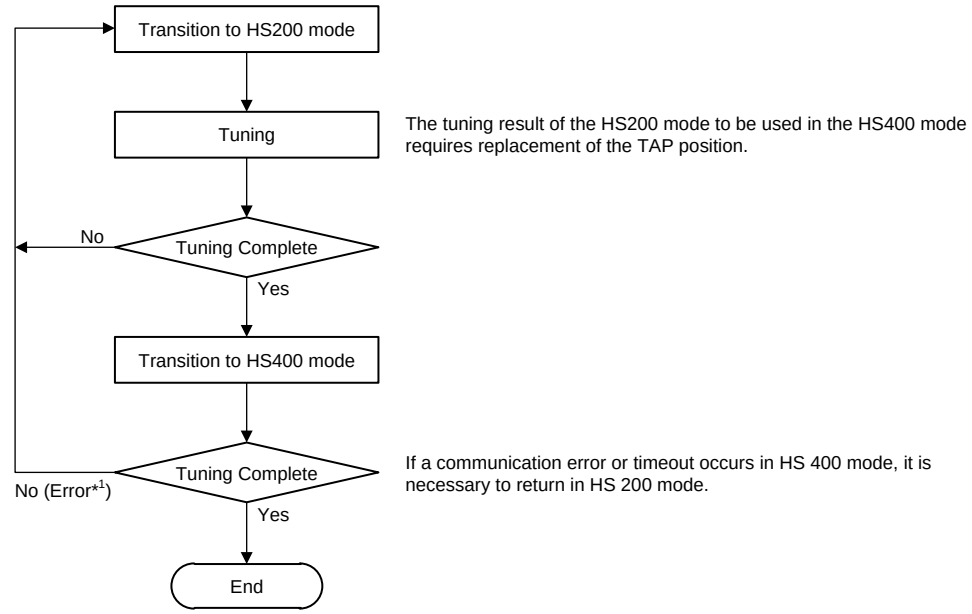

Figure 6.2-37 shows the change point of data between TAP2 and TAP3. Change point of the data can be confirmed by sampling data comparison register (SCC_SMPCMP). For the tuning of TAP2 or TAP3, the CMPNGU bit of sampling data comparison register indicates a mismatch. As the width of the input data is 1 (UI), select TAP6 or TAP7 which is the median of next TAP3 from TAP3.

6.2.8.4 MMC CMD tuning of the HS400 mode

6.2.8.4.1 CMD terminal tuning flow in the HS400 mode

When SDIP is used as HS400 mode (eMMC 5.0), it is necessary to perform CMD terminal tuning.

The CMD terminal tuning flow in the HS400 mode is shown. This will change after tuning in the HS200 mode to HS400 mode.

Note 1. Error: Communications error or timeout

Figure 6.2-38 HS400 Mode Transition Flow

The relationship between settings and eMMC mode is shown in the following table.

Table 6.2-12 Relationship between Settings and eMMC Mode

HS400EN	HS400ENHSTRB	TAPEN	Supported	eMMC Mode
0	0	0	○	HS-SDR/DDR
0	0	1	○	HS200
0	1	0	N/A	—
0	1	1	N/A	—
1	0	0	○*1	HS400
1	0	1	○*2	HS400
1	1	0	○	HS400 (Enhanced Strobe)
1	1	1	N/A	—

Note 1. If CRC error occurs, the tuning procedure need to be executed.

Note 2. In this condition, it is necessary to stop sampling clock and clock position correction of DAT lines

SECTION 6 HIGH-SPEED INTERFACE

6.3 Gigabit Ethernet Interface (GBETH)

This section describes the GBETH functions of this LSI.

This manual is a simplified version. For more information, refer to the Hardware Manual Additional Document.

6.3.1 Overview

6.3.1.1 Features

The LSI includes an Ethernet MAC that:

- Is compliant with the following standards:
  - IEEE 802.3-2008 for Ethernet MAC, Reduced Gigabit Media Independent Interface (RGMII), and Reduced Media Independent Interface (RMII)
  - IEEE 1588-2008 v2 standard for precision networked clock synchronization, IEEE 1588-2008 v2 is compliant with Power IEEE-C37.238 profile
  - IEEE 802.3-az, version D2.0 for Energy Efficient Ethernet (EEE).
  - IEEE 802.1Qav-2009, IEEE 802.1Qat-2009, IEEE 802.1AS-2011
- Supports 10/100/1000 Mbps data transfer rates
- Supports both half-duplex and full-duplex operation
- Has programmable frame length to support both standard and jumbo ethernet frames of size up to 16 KB (16 KB - 1):
  - Jumbo mode support in cut-through mode only (not implemented in store and forward due to TX and RX FIFO size).
- Contains 32 MAC address registers for the address filter block
- Supports variety of flexible addresses filtering modes:
  - Perfect (DA) address filters with masks for each byte
  - SA address comparison check with masks for each byte
  - 256-bit Hash filter for multicast and unicast (DA) addresses
  - Option to pass all multicast addressed frames
  - Promiscuous mode support to pass all frames without any filtering for network monitoring
  - Passes all incoming packets (as per filter) with a status report.
  - VLAN Filtering
  - L3 and L4 Filtering
- Supports native DMA with simple independent channels transmit and receive engines:
  - 4 RX channels of 8 KB FIFO size for receive channel
  - 4 TX channels of 8 KB FIFO size for transmit channel

- DMA implements dual buffer (ring) or linked list (chained) descriptor chaining.

- Supports advanced IEEE 1588-2002 & 2008 ethernet frame time stamping:
  - IEEE1588 time base information, with reference clock of 50 MHz
  - IEEE1588 external snapshot.
  - PTP Timestamp offload function
  - One-step timestamp
- Supports IEEE 802.1Qbv-2015, 802 1Qbu-2016, and 802.1.AS-Rev D5.0 for Time-Sensitive Networking (TSN) traffic
- Supports programmable CRC generation and checking
- TCP/IP offload / ARP offload features
- Supports RMON statistics (L2 layer only)
- Supports Station Management Block and MDIO interface
- Is Ethernet Energy Efficiency compliant with IEEE 802.3az-2010:
  - Supports wakeup on LAN on magic packet and packet filtering
  - Supports energy efficiency feature (LPI mode)
  - Wakeup capability.
- Has interface for:
  - RGMII and RMII (GMII and MII are not supported.)

6.3.1.2 Block Diagram

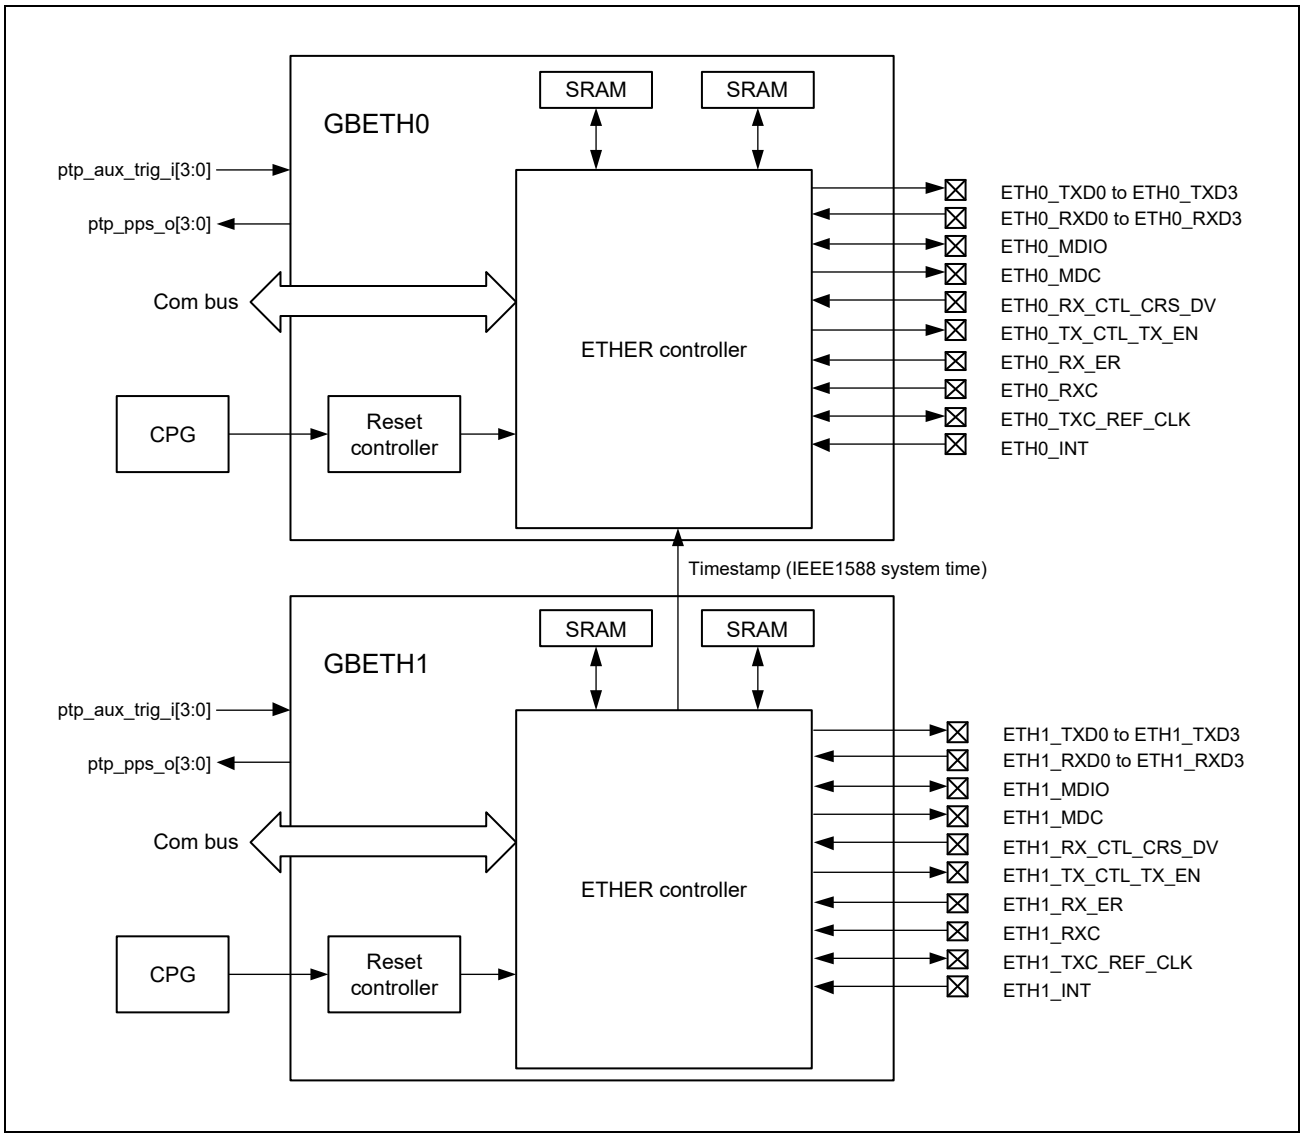

Figure 6.3-1 Block Diagram of the Ethernet Interface

6.3.1.3 External Pins

Table 6.3-1 Input/Output Pins of the GBETHm (m = 0, 1)

Pin Name	Input/ Output	Mode	Function Name	Input/ Output	Description
ETHm_TXC_REF_CLK	I/O	RGMII	TXC	Output	TX clock
		RMII	REF_CLK	I/O	Reference clock
ETHm_RXC	Input	RGMII	RXC	Input	RX clock
		RMII	Unused	—	—
ETHm_RX_CTL_CRS_DV	Input	RGMII	RX_CTL	Input	RX data valid and RX error
		RMII	CRS_DV	Input	Carrier sense and RX data valid
ETHm_TX_CTL_TX_EN	Output	RGMII	TX_CTL	Output	TX enable and TX error
		RMII	TX_EN	Output	TX enable
ETHm_TXD0	Output	RGMII/RMII	TXD0	Output	TX data 0
ETHm_TXD1	Output	RGMII/RMII	TXD1	Output	TX data 1
ETHm_TXD2	Output	RGMII	TXD2	Output	TX data 2
		RMII	Unused	—	—
ETHm_TXD3	Output	RGMII	TXD3	Output	TX data 3
		RMII	Unused	—	—
ETHm_RXD0	Input	RGMII/RMII	RXD0	Input	RX data 0
ETHm_RXD1	Input	RGMII/RMII	RXD0	Input	RX data 1
ETHm_RXD2	Input	RGMII	RXD2	Input	RX data 2
		RMII	Unused	—	—
ETHm_RXD3	Input	RGMII	RXD3	Input	RX data 3
		RMII	Unused	—	—
ETHm_MDIO	I/O	RGMII/RMII	MDIO	I/O	Management data I/O
ETHm_MDC	Output	RGMII/RMII	MDC	Output	Management data clock output
ETHm_INT	Input	RGMII/RMII	INT	Input	PHY interrupt signal

SECTION 6 HIGH-SPEED INTERFACE

6.5 USB2.0

This LSI includes 2 channels USB2.0 OTG/DRD (Host/Function) interface.

This section describes the overview of USB2.0 and USB2.0 PHY control.

The detail function of USB2.0 Host controller and the common function both Host module and Function module are described in **6.5A USB 2.0 Host Module**.

The detail function of USB2.0 Function controller is described in **6.5B USB 2.0 Function Module**.

6.5.1 Features

This interface complies the following specifications.

- Universal Serial Bus Specification Revision 2.0
- On-The-Go and Embedded Host Supplement to the USB Revision 2.0 Specification Revision 2.0 plus errata and ecn*1
- Enhanced Host Controller Interface (EHCI) Specification for Universal Serial Bus Revision 1.0
- EHCI v1.1 Addendum*2
- Open Host Controller Interface (OHCI) Specification for USB Release 1.0a
- Battery Charging Specification Revision 1.2*3

Note 1. Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) are not supported.
Note 2. Some EHCI v1.1 feature are not supported. (Refer to **6.5A USB 2.0 Host Module** for detail)
Note 3. DCP (Dedicated Charging Port) is not supported as downstream port.

6.5.1.1 Ch0: USB2.0 OTG/DRD (Host/Function) Interface

The following table shows features of this interface.

Table 6.5-1 Ch0: USB2.0 OTG/DRD (Host/Function) Interface Features

Function	Description
Host mode	• Support mode: High-Speed (480 Mbps)/Full-Speed (12 Mbps)/Low-Speed (1.5 Mbps) • Support Isochronous/Interrupt/Control/Bulk transfer modes • Support Isochroous/Interrupt high bandwidth transfer
Function mode	• Support mode: High-Speed (480 Mbps)/Full-Speed (12 Mbps) • Isochronous/Interrupt/Control/Bulk transfer • Up to 10 ch PIPE (includes default control PIPE)
Other functions	• OTG function (Rev2.0) • Battery Charging function • DRD (Dual-Role-Device) function (Static switch between Host and Function)

6.5.1.2 Ch1: USB2.0 OTG/DRD (Host/Function) Interface

The following table shows features of this interface.

Table 6.5-2 Ch1: USB2.0 OTG/DRD (Host/Function) Interface Features

Features	Description
Host mode	• Support mode: High-Speed (480 Mbps)/Full-Speed (12 Mbps)/Low-Speed (1.5 Mbps) • Support Isochronous/Interrupt/Control/Bulk transfer modes • Support Isochroous/Interrupt high bandwidth transfer
Function mode	• Support mode: High-Speed (480 Mbps)/Full-Speed (12 Mbps) • Isochronous/Interrupt/Control/Bulk transfer • Up to 10 ch PIPE (includes default control PIPE)
Other function	• OTG function (Rev2.0) • Battery Charging function • DRD (Dual-Role-Device) function (Static switch between Host and Function)

6.5.1.3 Block Diagram

The block diagram of USB interface is as follows.

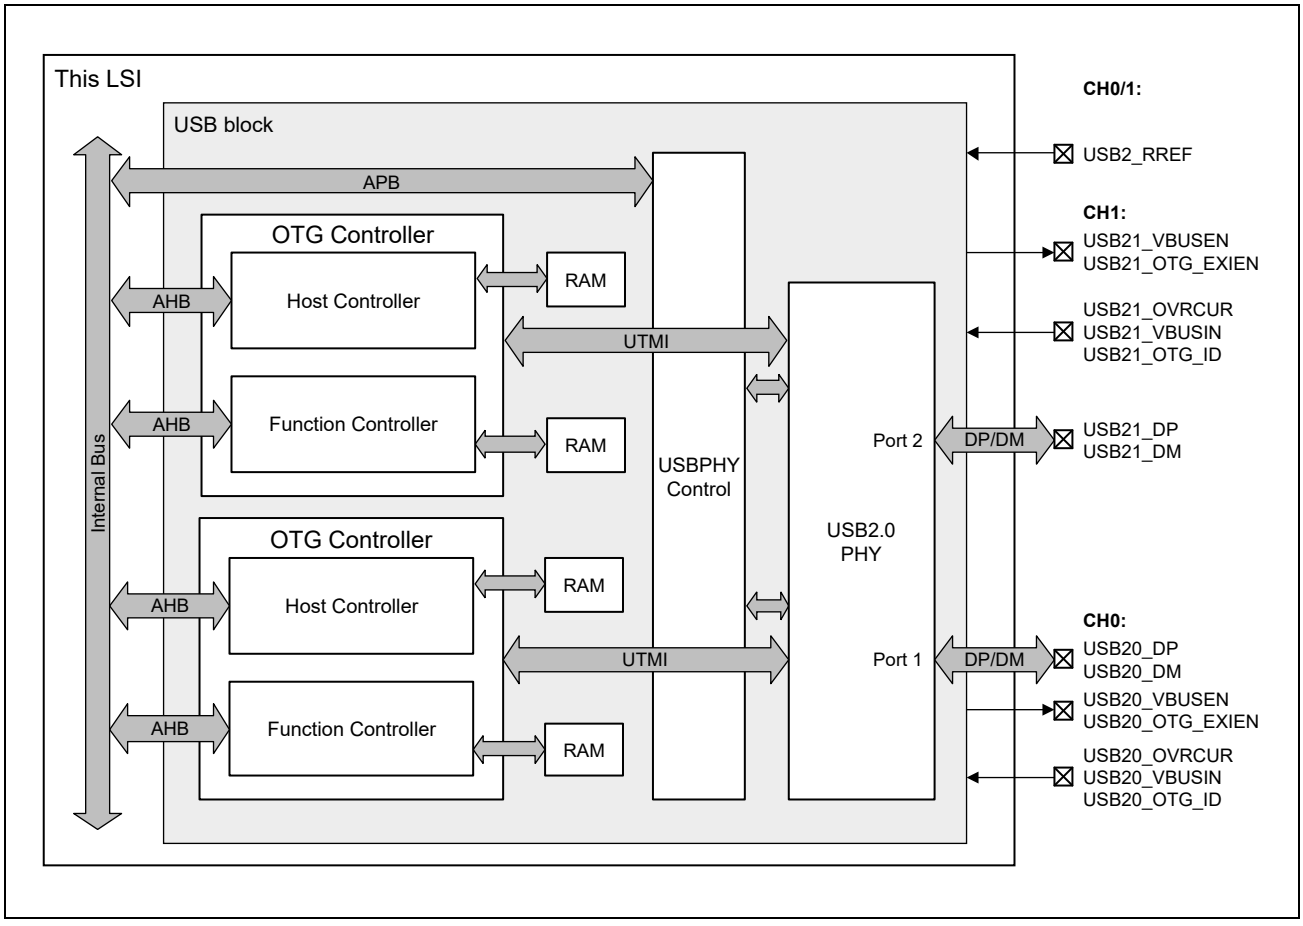

Figure 6.5-1 USB Interface Block Diagram

6.5.1.4 External Signal Pins

The following table shows external signal pins for USB block.

Table 6.5-3 External Signal Pins

Pin Name	Input/ Output	Functional Description	Active Level	Initial Value
USB20_DP	I/O	USB data pin Data+ (Ch0)	—	—
USB20_DM	I/O	USB data pin Data− (Ch0)	—	—
USB20_OVRCUR	Input	Over current detection input (Ch0)	L	—
USB20_VBUSEN	Output	VBUS output enable (Ch0)	H	0b
USB20_VBUSIN	Input	Peripheral VBUS input (Ch0)	H	—
USB20_OTG_EXICEN	Output	External power IC control (Ch0)	H	0b
USB20_OTG_ID	Input	OTG ID input (Ch0) When using OTG function, this pin should be pulled up.	—	—
USB21_DP	I/O	USB data pin Data+ (Ch1)	—	—
USB21_DM	I/O	USB data pin Data- (Ch1)	—	—
USB21_OVRCUR	Input	Over current detection input (Ch1)	L	—
USB21_VBUSEN	Output	VBUS output enable (Ch1)	H	0b
USB21_VBUSIN	Input	Peripheral VBUS input (Ch1)	H	—
USB21_OTG_EXICEN	Output	External power IC control (Ch1)	H	0b
USB21_OTG_ID	Input	OTG ID input (Ch1) When using OTG function, this pin should be pulled up.	—	—

6.5.1.5 Power and GND Pins

The following table shows Power and GND pins for USB block.

Table 6.5-4 Power and GND pins

Name	Functional Description
VDD18_USB2	Core supply power
VAA18_USB2	Internal Regulator Power (1.8 V), HS receiver power (1.8 V)
VAA33_USB2	IO power (3.3 V)
USB_RREF	Reference voltage
AVSS_USB2	GND

6.5.1.6 Interrupt

The following table shows interrupt list for USB block.

Table 6.5-5 USB Interrupt

Name	Description	Active Level	Type
U2H0_INT	USB2.0 Host AHB Interrupt (Ch0)	H	Level-Sensitive
U2H0_OHCI_INT	USB2.0 Host OHCI Interrupt (Ch0)	H	Level-Sensitive
U2H0_EHCI_INT	USB2.0 Host EHCI Interrupt (Ch0)	H	Level-Sensitive
U2H0_WAKEON_INT	USB2.0 Host EHCI Wakeup Interrupt (Ch0)	H	Level-Sensitive
U2H0_OBINT	USB2.0 Host OTG and Battery Charging Interrupt (Ch0)	H	Level-Sensitive
U2H1_INT	USB2.0 Host AHB Interrupt (Ch1)	H	Level-Sensitive
U2H1_OHCI_INT	USB2.0 Host OHCI Interrupt (Ch1)	H	Level-Sensitive
U2H1_EHCI_INT	USB2.0 Host EHCI Interrupt (Ch1)	H	Level-Sensitive
U2H1_WAKEON_INT	USB2.0 Host EHCI Wakeup Interrupt (Ch1)	H	Level-Sensitive
U2H1_OBINT	USB2.0 Host OTG and Battery Charging Interrupt (Ch1)	H	Level-Sensitive
U2P0_IXL_INT	USB2.0 Function controller Interrupt (Ch0)	H	Edge-Triggered
U2P0_INT_DMA[1:0]	USB2.0 Function controller DMA transaction complete interrupt (Ch0)	H	Level-Sensitive
U2P0_INT_DMAERR	USB2.0 Function controller DMA error response interrupt (Ch0)	H	Level-Sensitive
U2P1_IXL_INT	USB2.0 Function controller Interrupt (Ch1)	H	Edge-Triggered
U2P1_INT_DMA[1:0]	USB2.0 Function controller DMA transaction complete interrupt (Ch1)	H	Level-Sensitive
U2P1_INT_DMAERR	USB2.0 Function controller DMA error response interrupt (Ch1)	H	Level-Sensitive

6.5.2 Register Configuration

6.5.2.1 Host Controller Register

Refer to **6.5A USB 2.0 Host Module**.

6.5.2.2 Function Controller Register

Refer to **6.5B USB 2.0 Function Module**.

6.5.2.3 USBPHY Control Register

USBPHY Control Register mainly controls reset and power down of the USB/PHY.

Base Address: H'0_11E0_0000 (Cortex-A55 Address Space)
Base Address: H'41E0_0000 (Cortex-M33 Address Space Secure)
Base Address: H'51E0_0000 (Cortex-M33 Address Space Non-Secure)

The following table shows USBPHY Control Register list.

Prohibit to write undefined area.

Table 6.5-6 USBPHY Control Register List

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Reset register	RESET	R/W	H'0000_0133	H'000	32
Clock control register	UCLKCTL	R/W	H'0340_0303	H'018	32
Direct power down setting register	UDIRPD	R/W	H'0000_0000	H'01C	32
Connection control register	CON_CTRL	R/W	H'0000_0000	H'020	32
VBUSEN control register	VBENCTL	R/W	H'0000_0000	H'03C	32
Clock status register	CLK_STAT	R	H'0000_0000	H'104	32

6.5.3 Register Descriptions

6.5.3.1 Reset Register (RESET)

This register controls USB/PHY reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	sel_pll reset	—	—	—	pllreset	—	—	sel_p2 reset	sel_p1 reset	—	—	phyrst_2	phyrst_1
Initial Value	0	0	0	0	0	0	0	1	0	0	1	1	0	0	1	1
R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	sel_pllreset	0	R/W	Select USB/PHY PLL reset 1: Register (by bit8: pllreset) 0: Control by host controller (Ch0)
11 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	pllreset	1	R/W	PLL reset 1: PLL reset 0: Deassert PLL reset
7, 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	sel_p2reset	1	R/W	Select USB/PHY Port2 reset 1: Register (phyrst_2) 0: Control by host controller (Ch1)
4	sel_p1reset	1	R/W	Select USB/PHY Port1 reset 1: Register (phyrst_1) 0: Control by host controller (Ch0)
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	phyrst_2	1	R/W	USB/PHY reset (Port2) 1: USB/PHY reset 0: Deassert USB/PHY reset Only when sel_p2reset=1, this bit is valid.
0	phyrst_1	1	R/W	USB/PHY reset (Port1) 1: USB/PHY reset 0: Deassert USB/PHY reset Only when sel_p1reset = 1, this bit is valid.

6.5.3.2 Clock Control Register (UCLKCTL)

This register controls USB/PHY clock.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	sel_sleepm	—	—	sleepm_2	sleepm_1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	1	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	sel_suspendm	—	—	suspendm_2	suspendm_1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1	1
R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	sel_sleepm	0	R/W	Select SLEEPM control 1: Register (controlled by bit 24: sleepm_1 and bit 25: sleepm_2) 0: Control by controller
27, 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	sleepm_2	1	R/W	Sleep control (Port2) 1: Normal mode 0: Sleep mode
24	sleepm_1	1	R/W	Sleep control (Port1) 1: Normal mode 0: Sleep mode
23	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	—	1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21, 20	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19, 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17, 16	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15, 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	sel_suspendm	0	R/W	Select SUSPENDM control 1: Register (controlled by bit 8: suspendm_1 and bit 9: suspendm_2) 0: Control by controller In case of USB2 is used as a function mode, specify this bit to 1.

Bit	Bit Name	Initial Value	R/W	Description
11, 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	suspend_2	1	R/W	Suspend control (Port2) 0: Suspend mode 1: Normal mode
8	suspend_1	1	R/W	Suspend control (Port1) 0: Suspend mode 1: Normal mode
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	—	All 1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.5.3.3 Direct Power Down Setting Register (UDIRPD)

This register controls USB/PHY direct power down.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	sel_udirpd	—	—	—	dirpd
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	sel_udirpd	0	R/W	Select dirpd control 1: Register (dirpd) 0: Control by host controller (Ch0)
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	dirpd	0	R/W	Power down control to reduce the power consumption of the USB/PHY when not using the USB function. 0: Normal operation 1: Power save

6.5.3.4 Connection Control Register (CON_CTRL)

This register controls USB/PHY connection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	sel_connect	—	—	connect_2	connect_1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	sel_connect	0	R/W	Select USB connection notification control 1: Register (controlled by bit0: connect_1 and bit1: connect_2) 0: Control by host controller
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	connect_2	0	R/W	Notice of USB connection (port2) Used to notify UTM + core of USB connection status 0: USB not connected (single end receiver disabled) 1: USB not connected (single end receiver enabled)
0	connect_1	0	R/W	Notice of USB connection (port1) Used to notify UTM + core of USB connection status 0: USB not connected (single end receiver disabled) 1: USB not connected (single end receiver enabled)

6.5.3.5 VBUSEN Control Register (VBENCTL)

This register controls VBUSEN connection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	vbus_sel_1	vbus_sel_0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	vbus_sel_1	0	R/W	Select VBUSEN (ch1) control 0: Port Power bit of the EHCI/OHCI Operational register. 1: VBOUT bit of the VBUS Control register.
0	vbus_sel_0	0	R/W	Select VBUSEN (ch0) control 0: Port Power bit of the EHCI/OHCI Operational register. 1: VBOUT bit of the VBUS Control register.

6.5.3.6 Clock Status Register (CLK_STAT)

This register shows USB/PHY clock status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	frclk60 lock	frclk48 lock	phy lock	—	—	plllock_ 2	plllock_ 1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	frclk60_lock	0	R	FRCLK60 LOCK status 0: UNLOCK 1: LOCK
5	frclk48_lock	0	R	FRCLK48 LOCK status 0: UNLOCK 1: LOCK
4	phylock	0	R	PHY PLL LOCK Status (Transceiver) 0: UNLOCK 1: LOCK
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	plllock_2	0	R	PLL LOCK status (port2) 0: UNLOCK 1: LOCK
0	plllock_1	0	R	PLL LOCK status (port1) 0: UNLOCK 1: LOCK

6.5.4 Operation

6.5.4.1 USB/PHY Initialization

In the initial state, the reset of USB/PHY Port1 and Port2 is controlled by the register in the USBPHY Control Register, and the reset is asserted, so the control is switched to controller by the following initialization.

Also, in the initial state, the USB/PHY PLL Reset is controlled by the Host Controller in the OTG Controller, but it needs to be switched to controlled by the USBPHY Control Register.

- **Initialization when starting only Port1 of USB/PHY (when Port2 is not used)**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1022 to release the reset.
  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released. Port1 of USB/PHY is controlled by Host Controller, and Port2 is reset by USBPHY Control Register.)

- **Initialization when starting only Port2 of USB/PHY (when Port1 is not used)**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1011 to release the reset.
  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released. USB/PHY Port1 is reset by USBPHY Control Register, and port2 is controlled by Host Controller.)

- **Initialization when starting both Port1 and Port2 of USB/PHY**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1000 to release the reset.
  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released. USB/PHY Port1 is controlled by the Host Controller, and Port2 is controlled by the Host Controller.)

The common setting sequence both Host mode and Function mode including USB/PHY initialization is described in **6.5A.9.1 Host/Peripheral Common Setting Sequence**.

6.5.4.2 Handling of Permanently Unused Pin

Take the following measures when USB interface is not used permanently.

6.5.4.2.1 USB/PHY Related Pins

(1) When both Port1 and Port2 are unused

Take the following measures for the USB pins and power supply.

- Connect the USB0_DP/DM and USB1_DP/DM to GND via a resistor of 10kΩ.
- Set the RREF to Open.
- Connect USB_VDD18 to a 1.8 V power supply. However, there is no need to separate the digital and analog power supplies.
- Connect USB_VDD33 to GND.
- Connect VSS to GND.

Also, perform the following control with software.

- Set the direct power down (via UDIRPD register). See **6.5.4.3 Direct Power Down (DIRPD)** for more information.

(2) When either Port1 or Port2 is unused

Supply all power.

Since USB_VDD18/USB_VDD33 are common to 2 Port PHY, it is necessary to supply power even when one of the ports is not in use.

Make the following settings for unused port.

- Apply Port reset
  - Apply reset to unused USB/PHY port by controlling the Reset register (RESET).
  - Set sel_p1reset = 1 and phyrst_1 = 1 when USB/PHY Port1 is unused.
  - Set sel_p2reset = 1 and phyrst_2 = 1 when USB/PHY Port2 is unused.
- Power down setting
  - Set power down setting to unused USB/PHY port by controlling the Clock control register (UCLKCTL).
  - Set sel_suspendm=1 and suspendm_1 = 0 when USB/PHY Port1 is unused.
  - Set sel_suspendm=1 and suspendm_2 = 0 when USB/PHY Port2 is unused.
- Single-ended receiver stop
  - Stop single-ended receiver of unused USB/PHY port by controlling the Connection control register (CON_CTRL).
  - Set sel_connect=1 and connect_1 = 0 when USB/PHY Port1 is unused.
  - Set sel_connect=1 and connect_2 = 0 when USB/PHY Port2 is unused.

6.5.4.2.2 Handling of USB Controller Related Pins

(1) When Host controller is unused

The USB0_VBUSEN pin leaves open and fix the USB0_OVRCUR pin to 1 when USB/PHY port1 is unused.

The USB1_VBUSEN pin leaves open and fix the USB1_OVRCUR pin to 1 when USB/PHY port2 is unused.

(2) Function controller is unused

Fix the USB0_VBUSIN pin to 0 when USB/PHY port1 is unused.

6.5.4.3 Direct Power Down (DIRPD)

By directly controlling the power down signal of the USB/PHY with the USBPHY Control register, the USB/PHY can be put into a low power state regardless of the state of the controller.

When set to the direct power down state, all USB/PHY functions including the PLL will be stopped. Direct power down can only be used when the USB/PHY is unused (means both ports are unused).

Follow the procedure below to switch to / return to the direct power down mode.

For details on the USBPHY Control Register reset register and direct power down setting register used in the procedure below, refer to **6.5.3.1 Reset Register (RESET)** and **6.5.3.3 Direct Power Down Setting Register (UDIRPD)**, respectively.

6.5.4.3.1 Enter to Direct Power Down Mode

Follow the steps below to switch to direct power down mode.

(1) USB operation stop

Stop the operation of USB.

(2) Assert the direct power down signal.

It is asserted by setting H'0000_0010 in the direct power-down setting register (UDIRPD) and then setting H'0000_0011.

There are no timing restrictions when transitioning to direct power down. Immediately after setting, it shifts to power down mode.

6.5.4.3.2 Resume from Direct power down mode

Follow the steps below to recover from the direct power down mode.

(1) Assert a USB/PHY PLL reset.

The PLL reset is asserted by setting 1 to sel_pllreset bit of the Reset register (RESET) and then setting 1 to pllreset bit.

The reset period should be 1us or more.

(2) De-assert direct power down signal

Negate the direct power down signal after continuing to assert the PLL reset for more than 1us. It is negated by setting H'0000_0010 in the direct power down setting register (UDIRPD) and then setting H'0000_0000.

After negating the direct power down signal, keep asserting the PLL reset for at least 1µs.

(3) De-assert USB/PHY PLL reset

After negating the direct power down signal, continue to assert the PLL reset for 1us or more, and then negate the PLL reset.

The PLL reset is negated by clearing the pllreset bit in the reset register (RESET) and then clearing the sel_pllreset.

The timing chart when returning from the direct putter down is shown below.

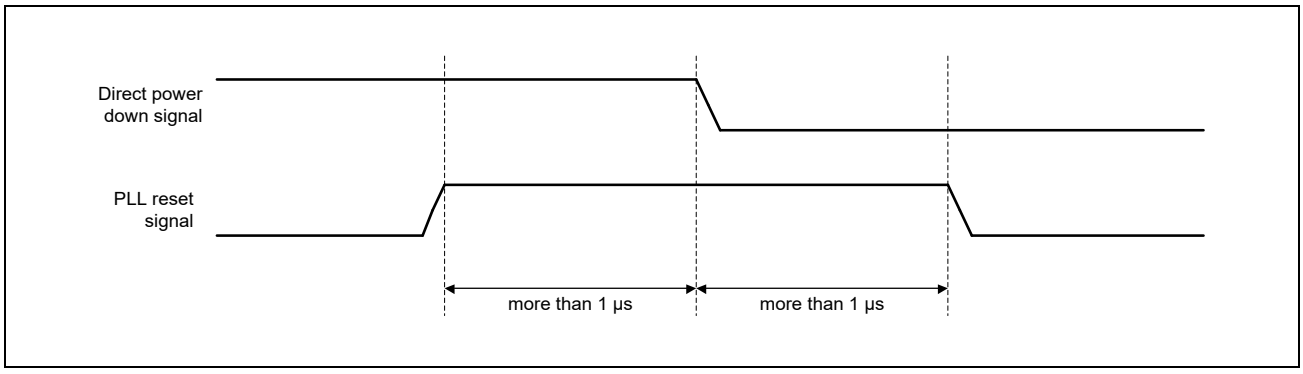

Figure 6.5-2 Resume from Direct Power Down Mode

6.5.5 Usage Notes

6.5.5.1 Precautions in Power Down Mode

When USB interface is unused, it can be set to power-down mode by register setting. For the setting, refer to **6.5.3.3 Direct Power Down Setting Register (UDIRPD)**.

The precautions for power down mode are as follows.

- Once enter to power down, do not access the interface.
- Move to the power-down state after the USB is in unused state. If USB interface moves power-down state while it is operating, current may continue to flow to the USB side and it may damage device.

SECTION 6 HIGH-SPEED INTERFACE

6.5A USB 2.0 Host Module

6.5A.1 Overview

6.5A.1.1 Overview

This LSI has two USB 2.0 host/function modules. For each module, you can switch between the host mode and the peripheral mode by specifying the UCOM register setting. This section describes the circuits that are common to both modes, and the host controller itself.

6.5A.1.2 Features

This module has the following features:

Function	Description
Host function	• Supporting high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfers • Compliant with Open Host Controller Interface (OHCI) Specification for USB Revision 1.0a • Compliant with Enhanced Host Controller Interface (EHCI) Specification for USB Revision 1.1*1
Other functions	• Battery charging (compliant with Battery Charging Specification Revision 1.2)*2 • Dual-role-device function (static switching between the USB host and USB peripheral functions)

Note 1. Some functions (specifications) are not supported.

Note 2. The setting for battery charging is handled by the host controller even if the function controller is selected.
This LSI does not support DCP (Dedicated Charging Port) as a Downstream Port.

6.5A.1.2.1 EHCI v1.1 functions

Conventional host controller modules comply with EHCI Specification Revision.1.0. Meanwhile, this module supports the additional functions listed below to comply with EHCI v1.1 Addendum.

Note, however, that this module supports only the functions marked with a circle "✓" in the table below.

Function Name	Support
Per-Port Change Events	✓
Shorter Periodic Frame List	✓
Hardware Prefetching	—
Link Power Management (LPM)	✓

Of the three features to support, the registers associated with "Per-Port Change Events" and "Shorter Periodic Frame List" are listed below. For more information on each register, refer to the appropriate register specification of the **6.5A.2 Register Descriptions**.

With regard to "Link Power Management (LPM)", it is described in **6.5A.1.2.2 Link Power Management (LPM) function**.

Table 6.5A-1 Per-Port Change Events

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: H'108)	bit 18	Per-Port Change Event Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H'120)	bit 15	Per-Port Change Events Enable	R/W	Per-Port event notification setting. Writing 1b to this bit enables the Per-Port event notification function.
USBSTS (offset: H'124)	bit 16	Port-1 Change Detect	R/W(1)	If a port-1 change event is detected, 1b is written to this bit.
USBINTR (offset: H'128)	bit 16	Port-1 Change Event Enable	R/W	Enable/Disable setting of the above "port-1 Change Detect" field. To reflect the port event on the above field for the port, set corresponding bit to 1b.

Table 6.5A-2 Shorter Periodic Frame List

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: H'108)	bit 19	32-Frame Periodic List Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H'120)	bit[3:2]	Frame List Size	R/W	This bit determines the Frame List Size. To determine 32-frames, set this field 11b.

6.5A.1.2.2 Link Power Management (LPM) function

This module supports the power management function conforming to “USB 2.0 Link Power Management Addendum to the Universal Serial Bus v2.0 Specification” (abbreviated as LPM).

When the peripheral device which supports LPM function is connected to this module, the device can be moved to suspend state faster than conventional by using LPM function.

*In using LPM function: 8 to 10 µs

The relevant registers are listed in the following. Refer to the appropriate register specification of each register detail in **6.5A.2 Register Descriptions**.

Relevant Register	Relevant Bit		Attribute	Function
HCCPARAMS (offset: H’108)	bit 17	Link Power Management Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H’120)	bit[27:24]	Host-Initiated Resume Duration	R/W	The minimum duration time of K-state drive in resume from LPM state.
PORTSC1 (offset: H’164)	bit[31:25]	Device Address [7:0]	R/W	The device address of the destination of LPM Token. In using LPM function, this setting is needed. Set the address of the device connected to the corresponding port before sending LPM Token.
	bit[24:23]	Suspend Status [1:0]	R	The device response to LPM Token.
	bit 9	Suspend using L1	R/W	In using LPM function, set this bit 1b.
	bit 7	Suspend	R/W	When this bit is set to 1b this module starts LPM Token transaction, in condition of “Suspend using L1 bit = 1b” and “Device address field = H’000”.
PORT_LPM_CTR1 (offset: H’320)	bit[7:4]	NYET_RETRY_CNT_P1[3:0]	R/W	The number of retry for NYET response of device in LPM transaction.
	bit 3	REMOTEWAKE_EN_P1	R/W	Setting of LPM RemoteWakeup permission. 0b: permitted (default) 1b: not permitted
	bit 2	SLEEP_INT_EN_P1	R/W	In LPM transaction, setting to generate an interrupt or not when received a response other than ACK. 0b: not to generate an interrupt (default) 1b: to generate an interrupt
	bit 1	RETRY_ENABLE_NYET_P1	R/W	In LPM transaction, setting to the host behavior when received NYET response from the device. 0b: not to Retry (default) 1b: to Retry
	bit 0	HIRD_SEL_P1	R/W	Setting the duration time of the K-state drive, in resume of LPM state.

6.5A.1.2.3 OTG function

Detects changing of the USB0_OTG_ID pin by U2H0_OBINT interrupt and switches the Host/Function role. Confirm the IDCHG_STA bit of **6.5A.2.4.5 (2) OTG-BC Interrupt Status Register** and the IDMON bit of **6.5A.2.4.5 (5) Line Control Port 1 Register**.

Host/Function role switching is performed by the OTG_PERI bit of **6.5A.2.4.5 (1) Common Control Register**.

OTG_PERI bit
0 : Host mode
1 : Function mode

6.5A.1.2.4 Battery-charging function

The Control and monitoring of the Battery Charging I/F of the USBPHY is set in the UCOM register of this module. The detail of the UCOM register, refer to **6.5A.2.4.5 UCOM Register**.

6.5A.1.2.5 Suspend extension function

This module implements the following two suspend extension functions to reduce power consumption by stopping PLL of USBPHY.

The detail of the register, refer to **6.5A.2.4.4 (6) Suspend Control Register**.

[Relevant register]

Suspend Control Register (offset: H’308)

[Functional specification]

Function		Relevant Bit	
[1]	Function to assert USBPHY SUSPENDM by asserting the Suspend bit in the OHCI/EHCI Operational Register	bit 31	SUSPENDM_ENABLE
[2]	Function to forcibly assert USBPHY SUSPENDM	bit 0	GLOBAL_SUSPENDM_P1

6.5A.1.3 Support of USB-Related Specifications

USB-Related Specification or Function			Support
Host function	High Speed	Bulk IN/OUT transfer	✓
		Control IN/OUT transfer	✓

×: no support

6.5A.2 Register Descriptions

6.5A.2.1 Register Attributes

Table 6.5A-3 Register Attributes

Register Attribute	Description
R/W	Register bits can be read and written.
R/W(1)	Register bits can be read. A clear bit may be set by writing “1”; writing 0 to R/W(1) bits has no effect.
R/W(0)	Register bits can be read. A clear bit may be set by writing “0”; writing 1 to R/W(0) bits has no effect.
R	Register bits can only be read.
W	Register bits can only be written.
Reserved	Reserved bits are Read Only field.

6.5A.2.2 Base Address

Table 6.5A-4 Base Addresses for Each Channel of the USB Host Module

Channel	Base Address	
0	H’0_11E1_0000	(Cortex-A55 Address Space)
	H’41E1_0000	(Cortex-M33 Address Space Secure)
	H’51E1_0000	(Cortex-M33 Address Space Non-Secure)
1	H’0_11E9_0000	(Cortex-A55 Address Space)
	H’41E9_0000	(Cortex-M33 Address Space Secure)
	H’51E9_0000	(Cortex-M33 Address Space Non-Secure)

6.5A.2.4 Description of Registers

6.5A.2.4.1 OHCI Operational Register

(1) HcRevision Register

Abbreviated name of register: HcRevision

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	Revision							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 0	Revision	All 0	R	This field indicates the version of HCI specifications implemented in this host controller module. Because this module conforms to OHCI standard 1.0a, H'10 is indicated.

(2) HcControl Register

Abbreviated name of register: HcControl

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RWC	—	HCFS		BLE	CLE	IE	PLE	CBSR	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved The write value should always be 0.
9	RWC	0	R/W	Remote Wakeup Connected This bit indicates whether the host controller supports remote wakeup signaling. Software should set this bit to 1b in the initialization sequence if it is required to support remote wakeup. Note that this bit can be initialized at hardware reset only. 0b: The remote wakeup is not supported. 1b: The remote wakeup is supported
8	—	0	R	Reserved The write value should always be 0.
7, 6	HCFS	All 0	R/W	Host Controller Functional State This field indicates the operating state of the host controller. 00b: USB Reset 01b: USB Resume 10b: USB Operational 11b: USB Suspend When the state is changed to USB Operational, the host controller module starts SOF transmission at 1 ms boundary. This field is basically controlled by software, but it can be controlled by the host controller in the state of USB Suspend only. If the host controller (in the state of USB Suspend) detects a Remote Wakeup signal from the connecting device, the state in this field is changed to USB Resume. Note that the reset value of this field differs between hardware reset and software reset. Hardware reset: 00b (USB Reset) Software reset: 11b (USB Suspend)
5	BLE	0	R/W	BulkList Enable This bit sets whether the bulk list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the bulk list, this bit must be 0b. 0b: The processing of the Bulk list is disabled. 1b: The processing of the Bulk list is enabled
4	CLE	0	R/W	ControlList Enable This bit sets whether the control list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the control list, this bit must be 0b. 0b: The processing of the Control list is disabled. 1b: The processing of the Control list is enabled.

Bit	Bit Name	Initial Value	R/W	Description
3	IE	0	R/W	Isochronous Enable This bit sets whether the isochronous ED processing is performed. The setting value of this bit is enabled from the next frame. If the host controller module detects isochronous ED (F = 1) during the periodic list processing, it checks the bit and determines whether to perform isochronous ED processing. 1b: The processing of the isochronous ED is continued. 0b: The periodic list processing is stopped, and the bulk/control list processing is started. 0b: The processing of the isochronous ED is disabled. 1b: The processing of the isochronous ED is enabled.
2	PLE	0	R/W	Periodic List Enable This bit indicates whether the periodic list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. The host controller module checks this bit before starting the periodic list processing. 0b: The processing of the periodic list is disabled. 1b: The processing of the periodic list is enabled.
1, 0	CBSR	All 0	R/W	Control Bulk Service Ratio This field defines the service ratio of the control transfer and bulk transfer. When the periodic list is processed, the service ratio defined in this field is used for transfer.

CBSR	No. of Control EDs Over Bulk EDs Served
00b	1:1
01b	2:1
10b	3:1
11b	4:1

(3) HcCommandStatus Register

Abbreviated name of register: HcCommandStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOC	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	BLF	CLF	HCR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17, 16	SOC	All 0	R	Scheduling Overrun Count This field counts the number of scheduling overrun. This field is initialized to 00b, and is counted up every time scheduling overrun is detected. After the field is incremented to 11b, it returns to 00b. Even if the SO (Scheduling Overrun) bit in the HcInterrupt Status register is set, this field is counted up when scheduling overrun is detected.
15 to 3	—	All 0	R	Reserved The write value should always be 0.
2	BLF	0	R/W	BulkList Filled This bit indicates whether TD exists in the bulk list. To add TD to ED in the bulk list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the bulk list. If this bit is set to 0b, the host controller does not start the list processing. If this bit is set to 1b, the host controller starts processing of the bulk list, and sets this bit to 0b. When the host controller finds TD in the bulk list, it sets this bit to 1b again, and continues processing of the bulk list. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the bulk list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the BLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the bulk list. 1b: TD exists in the bulk list.

Bit	Bit Name	Initial Value	R/W	Description
1	CLF	0	R/W	ControlList Filled This bit indicates whether TD exists in the control list. To add TD to ED in the control list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the control list. If this bit is set to 0b, the host controller does not start the processing of the control list. If this bit is set to 1b, the host controller starts processing of the control list, and set this bit to 0b. When the host controller finds TD in the control list, it sets this be to 1b again, and continues the list processing. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the control list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the CLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the control list. 1b: TD exists in the control list.
0	HCR	0	W	Host Controller Reset This bit is used to start OHCI software reset for the host controller. When this bit is set to 1b, the operating status of the host controller is changed to USB Suspend regardless of the functional state of the host controller. Also, the most OHCI Operational registers and OHCI control circuits are initialized. When the software reset finishes, the host controller clears this bit to 0b.

(4) HcInterruptStatus Register

Abbreviated name of register: HcInterruptStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSC	FNO	UE	RD	SF	WDH	SO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSC	0	R/W	Root Hub Status Change Interrupt bit that indicates that the state of the HcRhStatus register or HcRhPortStatus1 register has changed. When the Root Hub status is changed, the host controller sets this bit to 1b. Writing 1b to this bit clears the interrupt. 0b: The status of root hub has not changed. 1b: The status of root hub has changed.
5	FNO	0	R/W	Frame Number Overflow Interrupt bit that indicates that the MSB in the FrameNumber (FN) field of theHcFmNumber register has changed. When the MSB in the Frame Number field is changed from 0 to 1, or from 1 to 0, this bit is set after HccaFrameNumber is updated. Writing this bit to 1b clears the interrupt. 0b: The overflow of frame number has not occurred. 1b: The overflow of frame number has occurred.
4	UE	0	R/W	Unrecoverable Error Interrupt bit that indicates that a system error that is not related to the USB (for example, an error on the system bus) has been detected. Writing this bit to 1b clears the interrupt. 0b: The unrecoverable error has not occurred. 1b: The unrecoverable error has occurred.
3	RD	0	R/W	Resume Detected Interrupt bit that indicates that Resume has been detected. When the host controller detects the Resume signal (RemoteWakeup) from an USB device, it sets this bit to 1b. This bit is not set when the Resume signal is sent by setting the HCFS field to USB Resume. Writing this bit to 1b clears the interrupt. 0b: The host controller has not detected resume signaling (RemoteWakeup). 1b: The host controller has detected resume signaling (RemoteWakeup).

Bit	Bit Name	Initial Value	R/W	Description
2	SF	0	R/W	Start of Frame Interrupt bit that indicates that Hcca Frame Number was updated when each frame started. The host controller sends an SOF packet and updates HccaFrameNumber at the same time, and sets this bit to 1b. Writing this bit to 1b clears the interrupt. 0b: The host controller has not started new frame. 1b: The host controller has started new frame.
1	WDH	0	R/W	Writeback DoneHead Interrupt bit that indicates that the host controller has written the contents of HcDoneHead to HccDoneHead. The host controller sets this bit to 1b immediately after it updates HccaDoneHead. Note that HccaDoneHead is not updated until this bit is cleared. Writing this bit to 1b clears the interrupt. This bit must be cleared only after the contents of HccaDoneHead are saved. 0b: The write back to HccaDoneHead has not occurred. 1b: The write back to HccaDoneHead has occurred.
0	SO	0	R/W	Scheduling Overrun Interrupt bit that indicates that overrun of the USB schedule occurred. When USB scheduling overrun occurs, the host controller updates HccaFrameNumberl, and sets this bit to 1b. When this bit is set, the SchedulingOverrunCount field of the HcCommandStatus register is also incremented. Writing this bit to 1b clears the interrupt. 0b: The scheduling overrun has not occurred. 1b: The scheduling overrun has occurred.

(5) HcInterruptEnable Register

Abbreviated name of register: HcInterruptEnable

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MIE	OCE	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSCE	FNOE	UEE	RDE	SFE	WDHE	SOE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

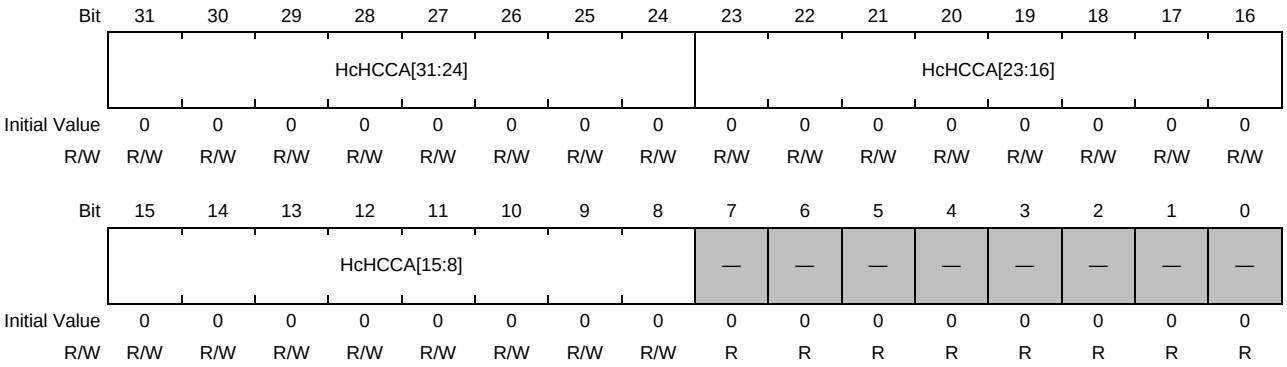
Bit	Bit Name	Initial Value	R/W	Description
31	MIE	0	R/W	Master Interrupt Enable This bit sets whether each Interrupt Enable setting (which is set in HcInterruptEnable [30:0]) is enabled. If this bit is set to 0b, all OHCI interrupts are masked. To clear this bit, set the MID bit (bit 31) of the HcInterruptDisable register to 1b. 0b: All interrupts are disabled. 1b: Interrupts that are set to 1b are enabled.
30	OCE	0	R/W	OC (Ownership Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes OC (OwnershipChange). To clear this bit, set the OCD bit (bit 30) of the HcInterruptDisable register to 1b. 0b: OC (OwnershipChange) interrupt is disabled. 1b: OC (OwnershipChange) interrupt is enabled.
29 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSCE	0	R/W	RHSC (RootHub Status Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RHSC (RootHub Status Change). To clear this bit, set the RHSCD bit (bit 6) of the HcInterruptDisable register to 1b. 0b: RHSC (RootHub Status Change) interrupt is disabled. 1b: RHSC (RootHub Status Change) interrupt is enabled.
5	FNOE	0	R/W	FNO (Frame Number Overflow) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes FNO (Frame Number Overflow). To clear this bit, set the FNOD bit (bit 5) of the HcInterruptDisable register to 1b. 0b: FNO (Frame Number Overflow) interrupt is disabled. 1b: FNO (Frame Number Overflow) interrupt is enabled.
4	UEE	0	R/W	UE (Unrecoverable Error) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes UE (Unrecoverable Error). To clear this bit, set the UED bit (bit 4) of the HcInterruptDisable register to 1b. 0b: UE (Unrecoverable Error) interrupt is disabled. 1b: UE (Unrecoverable Error) interrupt is enabled.
3	RDE	0	R/W	RD (Resume Detect) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RD (Resume Detect). To clear this bit, set the RDD bit (bit 3) of the HcInterruptDisable register to 1b. 0b: RD (Resume Detect) interrupt is disabled. 1b: RD (Resume Detect) interrupt is enabled.

Bit	Bit Name	Initial Value	R/W	Description
2	SFE	0	R/W	SF (Start of Frame) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SF (Start of Frame). To clear this bit, set the SFD bit (bit 2) of the HcInterruptDisable register to 1b. 0b: SF (Start of Frame) interrupt is disabled. 1b: SF (Start of Frame) interrupt is enabled.
1	WDHE	0	R/W	WDH (Writeback DoneHead) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes WDH (Writeback DoneHead). To clear this bit, set the WDHDD bit (bit 1) of the HcInterruptDisable register to 1b. 0b: WDH (Writeback DoneHead) interrupt is disabled. 1b: WDH (Writeback DoneHead) interrupt is enabled.
0	SOE	0	R/W	SO (Scheduling Overrun) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SO (Scheduling Overrun). To clear this bit, set the SOD bit (bit 0) of the HcInterruptDisable register to 1b. 0b: SO (Scheduling Overrun) interrupt is disabled. 1b: SO (Scheduling Overrun) interrupt is enabled.

(6) HcInterruptDisable Register

Abbreviated name of register: HcInterruptDisable

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MID	OCD	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W(1)	R/W(1)	R	R	R	R	R	R	R	R	R	R	R	R	R	R



Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSCD	FNOD	UED	RDD	SFD	WDHD	SOD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31	MID	0	R/W (1)	Master Interrupt Disable This bit sets whether the Enable setting (for each interrupt) that is set by HcInterruptEnable[30:0] is disabled. If this bit is set to 1b, the MIE bit (bit 31) of the HcInterruptEnable register is cleared to 0b, and all OHCI interrupts are masked. Writing 0b to this bit is ignored.
30	OCD	0	R/W (1)	OC (Ownership Change) Interrupt Disable bit. If this bit is set to 1b, the OCE bit (bit 30) of the HcInterruptEnable register is cleared to 0b, and OC (Ownership Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
29 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSCD	0	R/W (1)	RHSC (RootHub Status Change) Interrupt Disable bit. If this bit is set to 1b, the RHSCE bit (bit 6) of the HcInterruptEnable register is cleared to 0b, and RHSC (RootHub Status Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
5	FNOD	0	R/W (1)	FNO (Frame Number Overflow) Interrupt Disable bit. If this bit is set to 1b, the FNOE bit (bit 5) of the HcInterruptEnable register is cleared to 0b, and FNO (Frame Number Overflow) is excluded from the interrupt source. Writing 0b to this bit is ignored.
4	UED	0	R/W (1)	UE (Unrecoverable Error) Interrupt Disable bit. If this bit is set to 1b, the UEE bit (bit 4) of the HcInterruptEnable register is cleared to 0b, and UE (Unrecoverable Error) is excluded from the interrupt source. Writing 0b to this bit is ignored.
3	RDD	0	R/W (1)	RD (Resume Detected) Interrupt Disable bit. If this bit is set to 1b, the RDE bit (bit 3) of the HcInterruptEnable register is cleared to 0b, and RD (Resume Detected) is excluded from the interrupt source. Writing 0b to this bit is ignored.
2	SFD	0	R/W (1)	SF (Start of Frame) Interrupt Disable bit. If this bit is set to 1b, the SFE bit (bit 2) of the HcInterruptEnable register is cleared to 0b, and SF (Start of Frame) is excluded from the interrupt source. Writing 0b to this bit is ignored.
1	WDHD	0	R/W (1)	WDH (Writeback DoneHead) Interrupt Disable bit. If this bit is set to 1b, the WDHE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and WDH (Writeback DoneHead) is excluded from the interrupt source. Writing 0b to this bit is ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	SOD	0	R/W (1)	SO (Scheduling Overrun) Interrupt Disable bit. If this bit is set to 1b, the SOE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and SO (Scheduling Overrun) is excluded from the interrupt source. Writing 0b to this bit is ignored.

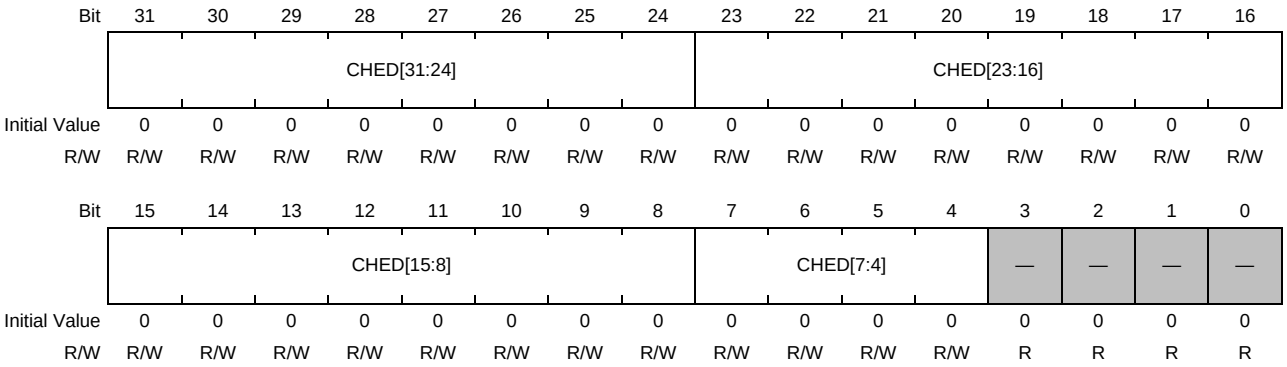
(7) HcHCCA Register

Abbreviated name of register: HcHCCA

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	HcHCCA	All 0	R/W	This field sets the base address (of the RAM) that is assigned as the Host Controller Communication Area. This field must be set at initialization. The host controller requests (as HCCA) 256-byte area from the base address specified in this field.
7 to 0	—	All 0	R	Reserved The write value should always be 0.

(8) HcPeriodicCurrentED Register

Abbreviated name of register: HcPeriodCurrentED

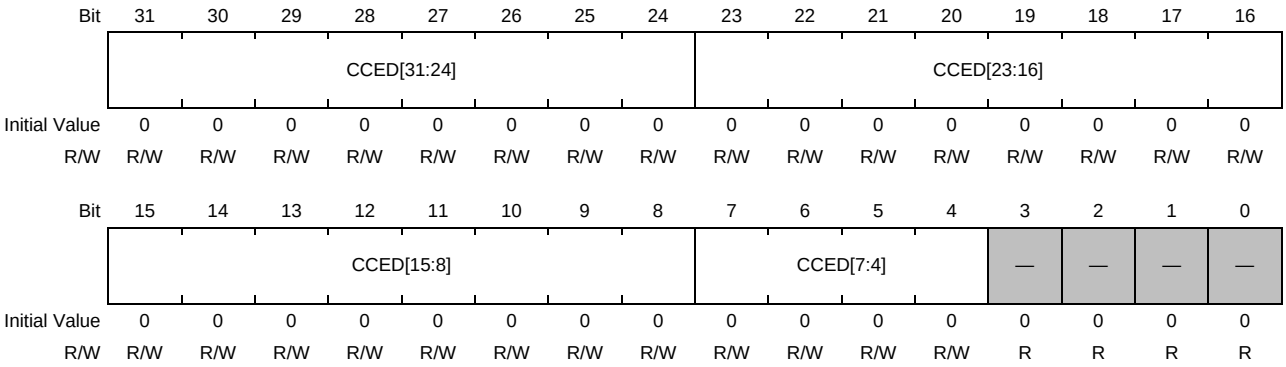


Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PECD[31:24]								PECD[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PECD[15:8]								PECD[7:4]				—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	PECD	All 0	R	Period Current ED This pointer indicates the physical address of ED in the periodic list that is currently processed. The host controller updates this pointer when the list processing of the periodic ED finishes.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

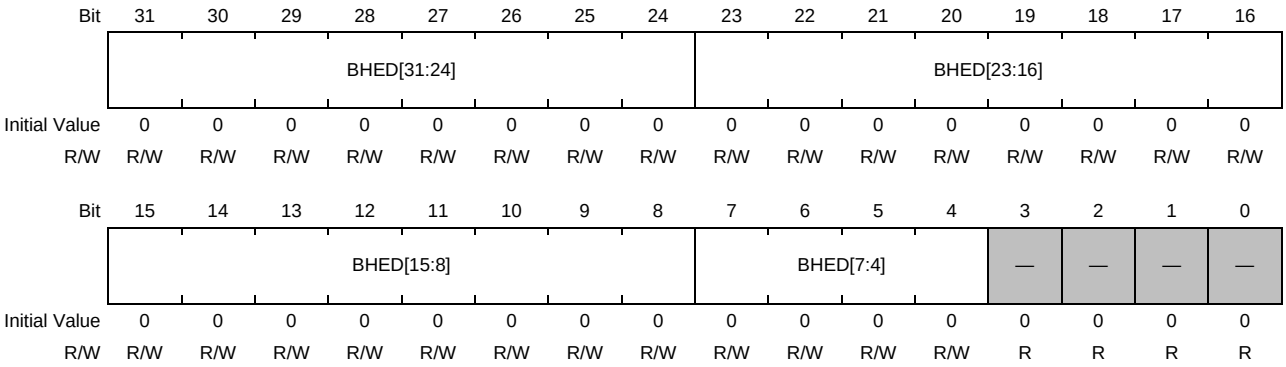
(9) HcControlHeadED Register



Abbreviated name of register: HcControlHeadED

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	CHED	All 0	R/W	Control Head ED This field specifies the physical address of the head ED of the control list. These bits must be set for control transfer before the CLE bit of the HcControl register is set. The host controller starts processing of the control list from the HcBulkHeadED pointer.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

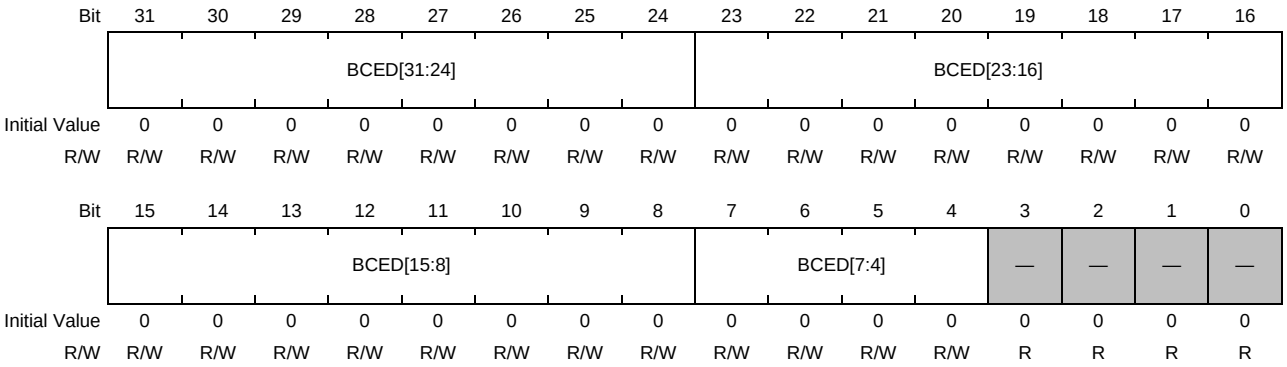
(10) HcControlCurrentED Register



Abbreviated name of register: HcControlCurrentED

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	CCED	All 0	R/W	Control Current ED This pointer indicates the physical address of the ED that is currently processed in the control list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the control list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcControlHeadED field are copied to the HcControlCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to H'0 to indicate the end of the control list.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(11) HcBulkHeadED Register



Abbreviated name of register: HcBulkHeadED

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	BHED	All 0	R/W	BulkHead ED This field specifies the physical address of the head ED of the bulk list. This field must be set for bulk transfer before the BLE bit of the HcControl register is set. The host controller starts the processing of the control list from the HcBulkHeadED pointer.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

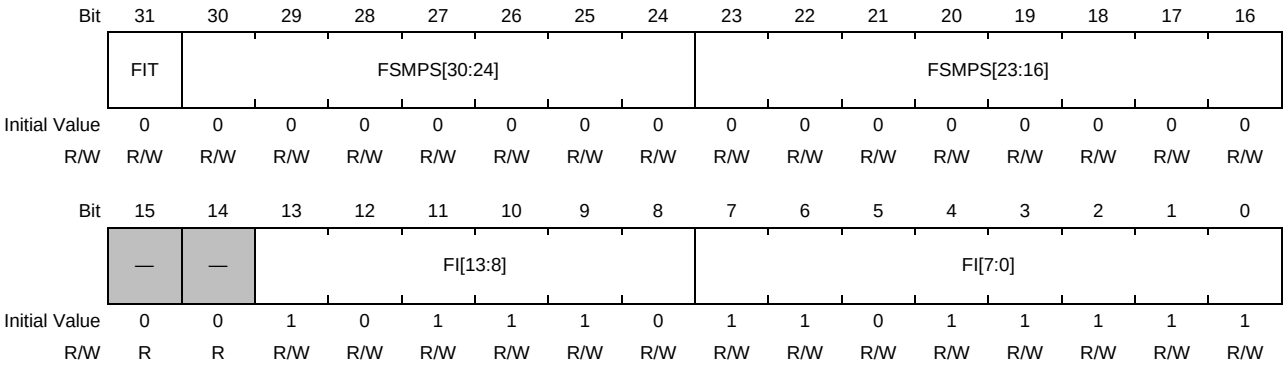
(12) HcBulkCurrentED Register

Abbreviated name of register: HcBulkCurrentED

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	BCED	All 0	R/W	Bulk Current ED This pointer indicates the physical address of the ED that is currently processed in the bulk list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the bulk list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcBulkHeadED field are copied to the HcBulklCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to H'0 to indicate the end of the bulk list.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(13) HcDoneHead Register

Abbreviated name of register: HcDoneHead



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DH[31:24]								DH[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DH[15:8]								DH[7:4]				—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	DH	All 0	R	Done Head This field indicates the physical address of the HcDoneHead of the host controller. The physical address of the TD that lately finished and is added to the Done queue. After the TD processing finishes, the host controller writes the contents of the HcDoneHead to the NextTD field of the TD. At the same time, the host controller overwrites the contents of HcDoneHead with the TD address. After the host controller writes the contents of this register into HCCA, it sets 0b to this register. Then, the WritebackDoneHead bit of the HcInterruptStatus register is set to 1b.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(14) HcFmInterval Register

Register abbreviation: HcFmInterval

Bit	Bit Name	Initial Value	R/W	Description
31	FIT	0	R/W	Frame Interval Toggle This bit is used to synchronize the frame setting value with the hardware (host controller). When the FI field is updated, the toggle value is written to this bit. When the FI field value is applied to the FR field of the HcFmRemaining register, the value of this bit is also applied to the FRT bit of the HcFmRemaining register. By checking the toggle value in the FRT bit of the cFmRemaining register, the software can check whether the value in the FI field has been applied to the FR field of the HcFmRemaining register.
30 to 16	FSMPS	All 0	R/W	FS Largest Data Packet This field sets the maximum amount of data (bits) that the host controller can send and receive without the fear of schedule overrun. The host controller compares the current frame position and the setting value in this field to determine the length (of the frame) that is ready to be transferred. This value differs depending on the capacity of the system bus and other reasons, estimate the value and set it to this field. *Note*: The maximum setting value for this field is H'2778. Do not set any value that is larger than H'2778.
15, 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	FI	H'2EDF	R/W	Frame Interval This field is used to set the length of the frame (bit time) used for Full Speed. Set the value of this field to "H'2EDF" so that 1 frame (= 1 ms) of USB standard is satisfied.

(15) HcFmRemaining Register

Register abbreviation: HcFmRemaining

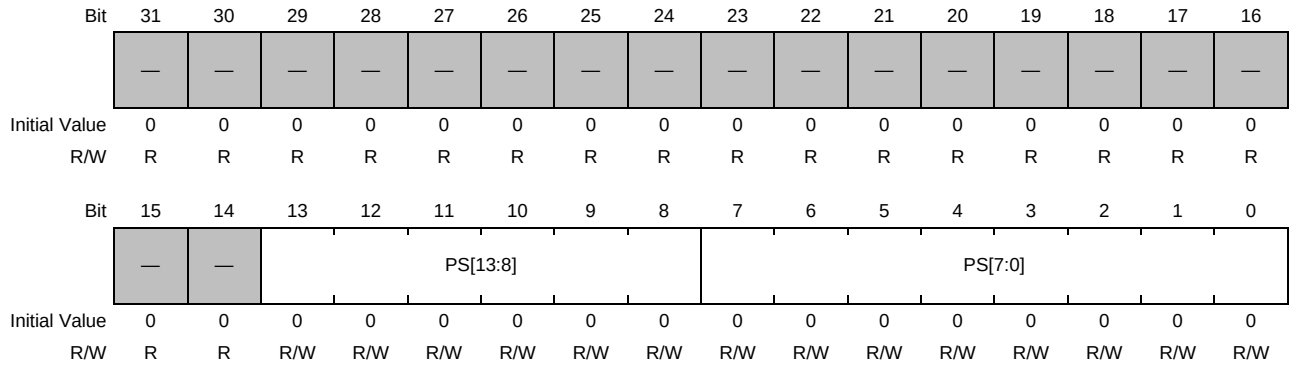
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FRT	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	FR[13:8]						FR[7:0]							
Initial Value	0	0	1	0	1	1	1	0	1	1	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	FRT	0	R	Frame Remaining Toggle This bit is used to synchronize the frame setting value with the hardware (host controller). When the FR (Frame Remaining) field is set to H'0000, the host controller copies the FI (Frame Interval) field value to the FR field, and copies the FIT (Frame Interval Toggle) bit value to this bit. This bit can be used to check that the FI field of the HcFmInterval register has been correctly copied to the FR field.
30 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	FR	H'2EDF	R	Frame Remaining This field indicates the current frame value for 14-bit down counter. The value in this field counts down as time passes. When the value becomes H'0000, the value of FI (Frame Interval) of the HcFmInterval register is loaded. When the state of the host controller is changed to the USB Operational state, the host controller reloads the value in the FI (Frame Interval) field of the HcFmInterval register, and the new value is used from the next SOF.

(16) HcFmNumber Register

Register abbreviation: HcFmNumber



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FN[15:8]								FN[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The write value should always be 0.
15 to 0	FN	All 0	R	Frame Number This field indicates the number of passed frames. When the HcFmRemaining register is reloaded, this field is incremented. If this field is reached to H'FFFF, the value is rolled over to H'0000. When the state of the host controller is changed to the USB Operational state, this field is automatically incremented. After the host controller increments the frame number at the frame boundary and sends SOF, the contents of this field are written to HCCA. This is performed before the host controller reads the first ED of the frame. After writing to HCCA, the host controller sets the SF bit of the HcInterruptStatus register.

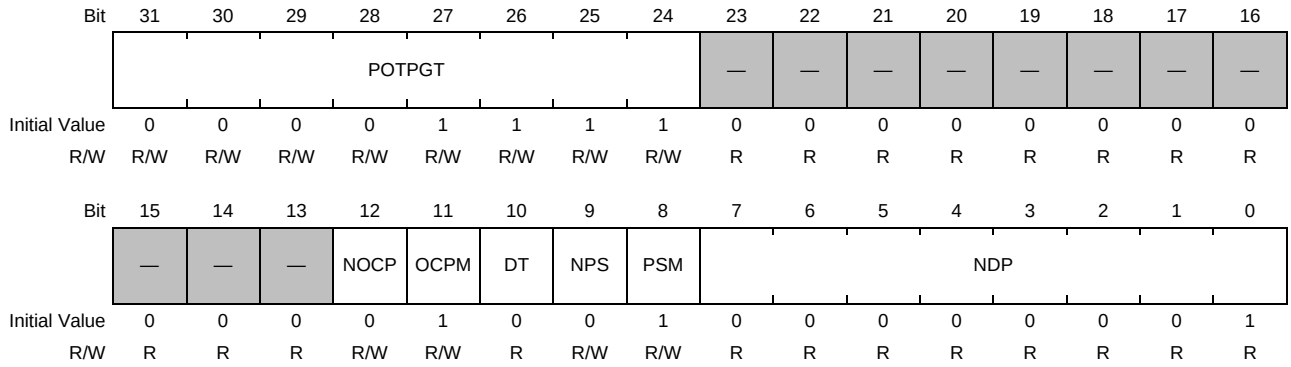
(17) HcPeriodicStart Register

Register abbreviation: HcPeriodicStart

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	PS	All 0	R/W	Periodic Start This field indicates the time the host controller starts the periodic list processing in the frame. Estimate an appropriate value, and set the value to this field at the initial setting of the host controller. OHCI standard recommends that you set this setting value to about 90% of the FI field value of the HcFmInterval register. The recommended value is H'2A2F. When the value in the FR field of the HcFmRemaining register reaches the value set to this field, the periodic list processing is given priority over the control/bulk list processing. Therefore, after the currently running control or bulk transfer finishes, the host controller starts the Interrupt list processing.

(18) HcLSThreshold Register

Register abbreviation: HcLSThreshold



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LST[11:8]				LST[7:0]							
Initial Value	0	0	0	0	0	1	1	0	0	0	1	0	1	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved The write value should always be 0.
11 to 0	LST	H'628	R/W	LS Threshold This field indicates the threshold value of whether transfer is available for the remaining time of the LS transfer frame. If the value of the FR field of the FmRemaining register is larger than the value set to this field, the host controller can start LS transfer.

(19) HcRhDescriptorA Register

Register abbreviation: HcRhDescriptorA

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	POTPGT	H'0F	R/W	PowerOn To PowerGood Time This field indicates the time for waiting until software can access the root hub port after the power is supplied to the port. The unit of time is 2 ms. Therefore, the wait time is POTPGT × 2 ms.
23 to 13	—	All 0	R	Reserved The write value should always be 0.
12	NOCP	0	R/W	No OverCurrent Protection This bit sets whether the overcurrent function of the root hub is supported. If this bit is set to 0b, the overcurrent state is reported depending on the setting of the OCPM bit. 0b: The overcurrent state is supported. 1b: The overcurrent state is not supported. If you do not require the overcurrent function, set this bit to 1b once the module is released from module standby. For details, see **6.5A.9.1 Host/Peripheral Common Setting Sequence**.
11	OCPM	1	R/W	OverCurrent Protection Mode This bit sets how to report the overcurrent state of the root hub. If this bit is reset, this bit must indicate the same mode as the PSM (Power Switching Mode) bit. This bit is valid only when the NOCP (NoOverCurrent Protection) bit is cleared (0b). 0b: The overcurrent state is collectively reported for all ports. 1b: The overcurrent state is reported for each port.
10	DT	0	R	Device Type This bit indicates that the root hub is not a composite device. This bit is always 0b because the root hub is not allowed to be a composite device.
9	NPS	0	R/W	No Power Switching This bit sets how to control the port power. If this bit is set to 0b, the PSM bit is used to set whether the power control is collectively performed for all ports or is performed for each port. 0b: The port power can be switched between on and off. 1b: The power is always on while the host controller is running.
8	PSM	1	R/W	Power Switching Mode This bit sets how to control the power switch for each port of the root hub. This bit is valid only when the NPS bit is 0b. 0b: The power of all ports is collectively controlled. 1b: The power of ports is controlled for each port. If the PPCM (PortPower Control Mask) bit of the HcRhDescriptorB register is set, each port responds only to the Set/ClearPortPower command. If the PPCM bit is cleared, each port is controlled by the Set/ClearGlobalPower command.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	NDP	H'01	R	Number Downstream Ports This field indicates the number of downstream ports supported by the root hub.

(20) HcRhDescriptorB Register

Register abbreviation: HcRhDescriptorB

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPCM	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DR	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	PPCM	1	R/W	PortPower Control Mask This bit sets the port power control command when the PSM (Power Switching Mode) bit of the HcRhDescriptorA register is set. If this bit is 0b, the Global Power Control command (Set/ClearGlobalPower) is used for control. If this bit is 1b, the Port Power Control command (Set/ClearPortPower) is used for control. If the PSM bit is 0b, this bit is ignored.
16 to 2	—	All 0	R	Reserved The write value should always be 0.
1	DR	0	R/W	Device Removable This bit indicates whether each port of the root hub is removable. If this bit is 0b, the connected device is removable. If this bit is 1b, the connected device is not removable.
0	—	0	R	Reserved The write value should always be 0.

(21) HcRhStatus Register

Register abbreviation: HcRhStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRWE	—	—	—	—	—	—	—	—	—	—	—	—	—	OCIC	LPSC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRWE	—	—	—	—	—	—	—	—	—	—	—	—	—	OCI	LPS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CRWE	0	W	Clear RemoteWakeup Enable This bit is used to clear the DRWE bit. If this bit is set to 1b, DRWE (Device RemoteWakeup Enable) bit can be cleared. Writing 0b to this bit has no effect.
30 to 18	—	All 0	R	Reserved The write value should always be 0.
17	OCIC	0	R/W (1)	OverCurrent Indicator Change This bit is used to report the change in the OCI bit. If there is any change in the OCI bit, the host controller sets this bit to 1b. If 1b is written to this bit while this bit is set to 1b, this bit can be cleared. Writing 0b to this bit has no effect. 0b: There is no change in the Overcurrent state. 1b: There is a change in the Overcurrent state.
16	LPSC	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Local Power Status Change This bit is always read as 0b because the Local Power Status is not supported. [Write] Set Global Power If this bit is set to 1b, the power to the ports is turned on. The ports whose power is turned on are determined by the settings of the PSM (Power Switching Mode) bit and the PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register.

written to this bit	PSM	PPCM[N]	Description
0	—	—	Setting ignored
1	0	—	1b is set to the PPS bit.
	1	0	1b is set to the PPS bit.
		1	Setting ignored

				Writing 0b to this bit has no effect.
15	DRWE	0	R/W	[Read] Device RemoteWakeup Enable This bit sets whether the RemoteWakeup event includes the CSC (Connect Status Change) bit. If this bit is set to 1b, the CSC bit of the HcRhPortStatus register becomes valid as the Resume event. If the CSC bit is changed to 1b, the state is changed from USB Suspend to USB Resume, and the Resume detection interrupt occurs. 0b: Connect Status Change is not the source of RemoteWakeup. 1b: Connect Status Change is the source of RemoteWakeup. [Write] Set RemoteWakeup Enable This bit is used to set the DRWE bit. Writing 0b to this bit has no effect.

Bit	Bit Name	Initial Value	R/W	Description
14 to 2	—	All 0	R	Reserved The write value should always be 0.
1	OCI	0	R	Over Current Indicator This bit is used to report the overcurrent state in the global overcurrent detection mode (OCPM bit = 0b). This bit always indicates 0b when overcurrent for each port is reported (when OPCM bit = 1b). 0b: The port state is normal. 1b: The port is in the overcurrent state.
0	LPS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Local Power Status This bit is always read as 0b because the Local Power Status is not supported. [Write] Clear Global Power If this bit is set to 1b, the power to the ports is turned off. The ports whose power is turned off are determined by the settings of the PSM (Power Switching Mode) bit and PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register.

written to this bit	PSM	PPCM[N]	Description
0	—	—	Setting ignored.
1	0	—	The PPS bit is cleared to 0b.
	1	0	The PPS bit is cleared to 0b.
		1	Setting ignored.

Writing 0b to this bit has no effect.

(22) HcRhPortStatus[1:NDP] Register

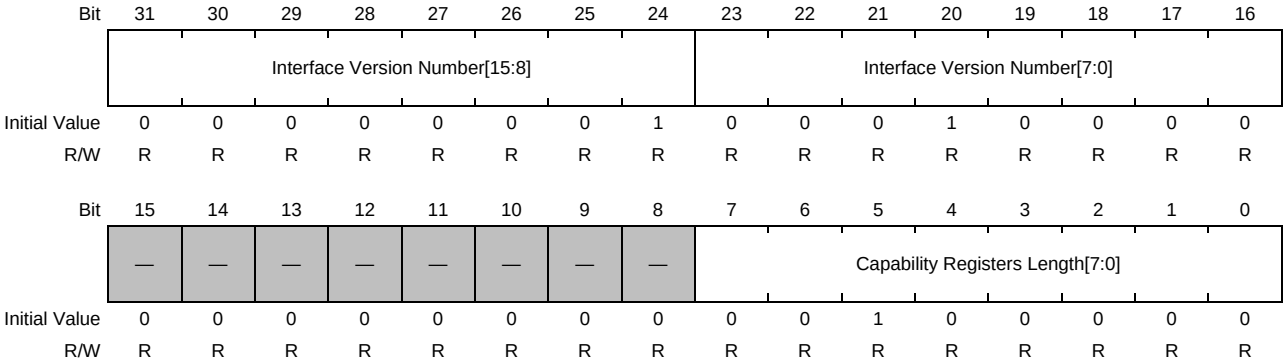
Register abbreviation: HcRhPortStatus1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	PRSC	OCIC	PSSC	PESC	CSC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	LSDA	PPS	—	—	—	PRS	POCI	PSS	PES	CCS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The write value should always be 0.
20	PRSC	0	R/W (1)	Port Reset Status Change This bit indicates that port reset (bus reset) has finished. The host controller sets this bit when 10 ms port reset (bus reset) finishes. 0b: Port reset has not finished, or the PRS (Port Reset Status) bit is not changed. 1b: Port reset has finished.
19	OCIC	0	R/W (1)	Port OverCurrent Indicator Change This bit is set when the overcurrent state of the port is detected. This bit is set when the host controller changed the POCI bit value. This bit is valid only under the setting that the overcurrent state is reported for each port (OCPM bit = 1b). If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The overcurrent state has not changed. 1b: The overcurrent state has changed (POCI bit changed).
18	PSSC	0	R/W (1)	Port Suspend Status Change This bit indicates that the Resume sequence finished. This sequence includes 20 ms of the Resume signal, LS EOP, and 3 ms of resynchronization delay. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If the PRSC (Port Reset Status Change) bit is set, this bit is cleared. 0b: The Resume sequence has not finished. 1b: The Resume sequence has finished.
17	PESC	0	R/W (1)	Port Enable Status Change This bit indicates that the PES (Port Enable Status) bit was changed. If a hardware event clears the PES bit, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The PES (Port Enable Status) bit has not changed. 1b: The PES (Port Enable Status) bit has changed.

Bit	Bit Name	Initial Value	R/W	Description
16	CSC	0	R/W (1)	Connect Status Change This bit indicates that the CCS (Current Connect Status) bit was changed. If the Connect/Disconnect event occurs, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If a request (Port Reset/Port Enable/Port Suspend) is received during the Disconnect status, this bit is set for reevaluation of device connection confirmation. 0b: The CCS (Current Connect Status) bit has not changed. 1b: The CCS (Current Connect Status) bit has changed.
15 to 10	—	All 0	R	Reserved The write value should always be 0.
9	LSDA	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Low Speed Device Attached This bit indicates the speed of the device connected to the port. This bit is valid only when the CCS (Current Connect Status) bit is set. 0b: Full Speed device is connected. 1b: Low Speed device is connected. [Write] Clear Port Power This bit is used to turn off the power of the port when the port is power controlled. Writing 1b to this bit turns off the port power. Writing 0b to this bit has no effect.
8	PPS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Power Status This bit indicates the power status of the port. This bit is cleared when the overcurrent is detected. 0b: Port power is off. 1b: Port power is on. [Write] Set Port Power This bit is used to turn on the power of the port when the port is power controlled. Writing 1b to this bit turns on the port power. Writing 0b has no effect.
7 to 5	—	All 0	R	Reserved The write value should always be 0.
4	PRS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Reset Status This bit indicates the port reset (bus reset) status. When 10 ms of port reset finishes, the PRSC (Port Reset Status Change) bit is set and this bit is cleared. When the CCS bit is cleared (when no device is connected), this bit cannot be set. 0b: Not during port reset 1b: During port reset [Write] Set Port Reset This bit is used to issue a port reset (bus reset) to the downstream port. Writing 1b to this bit starts 10 ms of port reset. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to ports to which no device is connected, that port reset was performed.

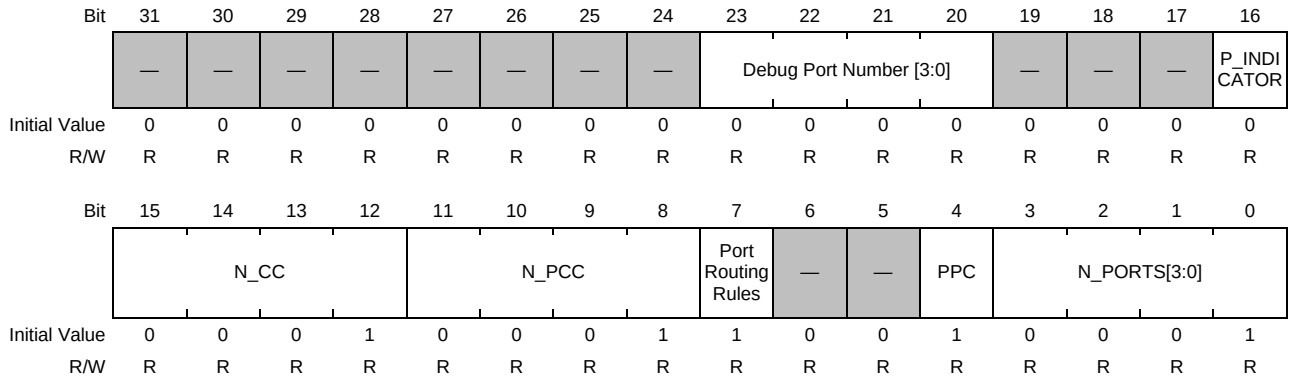


Bit	Bit Name	Initial Value	R/W	Description
3	POCI	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port OverCurrent Indicator This bit indicates that the downstream port is in the overcurrent status. This bit is valid only when the setting is specified that the overcurrent status is reported for each port (OCPM bit = 1b). On the other hand, if the setting is specified that the overcurrent status is reported for all ports, this bit is always read as 0b. 0b: The port is in normal status. 1b: The port is in overcurrent status. [Write] Clear Suspend Status This bit is used to finish the Suspend status and start the Resume sequence. Writing 1b to this bit starts the Resume sequence. Writing 0b has no effect. The Resume sequence starts only when PSS (Port Suspend Status) is set.
2	PSS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Suspend Status This bit indicates that the port status is in Suspend or Resume sequence. 0b: The port is not in Suspend status. 1b: The port is in Suspend status. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is cleared under the following conditions: • When the Resume sequence finished, and the PSSC (Port Suspend Status Change) bit is set • When the port reset finished, and the PRSC (Port Reset Status Change) bit is set • When the host controller is in the USB Resume state [Write] Set Port Suspend This bit is used to change the port status to Suspend. Writing 1b to this bit changes the status to Suspend. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to the ports to which no device is connected that the Suspend command was issued.
1	PES	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Enable Status This bit indicates whether the port status is Enable or Disable. If the host controller detects a bus error (for example, overcurrent state, disconnect, port power off, and babble error), it clears this bit. Then, the PESC (PortEnableStatusChange) bit is set. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is set “when port reset finished and the PRSC bit is set” or “when the port status becomes Suspend and the PRSC bit is set”. 0b: The port status is Disable. 1b: The port status is Enable. [Write] Set Port Enable This bit is used to set the PES bit. Writing 1b to this bit changes the port status to Enable. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report that the status of the ports to which no device is connected was tried to be changed to Enable.

Bit	Bit Name	Initial Value	R/W	Description
0	CCS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Current Connect Status The current connection status of the downstream port is applied to this bit. 0b: No device is connected. 1b: A device is connected. [Write] Clear Port Enable This bit is used to clear the PES (Port Enable Status) bit. Writing 1b to this bit changes the port status to Disable. Writing 0b to this bit has no effect.

6.5A.2.4.2 EHCI Controller Capability Register

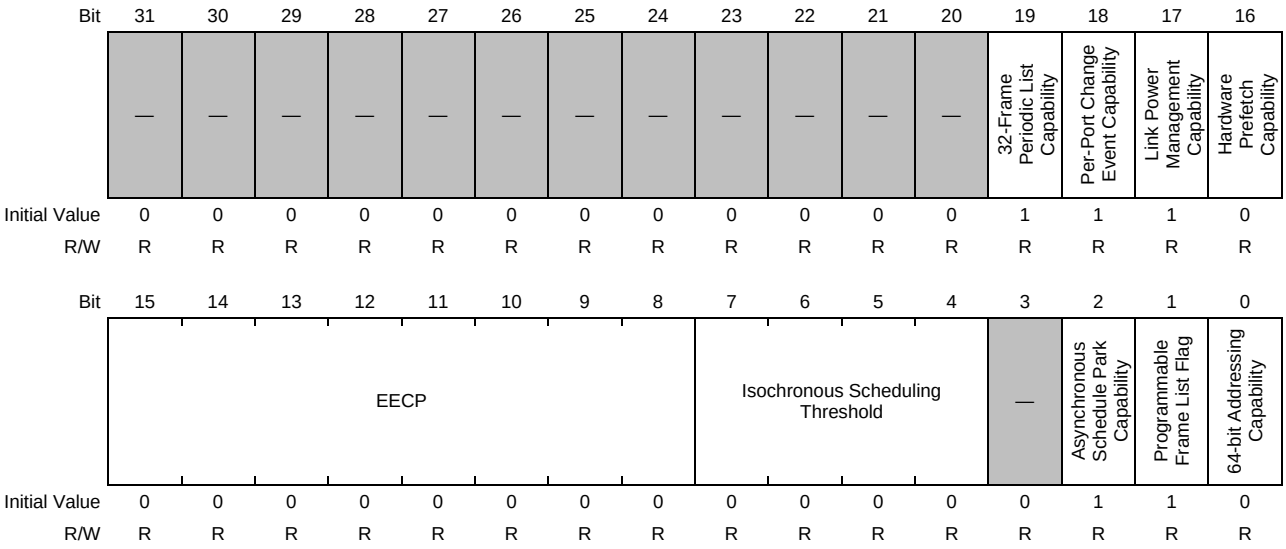
(1) HCIVERSION/CAPLENGTH Register



Register abbreviation: CAPL_VERSION

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Interface Version Number	H'0110	R	This field indicates the EHCI version supported by the host controller. H'0110 is indicated because this host controller supports EHCI Rev1.1.
15 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 0	Capability Registers Length	H'20	R	This field is used as an offset that is added to the base address to find the start address of the EHCI Operational register. H'20 is indicated because the EHCI Operation register of this module starts from H'20.

(2) HCSPARAMS Register



Register abbreviation: HCSPARAMS

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The write value should always be 0.
23 to 20	Debug Port Number	All 0	R	This field indicates that the host controller port is a debug port. 0000b is indicated because this module does not have a debug port.
19 to 17	—	All 0	R	Reserved The write value should always be 0.
16	P_INDICATOR	0	R	Port Indicators This bit indicates whether the host controller supports port indicator control. 0b is indicated because this module does not support port indicator control.
15 to 12	N_CC	H'1	R	Number of Companion Controller This field indicates the number of OHCI host controllers implemented in this module. H'1 is indicated because this module has one OHCI host controller.
11 to 8	N_PCC	H'1	R	Number of Ports per Companion Controller This field indicates the number of ports supported by an OHCI host controller. The setting value of the Port_no field of the PCI Configuration EXT1 register is applied to this field.
7	Port Routing Rules	1	R	This bit indicates how individual ports are mapped to the OHCI host controller. This bit indicates 1b because, in this module, the contents of the HCSP_PORTROUTE register show the mapping method.
6, 5	—	All 0	R	Reserved The write value should always be 0.
4	PPC	1	R	Port Power Control This bit indicates how the port power of this module is controlled. 0b: The port power is always on. 1b: The PP bit of the PORTSC register controls the port power.
3 to 0	N_PORTS	H'1	R	This field indicates the number of physical downstream ports used by this module. 0001b: 1 Port

(3) HCCPARAMS Register

Register abbreviation: HCCPARAMS

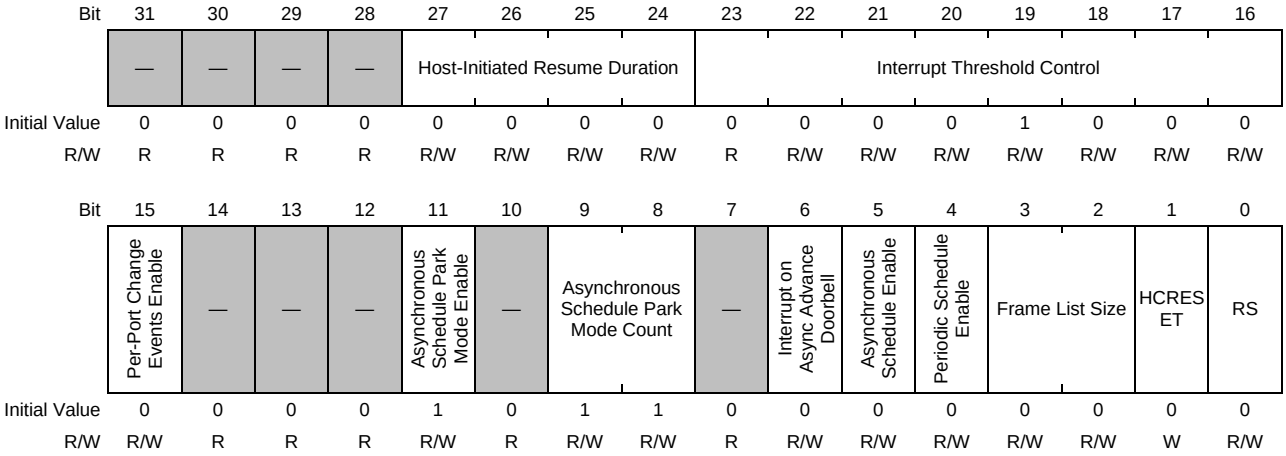
Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved The write value should always be 0.
19	32-Frame Periodic List Capability	1	R	This bit indicates 1b because this module supports 32-Frame Periodic List defined in EHCI V1.1. This means that the Frame List Size field of the USBCMD register is set to 11b, so this module supports 32-Frame Periodic List.
18	Per-Port Change Event Capability	1	R	This bit indicates 1b because this module supports event detection function for ports that are defined in EHCI V1.1. This means that this module supports event detection function for ports, and is associated with the Pre-Port Change Event Enable field of the USBCMD register, Port-1 Change Detect field of the USBSTS register, and Port-1 Change Interrupt Enable field of the USBINT register. If this bit is 0b, the corresponding fields of the above registers are treated as Reserved.
17	Link Power Management Capability	1	R	This bit indicates 1b because this module supports LPM (Link Power Management) defined in EHCI V1.1. This means that this module supports LPM L1 state, and is controlled by the Suspend using L1 bit, Suspend Status bit, and Device Address field of the PORTSC register. If this bit is 0b, the corresponding bits and field of the above PORTC register are treated as Reserved.
16	Hardware Prefetch Capability	0	R	This bit indicates 0b because this module does not support the hardware prefetch function defined in EHCI V1.1.
15 to 8	EECP	All 0	R	This field indicates the offset address of the EHCI Extend Capabilities Registers. This field indicates H'00 because this module does not use EHCI Extend Capabilities Registers.
7 to 4	Isochronous Scheduling Threshold	All 0	R	This field indicates H'0 because this module does not support caches with isochronous data structure for the entire frame.
3	—	0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2	Asynchronous Schedule Park Capability	1	R	This bit indicates whether the Park mode is supported for High Speed QH (Queue Head) in an asynchronous schedule. This bit indicates 1b because this module supports the above function.
1	Programmable Frame List Flag	1	R	This bit indicates the setting for the available frame list size. This bit indicates 1b for this module. If this bit is set to 1b, bit [3:2] (Frame List Size) of the USBCMD register can be used to set the available frame list size, and the frame list size smaller than 4 Kbyte is configurable.
0	64-bit addressing Capability	0	R	This bit indicates which type of memory pointer the data structure uses (32 bit address memory pointer or 64 bit address memory pointer). This bit indicates 0b for this module because this module has the data structure that uses 32 bit address memory pointer. 64 bit address is not supported.

(4) HCSP-PORTROUTE Register

Register abbreviation: HCSP_PORTROUTE

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Companion Port Route[31:24]								Companion Port Route[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R



Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Companion Port Route[15:8]								Companion Port Route[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Companion Port Route[31:0]	All 0	R	This field indicates the ports controlled by the OHCI host controller. This field indicates 0b for this module because this module has one OHCI host controller.

6.5A.2.4.3 HCI Operational Register

(1) USBCMD Register

Register abbreviation: USBCMD

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved The write value should always be 0.
27 to 24	Host-Initiated Resume Duration	All 0	R/W	This field indicates the minimum time of the K-state drive while the host controller resumes from the LPM (L1) state. The value in this field is sent to the connected device that has the LPM function via the HIDR field in the bmAttributes field of the LPM token. The encoded value of this field is defined as the name of the HIRD field in the LPM Token. Specifically, H'0 means 50 µs, and if the value is incremented by 1, 75 µs is incremented. For example, H'1 means 125 µs, and H'4 means 1175 µs.
23 to 16	Interrupt Threshold Control	H'08	R, R/W	This field indicates the maximum rate until the host controller issues an interrupt. Note that the setting values other than the following values are not guaranteed. Value / Maximum Interrupt Interval H'00 Reserved H'01 1 micro-frame H'02 2 micro-frames H'04 4 micro-frames H'08 8 micro-frames (default, equals to 1 ms) H'10 16 micro-frames (2 ms) H'20 32 micro-frames (4 ms) H'40 64 micro-frames (8 ms) Do not set H'00 to this field while the Halted bit is 0b.
15	Per-Port Change Events Enable	0	R/W	This field is used to enable the event report function of the ports defined by the Port-1 Change Detect field of the USBSTS register and the Port-1 Change Detect Enable field of the USBINTR register. 0b: The event report function of the ports is disabled. 1b: The event report function of the ports is enabled.
14 to 12	—	All 0	R	Reserved The write value should always be 0.
11	Asynchronous Schedule Park Mode Enable	1	R/W	This bit enables or disables the Asynchronous Schedule Park mode. 0b: The Park mode is disabled. 1b: The Park mode is enabled.

Bit	Bit Name	Initial Value	R/W	Description
10	—	0	R	Reserved The write value should always be 0.
9, 8	Asynchronous Schedule Park Mode Count	11b	R/W	This field sets the number of transactions that the host controller can serially execute for one QH (Queue Head) fetch in an asynchronous schedule. The valid value range is H'1 to H'3. This field is valid when bit 11 (Asynchronous Schedule Park Mode Enable) is 1b. Do not set H'0 to this field.
7	—	0	R	Reserved The write value should always be 0.
6	Interrupt on Async Advance Doorbell	0	R/W	This bit is used as the doorbell. In an asynchronous schedule processing, if you want an interrupt to occur before proceeding to the next QH (Queue), set this bit to 1b. After a QH processing normally finishes, the host controller clears this bit to 0b, and sets bit 5 (Interrupt on Async Advance bit) of the USBSTS register to 1b. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt occurs at the next interrupt timing. If the asynchronous schedule is disabled, do not write 1b to this bit.
5	Asynchronous Schedule Enable	0	R/W	This bit sets whether the host controller proceeds to the asynchronous list processing or skip the processing. 0b: The asynchronous list processing is skipped. 1b: Use the ASYNCLISTADDR register to proceed the asynchronous list processing.
4	Periodic Schedule Enable	0	R/W	This bit sets whether the host controller proceeds or skips the periodic list processing. 0b: The periodic list processing is skipped. 1b: Use the PERIODICLISTBASE register to proceed the periodic list processing.
3, 2	Frame List Size	0	R/W	This field specifies the frame list size. The setting value of this field determines the size of the Frame List Current index of the FRINDEX register. Value: 00b — The number of frames in Frame List: 1024 frames (default) Value: 01b — The number of frames in Frame List: 512 frames Value: 10b — The number of frames in Frame List: 256 frames Value: 11b — The number of frames in Frame List: 32 frames
1	HCRESET	0	W	Host Controller Reset This bit is used to initialize the EHCI circuit of the host controller. If this bit is set to 1b, the host controller initializes the internal pipelines, counters, and state machines, and communications on the USB immediately stop. At this time, port reset is not issued to the downstream ports. Reset by this bit has no effect on the registers other than the EHCI Operational register. The EHCI Operational register is initialized, and the port owner returns to OHCI. Software must be reset to return the host controller to the operational state. When this reset processing finishes, the host controller sets this bit to 0b. Writing 0b to this bit cannot stop the reset processing. If the HCHalted bit of the USBSTS register is set to 0b, do not set 1b to this bit.
0	RS	0	R/W	Run/Stop This bit is used to run or stop the EHCI host controller. If this bit is set to 1b, the host controller starts operation. As long as this bit is set to 1b, the host controller continues running. If this bit is set to 0b, the host controller finishes the currently executing transaction and some other transactions, and then is changed to the Halt status. The HCHalted bit of the USBSTS register indicates that the host controller finished the transaction processing and entered into the stop status. If the host controller is in a status other than Halt (the HCHalted bit of the USBSTS register is 1b), do not write 1b to this bit.

(2) USBSTS Register

Register abbreviation: USBSTS

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	Port-1 Change Detect
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Asynchronous Schedule Status	Periodic Schedule Status	Reclamation	HCHalted	—	—	—	—	—	—	Interrupt on Async Advance	Host System Error	Frame List Rollover	Port Change Detect	USBERRINT	USBINT
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved The write value should always be 0.
16	Port-1Change Detect	0	R/W (1)	If this bit is set to 1b, it indicates that a change in the port status was detected. This bit is used only when the Per-Port Change Events Enable bit of the USBCMD register is set to 1b.
15	Asynchronous Schedule Status	0	R	This bit indicates the current status of the asynchronous schedule. 0b: The asynchronous schedule is disabled. 1b: The asynchronous schedule is enabled. If this bit and bit 5 (Asynchronous Schedule Enable) of the USBCMD register have the same value, the asynchronous schedule is enabled (1b) or disabled (0b).
14	Periodic Schedule Status	0	R	This bit indicates the current status of the periodic schedule. 0b: The periodic schedule is disabled. 1b: The periodic schedule is enabled. If this bit and bit 4 (Periodic Schedule Enable) of the USBCMD register have the same value, the periodic schedule is enabled (1b) or disabled (0b).
13	Reclamation	0	R	This bit is used to detect an empty asynchronous schedule. If this bit is 1b, the asynchronous schedule is empty. After reset or when a QH (H = 1) is fetched, the host controller clears this bit to 0b. Also, when the host controller executes an asynchronous transaction or detects a start event, it sets this bit to 1b. If this bit is 0b and a QH (H = 1) is fetched, the host controller is entered into the Async Sched Sleeping mode.
12	HCHalted	1	R	If the Run/Stop bit of the USBCMD register is 1b, this bit indicates 0b. If the software or host controller sets the Run/Stop bit to 0b, the host controller stops operation, and sets 1b to this bit. 0b: The EHCI host controller is running. 1b: The EHCI host controller is stopped.
11 to 6	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	Interrupt on Async Advance	0	R/W (1)	This bit indicates the Async Advance Interrupt status. After the host controller fetches the QH, it checks bit 6 (Interrupt on Async Advance Doorbell [IAAD] bit) of the USBCMD Register. If the IAAD bit is set to 1b, the host controller clears the IAAD bit after the QH processing normally finishes, and sets this bit. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt due to this source will occur at the next interrupt timing after 1b is set to this bit. If HCD writes 1b to this bit, this bit can be cleared. Writing 0b to this bit has no effect. 0b: Async Advance Interrupt not occurred. 1b: Async Advance Interrupt status is detected.
4	Host System Error	0	R/W (1)	This bit is set to 1b if a serious error occurs in the host controller. If this error occurs, the host controller clears the Run/Stop bit of the USBCMD register to 0b so that the subsequent schedules are not executed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: No system error occurred. 1b: A system error occurred.
3	Frame List Rollover	0	R/W (1)	If a frame list rollover occurs, the host controller sets this bit to 1b. Specifically, when the Frame Index field of the FRINDEX register is returned to H'000 from the maximum value (rollover), the host controller sets this bit to 1b. The maximum value (the value at which rollover occurs) depends on the Frame List Size field of the USBCMD register. For example, if the Frame List Size is 1024 frame, rollover occurs every time FRIMDEX [13] toggles. If the Frame List Size is 512 frame, rollover occurs every time FRINDEX [12] toggles. If the Frame List Size is 256 frame, rollover occurs every time FRINDEX [11] toggles. Writing 1b to this bit can clears this bit. Writing 0b to this bit has no effect. 0b: The frame list is not returned to H'000. 1b: The frame list is returned to H'000 (rollover occurred).
2	Port Change Detect	0	R/W (1)	This bit indicates that the port status has changed. Among the ports for which the Port Owner bit of the PORTSC1 register is set to 0b, if any port satisfies one of the following conditions, the host controller sets this bit to 1b: • Connect or Disconnect status of a device is detected, and the Connect Status Change bit of the PORTSC1 register is changed from 0 to 1. • A change of the Enable status of the port is detected, and the Port Enable/Disable Change bit of the PORTSC1 register is changed from 0 to 1. • The overcurrent state is detected, and the Over-current Change bit of the PORTSC1 register is changed from 0 to 1. • J-K transition is detected on a port in the Suspend status, and the Force Port Resume bit of the PORTSC1 register is changed from 0 to 1. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.
1	USBERRINT	0	R/W (1)	USB Error Interrupt This bit indicates that a USB transaction finished with an error. When a USB transaction finishes with an error, the host controller sets this bit to 1b. If 1b is set to the IOC bit of qTD at which an error interrupt occurred, 1b is set to both of this bit and USBINT bit. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: USB transaction is normal. 1b: USB transaction finished with an error.

Bit	Bit Name	Initial Value	R/W	Description
0	USBINT	0	R/W (1)	USB Interrupt This bit indicates that a USB transfer has finished. The host controller sets this bit to 1b if one of the following conditions is satisfied: ● A USB transfer has finished. ● A short packet is received. Even if a USB transfer finished with an error, if IOC (Interrupt On Complete) of the TD is set to 1b, this bit is set to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: A USB transfer has not finished. 1b: A USB transfer has finished.

(3) USBINTR Register

Register abbreviation: USBINTR

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	Port-1 Change Event Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	Interrupt on Async Advance Enable	Host System Error Enable	Frame List Rollover Enable	Port Change Detect Enable	USB Error Interrupt Enable	USB Interrupt Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved The write value should always be 0.
16	Port-1 Change EventEnable	0	R/W	If this bit is 1b and the Port Change Detect bit of the USBSTS register is set to 1b, the host controller issues an interrupt.
15 to 6	—	All 0	R	Reserved The write value should always be 0.
5	Interrupt on Async Advance Enable	0	R/W	This bit sets whether bit 5 (Interrupt on Async Advance [IAA] bit) of the USBSTS register is enabled or disabled. If the IAA bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the IAA bit).
4	Host System Error Enable	0	R/W	This bit sets whether bit 4 (Host System Error [HSE] bit) of the USBSTS register is enabled or disabled. If the HSE bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the HSE bit).
3	Frame List Rollover Enable	0	R/W	This bit sets whether the bit 3 (Frame List Rollover [FLR] bit) of the USBSTS register is enabled or disabled. If the FLR bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the FLR bit).
2	Port Change Detect Enable	0	R/W	This bit sets whether bit 2 (Port Change Detect [PCD] bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the PCD bit).
1	USB Error Interrupt Enable	0	R/W	This bit sets whether bit 1 (USBERRINT bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBERRINT bit).

Bit	Bit Name	Initial Value	R/W	Description
0	USB Interrupt Enable	0	R/W	This bit sets whether bit 0 (IUSBINT bit) of the USBSTS register is enabled or disabled. If the USBINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBINT bit).

(4) FRINDEX Register

Register abbreviation: FRINDEX

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	Frame Index[13:8]						Frame Index[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

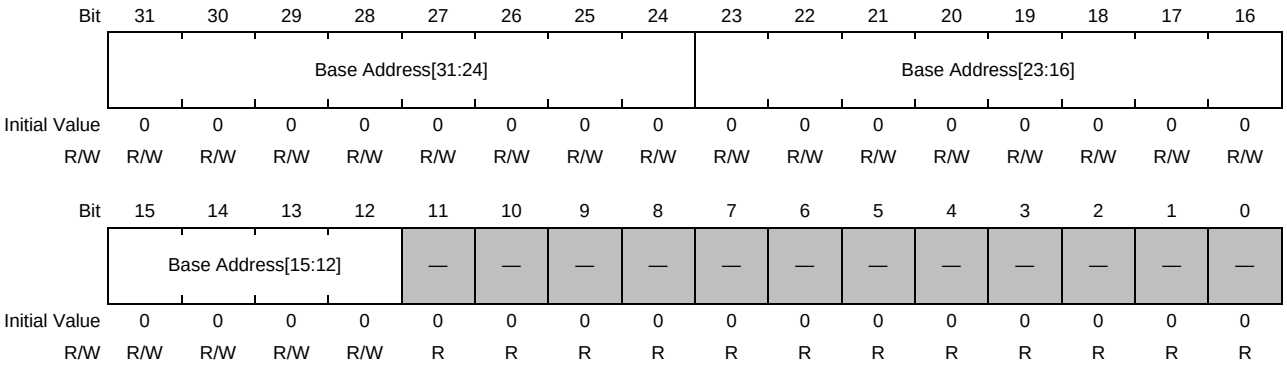
Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	Frame Index[13:0]	All 0	R/W	This field is used by the host controller to add an index to the periodic frame list. The value in this field is incremented at the end of a micro frame. Bit [N:3] of this field is used as the Frame List Current index. This means that, before the next index arrives, the current frame list is accessed 8 times. The value for N is determined, as follows, by the setting value of bit [3:2] (Frame List Size field) of the USBCMD register.

Frame List Size	Number of Frames	N
00b	1024	12
01b	512	11
10b	256	10
11b	32	12

Access this register only when the host controller is in stop status (bit 12 [HCHalted] = 1b). The setting value of this field is applied to the SOF frame number of the SOF token.

(5) CTRLDSSEGMENT Register

Register abbreviation: CTRLDSSEGMENT

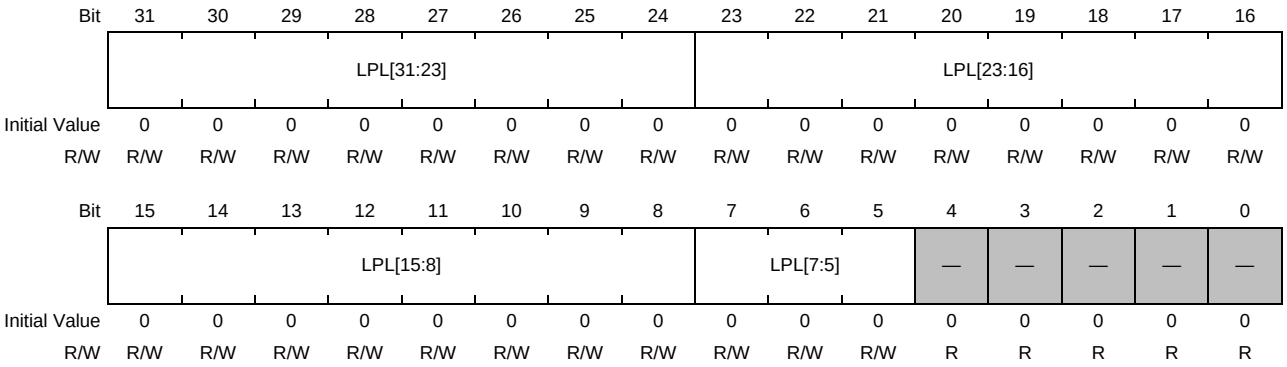


Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CTRLDSSEGMENT[31:24]								CTRLDSSEGMENT[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTRLDSSEGMENT[15:8]								CTRLDSSEGMENT[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTRLDSSEGMENT	All 0	R	This register is not used because this module does not support 64-bit address method. Therefore, HCD must not access this register.

(6) PERIODICLISTBASE Register



Register abbreviation: PERIODICLISTBASE

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	Base Address	All 0	R/W	This field indicates the head address of the periodic frame list on the system memory. The host controller loads the contents of this register before starting the list processing. The host controller determines the frame list to be processed by using this field and Frame Index of the FRINDEX register. Align the address of the periodic frame list by 4 Kbyte. Normal operation is not guaranteed if any of these bits are changed during operation.
11 to 0	—	All 0	R	Reserved The write value should always be 0.

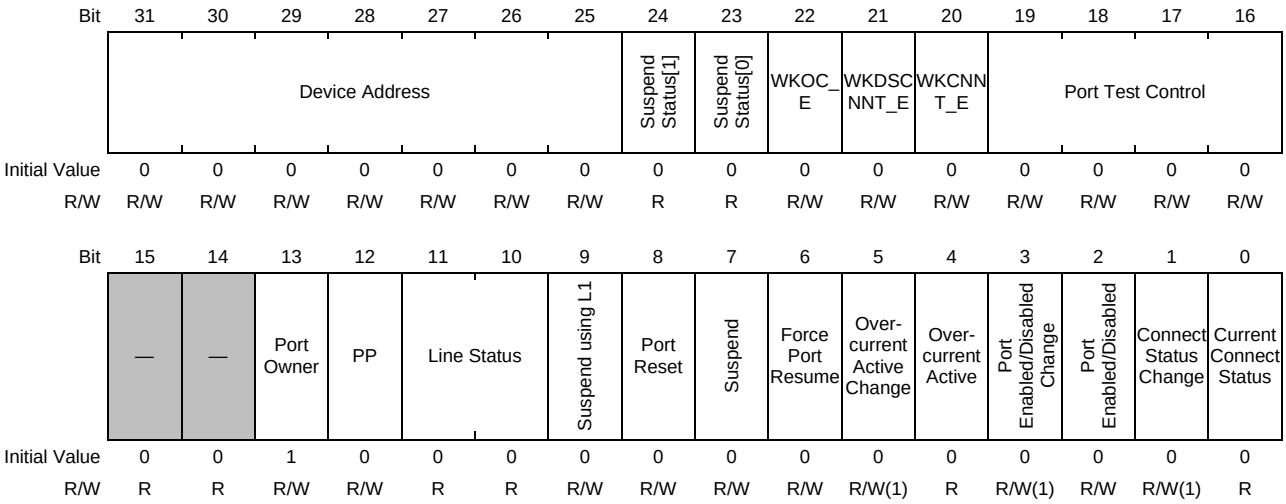
(7) ASYNCLISTADDR Register

Register abbreviation: ASYNCLISTADDR

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	LPL	All 0	R/W	Link Pointer Low This field indicates the address (on the system memory) of the Asynchronous Queue Head to be processed next time. Align the address of Asynchronous Queue Head by 32 byte.
4 to 0	—	All 0	R	Reserved The write value should always be 0.

(8) CONFIGFLAG Register

Register abbreviation: CONFIGFLAG



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved The write value should always be 0.
0	CF	0	R/W	Configuration Flag This bit controls which of OHCI or EHCI is routed by the port routing control circuit by default. At the end of the host controller configuration, this bit is set to 1b. 0b: The port routing control circuit routes each port to the OHCI host controller by default. 1b: The port routing control circuit routes each port to the EHCI host controller by default.

(9) PORTSC1Register

Register abbreviation: PORTSC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	Device Address	All 0	R/W	This field indicates the USB device address (7 bits) of the device connected to the down port. This address is used when the LPM Token is sent. If the value of this filed is H'00, it means that no device that needs to use this field has been connected.
24, 23	Suspend Status	All 0	R	This field indicates the response from the connected device to the LPM Token (L1 transition request). 00b: The device succeeded transition to the L1 state (ACK received from the device). 01b: The device has not changed to the L1 state (NYET received from the device). 10b: The device does not support the L1 state transition (STALL received from the device). 11b: Other response (for example, Timeout error) Change this field only when the Suspend bit is 0b.
22	WKOC_E	0	R/W	Wake on Overcurrent Enable By writing 1b to this bit, the overcurrent state can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
21	WKDSCNNT_E	0	R/W	Wake on Disconnect Enable By writing 1b to this bit, device disconnection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
20	WKCNNT_E	0	R/W	Wake on Connect Enable By writing 1b to this bit, device connection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>19 to 16</td><td>Port Test Control</td><td>All 0</td><td>R/W</td><td>This field is controlled by the test mode.
If the value of this field is other than 0000b, it indicates that this module is running in the test mode.

<tr><td></td><td></td><td></td><td>EHCI port reset is executing.</td></tr>
</table></td></tr>
</table>

Bit	Bit Name	Initial Value	R/W	Description
9	Suspend using L1	0	R/W	Suspend using L1 (LPM) control bit. If 1b is written to the Suspend bit (bit 7) while this bit is 1b, the state of this module is changed to the LPM state. Writing to this bit is possible only when the Suspend bit (bit 7) is 0b. 0b: Suspend using L2 1b: Suspend using L1 (LPM) If this bit is 1b and the Device Address field is other than H'0000, when the Suspend bit is set to 1b, the host controller generates an LPM Token to change the state to the L1 state. If this bit is 0b, the host controller operates as L2 Suspend.
8	Port Reset	0	R/W	This bit indicates the reset status of the port. 0b: The port is not being reset. 1b: The port is being reset. If 1b is written to this bit while this bit is 0b, the bus reset sequence defined in USB 2.0 standard starts. To finish the bus reset sequence, 0b must be written to this bit. Note that this bit must remain 1b long time enough to guarantee that the bus reset sequence defined in USB 2.0 standard will be complete. If bit 12 (HCHalted) of the USBSTS register is 1b, do not set this bit to 1b. If any of the PP (Port Power) bit, Port Owner bit, and Current Connect Status bit is in the following status, this bit becomes 0b. *Note*: Even if 1b is written to this bit, the bus reset sequence does not start. • PP (Port Power) bit = 0b • Port Owner bit = 1b • Current Connect Status bit = 0b
7	Suspend	0	R/W	This bit indicates the Suspend control and status of the port. This bit and bit 2 (Port Enabled/Disabled bit) indicate the following port status. To change the port state to L1 or L2 Suspend, set this bit to 1b. Whether the host controller supports L1 Suspend state or L2 Suspend state depends on the value in the Suspend Using L1 bit. In the Suspend state, data transfer to the downstream port is blocked by this port (except for port reset). If this bit is set to 1b during data transfer, blocking of transfer data does not occur until the current data transfer finishes. Writing 0b to this bit has no effect. This bit can be set to 1b only when all the following conditions are satisfied: "PP (Port Power) bit = 1b", "Port Owner bit = 0b", and "Current Connect Status bit = 1b". If any of the following conditions is satisfied, the host controller clears this bit: • "Resume is complete" is detected. • The PR bit is set to 1b when PR (Port Reset) bit is 0b. • The port owner is 1b (OHCI). • The PP (Port Power) bit is set to 0b. • The Port Enabled/Disabled bit is set to 0b.

Port Enabled	Suspend	Port Status
0b	—	Disable
1b	0b	Enable
	1b	Suspend

Bit	Bit Name	Initial Value	R/W	Description
6	Force Port Resume	0	R/W	This bit indicates that the Resume state of the port is detected. 0b: Resume signal is not detected or output. 1b: Resume (K-state) is detected or output. When the port is in Suspend state, if the host controller detects transition of the state from J to K (if RemoteWakeup is detected from the connected device), it sets this bit to 1b. The host controller also sets the Port Change Detect bit or Port-1 Changes Detect bit of the USBSTS register to 1b. If this bit is set to 1b, the host controller does not set 1b to the Port Change Detect bit and Port-1 Changes Detect bit of the USBSTS register. While this bit is 1b, the Resume signal (FS K) is driven onto the USB bus. For L2 transition, this bit must be cleared to 0b after an appropriate time has passed. By writing 0b to this bit while this bit is 1b, the port status is recovered to be the HS Idle status. This bit remains 1b until the port is recovered. The host controller must finish transition to the HS Idle state within 2msec since this bit is cleared to 0b. On the other hand, for L1 transition, the host controller sends a Resume signal at necessary timing, and this bit is cleared to 0b at Resume recovery. Note that the software sets the length of the Resume signal driven by the host controller, by using the Host-Initiated Resume Duration field of the USBCMD register. If the Port Power (PP) bit is 0b, this bit becomes 0b.
5	Over-current Change	0	R/W (1)	This bit indicates that bit 4 (Over-current Active bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: Over-current Active bit has not changed. 1b: Over-current Active bit has changed.
4	Over-current Active	0	R	This bit indicates the overcurrent status of the port. If the host controller detects overcurrent, it disables the port, and set this bit to 1b. After the overcurrent state is released, the host controller automatically clears this bit from 1b to 0b. 0b: The port is not in overcurrent state. 1b: The port is in overcurrent state.
3	Port Enable/ Disable Change	0	R/W (1)	This bit indicates that the host controller detected frame babble. If the Host Controller detects frame babble, it disables the port and sets this bit to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: Frame babble has not occurred. 1b: Frame babble is detected.
2	Port Enabled/ Disabled	0	R/W	This bit indicates the Enable/Disable status of the port. The host controller resets the port, and enables the port if the connected device is recognized as an HS device, and sets this bit to 1b. The software cannot set this bit to 1b. If the host controller detects disconnection of a device or other errors, it disables the port, and clears this bit to 0b. The port also becomes disabled when 0b is written to this bit. If the port is disabled, data transfer to the downstream port is blocked except for port reset. If Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the port becomes enabled, and this bit is set to 1b. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The port is disabled. 1b: The port is enabled.
1	Connect Status Change	0	R/W (1)	This bit indicates that bit 0 (Current Connect Status bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The Current Connect Status bit has no change. 1b: The Current Connect Status bit has changed.

Bit	Bit Name	Initial Value	R/W	Description
0	Current Connect Status	0	R	This bit indicates the connection status of the port. If the host controller detects connection of a device, it sets this bit to 1b. Also, if Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the Host Controller sets this bit to 1b even if no device is connected. On the other hand, if the host controller detects disconnection of a device, it sets this bit to 0b. If the Port Power (PP) bit is 0b, or the Port Owner (PO) bit is 0b, this bit becomes 0b. 0b: No device is connected to the port. 1b: A device is connected to the port.

6.5A.2.4.4 AHB Bridge Register

(1) INT_ENABLE Register

Abbreviated name of register: INT_ENABLE

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	WAKEON_INTEN	UCOM_INTEN	USBH_INTBEN	USBH_INTAEN	AHB_INTEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved The write value should always be 0.
4	WAKEON_INTEN	0	R/W	This bit enables or disables bit 4 (WAKEON_INT) of the INT_STATUS register. 0b: Disable 1b: Enable
3	UCOM_INTEN	0	R/W	This bit enables or disables bit 3 (UCOM_INT) of the INT_STATUS register. 0b: Disable 1b: Enable
2	USBH_INTBEN	0	R/W	This bit enables or disables bit 2 (USBH_INTB) of the INT_STATUS register. 0b: Disable 1b: Enable
1	USBH_INTAEN	0	R/W	This bit enables or disables bit 1 (USBH_INTA) of the INT_STATUS register. 0b: Disable 1b: Enable
0	AHB_INTEN	0	R/W	This bit enables or disables bit 0 (AHB_INT) of the INT_STATUS register. 0b: Disable 1b: Enable

(2) INT_STATUS Register

Abbreviated name of register: INT_STATUS

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	WAKEON_INT	UCOM_INT	USBH_INTB	USBH_INTA	AHB_INT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R	R	R	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved The write value should always be 0.
4	WAKEON_INT	0	R/W (1)	This bit indicates the state of WAKEON interrupt from the HOST module. Writing 1b to this bit can clear this bit. 0b: No WAKEON interrupt 1b: WAKEON interrupt
3	UCOM_INT	0	R	This bit indicates the state of interrupt from the UCOM register. To clear the interrupt, use the UCOM2 Register. 0b: No UCOM register interrupt 1b: UCOM register interrupt
2	USBH_INTB	0	R	This bit indicates the state of EHCI interrupt. To clear the interrupt, use the USBSTS Register (of the EHCI Operational Register). 0b: No INTB interrupt 1b: INTB interrupt
1	USBH_INTA	0	R	This bit indicates the state of OHCI interrupt. To clear the interrupt, use the HcInterruptStatus Register (of the OHCI Operational Register). 0b: No INTA interrupt 1b: INTA interrupt
0	AHB_INT	0	R/W (1)	This bit indicates that a BUS Master error occurred. Writing 1b to this bit can clear this bit. 0b: No bus error occurred. 1b: A bus error occurred.

(3) AHB_BUS_CTR Register

Abbreviated name of register: AHB_BUS_CTR

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT_TYPE				—	—	—	PROT_MODE	—	—	ALIGN_ADDRESS		—	—	MAX_BURST_LEN	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The write value should always be 0.
15 to 12	PROT_TYPE	All 0	R/W	This field sets MHPROT [3:0] used when the BUS Master interface issues a transfer request. bit 15 0b: Cache disabled. 1b: Cache enabled. bit 14 0b: Buffer disabled. 1b: Buffer enabled. bit 13 0b: User access 1b: Privileged access bit 12 0b: Operation code 1b: Data
11 to 9	—	All 0	R	Reserved The write value should always be 0.
8	PROT_MODE	0	R/W	This bit selects the mode of MHPROT [3:0] used when the Master interface issues a transfer request. 0b: The value of PROT_TYPE is output as MHPROT [3:0]. 1b: When a DMA transfer is performed, MHPROT [3:0] is set to 0000b if the final burst is performed, or MHPROT [3:0] is set to the PROT_TYPE value if another burst transfer is performed.
7, 6	—	All 0	R	Reserved The write value should always be 0.
5, 4	ALIGN_ADDRESS	All 0	R/W	This field sets the address boundary used when the BUS Master interface issues a burst transfer. 00b: A burst transfer is issued so that not to exceed 1-Kbyte boundary. 01b: A burst transfer is issued so that not to exceed 64-byte boundary. 10b: A burst transfer is issued so that not to exceed 32-byte boundary. (The maximum burst length is INCR8. This is because, if INCR16 is used, 32-byte boundary is exceeded.) 11b: A burst transfer is issued so that not to exceed16 byte boundary. (The maximum burst length is INCR4. This is because, if the length is at least INCR8, 16-byte boundary is exceeded.)
3,2	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	MAX_BURST_LEN	All 0	R/W	This field selects the maximum burst length used when the BUS Master interface issues a transfer request. 00b: Setting prohibited 01b: Setting prohibited 10b: INCR4 11b: SINGLE

(4) USBCTR Register

Abbreviated name of register: USBCTR

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DIRPD	PLL_RST	USBH_RST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved The write value should always be 0.
2	DIRPD	0	R/W	USBPHY Standby Mode Control 0b: USBPHY normal operating mode 1b: USBPHY standby mode *Note*: When the USB module is not in use, setting this bit to 1 reduces power consumption by the USBPHY module. Only set it to 1 when the USB module is not in use. In transitions from USBPHY standby mode to USBPHY normal operating mode, assert the reset signal for the USBPHY module for at least 1 µs before the transition.
1	PLL_RST	1	R/W	This bit controls resetting of the USBPHY module. 0b: The USBPHY reset is released. 1b: The USBPHY module is reset.
0	USBH_RST	0	W	Software reset to this module. Setting this bit to 1b resets this module entirely. This bit is always read as 0b. *Note*: Set this bit only when the BUS Master interface of this module is not running. Access to this module becomes valid 10 CLK (internal bus clock [P1ϕ]) after this bit is written. 0b: Nothing occurs. 1b: Reset is issued to this module.

(5) Register Enable/Clock Gating Control Register

Abbreviated name of register: REGEN_CG_CTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NONUSE_CLK_MSK	—	HOST_CLK_MSK	PERI_CLK_MSK	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

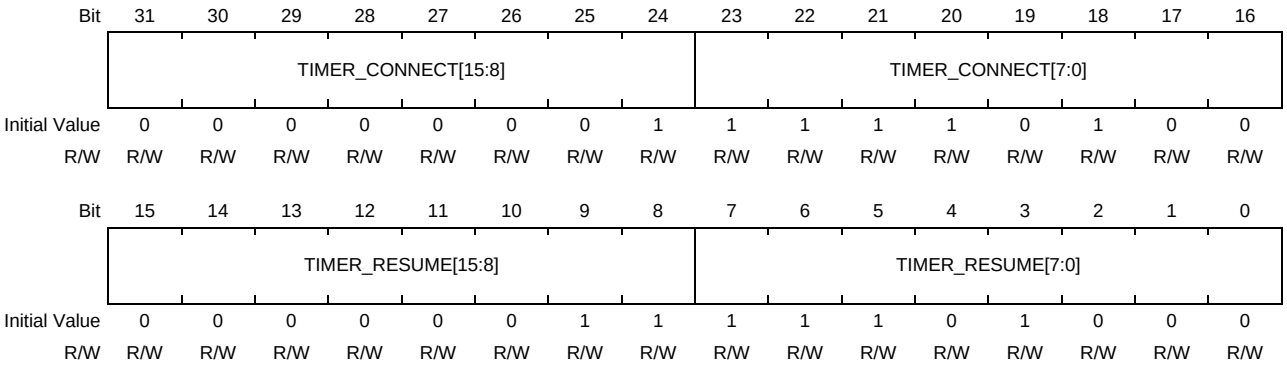
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	NONUSE_CLK_MSK	0	R/W	This bit is used to mask the clock for the unused host or peripheral controller, depending on the setting value of the OTG_PERI bit of the COMMCTRL register. 0b: Do not mask the clock. 1b: Mask the clock. For details, see **6.5A.3.1.2 Specifications of NONUSE_CLK_MSK operation**.
30	—	0	R	Reserved The write value should always be 0.
29	HOST_CLK_MSK	0	R/W	This bit is used to forcibly mask clock supply to the host controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see **6.5A.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**.
28	PERI_CLK_MSK	0	R/W	This bit is used to forcibly mask the clock supply to the peripheral controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see **6.5A.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**.
27 to 24	—	All 0	R	Reserved The write value should always be 0.
23 to 0	—	All 0	R	Reserved The write value should always be 0.

(6) Suspend Control Register

Abbreviated name of register: SPD_CTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SUSPENDM_ENABLE	SLEEPM_ENABLE	—	—	—	—	—	—	WKCNNT_ENABLE	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

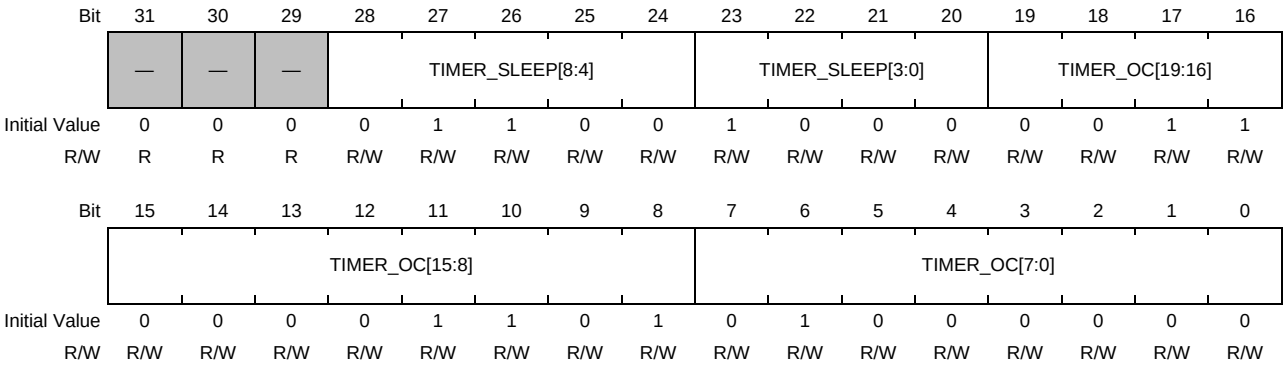


Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GLOBAL_SUSPENDM_P1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SUSPENDM_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the suspend status (the state in which PHY built-in PLL is stopped) when this module is changed to the USB Suspend mode. If this bit is set to 1b, the Suspend related bits of the OHCI/EHCI Operational registers below are set. If this module is changed to the USB Suspend mode, USBPHY is placed into the suspend status. [This function is valid for the following OHCI/EHCI Operational registers] EHCI: bit [7] (Suspend bit) of the PORTSC1 register OHCI: bit [2] (PSS bit) of the HcRhPortStatus register OHCI: bit [7:6] (HCFS field) of the HcControl register
30	SLEEPM_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the sleep status when the LPM function is used to change to the L1 Suspend mode. (In the sleep status, the PHY built-in PLL is running, but the 60MHz clock from USBPHY is gated.) This bit is valid when "Suspend using L1" of the POTSC register is 1b. If this bit is set to 1b, an L1 transition request is issued to the device. If the request is accepted, USBPHY is placed into the sleep status after the following EHCI register bit is set to 1b. [This function is valid for the following OHCI/EHCI Operational register] EHCI: bit [7] (Suspend bit) of the PORTSC1 register
29 to 24	—	All 0	R	Reserved The write value should always be 0.
23	WKCNNT_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (the OTG_PERI bit of the COMMCTRL register is 0b). If this bit is set to 1b, when a device disconnect occurs while USBPHY is in the suspend or sleep status, the suspend or sleep status is released. This bit is valid only when the SUSPENDM_ENABLE bit (bit 31) or SLEEP_ENABLE bit (bit 30) is 1b. *Note*: To set 1b to the SUSPENDM_ENABLE bit (bit 31) or SLEEPM_ENABLE bit (bit 30), as the general rule, set this bit to 1b. If, in the above case, this bit is not set to 1b, the suspend or sleep status cannot be released even if a device disconnect occurs.
22 to 1	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	GLOBAL_SUSPENDM_P1	0	R/W	The setting of this bit is valid regardless of the value of the OTG_PERI bit of the COMMCTRL register. This bit is used to forcibly place USBPHY into the suspend status (in which the PHY built-in PLL is stopped). If this bit is set to 1b, USBPHY is placed into the suspend status, regardless of the operating status and port status of the host controller. *Note*: – Do not set this bit to 1b during data transfer. We recommend that you set this bit to 1b after “stopping the EHCI/OHCI list processing” and “placing the port in the disabled status”. – If the SUSPENDM_ENABLE bit (bit 31) is 1b, do not set this bit to 1b.

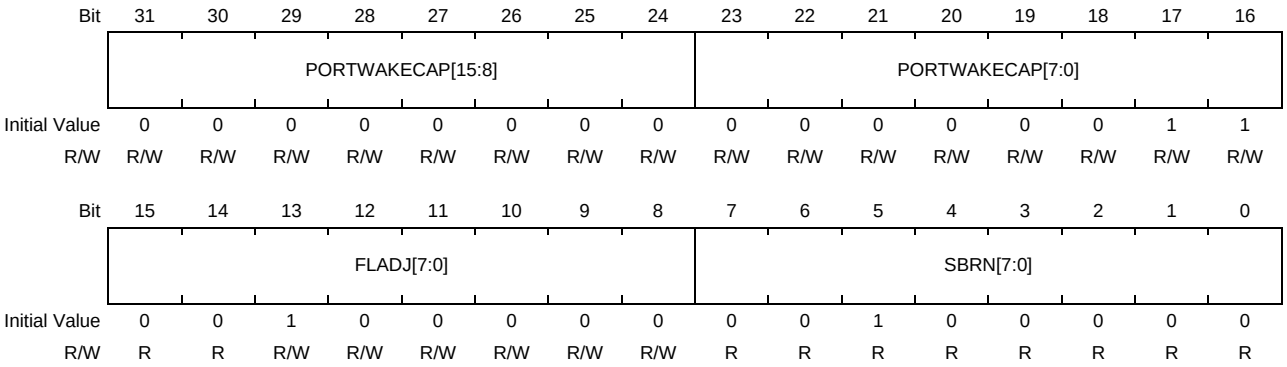
(7) Suspend/Resume Timer Setting Register



Abbreviated name of register: SPD_RSM_TIMSET

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TIMER_CONNECT[15:0]	H’01F4	R/W	This field indicates the timer value used by USBPHY to detect Device Connect/Disconnect of the device in the suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether Connect/Disconnect occurs is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 2.5 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: At least H’FA
15 to 0	TIMER_RESUME[15:0]	H’03E8	R/W	This field indicates the timer value used by USBPHY to detect RemoteWakeup signal from the device in suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 5 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: At least H’1F4

(8) Overcurrent Detection/Sleep Timer Setting Register



Abbreviated name of register: OC_SLP_TIMSET

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The write value should always be 0.
28 to 20	TIMER_SLEEP[8:0]	H'0C8	R/W	This field indicates the timer value used by USBPHY when the SLEEPM_ENABLE bit of the SPD_CTRL register is set to 1b. This timer value is used to measure the time for detecting RemoteWakeup reception and Resume-K drive time during sleep status (in which the PHY built-in PLL is running, but 60MHz clock from the USBPHY is gated). When USBPHY is in sleep status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes 1 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: H'064
19 to 0	TIMER_OC[19:0]	H'30D40	R/W	This field indicates the timer value used for overcurrent detection. If the overcurrent input (OVRCUR) set in this field is continuously asserted (0b) for the duration set in this register, this module determines that overcurrent occurred. According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 1 ms. 1 bit is 1 cycle (µs). (Setting guideline) For 100 MHz and 1 ms: At least H'1_86A0

(9) SBRN_FLADJ_PORTWAKECAP Register

Abbreviated name of register: SBRN_FLADJ_PW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PORTWAKECAP[15:0]	H'0003	R/W	This field is used to mask the ports (of the connected device) that are used for Wakeup event. Operation on this field has no effect on the operation of the HOST module.
15 to 8	FLADJ[7:0]	H'20	R, R/W	This field adjusts the length of one micro frame by 16HS bit time unit. The initial value indicates H'20 (60000d HS bit time).
7 to 0	SBRN[7:0]	H'20	R	This field indicates the Serial Bus Release Number. The fixed value "H'20" is indicated.

(10) PORT_LPM_CTR1 Register

Abbreviated name of register: PORT_LPM_CTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	NYET_RETRY_CNT_P1[3:0]				REMOTEWAKE_EN_P1	SLEEP_INT_EN_P1	RETRY_ENABLE_NYET_P1	HIRD_SEL_P1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 4	NYET_RETRY_CNT_P1[3:0]	All 0	R/W	This field sets the number of retries that are allowed when the response from the device in the LPM transaction was NYET. The setting value of this bit is valid if the RETRY_ENABLE_NYET_P1 bit (bit 1) is 1b. 0000b: No retry. 0001b to 1111b: Retries the set number of times. (MAX: 15 retries)
3	REMOTEWAKE_EN_P1	0	R/W	This bit is used to indicate the value of the RemoteWakeup bit of the LPM Token. 0b: RemoteWakeup is supported. 1b: RemoteWakeup is not supported.
2	SLEEP_INT_EN_P1	0	R/W	This bit is used to enable an interrupt to occur when a status other than ACK is received in the LPM transaction. The Per-Port Change interrupt can occur. 0b: No interrupt occurs. 1b: An interrupt occurs.
1	RETRY_ENABLE_NYET_P1	0	R/W	This bit is used to set the behavior of the host controller when a response from the device is NYET in an LPM transaction. 0b: No retry. 1b: Retries are made.

Bit	Bit Name	Initial Value	R/W	Description
0	HIRD_SEL_P1	0	R/W	This bit sets the time for K drive for when recovered from the Sleep state. Based on the setting values of this bit and EHCI USBCMD Register bit [27:24], the K drive time is determined as follows.

USBCMD Register	HIRD_SEL_P1 (Setting value of this bit)	
bit [27:24]	0b	1
0000b	75 µs	50 µs
0001b	100 µs	125 µs
0010b	150 µs	200 µs
0011b	250 µs	275 µs
0100b	350 µs	350 µs
0101b	450 µs	425 µs
0110b	950 µs	500 µs
0111b	1950 µs	575 µs
1000b	2950 µs	650 µs
1001b	3950 µs	725 µs
1010b	4950 µs	800 µs
1011b	5950 µs	875 µs
1100b	6950 µs	950 µs
1101b	7950 µs	1025 µs
1110b	8950 µs	1100 µs
1111b	9950 µs	1175 µs

6.5A.2.4.5 UCOM Register

(1) Common Control Register

Abbreviated name of register: COMMCTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OTG_PERI	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	OTG_PERI	1	R/W	This bit specifies whether this module is set to the host mode or function mode. 0b: Host mode 1b: Function mode
30 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.

(2) OTG-BC Interrupt Status Register

Abbreviated name of register: OBINTSTA

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPMONCHG_STA	DMMONCHG_STA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CHGDETCHG1_STA	—	PDDETCHG1_STA	—	—	OCINT_STA	IDCHG_STA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R/W(1)	R	R/W(1)	R	R	R/W(1)	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	DPMONCHG_STA	0	R/W (1)	This bit is set if the DPMON bit of the LINECTRL1 register has changed. 0b: The DPMON bit of the LINECTRL1 register has not changed. 1b: The DPMON bit of the LINECTRL1 register has changed.
16	DMMONCHG_STA	0	R/W (1)	This bit is set if the DMMON bit of the LINECTRL1 register has changed. 0b: The DMMON bit of the LINECTRL1 register has not changed. 1b: The DMMON bit of the LINECTRL1 register has changed.
15 to 7	—	All 0	R	Reserved The write value should always be 0.
6	CHGDETCHG1_STA	0	R/W (1)	This bit is set if the CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. 0b: The CHGDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b 1b: The CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.
5	—	0	R	Reserved The write value should always be 0.
4	PDDETCHG1_STA	0	R/W (1)	This bit is set if the PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. 0b: The PDDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b. 1b: The PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.
3	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	OCINT_STA	0	R/W (1)	This bit is set if the OVRCUR pin is asserted. 0b: The OVRCUR pin is not asserted (and remains 1b). 1b: The OVRCUR pin is asserted (and became 0b).
0	IDCHG_STA	1	R/W (1)	This bit is set if the input value from the OTG_ID pin has changed. 0b: There is no change in the OTG_ID pin. 1b: There is a change in the OTG_ID pin. *Note*: The initial value is 1. Before using this bit, clear the status.

(3) OTG-BC Interrupt Enable Register

Abbreviated name of register: OBINTEN

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPMONCHG_EN	DMMONCHG_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CHGDETCHG1_EN	—	PDDETCHG1_EN	—	—	OCINT_EN	IDCHG_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	DPMONCHG_EN	0	R/W	DPMONCHG_STA bit interrupt enable 0b: Interrupt via the DPMONCHG_STA bit is disabled. 1b: Interrupt via the DPMONCHG_STA bit is enabled.
16	DMMONCHG_EN	0	R/W	DMMONCHG_STA bit interrupt enable 0b: Interrupt via the DMMONCHG_STA bit is disabled. 1b: Interrupt via the DMMONCHG_STA bit is enabled.
15 to 7	—	All 0	R	Reserved The write value should always be 0.
6	CHGDETCHG1_EN	0	R/W	CHGDETCHG1_STA bit interrupt enable 0b: Interrupt via the CHGDETCHG1_STA bit is disabled. 1b: Interrupt via the CHGDETCHG1_STA bit is enabled.
5	—	0	R	Reserved The write value should always be 0.
4	PDDETCHG1_EN	0	R/W	PDDETCHG1_STA bit interrupt enable 0b: Interrupt via the PDDETCHG1_STA bit is disabled. 1b: Interrupt via the PDDETCHG1_STA bit is enabled.
3	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	OCINT_EN	0	R/W	OCINT_STA bit interrupt enable 0b: Interrupt via the OCINT_STA bit is disabled. 1b: Interrupt via the OCINT_STA bit is enabled.
0	IDCHG_EN	0	R/W	IDCHG_STA bit interrupt enable 0b: Interrupt via the IDCHG_STA bit is disabled. 1b: Interrupt via the IDCHG_STA bit is enabled.

(4) VBUS Control Register

Abbreviated name of register: VBCTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VGPUO	—	—	—	VBOUT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved The write value should always be 0.
29	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
28 to 22	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
21	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
20 to 17	—	All 0	R	Reserved The write value should always be 0.
16	—	1	R	Reserved The write value should always be 1.
15 to 5	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
4	VGPUO	0	R/W	The level corresponding to the inverse of this bit (in terms of positive logic) is output from the OTG_EXICEN pin. This bit is used, for example, for control of the external power IC.
3 to 1	—	All 0	R	Reserved The write value should always be 0.
0	VBOUT	0	R/W	This bit is one of the VBUSEN control bits. This bit is used to assert VBUS by controlling the external power IC. 0b: VBUS output disable 1b: VBUS output enable If overcurrent occurs, this bit is automatically cleared to 0.

(5) Line Control Port 1 Register

Abbreviated name of register: LINECTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	DPRPU_EN	DP_RPU	DPRPD_EN	DP_RPD	DMRPD_EN	DM_RPD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	DPMON	DMMON	—	IDMON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved
25, 24	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23, 22	—	All 0	R	Reserved
21	DPRPU_EN	0	R/W	This bit enables the DP_RPU (bit 20) setting for pullup control of D+ in port 1. 0: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is disabled. 1: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is enabled.
20	DP_RPU	0	R/W	This bit controls pullup of D+ in port 1. This control is enabled only when DPRPU_EN (bit 21) = 1. Note that if this bit is cleared to 0 when DPRPU_EN (bit 21) = 1, D+ is in the floating state while no device drives the USB bus. Note also that setting DPRPD_EN (bit 19) and DP_RPD (bit 18) to enabled is prohibited while this bit is set to enabled - that is, enabling both pullup and pulldown of D+ together is prohibited. 0: Pullup of D+ in port 1 is disabled. 1: Pullup of D+ in port 1 is enabled.
19	DPRPD_EN	0	R/W	This bit enables DP_RPD (bit 18) to control USB bus (DP) 15 kΩ Pulldown resister. 0b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is disabled. 1b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is enabled.
18	DP_RPD	0	R/W	This bit controls USB bus (DP) 15 kΩ Pulldown resister when DPRPD_EN (bit 19) = 1b. 0b: DP-side 15 kΩ Pulldown resister is OFF. 1b: DP-side 15 kΩ Pulldown resister is ON.
17	DMRPD_EN	0	R/W	This bit enables DM_RPD (bit 16) to control USB bus (DM) 15 kΩ Pulldown resister. 0b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is disabled. 1b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is enabled.
16	DM_RPD	0	R/W	This bit controls USB bus (DM) 15 kΩ Pulldown resister when DMRPD_EN (bit 17) = 1b. 0b: DM-side 15 kΩ Pulldown resister is OFF. 1b: DM-side 15 kΩ Pulldown register is ON.
15 to 4	—	All 0	R	Reserved The write value should always be 0.
3	DPMON	0	R	This bit indicates the value of USB bus DP.
2	DMMON	0	R	This bit indicates the value of USB bus DM.
1	—	0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	IDMON	0	R	This bit indicates the value of the OTG_ID pin.

(6) BC Control Port 1 Register

Abbreviated name of register: BCCTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PDDETSTS	CHGDETSTS	—	—	DCPMODE	VDMSRCE	IDPSINKE	VDPSRCE	IDMSINKE	IDPSRCE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	H'00_C000	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
9	PDDETSTS	0	R	This bit indicates the USBPHY Portable Device Detect signal state.
8	CHGDETSTS	0	R	This bit indicates the USBPHY Charging Downstream Port Detect signal state.
7, 6	—	All 0	R	Reserved The write value should always be 0.
5	DCPMODE	0	R/W	If USBPHY is used as DCP (Dedicated Charging Port), this bit is set to 1b.
4	VDMSRCE	0	R/W	This bit controls the USBPHY built-in VDM_SRC circuit. If this bit is set to 1b, VDM_SRC goes ON, and the DM pin is driven.
3	IDPSINKE	0	R/W	This bit controls the USBPHY built-in Portable Device Detect circuit. If this bit is set to 1b, Portable Device detection is enabled.
2	VDPSRCE	0	R/W	This bit controls the USBPHY built-in VDP_SRC circuit. If this bit is set to 1b, VDP_SRC goes ON, and the DP pin is driven.
1	IDMSINKE	0	R/W	This bit controls the USBPHY built-in Charging Downstream Port Detect circuit. If this bit is set to 1b, Charging Downstream Port detection is enabled.
0	IDPSRCE	0	R/W	This bit controls the USBPHY built-in IDP_SRC circuit. If this bit is set to 1b, IDP_SRC goes ON, and the DP pin is driven.

6.5A.3 Clock Signals

6.5A.3.1 Clock Gating Specifications

6.5A.3.1.1 Overview of clock gating

Because this module has a feature of switching the host controller and peripheral controller, clock supply to the unused controller might not be necessary.

Therefore, three clock gating control bits are allocated in the Register Enable/Clock Gating Control Register for the purpose of reducing power consumption by implementing clock gating for the “circuits that do not require clock supply temporarily.”

The clock gating control bits can be controlled to gate the clock that is supplied to the host controller or the peripheral controller.

[Target Register]

Register Enable/Clock Gating Control Register (offset:H’304)

[Functional specification]

bit	Symbol	Functional specification
31	NONUSE_CLK_MSK	Gating clocks for unused host controller or peripheral controller.
29	HOST_CLK_MSK	Gating clocks for host controller.
28	PERI_CLK_MSK	Gating clocks for peripheral controller.

6.5A.3.1.2 Specifications of NONUSE_CLK_MSK operation

This function automatically gates the clock to the unused host controller or the unused peripheral controller.

This function is enabled if the NONUSE_CLK_MSK bit (bit 31) is set to 1b.

If it is no problem whether the clock supply to the unselected function is stopped, use this function.

The following table shows the operating specifications of this function, based on the setting of the OTG_PERI bit (bit 31) of the Common Control Register (offset: H’800).

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
1	0	0	0		✓
			1	✓	

[Note on using the NONUSE_CLK_MSK bit]

If the NONUSE_CLK_MSK bit is used, as the general rule, set the HOST_CLK_MSK/PERI_CLK_MSK bit to 0b.

If the HOST_CLK_MSK/PERI_CLK_MSK bit is 1b, the effect of clock gating becomes logical OR of each bit.

6.5A.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations

This function forcibly gates the clock to the host controller and function controller.

The following table shows the operating specifications of this function.

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
0	1	0	—	✓	
	0	1	—		✓
	1	1	0	✓	✓

Note: If the HOST_CLK_MSK/PERI_CLK_MSK bit is used, as the general rule, set the NONUSE_CLK_MSK bit to 0b.
If the NONUSE_CLK_MSK bit is set t0 1b, the effect of clock gating becomes logical OR of each bit.

6.5A.4 Interrupt Sources

6.5A.4.1 Interrupt Signals

This module has the five interrupt signals listed below.

Interrupt Source Name	Interrupt Type	Pulse/ Level	Active Level
U2H_INT	BUS Master interrupt signal. This signal is asserted when a bus error occurs in the BUS Master. Interrupt control is performed by the AHB Bridge Register.	Level	H
U2H_OHCI_INT	OHCI interrupt signal This signal is asserted during FS/LS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the OHCI Operational Register.	Level	H
U2H_EHCI_INT	EHCI interrupt signal. This signal is asserted during HS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_WAKEON_INT	EHCI Wakeup interrupt signal. This signal is asserted by an EHCI Wakeup event. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_OBINT	OTG/Battery Charging interrupt signal. This signal is asserted by OTG or Battery Charging related event. Interrupt control is performed by the UCOM2 Register.	Level	H

6.5A.4.2 Interrupt Sources and Control

6.5A.4.2.1 U2H_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the register below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H’200) bit[0] (AHB_INTEN)

[Interrupt source]

A bus error (MHRESP = 1b) occurs in the AHB master.

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:H’204) bit[0] (AHB_INT)

6.5A.4.2.2 U2H_OHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[1] (USBH_INTAEN)

OHCI Operational Register HcInterruptEnable Register (offset:H'010) bit[31], bit[6:0]*[1]

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting							
			HcInterruptEnable						
		USBH_INTAEN	bit [31] MIE	bit [6] RHSCE	bit [5] FNOE	bit [3] ROE	bit [2] SFE	bit [1] WDHE	bit [0] SOE
1	Device connection is detected.	✓	✓	✓					
2	Device disconnection is detected.	✓	✓	✓					
3	Port power is OFF (excluding overcurrent detection).	✓	✓	✓					
4	Babble error is detected during a USB transfer.	✓	✓	✓					
5	Resume is complete.	✓	✓	✓					
6	Overcurrent is detected.	✓	✓	✓					
7	Bus reset is complete.	✓	✓	✓					
8	When the HcRhDescritorB Register DR bit is 1b, OHCI becomes "USB Operational" (HCFS[1:0] bit = 10b) or "USB Suspend" (HCFS[1:0] bit = 11b).	✓	✓	✓					
9	When no device is connected (CCS bit = 0b), 1 is written to bit [0] (Clear Port Enable) of the OHCI HcRhPort Status register.	✓	✓	✓					
10	When no device is connected (CCS bit = 0b), 1 is written to bit [1] (Set Port Enable) of the OHCI HcRhPort Status register.	✓	✓	✓					
11	When no device is connected (CCS bit = 0b), 1 is written to bit [2] (Set Port Suspend) of the OHCI HcRhPort Status register.	✓	✓	✓					
12	When no device is connected (CCS bit = 0b), 1 is written to bit [3] (Clear Suspend Status) of the OHCI HcRhPort Status register.	✓	✓	✓					
13	When no device is connected (CCS bit = 0b), 1 is written to bit [4] (Set Port Reset) of the OHCI HcRhPort Status register.	✓	✓	✓					
14	When no device is connected (CCS bit = 1b), the port power is turned off.	✓	✓	✓					
15	The MSB of bit [15:0] (Frame Number) of the HcFmNumber register has changed.	✓	✓		✓				
16	RemoteWakeup signal (Resume signal) is detected from a device.	✓	✓			✓			
17	HccaFrameNumber is updated. (Almost the same meaning as SOF is sent.)	✓	✓				✓		
18	A transfer finishes (including an error), and the host module updated HccaDoneHead.	✓	✓					✓	
19	USB schedule overrun occurred for the frame.	✓	✓						✓

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

OHCI Operational Register HcInterruptStatus Register (offset:H'00C) bit[6:0]

6.5A.4.2.3 U2H_EHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.
AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[2] (USBH_INTBEN)

EHCI Operational Register USBINTR Register (offset:H'128) bit[16], bit[5:0]*1

Note 1. Enable the bit required as the assertion source.

Also, control the relevant bit(s) in the register below as required.

EHCI Operational Register USBCMD Register (offset:H'120) bit[15], bit[6]

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting								
			USBCMD		USBINTR					
			bit [15]	bit [6]	bit [16]	bit [5]	bit [3]	bit [2]	bit [1]	bit [0]
		USBH_INTBEN	Per-Port Change Event	Doorbell	Port-1 Change Event	Async Advance	Frame List Rollover	Port Change Detect	USB ERRINT	USB INT
[1]	Device connection is detected.	✓						✓		
[2]	Device disconnection is detected.	✓						✓		
[3]	Overcurrent is detected.	✓						✓		
[4]	RemoteWakeup signal (Resume Signal) is detected from a device.	✓								
[5]	Babble status of the USB bus is detected.	✓						✓		
[6]	USB transfer with "qTD IOC = 1b" normally finishes.	✓								✓
[7]	Short packet is received.	✓								✓
[8]	USB transfer finished with an error. (Retry transfer failed three times. A bubble error was detected. STALL was received.)	✓							✓	
[9]	The QH processing normally finished while the USBCMD Register bit [6] (Interrupt on Async Advance Doorbell) is 1b.	✓		✓		✓				
[10]	The FRINDEX Register FrameIndex bit returned from the maximum value to H'000 (rollover detected).	✓					✓			
[11]	The Port Change Detect event (interrupt source 1 to 5) was detected.	✓	✓		✓					

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

EHCI Operational Register USBSTS Register (offset:H'124) bit[16], bit[5:0]

6.5A.4.2.4 U2H_WAKEON_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[4] (WAKEON_INTEN)

EHCI Operational Register PORTSC[1:2] Register (offset:H'164/H'168) bit[22:20]*1

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting			
			PORTSC		
		WAKEON_INTEN	bit [22]	bit [21]	bit [20]
			WKOC_E	WKDSCNNT_E	WKCNNT_E
1	Device connection is detected.	✓			✓
2	Device disconnection is detected.	✓		✓	
3	Overcurrent is detected.	✓	✓		
4	RemoteWakeup signal (Resume Signal) is detected from a device.	✓			

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:H'204) bit[4] (WAKEON_INT)

6.5A.4.2.5 U2H_OBINT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[3] (UCOM_INTEN)

UCOM Register OTG-BC Interrupt Enable Register (offset:H'808) bit[17:16], bit[6], bit[4], bit[1:0]*[1]

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source	Registers That Require Interrupt Enable Setting		
		OTG-BC Interrupt Enable	
		bit [17]	bit [16]
	UCOM_INTEN	DPMONCHG_EN	DMMONCHG_EN
1 The DP pin has changed.	✓	✓	
2 The DM pin has changed.	✓		✓

Interrupt Source	Registers That Require Interrupt Enable Setting		
		OTG-BC Interrupt Enable	
		bit [6]	bit [4]
	UCOM_INTEN	CHGDETCHG1_EN	PDDETCHG1_EN
1 The portable device detection signal has changed.	✓		✓
2 The charging port detection signal has changed.	✓	✓	

Interrupt Source	Registers That Require Interrupt Enable Setting		
		OTG-BC Interrupt Enable	
		bit [1]	bit [0]
	UCOM_INTEN	OCINT_EN	IDCHG_EN
1 Overcurrent is detected. (The change of the OVRCUR pin from 1 to 0b is detected.)	✓	✓	
2 The OTG_ID pin has changed.	✓		✓

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

UCOM Register OTG-BC Interrupt Status Register (offset:H'804) bit[17:16], bit[6], bit[4], bit[1:0]

6.5A.4.3 Timing of De-asserting Interrupt Signals

After the register access to clear an interrupt source, it may take time to begin clearing the interrupt triggered by the interrupt source. Therefore, take a measure to prevent the false recognition of interrupts during the period from the end of the register clear access until the next interrupt is recognized.

6.5A.5 Power-Saving Function

This module controls power consumption by using the following two methods:

1. Controlling the SUSPENDM/SLEEPM pin of USBPHY
2. Using clock gating to stop the clock to the host controller or peripheral controller.

6.5A.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USBPHY

You can expect the following power-saving effects by asserting the SUSPENDM and SLEEPM pins of the USBPHY:

- Reducing the power consumption by the USBPHY
- Reducing the power consumption by the host core by stopping the clocks from the USBPHY

As described at **6.5A.1.2.5 Suspend extension function**, by default, the SUSPENDM and SLEEPM pins of the USBPHY are not asserted even when EHCI and OHCI are put into the Suspended state.

See **6.5A.2.4.4 (6) Suspend Control Register** and control the relevant registers appropriately.

6.5A.5.2 Controlling the Clock-Gating Function

See **6.5A.2.4.4 (5) Register Enable/Clock Gating Control Register** and **6.5A.3.1 Clock Gating Specifications**, then control the relevant registers appropriately.

6.5A.6 Battery Charging

6.5A.6.1 Support of charging port

The charging port refers to a port that supplies power in compliance with the Battery Charging Specification. The charging port is usually installed on the host controller.

Charging ports can be generally classified by function as described below.

Type	Function
CDP (Charging Downstream Port)	Downstream port that can supply power in compliance with the Battery Charging Specification. This type of charging port detects a portable device, and after the handshake (for Battery Charging) finishes, it proceeds to the usual device connect sequence (and operates as the usual host).
DCP (Dedicated Charging Port)	Port that provides only power supply function in compliance with the Battery Charging Specification. This type of charging port does not operate as the usual host.
SDP (Standard Downstream Port)	Standard Downstream Port that is not compliant with the Battery Charging Specification. This type of charging port supplies power in the range conforming to the conventional USB 2.0 standard, and operates as the usual host.

6.5A.6.2 Support of portable device

A portable device refers to a device that is supplied power (or that requests power supply) in compliance with the Battery Charging Specification. The portable port is usually installed in the peripheral controller.

6.5A.7 Bus Master

6.5A.7.1 Functional specifications of the bus master

6.5A.7.1.1 Supported bus master functions

Function as the BUS MASTER	Status
Residual burst after an error response is received	The transfer is not stopped.
1 Kbyte boundary processing	The fixed length burst (INCRx) across 1 Kbyte boundary is not performed.

6.5A.7.1.2 Issuing requests for different types of bus transfer

MHTRANS[1:0]	MHSIZE[2:0]	MHWRITE	MHBURST[2:0]	Reply	Remarks
IDLE (00b)	—	—	—	—	—
BUSY (01b)	—	—	—	—	Not issued.
NONSEQ (10b)	32-bit (010b)	WRITE	SINGLE INCR4 INCR8 INCR16	OKAY/ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ			
	8-bit (000b) 16-bit (001b)	WRITE	SINGLE	OKAY/ERROR	8-bit/16-bit transfer is issued (SINGLE only). A response error is reported by an interrupt.
	other than the above	—	—	—	Not issued.
SEQ (11b)	32-bit (010b)	WRITE	INCR4 INCR8 INCR16	OKAY/ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ		OKAY/ERROR	
	other than the above	—	—	—	Not issued.

6.5A.7.1.3 Supported responses

Response type	Response	Remarks
OKAY	Enable	Supported.
ERROR	Enable	A response error is reported by an interrupt, and termination of transfer (Early Burst Termination) is not performed.

6.5A.7.1.4 Protection control information

The value of MHPROT[3:0] can be set in the PROT_TYPE bits (bits [15:12]) in the AHB_BUS_CTR Register (offset: H’208).

Also, when the PROT_MODE bit (bit 8) in the AHB_BUS_CTR Register is set, only the last data transfer in an EHCI/OCHI DMA transfer can be handled as a non-buffered transfer, and other transfers can be handled as buffered transfers.

6.5A.7.1.5 Maximum burst length

The maximum burst length can be selected from SINGLE, INCR4, INCR8, and INCR16 by using the MAX_BURST_LEN bits (bit[1:0]) in the AHB_BUS_CTR Register (offset: H’208). The maximum burst length is common to reading and writing.

6.5A.7.1.6 Boundary of transfer data

The value of MHADDR[31:0] bits does not exceed 1 KB boundary during a burst transfer. Also, you can change the address boundary for burst transfer to 16, 32, or 64 bytes by writing a value to the ALIGN_ADDRESS bits (bit[5:4]) in the AHB_BUS_CTR Register (offset: H’208).

6.5A.7.1.7 Start address of fixed-length INCR burst transfer

The following table lists the values of the lower bits of MHADDR to be applied when a fixed-length INCR burst transfer starts.

ALIGN_ADDRESS Setting	Fixed length Start Address of INCR Burst		
	INCR4	INCR8	INCR16
00b (Aligned at the 1-Kbyte boundary)	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3D0 H'3D4 H'3D8 H'3DC H'3E0 H'3E4 H'3E8 H'3EC H'3F0	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3C8 H'3CC H'3D0 H'3D4 H'3D8 H'3DC H'3E0	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3B8 H'3BC H'3C0
01b (Aligned at the 16-byte boundary)	MHADDR[3:0] = H'0	-- (Not issued)	-- (Not issued)
10b (Aligned at the 32-byte boundary)	MHADDR[4:0] = H'00 H'04 H'08 H'0C H'10	MHADDR[4:0] = H'00	-- (Not issued)
11b (Aligned at the 64-byte boundary)	MHADDR[5:0] = H'00 H'04 H'08 H'0C H'10 H'14 H'18 H'1C H'20 H'24 H'28 H'2C H'30	MHADDR[5:0] = H'00 H'04 H'08 H'0C H'10 H'14 H'18 H'1C H'20	MHADDR[5:0] = H'00

6.5A.8 Overcurrent Control and VBUS Control

6.5A.8.1 OVRCUR/VBUSEN pin

Overcurrent detection on the USB port and port power (VBUS) control are performed by the external power IC connected to this module.

This module pin	Input/Output	Level	Description
OVRCURI	Input	L	Overcurrent status was detected.
		H	Overcurrent status was not detected.
VBUSEN	Output	L	Port Power (VBUS) OFF
		H	Port Power (VBUS) ON

6.5A.8.2 Overcurrent detection timer setting

This module detects overcurrent when the OVRCUR pin remains asserted (0b) for a set period.

The period over which assertion of the OVRCUR pin is required (“vercurrent detection time”) can be set in the following register.

Register	Overcurrent detection/sleep timer setting register (offset: H'310)
Bits	TIMER_OC[19:0]
Initial value	H'3_0D40

The overcurrent detection time can be converted from the setting value of the above register, taking that one bit equal to the internal bus clock (P1ϕ) cycle.

Therefore, set the value of the above register at initial configuration, considering “the internal bus clock (P1ϕ) frequency to be used” and “the overcurrent detection time you want to specify”.

6.5A.8.3 Port Power (VBUS) control specifications

VBUSEN can be controlled by the Port Power bit of the EHCI/OHCI Operational register or by the VBOUT bit of the VBUS Control Register. Which of the above bit controls VBUSEN is determined by the VBUSEN control (VBENCTL) register in USBPHY Control. Refer to **6.5.3.5 VBUSEN Control Register (VBENCTL)**. When using as Function, VBUSEN should be 0.

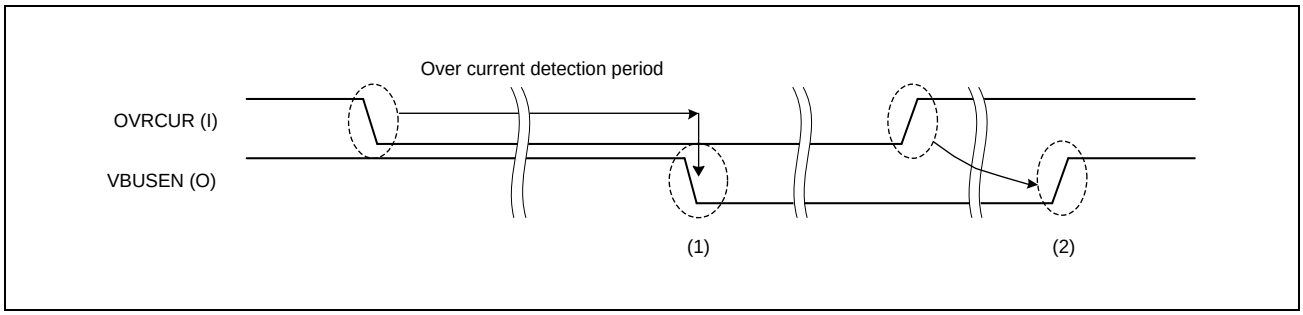
The following table describes control examples by the Port Power bit of the EHCI/OHCI Operational register.

Situation		Register		bit
EHCI control		PORTSC1 (offset: H'164)		bit 12 (PP)
OHCI control	Global control*1	ON setting	HcRhStatus Register (offset: H'050)	bit 16 (Set Global Power)
		OFF setting		bit 0 (Clear Port Status)
	Selective control*2	ON setting	HcRhPortStatus1 Register (offset: H'054)	bit 8 (Set Port Power)
		OFF setting		bit 9 (Clear Port Power)

Note 1. Global control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 0b
or
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: H'04C) bit 17 (PPCM[1]) = 0b

Note 2. Selective control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: H'04C) bit 17 (PPCM[1]) = 1b

However, if the register settings are as follows, the VBUSEN pin is always asserted (1b), and the Port Power (VBUS) becomes ON, regardless of the OVRCUR pin's status.



Specify the settings as necessary (for example, your system needs that VBUS is always ON).

EHCI Operational	OHCI Operational				
HCSPARAMS (offset: H'104)	HcRhDescriptorA (offset: H'048)			HcRhDescriptorB (offset: H'04C)	Pin Operation
PPC (bit 4)	NOCP (bit 12)	NPS (bit 9)	PSM (bit 8)	PPCM[1] (bit 17)	When the OVRCUR pin is asserted (0b)
0	—	—	—	—	Fixed to 1b
—	1	—	—	—	Fixed to 1b
—	—	1	—	—	Fixed to 1b
1	0	0	0	—	0b
			1	0	
				1	

6.5A.8.4 Timing Chart for Overcurrent Detection and Recovery

The figure below shows the assertion/de-assertion timings of the OVRCUR and VBUSEN pins signals at overcurrent detection and recovery.

Note that this timing chart is on the assumption that the changes of register settings to fix the Port Power bit to asserted state (see **6.5A.8.3 Port Power (VBUS) control specifications**) have not been made.

1. When the OVRCUR pin is kept asserted (0b) for the overcurrent detection time, this module determines the occurrence of overcurrent, and then de-asserts the VBUSEN pin (0b).
2. After the overcurrent status has been resolved, and de-assertion of the OVRCUR pin (1b) is confirmed, 1b is written to the Port Power bit described in **6.5A.8.3 Port Power (VBUS) control specifications** to turn on the Port Power (Vbus).

NOTE

Before the Port Power bit is set by firmware, be sure to check that the OVRCUR pin has been deasserted.

6.5A.9 Procedure for Setting this Module

6.5A.9.1 Host/Peripheral Common Setting Sequence

The following shows the necessary sequence common to both host and peripheral modes.

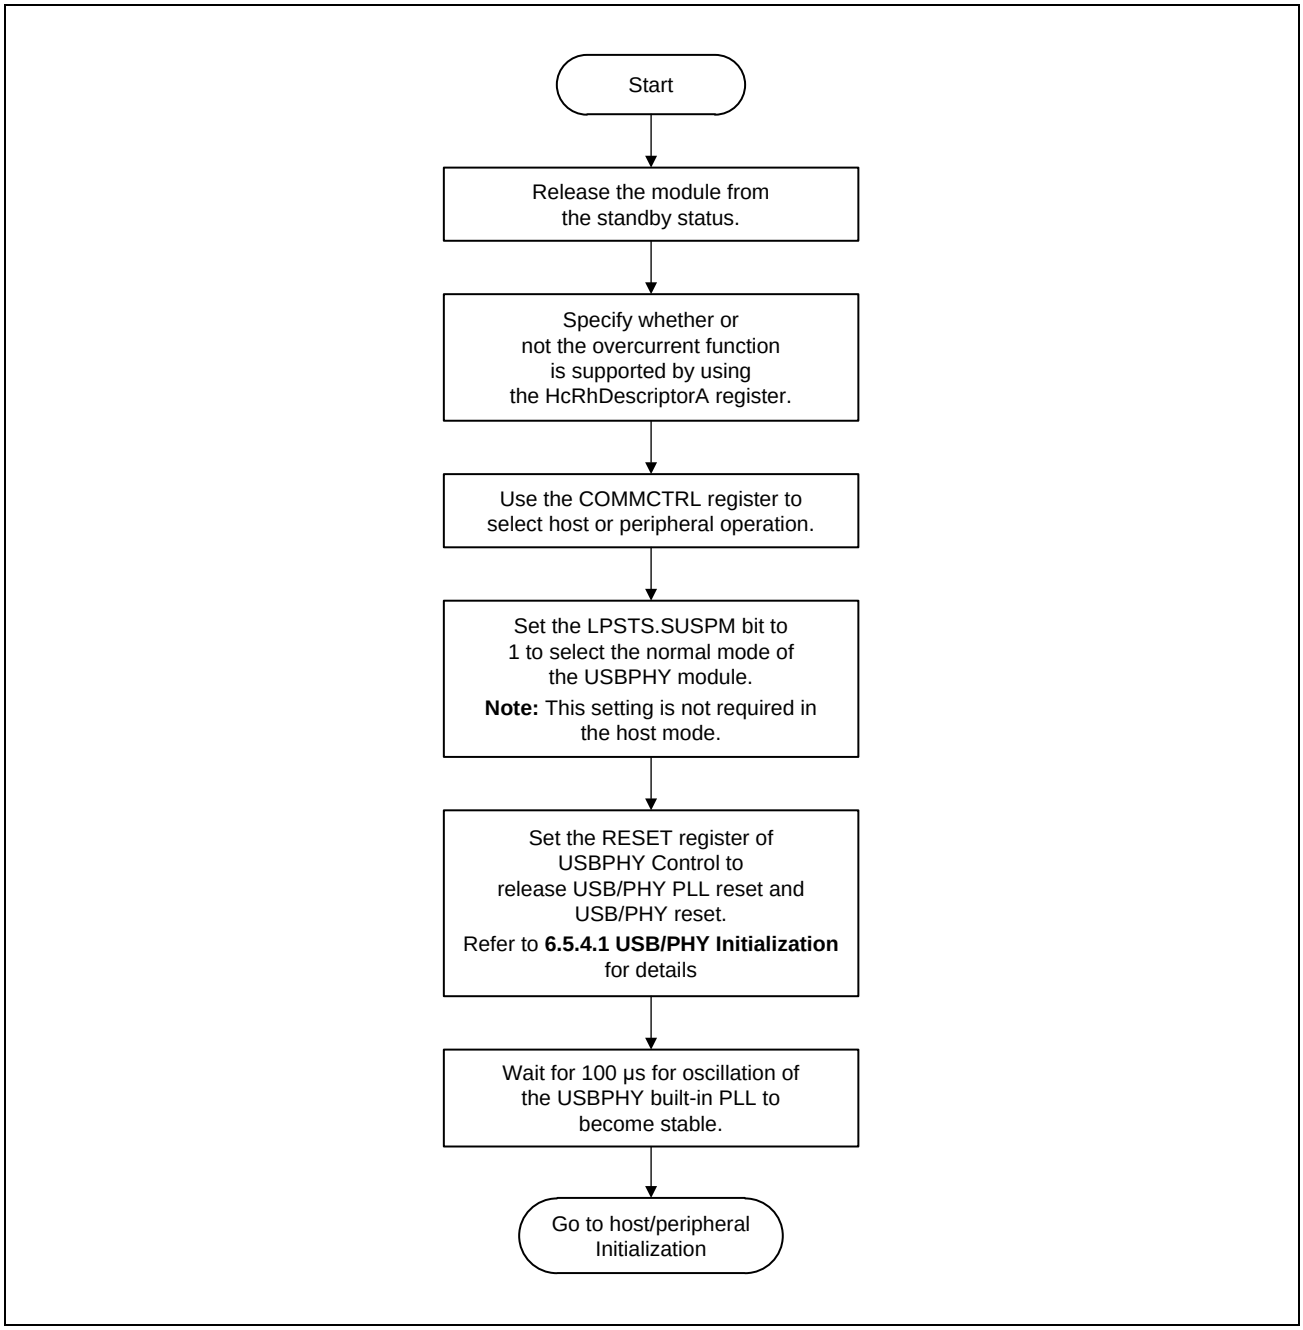


Figure 6.5A-1 Sequence Common to Both Host and Peripheral Modes

6.5A.9.2 Initialization Sequence

The following shows the initialization sequence in the Host mode

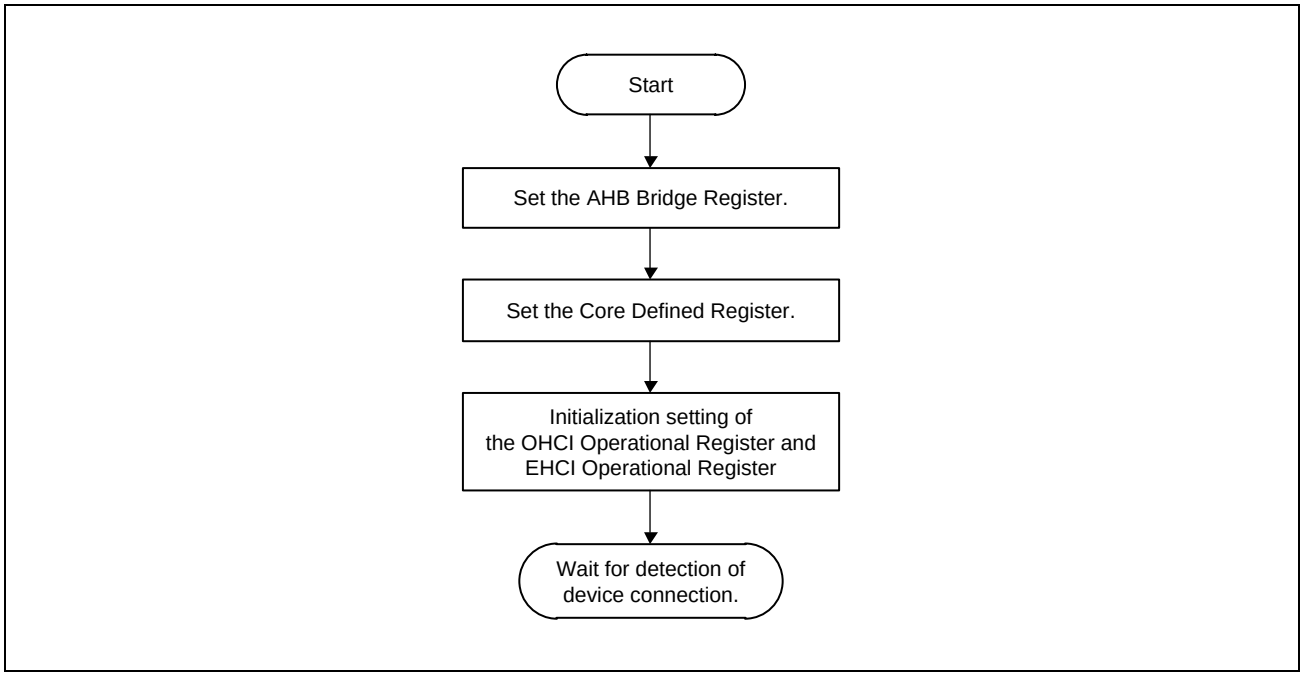

Figure 6.5A-2 Initialization Sequence

6.5A.9.3 Flow of Error Handling

While operating this module, if the operation falls into an abnormal state and recovery to the normal flow seems difficult, perform the following steps for reset.

[When an abnormality occurs while EHCI is running]

1. Write 1b to the HCRESET bit (bit 1) of the EHCI Operational Register USBCMD Register (offset: H’120) to execute EHCI software reset.
2. Re-initialize the EHCI Operational Register.

[When an abnormality occurs while OHCI is running]

1. Write 1b to the HCR bit (bit 0) of the OHCI Operational Register HcCommandStatus Register (offset: H’008) to execute OHCI software reset.
2. Re-initialize the OHCI Operational Register.

SECTION 6 HIGH-SPEED INTERFACE

6.5B USB 2.0 Function Module

6.5B.1 Overview

6.5B.1.1 Overview

This LSI has two channels of USB 2.0 host/function module. Switching between the host and peripheral functions for each channel is possible by setting the UCOM register.

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

This chapter describes the peripheral controller. For details on the host/peripheral common circuit and battery charging, see **6.5A USB 2.0 Host Module**.

This module is a universal serial bus (USB) controller that has peripheral functions.

This module supports high-speed and full-speed transfer defined by the Universal Serial Bus Specification Revision 2.0.

This module supports all transfer types defined in the USB Specification. This module incorporates 8 Kbytes of buffer memory for data transfer, and can use a maximum of 10 pipes. You can assign any endpoint number to any pipe other than pipe 0 in conformity to the peripheral equipment or system to communicate with.

6.5B.1.2 Features

6.5B.1.2.1 Peripheral controller supporting high-speed USB

(1) On-chip peripheral USB controller

6.5B.1.2.2 Support of all types of USB transfer

(1) Supporting all types of USB transfer, including isochronous transfer

(2) Control transfer

(3) Bulk transfer

(4) Interrupt transfer (high-bandwidth transfers not supported)

(5) Isochronous transfer (high-bandwidth transfers not supported)

6.5B.1.2.3 Bus interface

(1) Includes a two-channel DMA interface

6.5B.1.2.4 Pipe configuration

(1) 8 Kbytes of buffer memory for USB communications for each channel

(2) Up to 10 pipes (including the default control pipe) selectable for each channel

(3) Programmable pipe configuration

(4) Any endpoint number assignable to pipes other than pipe 0

Table 6.5B-1 Pipe Settings

PIPE	Transfer Type	Double buffer	Continuous transfer mode	Buffer size
PIPE0	Control	—	—	Fixed to 64 bytes/ 256 bytes (CNTMD = 1)
PIPE1	Iso/Bulk	✓	✓ (Bulk only)	Up to 2 Kbytes
PIPE2	Iso/Bulk	✓	✓ (Bulk only)	Up to 2 Kbytes
PIPE3	Bulk	✓	✓	Up to 2 Kbytes
PIPE4	Bulk	✓	✓	Up to 2 Kbytes
PIPE5	Bulk	✓	✓	Up to 2 Kbytes
PIPE6	Int	—	—	Fixed to 64 bytes
PIPE7	Int	—	—	Fixed to 64 bytes
PIPE8	Int	—	—	Fixed to 64 bytes
PIPE9	Int	—	—	Fixed to 64 bytes

6.5B.1.2.5 Features of peripheral functions

(1) Support of high-speed transfer (at 480 Mbps) and full-speed transfer (at 12 Mbps)

(2) Automatic recognition of high-speed or full-speed operation based on automatic response to the reset handshake

(3) Control transfer stage monitoring function

(4) Device state monitoring function

(5) Automatic response to SET_ADDRESS request

(6) NAK response interrupt (NRDY)

(7) SOF interpolation

6.5B.1.2.6 Features of DMA transfer

DMA transaction mode: Fetching in both register and link modes are supported.

Interrupt: Level is supported.

Transfer size: A transfer size from 1 to 128 bytes can be selected separately for the transfer source and transfer destination.

Skip (scatter/gather) function: The access size and skip size can be specified separately for the transfer source and destination.

Suspend function: A running DMA transaction can be suspended temporarily.

Interval function: The interval of DMA transfers can be specified to control the bus occupancy.

6.5B.1.2.7 Other functions

(1) Byte endian swap function to support both big endian and little endian as data formats (when using only CFIFO)

(2) Transfer ending function using a transaction counter

(3) SOF pulse output function

(4) BRDY interrupt event notification timing change function (BFRE)

(5) Function (SHTNAK) to set NAK in the response PID when transfer ends

(6) Support of the Link Power Management (LPM) ECN, making available a new low-power-consumption state (L1 state)

6.5B.1.3 Overview of Functions

6.5B.1.3.1 Automatic recognition of USB transfer speed

This module automatically recognizes USB transfer speed.

(1) Methods of FIFO buffer memory access

This module supports the two types of access described below to the FIFO buffer memory for USB data transfer.

(a) Access from the CPU

Specify a FIFO port address, and then write data to or read data from the FIFO buffer memory.

(b) Direct memory access (DMA)

Selecting a pipe window and setting the DMA control registers enables writing data to or reading data from the FIFO buffer memory.

6.5B.1.3.2 USB event

This module notifies the event in USB operation by issuing an interrupt.

You can specify whether to enable notification by interrupt for individual interrupt types and sources through software settings.

6.5B.1.3.3 USB data transfer

This module performs all types of USB data transfer: control transfer, bulk transfer, interrupt transfer, and isochronous transfer. The following pipe resources are available for individual transfer types:

(1) One pipe dedicated to control transfer

(2) Four pipes dedicated to interrupt transfer

(3) Three pipes dedicated to bulk transfer

(4) Two pipes selectively used for bulk or isochronous transfer

For each pipe, specify the settings, including transfer type, endpoint number, and maximum packet size, required for USB transfer according to the system.

This module can incorporate up to 8 Kbytes of buffer memory. For the pipes dedicated to bulk transfer and those selectively used for bulk transfer or isochronous transfer, allocate buffer memory and specify a buffer operating mode and other necessary settings according to the system. Setting the buffer operating mode enables high-speed data transfers with fewer interrupts to be performed by using double-buffering and continuous transfer of data packets.

6.5B.1.3.4 SOF pulse output function

This module has a function to output an SOF pulse to indicate the timing of SOF packet transmission. This module asserts a SOF pulse output signal when an SOF packet is received. This module outputs pulses at regular intervals based on an SOF interpolation timer even when an SOF packet is damaged.

6.5B.1.4 Restriction matter and Notes

6.5B.1.4.1 Restriction matter

(1) Restrictions on the USB specifications

It’s no support About below of USB 2.0 specification

- HighBandWidth transfer is no support

(2) Restrictions on DMA Master

- DAD = 1 (destination address fixed) and cannot use skip transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and cannot use skip transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- DAD = 1 (destination address fixed), and cannot use the beat unalign transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and cannot use beat unalign transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- When REQD =1, SBE = 1 (sweep mode) and compulsion discharge function cannot use.

6.5B.1.4.2 Notes

(1) DMA transfer and passing problem of interrupt signal in DMA Master construction.

(a) Overview

A USBFDMAmn interrupt (m, n = 0, 1) might occur before the last data of DMA transaction is written to the write-target device.

(b) Plan to avoid

A plan to avoid the above problem is indicated below.

Plan to avoid 1) HPROT is set as non bufferable.

According to the DMA mode, set 0 in the DPR[2] bit in the CHEXT_n register or the LDPR[2] bit in the DCTRL register, set the HPROT signal as non bufferable, and then perform the DMA transaction.

If all transfers are set to non bufferable, transfer efficiency might fall.

In such cases, set the most part of transaction as bufferable and perform a transfer, and then perform the last transfer by setting a register set or descriptor as non bufferable.

(2) Setting for battery charging when the peripheral controller is selected

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

6.5B.2 Registers

How to read the register table

(1) Bit number:

(2) State after reset: Initial state of the register that occurs immediately after a reset “Power on Reset” indicates the initial state at power-on reset.
The state after USB reset is the initial state of the register that occurs when this module detects a USB bus reset.
Significant points regarding reset operation are indicated in notes.
“—” indicates that a user’s setting is retained without this module operation having been performed. “X” indicates that the value is undefined.

(4) Access condition: The condition to be met when this module accesses the register for an operation.

R: Reading only
W: Writing only
R/W: Reading or writing
R(0): 0-reading only
W(1): 1-writing only

(5) Name: Bit symbol and bit name

(6) Function: Description of functions.

<Example of description>

(1) Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	A bit	B bit	C bit	—	—	—	—	—	—	—	—	—	—	—	—
(2) Initial Value	X	0	0	0												
R/W	X	0	—	—												

Bit	Bit Name	Initial Value	R/W	Description
15	—			Nothing is assigned. Fix this bit to 0.
14	A bit		R/W	AAA enable 0: Disables operation 1: Enables operation
13	B bit		R	BBB operation 0: Outputs low-level signal 1: Outputs high-level signal
12	C bit		R(0)/ W(1)	CCC control 0: ..... 1: .....
	(5)		(4)	(6)

6.5B.2.1 Base Address

Table 6.5B-2 Base addresses for each channel of the USB function module

Channel number	Base address
0	H'0_11E3_0000 (Cortex-A55 Address Space)
	H'41E3_0000 (Cortex-M33 Address Space Secure)
	H'51E3_0000 (Cortex-M33 Address Space Non-Secure)
1	H'0_11EB_0000 (Cortex-A55 Address Space)
	H'41EB_0000 (Cortex-M33 Address Space Secure)
	H'51EB_0000 (Cortex-M33 Address Space Non-Secure)

6.5B.2.2 List of Registers

Table 6.5B-3 lists the registers of this module.

Table 6.5B-3 List of Registers (1/3)

Address	Symbol	Name	Access Unit
000	SYSCFG0	System Configuration Control Register 0	16-bit
002	SYSCFG1	System Configuration Control Register 1	16-bit
004	SYSSTS0	System Configuration Status Register	16-bit

6.5B.2.3 System Configuration Control Registers

6.5B.2.3.1 System Configuration Control Register 0 [SYSCFG0] <Address: H'000>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CNEN	HSE	—	DRPD	DPRPU	—	—	—	USBE
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	CNEN	0	R/W	This bit prohibits or enables single-ended receiver operation. 0: Single-ended receiver operation prohibited 1: Single-ended receiver operation enabled
7	HSE	0	R/W	This bit prohibits or enables High-Speed operation. 0: High-Speed operation prohibited (Full-Speed) 1: High-Speed operation enable (The controller detects the communication speed.)
6	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
5	DRPD	1	R/W	D+/D- line resistor control Set this bit to 0 to use this module. For details, see Control of USB Data Bus Resistors.
4	DPRPU	0	R/W	D+ line resistor control This bit prohibits or enables D+ line pull-up for the peripheral controller function. For details, see Control of USB Data Bus Resistors. 0: Pull Up prohibited 1: Pull Up enabled
3 to 1	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
0	USBE	0	R/W	USB block operation prohibited This bit prohibits or enables USB block operation. 0: USB block operation prohibited 1: USB block operation enabled

Note: Data can be written to and read from this register even while the UTMI+PHY clock is stopped. However, if a value is set while the UTMI+PHY clock is stopped, the corresponding function takes effect after the oscillation of UTMI+PHY clock starts.

(1) Single-ended receiver operation enable (CNEN) bit

Setting this bit enables the single-ended receiver to operate. This bit is intended to prevent damage by inrush current that can be caused when the single-ended receiver in unattached status goes floating. This bit also allows the LNST bit to be referenced.

Set this bit when VBUS is detected as the result of a VBUS interrupt. Clear this bit when VBUS is removed.

(2) High-speed operation enable (HSE) bit

Setting this bit enables the high-speed operation. When this bit is 1, this module performs a high-speed or full-speed operation according to the result of reset handshake.

- When the HSE bit is 0, this module performs a full-speed operation.
- When the HSE bit is 1, this module executes the reset handshake protocol, and then automatically performs a high-speed or full-speed operation according to the result of reset handshake.

Rewriting the value of this bit must be done when the DPRPU bit is 0.

(3) D+/D- line resistor control (DRPD or DPRPU) bit

Table 6.5B-4 shows available settings of the resistors for the USB data bus. Use the DPRPU bit to select the USB data bus resistors.

Table 6.5B-4 Control of USB Data Bus Resistors

Setting		Control of USB Data Bus Resistors		
DRPD	DPRPU	D- Line	D+ Line	Remarks
0	0	Open	Open	
0	1	Open	Pull-Up	Specify the settings as shown in the left.
1	0	Pull-Down	Pull-Down	Initial state (When power on reset is canceled)
1	1	Pull-Down	Pull-Up	Setting prohibited

(a) D+ pull-up resistor control (DPRPU) bit

Setting this bit enables this module to notify the USB host of attaching by pulling up the D+ line voltage to 3.3 V. Clearing this bit enables this module to let the USB host know that the device has been detached by stopping pulling up the D+ line voltage.

(4) USB block operation enable (USBE) bit

This bit enables or disables the operation of the USB block of this module.

When this bit is changed from 1 to 0, this module initializes the bits shown in **Table 6.5B-5**.

Table 6.5B-5 Register Bits That Are Initialized by Writing 0 to the USBE Bit

Register Name	Bit Name
SYSSTS0	LNST
DVSTCTR0	RHST
INTSTS0	DVSQ
USBADDR	USBADDR
USBREQ	bRequest bmRequestType
USBVAL	wValue
USBINDX	wIndex
USBLENG	wLength

Note: Changing the value of this bit must be done when the SUSPENDM bit is 1 and after the oscillation of UTMI+PHY clock starts.

6.5B.2.3.2 System Configuration Control Register 1 [SYSCFG1] <Address: H'002>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BWAIT					
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	—	H'F	R	Nothing is assigned to these bits. Fix these bits to 0.
7, 6	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
5 to 0	BWAIT	H'0F	R/W	CPU bus access wait specification These bits specify the number of wait cycles for the access to this module. 000000: 0 wait cycles (2 access cycles) : 000010: 2 wait cycles (4 access cycles) : 000100: 4 wait cycles (6 access cycles) : 001111: 15 wait cycles (17 access cycles) (default) : 111111: 63 wait cycles (65 access cycles)

(1) CPU bus access wait specification (BWAIT) bits

These bits specify the wait cycles for the access to the HPB.

The following restriction is placed on the cycle of the access to the registers at address H'04 or after of this module: Restriction on wait cycle: The cycle of continuous accesses to registers of this module must be at least 67 ns.

To comply with this restriction, you must control the number of wait cycles with the internal bus clock (P1ϕ) frequency.

The default of wait cycles is 17 clock cycles (maximum limit). Select an optimum setting.

This setting is also applied to accesses to FIFO port registers. The maximum speeds of accesses to FIFO ports are as follows:

MBW = 10 (32-bit access width): Max 60 MBytes/sec
MBW = 01 (16-bit access width): Max 30 MBytes/sec
MBW = 00 (8-bit access width): Max 15 MBytes/sec

6.5B.2.4 System Configuration Status

6.5B.2.4.1 System Configuration Status Register (SYSSTS0) <Address: H'004>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LNST	
Initial Value	—	—	0	0	0	0	0	0	0	0	0	0	0	—	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	—	See above	R	Nothing is assigned to these bits. Fix these bits to 0.
1, 0	LNST	All 0	R	USB Line status monitor The USB line status is displayed. *Note*: See the detailed description.

(1) Line status monitor (LNST) bits

Table 6.5B-6 shows the line status of the USB data bus of this module. This module monitors the line status (status of the D+ and D- lines) of the USB data bus in the LNST bits of the SYSSTS0 register.

Referencing the LNST bits must be done only after the USBE bit is set and attaching is performed (the DPRPU bit is set).

Table 6.5B-6 Line Status of USB Data Bus

LNST [1]	LNST [0]	Full-Speed operation	High-Speed operation	Chirp operation
0	0	SE0	Squelch	Squelch
0	1	J State	Unsquelch	Chirp J
1	0	K State	Invalid	Chirp K
1	1	SE1	Invalid	Invalid

Note: Chirp: State in which high-speed operation is enabled (HSE = 1) and the reset handshake protocol is being executed
Squelch: SE0 or idle state
Unsquelch: High-speed J or high-speed K state
Chirp J: Chirp J State
Chirp K: Chirp K State

6.5B.2.5 USB Signal Control Registers

6.5B.2.5.1 Device State Control Register 0 [DVSTCTR0] <Address: H'008>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WKUP	—	—	—	—	—	RHST		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	0	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W(1)	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
14 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	WKUP	0	R/W (1)	Remote wakeup output This bit prohibits or enables Remote wakeup (resume signal output). 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output.
7 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	RHST	All 0	R	Reset handshake This bit indicates the reset handshake status. *Note*: See the detailed description.

(1) Remote wakeup (resume signal output) enable (WKUP) bit

When this bit is set, this module outputs the remote wakeup signal to the USB.

This module manages the time of remote wakeup signal output. When the WKUP bit is set, this module outputs the K state for 10 ms, and then clears the WKUP bit.

The USB Specification requires the USB idle state to be retained for at least 5 ms before the remote wakeup signal is sent. Therefore, even if the WKUP bit is set immediately after the suspended state is detected, this module waits for 2 ms, and then outputs the K state.

Writing 1 to the WKUP bit must be done only when the device is in the suspended state (DVSQ = 1xx) and remote wakeup is allowed by the USB host.

When setting the WKUP bit, do not stop the internal clock even if the device is in the suspended state. (Write 1 to the WKUP bit when the SUSPM bit is 1.)

When the WKUP bit is set at a transition to the L1 state, this module outputs the K state for 50 µs, and then clears the WKUP bit. In the L1 state, setting the WKUP bit must be done only when the DVSQ[4] bit is 1.

(2) Reset handshake status (RHST) bits

This module outputs the result of reset handshake to this bit. **Table 6.5B-7** lists the results of reset handshake.

Table 6.5B-7 Reset Handshake Status

Bus State	Value of RHST Bit
Powered or disconnected state	000
Reset handshake in process	100
Full-speed connection	010
High-speed connection	011

If the HSE bit is 1, the RHST bits indicate 100 when this module detects a USB bus reset. Then, after this module has output Chirp K, these bits indicate 011 when this module detects Chirp JK from the USB host three times. If the status is not fixed to High-Speed within 2.5 ms after Chirp K is output, these bits indicate 010.

If the HSE bit is 0, the RHST bits indicate 010 when this module detects a bus reset.

After this module has detected a USB reset, a DVST interrupt occurs when the value of the RHST bits is fixed to 010 or 011.

6.5B.2.6 Test Mode Register

6.5B.2.6.1 Test Mode Register [TESTMODE] <Address: H'00C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UTST			
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

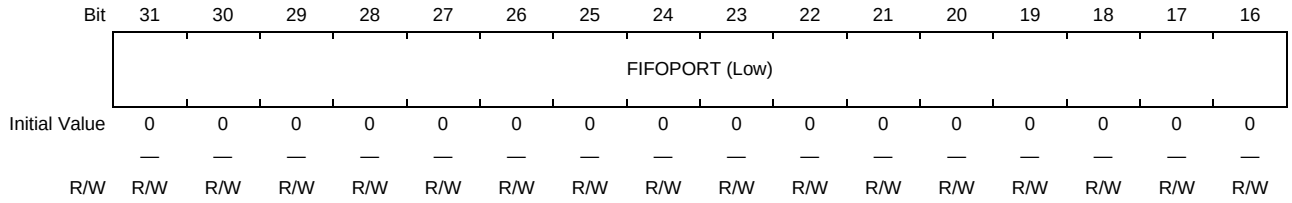
Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	—	0	R	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11	—	0	R	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10 to 4	—	H'10	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	UTST	All 0	R/W	Test mode See the detailed description.

(1) Test mode (UTST) bits

When a value is written to these bits, this module outputs a USB test signal during high-speed operation.

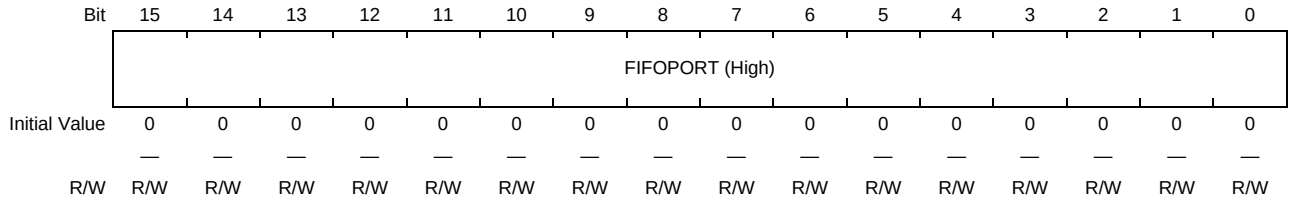
Table 6.5B-8 lists the test modes of this module.

Table 6.5B-8 List of test mode operation



Test mode	Value of UTST Bits
Normal operation	0000
Test_J	0001
Test_K	0010
Test_SE0_NAK	0011
Test_Packet	0100
Test_Force_Enable	—
Reserved	0101 to 0111

Write a value to these bits according to the SetFeature request sent from the USB host during high-speed communication. When these bits contain a value from 0001 to 0100, this module does not enter the suspended state.



To perform a normal USB communication after setting a test mode, perform Power on reset.

6.5B.2.7 FIFO Port Registers

6.5B.2.7.1 CFIFO Port Register [CFIFO] <Address: H'014>

6.5B.2.7.2 CFIFO Port Register [CFIFO] <Address: H'016>

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT	All 0	R/W	FIFO port These bits are accessed to read received data from the FIFO buffer or to write send data to the FIFO buffer.

(1) FIFO port control bits (for FIFOPORT)

The send/receive buffer memory of this module has a FIFO structure (FIFO buffer). Use FIFO port registers to access the FIFO buffer. The FIFO port consists of the port register (CFIFO) to read data from and write data to the FIFO buffer, the register (CFIFOSEL) to select the pipe to be allocated to the FIFO port, and the control register (CFIFOCTR).

Individual FIFO ports have the following features:

1. The CFIFO port must be used to access the FIFO buffer through the DCP.
2. When functions specific to FIFO ports are used, the pipe number (selected pipe) specified in the CURPIPE bits cannot be changed.
3. The registers configured for a FIFO port do not affect any other FIFO ports.
4. The FIFO buffer memory can be accessed by either the CPU or SIE. Access by the CPU is not possible while the SIE has the right of access to the FIFO buffer memory.

(2) FIFO port bits (CFIFO)

When one of these registers is accessed, this module accesses the FIFO buffer allocated to the pipe number specified in the CURPIPE bits in the corresponding pipe select register (CFIFOSEL).

These registers can be accessed only when the FRDY bit of the respective control registers (CFIFOCTR) is 1 (or when the UCL_Dx_DREQ output is asserted by this module).

The valid bits of these registers vary depending on the values of the NBW and BIGEND bits. The valid bits are shown in **Table 6.5B-9** to **Table 6.5B-11**.

Table 6.5B-9 Endian Operation in 32-Bit Access (When MBW = 10)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	N + 3 address	N + 2 address	N + 1 address	N + 0 address
1	N + 0 address	N + 1 address	N + 2 address	N + 3 address

Table 6.5B-10 Endian Operation in 16-Bit Access (When MBW = 01)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1		even-numbered address	odd-numbered address
1	even-numbered address	odd-numbered address	Writing: invalid Reading: prohibited*1	

Table 6.5B-11 Endian Operation in 8-Bit Access (When MBW = 00)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1			Writing: valid Reading: valid
1	Writing: valid Reading: valid	Writing: invalid Reading: prohibited*1		

Note 1. Reading words or bytes from an invalid register is prohibited.

6.5B.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: H'020>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	—	—	MBW		—	BIGEND	—	—	ISEL	—	CURPIPE			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R(0)/W	R	R	R/W	R/W	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read count mode This bit specifies DTLN read mode for the CFIFOCTR register. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read.
14	REW	0	R(0)/W	Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer.
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11, 10	MBW	All 0	R/W	CFIFO port access bit width This bit specifies the bit width for access to the CFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited
9	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
8	BIGEND	0	R/W	FIFO port byte endian control This bit specifies the byte endian of the CFIFO port. 0: Little endian 1: Big endian
7, 6	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
5	ISEL	0	R/W	FIFO port access direction with DCP selected This bit specifies the FIFO port access direction when DCP is selected for the CURPIPE bits. 0: Selects reading of buffer memory. 1: Selects writing of buffer memory.
4	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
3 to 0	CURPIPE	All 0	R/W	FIFO port access pipe specification This bit specifies the pipe number used for accessing the CFIFO port. 0000: DCP 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9 ↓ 1110: PIPE14 1111: PIPE15

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the CFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the CFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) CFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the CFIFO port.

If you start reading after setting a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, do not change the value of these bits until data is all read.

Also, to set a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, temporarily change the original value of the CURPIPE bits to a different value, and then set the values of the CURPIPE and MBW bits at the same time.

For how to change the value of the CURPIPE bits, see the description of the CURPIPE bits.

When the pipe specified in the CURPIPE bits is in the sending direction, you cannot change the bit width from 8 bits to 16 bits or 32 bits or from 16 bits to 32 bits while writing to the buffer memory is in process.

Even with the 16-bit width or 32-bit width setting, you can write data also to odd bytes by using byte access control.

(4) FIFO port byte endian control (BIGEND) bit

This bit is used to specify the byte endian of the CFIFO port.

For details see **6.5B.2.7.2 (1) FIFO port control bits (for FIFOPORT)**.

(5) FIFO port access direction with DCP selected (ISEL) bit

To change the value of this bit when the specified pipe is DCP, write a value to this bit, read the bit, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of the bit is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

Set this bit simultaneously with setting of the CURPIPE bits.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number of the pipe through which to read or write data via the CFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

6.5B.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address:H'028>
D1FIFO Port Select Register [D1FIFOSEL] <Address:H'02C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	DCLRM	DREQE	MBW		—	—	—	—	—	—	CURPIPE			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R(0)/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read count mode This bit specifies Dx_FIFOCTR DTLN read mode. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read.
14	REW	0	R(0)/W	Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer.
13	DCLRM	0	R/W	Automatic buffer memory clear mode after reading data through the specified pipe This bit prohibits or enables automatic buffer memory clear after data is read through the specified pipe. 0: Automatic FIFO buffer clear prohibited 1: Automatic FIFO buffer clear enabled
12	DREQE	0	R/W	UCL_Dx_DREQ output enable This bit prohibits or enables the output of the UCL_Dx_DREQ signal. 0: Output prohibited 1: Output enabled
11, 10	MBW	All 0	R/W	DxFIFO port access bit width This bit specifies the bit width for access to the DxFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited
9 to 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	CURPIPE	All 0	R/W	FIFO port access pipe specification 0000: No specification 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the DxFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the DxFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) Automatic FIFO buffer clear enable (DCLRM) bit

This bit is used to enable or disable the mode to automatically clear the FIFO buffer memory after reading data from the specified pipe. With this bit set, this module performs the “BCLR = 1” processing on the FIFO buffer, if a zero-length packet is received when the FIFO buffer allocated to the specified pipe is empty or if data reading ends because a short packet is received when the BFRE bit is 1.

Always clears this bit when you use this module with the BRDYM bit set.

(4) UCL_Dx_DREQ output enable (DREQE) bit

This bit is used to enable or disable the output of the UCL_Dx_DREQ signal.

When enabling the UCL_Dx_DREQ signal, set this bit always after setting a value in the CURPIPE bits. When changing the value of the CURPIPE bits, change the value always after clearing this bit.

(5) DxFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the DxFIFO port. For details, see **6.5B.2.7.3 (3) CFIFO port access bit width (MBW) bits**.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number through which to read or write data via the DxFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

Do not specify the same pipe number for the CURPIPE bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

6.5B.2.7.5 CFIFO Port Control Register [CFIFOCTR] <Address: H'022>
D0FIFO Port Control Register [D0FIFOCTR] <Address: H'02A>
D1FIFO Port Control Register [D1FIFOCTR] <Address: H'02E>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BVAL	BCLR	FRDY	—	DTLN											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W(1)	R(0)/W(1)	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	BVAL	0	R/W(1)	Buffer memory valid flag Specify 1 for this bit when writing to the FIFO buffer on the CPU side through the pipe specified in CURPIPE (current pipe) ends. 0: Invalid 1: Writing complete
14	BCLR	0	R(0)/W(1)	CPU buffer clear Specify 1 for this bit to clear the FIFO buffer on the CPU side of the current pipe. 0: Invalid 1: CPU buffer memory clear
13	FRDY	0	R	FIFO port ready This bit indicates whether the FIFO port can be accessed. 0: The FIFO port cannot be accessed. 1: The FIFO port can be accessed.
12	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
11 to 0	DTLN	All 0	R	Receive data length These bits indicate the length of receive data.

(1) Buffer memory valid flag (BVAL)

When the pipe (selected pipe) specified in the CURPIPE bits is in the sending direction, this bit must be set in the cases descried below. This module switches the FIFO buffer from the CPU side to the SIE side to enable data sending.

(1) To send short packets, set this bit when data writing ends.

(2) To send zero length packets, set this bit before writing data to the FIFO buffer.

(3) Set this bit after writing, to the pipe in continuous transfer mode, the data of which the size is a positive integral multiple of the maximum packet size and less than the buffer size.

When the maximum packet size of data is written to the pipe in non-continuous transfer mode, this module sets this bit to switch the FIFO buffer from the CPU side to the SIE side and enable data sending.

When this bit and the BCLR bit are set at the same time when the specified pipe is in the sending direction, this module clears the data that has been written so far and enables zero-length packets to be sent.

Setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit. Do not set this bit when the specified pipe is in the receiving direction.

(2) CPU buffer clear (BCLR) bit

When this bit is set, this module clears the FIFO buffer on the CPU side among the FIFO buffers allocated to the specified pipe.

Even if the two FIFO buffers in a double-buffer configuration are allocated to the specified pipe and both buffers can be read, this module clears only one of the two buffers.

If this bit is set when the specified pipe is the DCP, this module clears the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or it is on the SIE side. To clear the buffer on the SIE side, set this bit always after setting the PID bits for DCP to “NAK”.

When the specified pipe is other than the DCP, setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit.

(3) FIFO port ready (FRDY) bit

This bit indicates whether the FIFO port can be accessed from the CPU. This bit is operated by this module.

In the cases described below, even when this module sets this bit, data cannot be read from the FIFO port because the FIFO buffer does not contain data to be read. In these cases, set the BCLR bit to clear the FIFO buffer to enable the next sending and receiving of data.

(1) A zero-length packet has been received while the FIFO buffer allocated to the specified pipe is empty.

(2) A short packet has been received and data reading has ended while the BFRE bit is 1.

(4) Receive data length (DTLN) bits

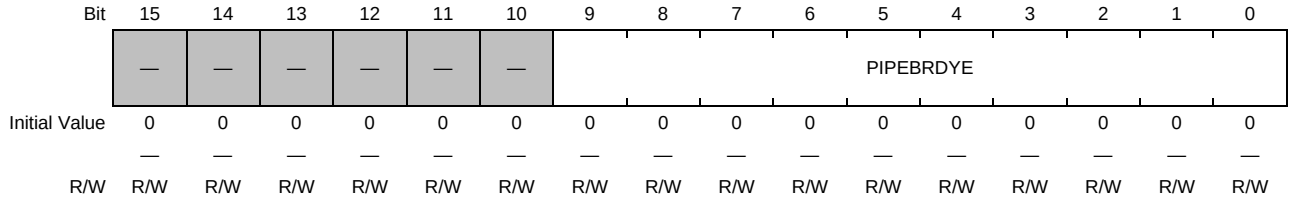
These bits indicate the length of receive data. These bits are operated by this module. During reading of the FIFO buffer, the value of these bits varies depending on the value of the RCNT bit as described below.

(1) When the RCNT bit is 0:
This module indicates a receive data length by using these bits until the CPU ends reading all received data from one FIFO buffer.
When the BFRE bit is 1, this module retains the receive data length until the BCLR bit is set even if reading of received data has ended.

(2) When the RCNT bit is 1:
This module decrements the value of these bits each time the CPU reads data.
(The value is decremented by 1 when the MBW bits are 00, by 2 when the MBW bits are 01 or by 4 when the MBW bits are 10.)

When the CPU ends reading from one FIFO buffer, this module clears these bits. If reading of one of the FIFO buffers in a double-buffer configuration, however, ends before reading of received data from the other FIFO buffer ends, these bits indicate the receive data length for the other FIFO buffer at the end of reading from the FIFO buffer of which reading ends earlier.

When these bits are read during reading of the FIFO buffer when the RCNT bit is 1, this module updates the value of these bits within 150 ns after a cycle of read access to the corresponding FIFO port.



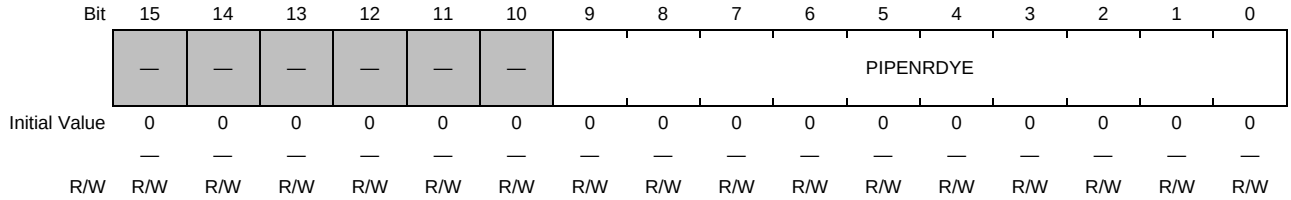
6.5B.2.8 Interrupt Enable Registers (INTENBx, BRDYENB, NRDYENB, BEMPENB)

6.5B.2.8.1 Interrupt Enable Register 0 [INTENB0] <Address: H'030>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBSE	RSME	SOFE	DVSE	CTRE	BEMPE	NRDYE	BRDYE	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBSE	0	R/W	VBUS Interrupt Enable This bit prohibits or enables a USB interrupt when a VBINT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
14	RSME	0	R/W	Frame number update interrupt enable Resume interrupt enable This bit prohibits or enables a USB interrupt when a RESM interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
13	SOFE	0	R/W	This bit prohibits or enables a USB interrupt when a SOF interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
12	DVSE	0	R/W	Device state transition interrupt enable This bit prohibits or enables a USB interrupt when a DVST interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
11	CTRE	0	R/W	Control transfer stage transition interrupt enable This bit prohibits or enables a USB interrupt when a CTRT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
10	BEMPE	0	R/W	Buffer empty interrupt enable This bit prohibits or enables a USB interrupt when a BEMP interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
9	NRDYE	0	R/W	Buffer not ready response interrupt enable This bit prohibits or enables a USB interrupt when an NRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
8	BRDYE	0	R/W	Buffer ready interrupt enable This bit prohibits or enables a USB interrupt when a BRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

6.5B.2.8.2 BRDY Interrupt Enable Register [BRDYENB] <Address: H'036>



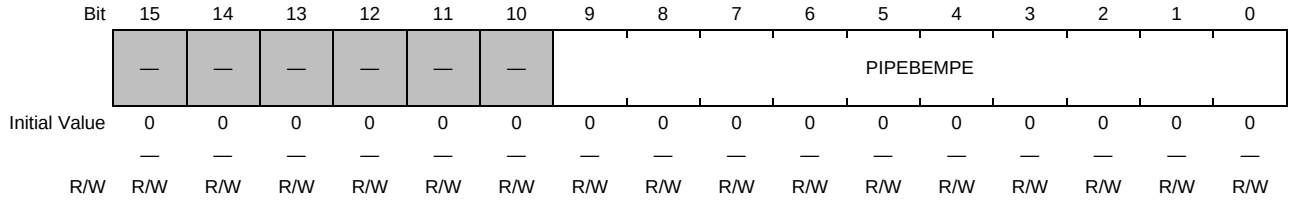
Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBRDYE	All 0	R/W	Pipe BRDY interrupt enable These bits prohibit or enable the BRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled

(1) Pipe BRDY interrupt enable (PIPEBRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register, sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBRDY bits in the BRDYSTS register is 1 and software changes the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

6.5B.2.8.3 NRDY Interrupt Enable Register [NRDYENB] <Address: H'038>



Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPENRDYE	All 0	R/W	Pipe NRDY interrupt enable These bits prohibit or enable the NRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled

(1) Pipe NRDY interrupt enable (PIPENRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPENRDY bit in the NRDYSTS register, sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPENRDY bits in the NRDYSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

6.5B.2.8.4 BEMP Interrupt Enable Register [BEMPENB] <Address: H'03A>

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBEMPE	All 0	R/W	Pipe BEMP interrupt enable These bits prohibit or enable the BEMP bit to be set when a BRDY interrupt to a pipe is detected 0: Interrupt output prohibited 1: Interrupt output enabled

Note: Bit numbers correspond to pipe numbers.

(1) Pipe BEMP interrupt enable (PIPEBEMPE) bits

When this module detects a BEMP interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBEMP bit in the BEMPSTS register, sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBEMP bits in the BEMPSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

6.5B.2.9 SOF Control Register

6.5B.2.9.1 SOF Output Configuration Register [SOFCFG] <Address: H'03C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	BRDYM	—	—	SOFM		—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6	BRDYM	0	R/W	PIPEBRDY interrupt status clear timing This bit specifies the timing at which the PIPEBRDY interrupt is to be cleared. 0: Software clears the status. 1: Hardware clears the status by reading from or writing to the FIFO buffer. This bit can be set only during initialization (before communication). The setting cannot be changed after communication.
5, 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3, 2	SOFM	All 0	R/W	SOF function setting These bits are used to select SOF pulse output mode. 00: SOF output disabled 01: SOF output in units of 1 ms 10: µSOF output in units of 125 µs 11: Reserved
1, 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

6.5B.2.10 Interrupt Status

6.5B.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: H'040>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ			VALID	CTSQ		
Initial Value	0	0	0	0	0	0	0	0	—	0	0	0	0	0	0	0
	—	—	—	1	—	—	—	—	—	0	0	1	—	—	—	—
R/W	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R	R	R	R	R	R	R	R/W(0)	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0	R/W(0)	Change detection interrupt status This bit indicates the VBUS change detection interrupt status. 0: No VBUS interrupt is generated. 1: A VBUS interrupt is generated.
14	RESM	0	R/W(0)	Resume interrupt status This bit indicates the resume detection interrupt status. 0: No resume interrupt is generated. 1: A resume interrupt is generated.
13	SOFR	0	R/W(0)	Frame number update interrupt status This bit indicates the frame number update interrupt status. 0: No SOF interrupt is generated. 1: A SOF interrupt is generated.
12	DVST	0	R/W(0)	Device state transition interrupt status This bit indicates the device state transition interrupt. 0: No device state transition interrupt is generated. 1: A device state transition interrupt is generated.
11	CTRT	0	R/W(0)	Control transfer stage transition interrupt status This bit indicates the status of a control transfer stage transition interrupt. 0: No control transfer stage transition interrupt is generated. 1: A control transfer stage transition interrupt is generated.
10	BEMP	0	R	BEMP interrupt status This bit indicates the BEMP interrupt status. 0: No BEMP interrupt is generated. 1: A BEMP interrupt is generated.
9	NRDY	0	R	NRDY interrupt status This bit indicates the NRDY interrupt status. 0: No NRDY interrupt is generated. 1: An NRDY interrupt is generated.
8	BRDY	0	R	BRDY interrupt status This bit indicates the BRDY interrupt status. 0: No BRDY interrupt is generated. 1: A BRDY interrupt is generated.
7	VBSTS	—	R	VBUS input status This bit indicates the VBUS pin input status. 0: The VBUS pin is at the low level. 1: The VBUS pin is at the high level.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	DVSQ	All 0	R	Device state These bits indicate the device state. 000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state
3	VALID	0	R/W(0)	USB request reception This bit indicates whether USB request reception is detected. 0: Not detected 1: A setup packet is received.
2 to 0	CTSQ	All 0	R	Control transfer stage These bits indicate the control transfer stage. 000: Idle or setup stage 001: Control reading data stage 010: Control reading status stage 011: Control writing data stage 100: Control writing status stage 101: Control writing (No Data) status stage 110: Control transfer sequence error 111: Reserved

Note: When you want to clear the status indicated by the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 to only the bit to be cleared and 1 to other bits. Do not write 0 to any status bit that is currently 0.

Note: This module detects a status change indicated by the VBINT or RESM bit in this register even while the clock is stopped (the SUSPM bit is 0), and reports an interrupt corresponding to the status bit if the interrupt is enabled. Clearing the interrupt status must be done after the clock enabled.

(1) VBUS change interrupt status (VBINT) bit

This module sets this bit when it detects a change of the level of the VBUS pin input (from the high level to low level, or vice versa). This module indicates the level of the VBUS pin input by the VBSTS bit. When a VBINT interrupt occurs, read the VBSTS bit several times to check for consistency and remove chattering.

(2) Resume interrupt status (RESM) bit

This module sets this bit when it is in the suspended state (DVSQ bits are 1XXb) and detects a falling edge of the signal at the DP pin.

(3) Frame number update interrupt status (SOFR) bit

This module sets this bit under the following conditions:

This module sets this bit when the frame number is updated. (The frame number update interrupt is monitored at intervals of 1 ms.)

This module detects an SOFR interrupt based on SOF interpolation even when an SOF packet from the USB host is damaged.

(4) Device state transition interrupt status (DVST) bit

When this module detects a change of the device state, this module updates the value of the DVSQ bits, and sets this bit. When a device state transition interrupt occurs, clear the interrupt status before this module detects the next device state transition.

(5) Control transfer stage transition interrupt status (CTRT) bit

When this module detects a transition of control transfer stage, this module updates the value of the CTSQ bits and sets this bit.

When a control transfer stage transition interrupt occurs, clear the interrupt status before this module detects the next transition of control transfer stage.

(6) Buffer empty interrupt status (BEMP) bit

This module sets this bit when at least one of the PIPEBEMP bits in the BEMPSTS register corresponding to the pipes for which the PIPEBEMPE bit in the BEMPENB register is set (that is, when this module detects a BEMP interrupt to at least one of the pipes for which is enabled BEMP interrupt notification).

For the conditions to assert the PIPEBEMP status signal, see the description of the BEMPSTS register.

This module clears this bit when writes 0 to all the PIPEBEMP bits corresponding to the pipes for which a BEMP interrupt has been enabled by setting the PIPEBEMPE bit.

Cannot clear this bit even by writing 0.

(7) Buffer not-ready interrupt status (NRDY) bit

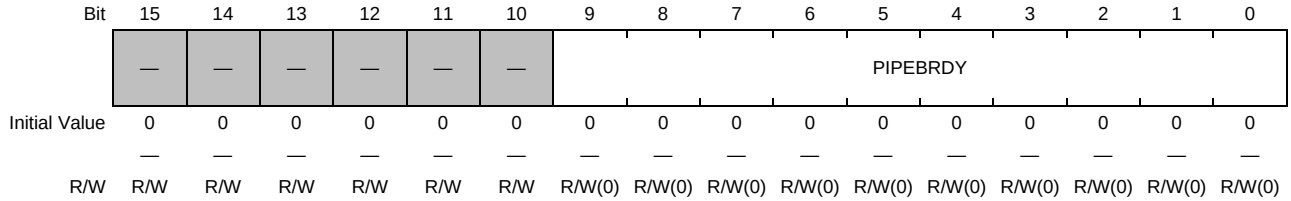
This module sets this bit when at least one of the PIPENRDY bits in the BNRDYSTS register corresponding to the pipes for which the PIPENRDYE bit in the NRDYENB register is set (that is, when this module detects an NRDY interrupt to at least one of the pipes for which is enabled NRDY interrupt notification).

For the conditions to assert the PIPENRDY status signal, see the description of the NRDYSTS register.

This module clears this bit when writes 0 to all the PIPENRDY bits corresponding to the pipes for which a NRDY interrupt has been enabled by setting the PIPENRDYE bit.

Software cannot clear this bit even by writing 0.

(8) Buffer ready interrupt status (BRDY) bit



This module sets this bit when at least one of the PIPEBRDY bits in the BRDYSTS register corresponding to the pipes for which the PIPEBRDYE bit in the BRDYENB register is set (that is, when this module detects an BRDY interrupt to at least one of the pipes for which is enabled BRDY interrupt notification).

For the conditions to assert the PIPEBRDY status signal, see the description of the BRDYSTS register.

This module clears this bit when writes 0 to all the PIPEBRDY bits corresponding to the pipes for which a BRDY interrupt has been enabled by setting the PIPEBRDYE bit.

Software cannot clear this bit even by writing 0.

6.5B.2.10.2 BRDY Interrupt Status Register [BRDYSTS] <Address: H'046>

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBRDY	All 0	R/W(0)	Pipe BRDY interrupt status These bits indicate the BRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register when the BRDYM bit is 0, write 0 to only the bit to be cleared and 1 to other bit.

Note: When the BRDYM bit is 0, clearing the BRDY interrupt status must be done always before the next access to the FIFO.

(1) Pipe BRDY interrupt status (PIPEBRDY) bit

When this module detects a BRDY interrupt to a pipe, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register. At that time, if already set the corresponding bit in the BRDYENB register, this module sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

Conditions to generate and clear a BRDY interrupt vary depending on the values of the BRDYM bit, and the BFRE bit for each pipe.

(a) BRDYM = 0 and BFRE = 0

When the BRDYM and BFRE bits are 0, the BRDY interrupt is generated to indicate that the FIFO port has become ready for access.

Under the conditions described below, this module generates an internal BRDY interrupt request trigger, and sets the PIPEBRDY bit corresponding to the pipe for which the request trigger is generated.

1. For the pipe in the sending direction

(a) When the DIR bit changes from 0 to 1

(b) When this module has ended sending packets through a pipe when data writing by the CPU to the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
In continuous transfer mode, a request trigger is generated when data has all been sent from one FIFO buffer.

(c) When, in a double-buffer configuration, one FIFO buffer is empty when writing to the other FIFO buffer has ended
If sending to one FIFO buffer has ended during writing to the other FIFO buffer, no request trigger is generated until the ongoing writing to the other FIFO buffer ends.

(d) When this module flushes the FIFO buffer allocated to the pipe of which the transfer type is isochronous.

(e) When the state of the FIFO buffer is changed from the write-disabled state to the write-enabled state by writing 1 to the ACLRM bit

No request trigger is generated when the pipe is the DCP (in other words, when data is sent by a control transfer).

2. For the pipe in the receiving direction

(a) When this module has ended receiving packets through a pipe and reading from the FIFO buffer is enabled when data reading by the CPU from the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
No request trigger is generated for the transaction that involves a data PID mismatch.
In continuous transmission/reception mode, no request trigger is generated when the data size is the maximum packet size and the FIFO buffer still has a free space.
If a short packet is received, a request trigger is generated even when the FIFO buffer has a free space.
When the transaction counter is used, a request trigger is generated when the specified number of packets have been received.
In that case, the request trigger is generated even if the FIFO buffer has a free space.

(b) When, in a double-buffer configuration, one FIFO buffer is in the read-enabled state when reading from the other FIFO buffer has ended
If receiving from one FIFO buffer has ended during reading from the other FIFO buffer, no request trigger is generated until the ongoing reading from the other FIFO buffer ends.

This interrupt does not occur during the communication at the status stage of a control transfer.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to all the PIPEBRDY bits corresponding to other pipes.

Clearing the pipe BRDT interrupt status must be done always before the next access to the FIFO buffer.

(b) When BRDYM = 0 and BFRE = 1

When the BRDYM bit is 0 and the BFRE bit is 1, this module determines that a BRDY interrupt occurs when all the data for a transfer has been read through a receiving pipe, and sets the PIPEBRDY bit corresponding to the pipe.

This module determines that the last data in a transfer has been received when one of the following conditions is met:

1. A short packet or a zero-length packet has been received.
2. The transaction counter (TRNCNT bits) is used, and as many packets as the value of the TRNCNT bits have been received.

When one of the above conditions is met and reading of the relevant data has ended, this module determines that all the data in a transfer has been read.

If a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data in a transfer has been read when the FRDY bit is set and the DTLN bits are cleared in the corresponding FIFO Port Control Register. To start the next transfer in that case, write 1 to the BCLR bit in the corresponding FIFOCTR.

When the BRDYM bit is 0 and the BFRE bit is 1, this module does not detect any BRDY interrupt to the pipe in the sending direction.

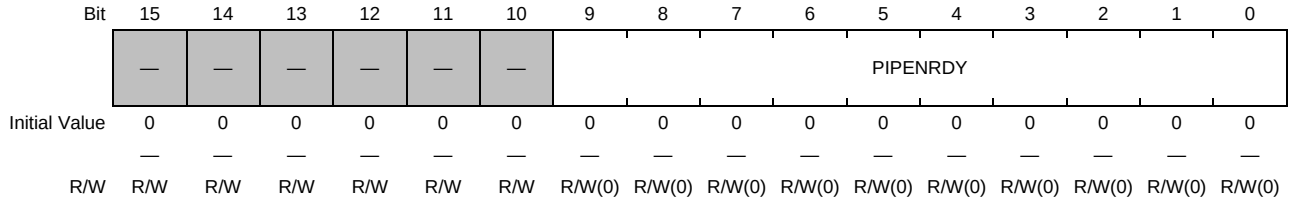
The PIPEBRDY interrupt status of the corresponding pipe can be cleared to “0” by writing “0” to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to the PIPEBRDY bits corresponding to other pipes.

In this mode, do not change the value of the BFRE bit until all the processing for a transfer ends.

If you need to change the value of the BFRE bit during the transfer, set the ACLRM bit to clear all the FIFO buffers for the specified pipe.

(c) When BRDYM = 1 and BFRE = 0

When the BRDYM bit is 1 and the BFRE bit is 0, the values of individual PIPEBRDY bits interlock with the values of the BSTS bits for individual pipes. In other words, this module sets or clears the BRDY interrupt status of a pipe according to the state of the FIFO buffer allocated to the pipe.



(a) For the pipe in the sending direction
This module sets the PIPEBRDY bit for the pipe when data can be written to the FIFO port or clears the PIPEBRDY bit when data cannot be written to the FIFO port.
The BRDY interrupt signal, however, is not asserted even when the sending pipe is write-enabled if the pipe is the DCP.

(b) For the pipe in the receiving direction
This module sets the PIPEBRDY bit for the pipe when data can be read from the FIFO port or clears the PIPEBRDY bit when all data has been read (that is, when data reading from the FIFO port is disabled).
If a zero-length packet is received when the FIFO buffer is empty, the PIPEBRDY bit corresponding to the specified pipe is kept being set and the BRDY interrupt signal is kept being asserted until sets the BCLR bit.

When the BRDYM bit is 1 and the BFRE bit is 0, this module cannot clear any PIPEBRDY bit.

When the BRDYM bit is 1, all the BFRE bits (for all pipes) must be 0.

6.5B.2.10.3 NRDY Interrupt Status Register [NRDYSTS] <Address: H'048>

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPENRDY	All 0	R/W(0)	Pipe NRDY interrupt status These bits indicate the NRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

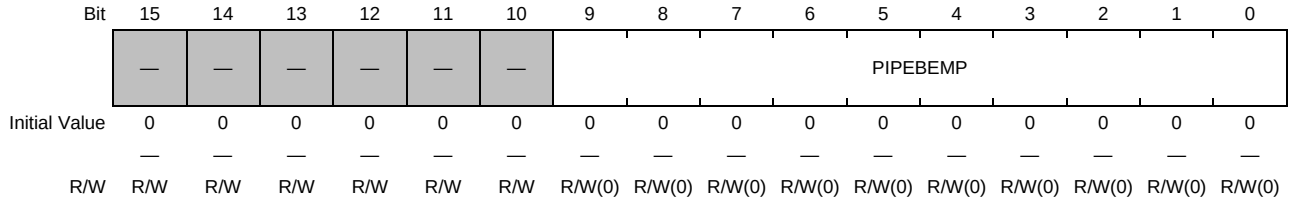
(1) Pipe NRDY interrupt status (PIPENRDY) bit

When this module issues an internal NRDY interrupt request for a pipe of which the PID is set to BUF, this module sets the PIPENRDY bit corresponding to the pipe in the NRDYSTS register. At that time, if the NRDYENB register bit corresponding to the pipe is set, this module sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal NRDY interrupt request for individual pipes under the conditions described below. This module does not issue any interrupt request at the status stage of a control transfer.

(a) For the pipe in the sending direction

(1) When an IN token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer does not contain send data
When an IN token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module sends a zero- length packet, and sets the OVRN bit.



(b) For the pipe in the receiving direction

(1) When an OUT token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module issues an NRDY interrupt request, sets the PIPENRDY bit, and sets the OVRN bit.
If the transfer type of the pipe for which the interrupt is generated is not isochronous transfer, this module issues an NRDY interrupt request when sending an NAK Handshake signal after receiving the data that follows the OUT token, and sets the PIPENRDY bit.
Note, however, that this module does not issue an NRDY interrupt request when resending data (when a DATA-PID mismatch has occurred).
This module does not issue an NRDY interrupt request also when an error has occurred in a data packet.

(2) When a PING token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
When a PING token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.

(3) When the transfer type of the specified pipe is isochronous transfer, the PID bits corresponding to the specified pipe are 01 (BUF), and data has not been received normally within an interval frame
When an SOF token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit for the specified pipe.

6.5B.2.10.4 BEMP Interrupt Status Register [BEMPSTS] <Address: H'04A>

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBEMP	All 0	R/W(0)	Pipe BEMP interrupt status These bits indicate the BEMP interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe BEMP interrupt status (PIPEBEMP) bit

When this module detects a BEMP interrupt to a pipe of which the PID is set to BUF, this module sets the PIPEBEMP bit corresponding to the pipe in the BEMPSTS register. At that time, if the BEMPENB register bit corresponding to the pipe is set, this module sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal BEMP interrupt request for individual pipes under the conditions described below.

1. When data sending (including sending of zero-length packets) to a pipe in the sending direction has ended and the FIFO buffer allocated to the pipe is empty
   In a single-buffer configuration, this module generates a BRDY interrupt at the same time as issuing an internal BEMP interrupt request for the pipes other than the DCP.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

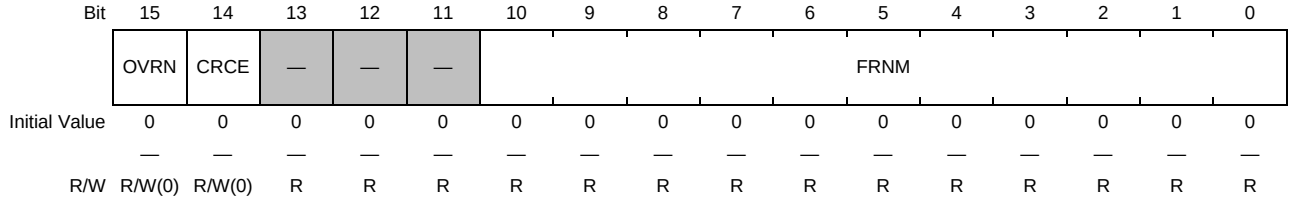
(a) When software (DMAC) has already started writing to the CPU-side FIFO buffer, in a double-buffer configuration, when sending data for one buffer ends

(b) When the buffer is cleared (to empty the buffer) by writing 1 to the ACLRM or BCLR bit

(c) During an IN transfer (sending zero-length packets) at the status stage of a control transfer

2. For the pipe in the receiving direction
   When the data larger than the specified maximum packet size has been received normally
   In that case, this module issues a BEMP interrupt request, sets the PIPEBEMP bit for the specified pipe, discards the received data, and changes the value of the PID bits for the specified pipe to 11 (STALL).
   Then, this module returns a STALL packet.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

(a) When a CRC or bit stuff error has been detected in the received data



(b) When a SETUP transaction is being executed

Writing 0 to this bit clears the interrupt status.

Writing 1 to this bit causes no effect.

6.5B.2.11 Frame Number Registers (FRMNUM, UFRMNUM)

6.5B.2.11.1 Frame Number Register [FRMNUM] <Address: H'04C>

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0	R/W(0)	Overrun/underrun detection status This bit indicates whether an overrun or underrun is detected in the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred.
14	CRCE	0	R/W(0)	CRC error detection status This bit indicates the CRC error detection status for the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred.
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 0	FRNM	All 0	R	Frame number These bits indicate the latest frame number.

Note: The OVRN bit is intended for debugging. When designing a system, design transfer timings appropriately to prevent buffer overruns and underruns.

(1) Overrun/underrun detection status (OVRN) bit

This module sets this bit when this module detects an overrun or underrun in a pipe of which the transfer type is isochronous transfer.

When this module detects an overrun or underrun, this module issues an internal NRDY interrupt request. For details, see **6.5B.2.10.3 (1) Pipe NRDY interrupt status (PIPENRDY) bit**.

Software can clear this bit by writing 0 to this bit. If the CRCE bit should not be cleared together when this bit is cleared, write H'40.

When the peripheral controller function is selected

This module sets this bit in the following cases:

1. When an IN token is received although writing send data to the FIFO has not ended, in the case of a pipe that is in the sending direction and performs an isochronous transfer
2. When an OUT token is received although the free space of FIFO buffer is less than the size of one FIFO buffer, in the case of a pipe that is in the sending direction and performs an isochronous transfer

(2) CRC error detection status (CRCE) bit

This module sets this bit when this module detects a CRC or bit stuff error in a pipe of which the transfer type is isochronous transfer.

Software can clear this bit by writing 0 to this bit. If the OVRN bit should not be cleared together when this bit is cleared, write H’80.

When this module detects a CRC error, this module issues an internal NRDY interrupt request. For details, see **6.5B.2.10.3 (1) Pipe NRDY interrupt status (PIPENRDY) bit**.

(3) Frame number (FRNM) bits

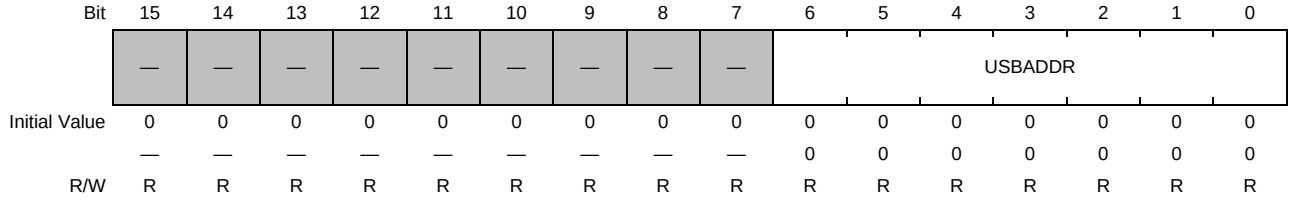
This module updates the value of these bits each time an SOF packet is received (once per 1 ms), and indicates the latest frame number in these bits.

When reading these bits, read them twice and check for consistency.

6.5B.2.11.2 Micro Frame Number Register [UFRMNUM] <Address: H'04E>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UFRNM		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to these bits. Fix these bits to 0.
14 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	UFRNM	All 0	R	Micro frame These bits indicate the micro frame number.



(1) Micro frame number (UFRNM) bit

In high-speed transfer mode, this module writes the micro frame number to these bits. In a mode other than high-speed transfer mode, this module writes H'00 to these bits.

When reading these bits, read them twice and check for consistency.

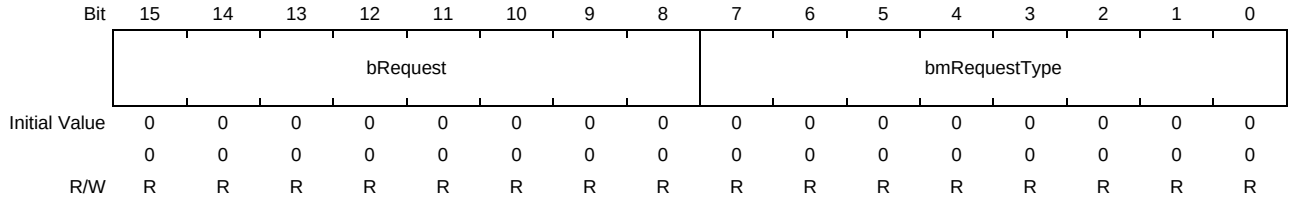
6.5B.2.12 USB Address

6.5B.2.12.1 USB Address Register [USBADDR] <Address: H'050>

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 8	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
7	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
6 to 0	USBADDR	All 0	R	USB address These bits indicate the USB address allocated by the host.

(1) USB address (USBADDR) bits

When this module has received and normally processed a SetAddress request, this module writes the received USB address to these bits.



When this module detects a USB bus reset, this module writes H'00 to these bits.

6.5B.2.13 USB Request Registers

USB request registers are used to store control transfer setup requests.

These registers store the values set in the received USB requests.

6.5B.2.13.1 USB Request Type Register [USBREQ] <Address: H'054>

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	bRequest	All 0	R	Request Value of USBRequestbRequest
7 to 0	bmRequestType	All 0	R	Request type Value of USBRequestbmRequestType

(1) USB request (bRequest) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(2) USB request type (bRmRequestType) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

6.5B.2.13.2 USB Request Value Register [USBVAL] <Address: H'056>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wValue															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wValue	All 0	R	Value Value of the wValue field in a USB request

(1) Value (wValue) bits

These bits indicate the value of the wValue field in a USB request.

These bits indicate the value of wValue field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

6.5B.2.13.3 USB Request Index Register [USBINDX] <Address: H'058>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wIndex															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wIndex	All 0	R	Index Value of the wIndex field in a USB request

(1) Index (wIndex) bits

These bits indicate the value of the wIndex field in a USB request.

These bits indicate the value of wIndex field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

6.5B.2.13.4 USB Request Length Register [USBLENG] <Address: H'05A>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wLength															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

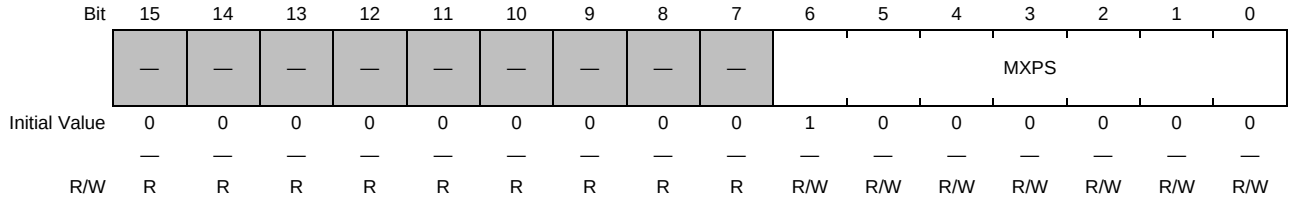
Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wLength	All 0	R	Length Value of the wLength field in a USB request

(1) Length (wLength) bits

These bits indicate the value of the wLength field in a USB request.

These bits indicate the value of wLength field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

6.5B.2.14 DCP Configuration



When performing a data communication by a control transfer, use the default control pipe (DCP).

6.5B.2.14.1 DCP Configuration Register [DCPCFG] <Address: H'05C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CNTMD	SHTNAK	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	CNTMD	0	R/W	Continuous transfer mode This bit specifies whether to use the default control pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode
7	SHTNAK	0	R/W	Pipe disable at transfer end When the default control pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends 1: Disables the pipe when the transfer ends
6 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

6.5B.2.14.2 DCP Max. Packet Size Register [DCPMAXP] <Address: H'05E>

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6 to 0	MXPS	H'40	R/W	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the DCP.

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the DCP.

The default is H'40 (64 bytes).

The value of the MXPS bits must conform to the USB Specification.

Writing a value to the MXPS bits must be done when the PID is set to NAK and no value is set in the CURPIPE bits. If you need to change the value of these bits after changing the PID setting for the specified pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

6.5B.2.14.3 DCP Control Register [DCPCTR] <Address: H'060>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	—	—	—	—	—	—	SQCLR	SQSET	SQMON	PBUSY	—	—	CCPL	PID	
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0
R/W	R	R	R	R	R	R	R	R(0)/W(1)	R(0)/W(1)	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer status This bit indicates the accessibility status of the DCP FIFO buffer. 0: Buffer access is not possible. 1: Buffer access is possible.
14 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	SQCLR	0	R(0)/W(1)	Toggle bit clear This bit can set DATA0 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA0 specified
7	SQSET	0	R(0)/W(1)	Toggle bit set This bit can set DATA1 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA1 specified
6	SQMON	1	R	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: DATA0 1: DATA1
5	PBUSY	0	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.
4 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2	CCPL	0	R/W	Control transfer end enable Setting this bit permits the status stage of the control transfer to end. 0: Does not permit the control transfer to end. 1: Permits the control transfer to end.
1, 0	PID	All 0	R/W	Response PID These bits control responses from this module in control transfer. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the DCP. This bit is operated by this module. The meaning of this bit varies as follows depending on the value of the ISEL bit:

1. When ISEL = 0: This bit indicates whether receive data can be read from the FIFO buffer.
2. When ISEL = 1: This bit indicates whether send data can be written to the FIFO buffer.

(2) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(4) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the specified pipe. This bit is operated by this module. When a transaction ends normally, this module toggles this bit.

This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

When a SETUP packet is received normally, this module sets this bit (to specify DATA1 as the expected value).

This module does not reference this bit in an IN or OUT transaction at the status stage. Also, this module does not toggle this bit even when the transaction ends normally.

(5) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the specified pipe starts. This module changes this bit from 1 to 0 when the transaction ends.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(6) Control transfer end enable (CCPL) bit

When software sets this bit when the PID of the specified pipe is BUF, this module ends the status stage of the ongoing control transfer.

In other words, in a control read transfer, this module sends an ACK handshake in response to an OUT transaction request from the USB host, and, in a control write or no-data control transfer, this module sends a zero-length packet in response to an IN transaction request from the USB host. If, however, a SetAddress request is detected, this module performs automatic response throughout the period from the setup stage to the end of the status stage regardless of the value of this bit.

When a new SETUP packet is received, this module changes this bit from 1 to 0.

When the VALID bit is 1, software cannot set this bit.

(7) Response PID (PID) bits

The setting of these bits must be changed from NAK to BUF when the data stage or status stage of a control transfer is executed.

This module changes the value of these bits in the following cases:

1. This module changes the value of these bits to 00 (NAK) when it receives a SETUP packet. At that time this module sets the VALID bit. Software cannot change the value of these bits until it clears the VALID bit.
2. When set these bits to 01 (BUF), this module changes the value of these bits to 11 (STALL) when it receives the data exceeding the specified maximum packet size.
3. This module changes the value of these bits to 1x (STALL) when it detects a sequence error in a control transfer.
4. This module changes the value of these bits to 00 (NAK) when it detects a USB reset.

This module does not reference these bits during SetAddress request processing (automatic processing).

6.5B.2.15 Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI)

To configure pipes 1 to 15, use the PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPExCTR, PIPExTRE, and PIPExTRN registers.

Select the pipes to be used by using the PIPESEL register, and then configure functions of individual pipes by using the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Note that you can use the PIPExCTR, PIPExTRE, and PIPExTRN registers for setting regardless of the pipe selection by the PIPESEL register.

6.5B.2.15.1 Pipe Window Select Register [PIPESEL] <Address: H'064>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	PIPESEL			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	PIPESEL	All 0	R/W	Pipe window select These bits specify a pipe for registers at addresses H'68 to H'6E. 0000: No selection 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9

Note: When the PIPESEL bits are 0000, all bits of the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers are cleared. When the PIPESEL bits are 0000, writing to the registers at addresses H'68 to H'6E is ignored.

(1) Pipe Window select (PIPESEL) bits

When software a value from 0001 to 1111 to these bits, this module indicate the pipe information and settings corresponding to the registers at addresses H'68 to H'6E. After a pipe is selected by these bits, the values set in the areas at addresses H'68 to H'6E are applied, by this module, to the transfer operation using the selected pipe.

When writes 0000 to these bits, this module writes 0 to all bits of the registers at addresses H'68 to H'6E. Then, writing to the areas at addresses H'68 to H'6E is ignored.

6.5B.2.15.2 Pipe Configuration Register [PIPECFG] <Address: H'068>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TYPE		—	—	—	BFRE	DBLB	CNTMD	SHTNAK	—	—	DIR	EPNUM			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	TYPE	All 0	R/W	Transfer type These bits specify the transfer type of the pipe specified in the PIPESEL bit. 00: The pipe cannot be used. 01: Bulk transfer 10: Interrupt transfer 11: Isochronous transfer
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10	BFRE	0	R/W	BRDY interrupt operation specification This bit specifies the timing at which this module notifies a BRDY interrupt relating to the specified pipe. 0: A BRDY interrupt is notified when data is sent or received. 1: A BRDY interrupt is notified when reading of data is completed.
9	DBLB	0	R/W	Double-buffer mode This bit specifies a single or double FIFO buffer to be used by the specified pipe. 0: Single buffer 1: Double buffer
8	CNTMD	0	R/W	Continuous transfer mode This bit specifies whether to use the specified pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode
7	SHTNAK	0	R/W	Pipe disable at transfer end When the specified pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends. 1: Disables the pipe when the transfer ends.
6, 5	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
4	DIR	0	R/W	Transfer direction This bit specifies the transfer direction of the specified pipe. 0: Receiving direction 1: Sending direction
3 to 0	EPNUM	All 0	R/W	Endpoint number These bits specify the endpoint number of the specified pipe.

(1) Transfer type (TYPE) bits

These bits are used to specify the USB transfer type of the pipe (selected pipe) specified in the PIPESEL bits.

Table 6.5B-12 lists pipes and the transfer types specifiable in these bits.

Table 6.5B-12 Selected Pipes and the Transfer Types Specifiable in the TYPE Bits

Selected Pipe	TYPE Bits	USB Transfer Type
PIPE1 or PIPE2	01 or 11	Bulk or isochronous transfer
PIPE3 to PIPE5	01	Bulk transfer
PIPE6 to PIPE9	10	Interrupt transfer

Always specify a value other than 00 in these bits for a selected pipe before setting the PID of the selected pipe to BUF (to start USB communication using the selected pipe).

The value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK. If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(2) BRDY interrupt operation specification (BFRE) bit

This bit is valid when the selected PIPE is PIPE1 to PIPE5.

When set this bit and been using the selected pipe in the receiving direction (in other words, the DIR bit is 0), this module detects the end of transfer (when it occurs) and generates a BRDY interrupt when reading of the last packet ends.

If a BRDY interrupt occurs with the above settings, software must write 1 to the BCLR bit. The FIFO buffer allocated to the selected pipe remains unready for reception until 1 is written to the BCLR bit.

When set this bit and been using the selected pipe in the sending direction (in other words, the DIR bit is 1), this module does not generate any BRDY interrupt.

For details, see the description of the PIPEBRDY interrupt status bit.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Double-buffer mode (DBLB) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5.

When set this bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in the BUFSIZE bits in the PIPEBUF register.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(4) Continuous transfer mode (CNTMD) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5, and the transfer type of the selected pipe is bulk transfer.

This module determines whether data sending from or receiving in the FIFO buffer allocated to the selected pipe has ended according to the value of this bit in the way described in **Table 6.5B-13**.

Table 6.5B-13 How to Determine the End of Data Sending from or Receiving in the FIFO Buffer According to the Value of the CNTMD Bit

CNTMD Bit Setting Value	How to Determine Whether Reading or Sending is Enabled
0	Condition for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): This module receives one packet
	Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): Either of the following conditions (1) and (2) is met: (1) Data for the maximum packet size is written to the FIFO buffer. (2) Data for the short packet (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit.
1	Conditions for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): (1) The number of bytes in data received in the FIFO buffer allocated to the selected pipe becomes equal to the number of allocated bytes ((BUFSIZE + 1) * 64). (2) This module receives a short packet other than a zero-length packet. (3) This controller receives a zero-length packet when the FIFO buffer allocated to the selected pipe already contains data. (4) Packets are received as many times as the value of the transaction counter set for the selected pipe.
	Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): One of the following conditions (1) to (3) is met: (1) The amount of written data becomes equal to the size of one FIFO buffer allocated to the selected pipe. (2) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit. (3) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer, and a transfer end signal is asserted at the same time of the last writing.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) PIPE disable at transfer end (SHTNAK) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 and is in the receiving direction.

When set this bit for a selected pipe in the receiving direction, this module changes the PID of the selected pipe to NAK when this module determines the end of data transfer to the selected pipe. This module determines the end of transfer when one of the following conditions (1) and (2) is met:

(1) This module has normally received short packet data (including zero-length packets).

(2) When using a transaction counter, this module has normally received as many packets as the value set in the transaction counter.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

For the pipes in the sending direction, this bit must be cleared.

(6) Transfer direction (DIR) bit

When writes 0 to this bit for a selected pipe, this module uses the selected pipe in the receiving direction. When software writes 1 to this bit for the selected pipe, this module uses the selected pipe in the sending direction.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Endpoint number (EPNUM) bits

These bits are used to specify the endpoint number of the endpoint of a selected pipe. Note that specifying 0000 in these bits for a pipe means that the pipe is not used.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

The combination of the values of the DIR bit and EPNUM bits for a pipe must be unique among those for all pipes. (The setting "EPNUM = 000" [the selected pipe is not used] can be duplicated for multiple pipes.)

6.5B.2.15.3 Pipe Buffer Setting Register [PIPEBUF] <Address: H'06A>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BUFSIZE					—	—	BUFNMB							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14 to 10	BUFSIZE	All 0	R/W	Buffer size These bits specify the size of the FIFO buffer for the pipe specified in the PIPESEL bit. H'00: 64 bytes H'01: 128 bytes ... (H'1F: 2 Kbytes)
9, 8	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
7 to 0	BUFNMB	All 0	R/W	Buffer number These bits specify the FIFO buffer number of the specified pipe. (H'4 to H'7F)

Note: Changing values of these register bits for a selected pipe must be done when sets the PID of the selected pipe to NAK, and specifies no pipe in the CURPIPE bits.

Note: If you change values of these register bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the values of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Buffer size (BUFSIZE) bits

These bits are used to specify the size of the FIFO buffer to be allocated to the selected pipe. Specify the FIFO buffer size in units of blocks. One block has 64 bytes.

When set the DBLB bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in these bits.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

The following value can be specified in these bits:

(1) Any value from H'0 to H'1F when the selected pipe is PIPE1 to PIPE5.

(2) H'0 only when the selected pipe is PIPE6 to PIPE9.

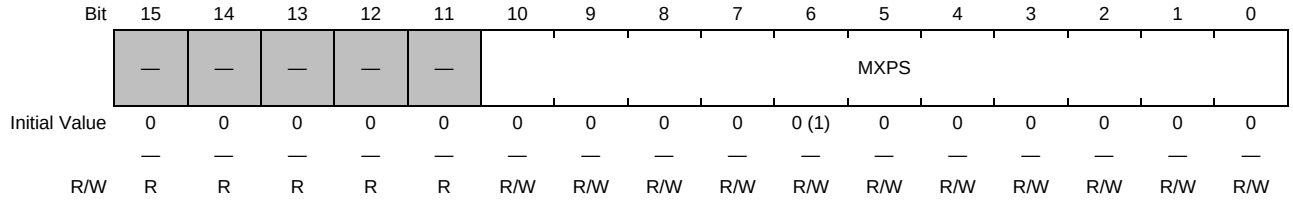
In continuous transfer mode (CNTMD = 1), specify an integral multiple of the maximum packet size in the BUFSIZE bits.

(2) Buffer number (BUFNMB) bits

These bits are used to specify the block number of the first block in the FIFO buffer to be allocated to the selected pipe. This module allocates the following blocks of FIFO buffer to the selected pipe:

Block with block number “BUFNMB” to the block with block number “BUFNMB + (BUFSIZE + 1) × (DBLB + 1) - 1”

The value of these bits must be H’04 to H’7F. Note, however, that the following rules must be observed: Value " H’00" is exclusively used for DCP.



Value “H’04” is exclusively used for PIPE6. When, however, PIPE6 is not used, this value can be used for another pipe. If PIPE6 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’04 in the BUFNMB bits for PIPE6.

Value “H’05” is exclusively used for PIPE7. When, however, PIPE7 is not used, this value can be used for another pipe. If PIPE7 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’05 in the BUFNMB bits for PIPE7.

Value “H’06” is exclusively used for PIPE8. When, however, PIPE8 is not used, this value can be used for another pipe. If PIPE8 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’06 in the BUFNMB bits for PIPE8.

Value “H’07” is exclusively used for PIPE9. When, however, PIPE9 is not used, this value can be used for another pipe. If PIPE9 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’07 in the BUFNMB bits for PIPE9.

6.5B.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: H'06C>

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 0	MXPS	*Note	R/W	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the specified pipe. For PIPE6 to PIPE8, a value from H'1 to H'40 (bytes) can be set.

Note: The initial value of the MXPS bits is H'000 when no pipe is specified in the PIPESEL bits in the PIPESEL register or H'040 when a pipe is specified in the PIPESEL bits.

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the selected pipe.

The initial value of these bits is H'40 (64 bytes).

- For PIPE1 and PIPE2, a value from H'1 (1 byte) to H'400 (1024 bytes) can be specified.
- For PIPE3 to PIPE5, H'8 (8 bytes), H'10 (16 bytes), H'20 (32 bytes), H'40 (64 bytes), or H'200 (512 bytes) can be specified. (Bits [2:0] are excluded.)
- For PIPE6 to PIPE9, a value from H'1 (1 byte) to H'40 (64 bytes) can be specified.

The value of the MXPS bits for individual transfer type must conform to the USB Specification.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of thee bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

6.5B.2.15.5 Pipe Cycle Control Register [PIPEPERI] <Address: H'06E>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
12	IFIS	0	R/W	Isochronous IN buffer flush This bit specifies whether to perform a buffer flush when the pipe specified in the PIPESEL bit is used for isochronous IN transfer. 0: Does not perform a buffer flush. 1: Performs a buffer flush.
11 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	IITV	All 0	R/W	These bits specify the transfer interval of the specified pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

(1) Isochronous IN buffer flush (IFIS) bit

When the selected pipe is used for isochronous IN transfer, this bit is used to specify this module automatically clears the FIFO buffer if this module fails to receive the IN token from the USB host in a (micro) frame sent at intervals specified in the IITV bits.

In double-buffer mode (DBLB = 1), this module clears only the data in one buffer used earlier than the other.

This module clears the FIFO buffer when it receives an SOF packet immediately after the (micro) frame in which the IN token hag to be received. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

(2) Interval error detection interval (IITV) bits

These bits specify the interval of interval error detection for the selected pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of thee bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value specified in these bits to another after a USB communication, change the PID to NAK, and then set the ACLRM bit to initialize the interval timer before changing the value.

For PIPE3 to PIPE5 these bits are ignored. Write 0 to all these bits corresponding to PIPE3 to PIPE5.

You can specify a value in these bits when the transfer type of the selected pipe is isochronous.

(a) When the selected pipe is used for isochronous OUT transfer

If this module does not receive any data packet in the (micro) frame sent at intervals specified in the IITV bits, this module generates an NRDT interrupt.

This module generates an NRDY interrupt also if this module cannot receive data because an error, e.g., CRC error, has occurred in a data packet or because the FIFO buffer is full (such a situation might result if, for example, software [DMAC] delays in reading data from the FIFO buffer).

This module generates the NRDY interrupt when it receives an SOF packet. Even if the SOF packet is corrupted, this module generates the NRDY interrupt in the same timing to receive the SOF packet by the use of the internal interpolation function.

When, however, the value of the IITV bits is not 0, this module generates the NRDY interrupt every time an SOF packet is received at the specified intervals after interval counting starts.

If the PID of the selected pipe is changed to NAK after the interval timer starts, this module does not generate the NRDY interrupt even when it receives an SOF packet.

The condition for starting interval counting varies by the value of the IITV bits.

(a) When IITV = 0: Interval counting starts when the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	OUT	DATA0
Setting of PID bits	NAK	NAK	BUF			BUF		
Whether token reception is expected (0: reception expected —: non-reception expected)	—	—	0			0		
Start of interval counting			↑					

Figure 6.5B-1 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 0

(b) When IITV is not 0: Interval counting starts at the end of the first normal reception of data packet after the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0
Setting of PID bits	NAK	BUF	BUF			BUF	BUF			BUF	BUF		
Whether token reception is expected (0: reception expected —: non-reception expected)	—	—	0			—	0			—	0		
Start of interval counting			↑										

Figure 6.5B-2 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 1

(b) When the selected pipe is used for isochronous IN transfer

The IITV bits are used in combination with the setting of the IFIS bit to 1. When the IFIS bit is 0, this module sends a data packet in response to a received token regardless of the value of the IITV bits.

When the IFIS bit is 1, if this module does not receive any IN token in the (micro) frame sent at intervals specified in the IITV bits although the FIFO buffer has sendable data, this module clears the FIFO buffer.

This module clears the FIFO buffer also when it cannot receive an IN token normally because of a bus error, e.g., CRC error.

This module clears the FIFO buffer when it receives an SOF packet. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

The condition for starting interval counting varies by the value of the IITV bits. (The condition is the same as that for isochronous OUT transfer.)

The interval counter is cleared when one of the following conditions (1) to (3) is met:

(1) This module is reset (then, also the IITV bits are cleared).

(2) The ACLRM bit is set.

(3) This module detects a USB bus reset.

6.5B.2.16 Pipe Control Registers (PIPExCTR)

6.5B.2.16.1 PIPE1 Control Register [PIPE1CTR] <Address: H'070>
PIPE2 Control Register [PIPE2CTR] <Address: H'072>
PIPE3 Control Register [PIPE3CTR] <Address: H'074>
PIPE4 Control Register [PIPE4CTR] <Address: H'076>
PIPE5 Control Register [PIPE5CTR] <Address: H'078>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer status This bit indicates the FIFO buffer status of the specified pipe. 0: Buffer access is not possible. 1: Buffer access is possible.
14	INBUFM	0	R	Transmit buffer monitor When the specified pipe is in the sending direction, this bit indicates the FIFO buffer status of the specified pipe. 0: The FIFO buffer does not contain data that can be sent. 1: The FIFO buffer contains data that can be sent.
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10	ATREPM	0	R/W	Automatic response mode This bit prohibits or enables automatic response of the specified pipe. 0: Automatic response prohibited 1: Automatic response enabled. (A zero-length packet response is sent during transmission. For reception, an NAK response is sent and an NRDY interrupt is generated.)
9	ACLRM	0	R/W	Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0: Prohibited 1: Enabled (all buffers are initialized)
8	SQCLR	0	R(0)/W(1)	Toggle bit clear Specify 1 in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0: Writing disabled 1: DATA0 specified
7	SQSET	0	R(0)/W(1)	Toggle bit set Specify 1 in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1. 0: Writing disabled 1: DATA1 specified
6	SQMON	0	R	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0: DATA0 1: DATA1

Bit	Bit Name	Initial Value	R/W	Description
5	PBUSY	0	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.
4 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1, 0	PID	All 0	R/W	Response PID These bits specify the response method for the next transaction in the specified pipe. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the selected pipe. This bit is operated by this module.

The meaning of this bit varies as follows depending on the value of the values of the DIR, BFRE, and DCLRM bits:

Table 6.5B-14 BSTS Bit Operations

DIR bit Setting Value	BFRE bit Setting Value	DCLRM bit Setting Value	Meaning of the BSTS Bit
0	0	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
		1	Setting prohibited
	1	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible. This bit indicates 0 when 1 is written in the BCLF bit after reading data has finished.
		1	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
1	0	0	This bit indicates 1 when writing of send data in the FIFO buffer becomes possible, and indicates 0 when writing data has finished.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

(2) Transmit buffer monitor (INBUFM) bit

When the selected pipe is in the sending direction (DIR = 1), this module sets this bit when software (or the DMAC) has finished writing data to at least one FIFO buffer.

This module clears this bit when this module finishes sending all data from the FIFO buffer to which the data has been written. In double-buffer mode (DBLB = 1), this module clears this bit when this module has finished sending all data from the two FIFO buffers and software (or the DMAC) has not yet finished writing data to one FIFO buffer.

When the selected pipe is in the receiving direction (DIR = 0), this bit indicates the same value as that of the BSTS bit.

(3) Automatic response mode (ATREPM) bit

This bit can be set when the transfer type of the selected pipe is bulk transfer.

When this bit is 1, this module responds to tokens sent from the USB host as described below.

1. When the selected pipe is used for bulk IN transfer (TYPE = 01 and DIR = 1)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an IN token by sending a zero-length packet.
   Each time this module receives ACK from the USB host (the sequence of one transaction is receiving an IN token, sending a zero-length packet, and then receiving ACK), this module updates (toggles) the sequence toggle bit (DATA- PID).
   This module does not generate BRDY and BEMP interrupts.

2. When the selected pipe is used for bulk OUT transfer (TYPE = 01 and DIR = 0)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an OUT token (or a PING token) by sending an NAK response and generates an NRDY interrupt.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

To perform a USB communication with this bit set, the FIFO buffer must be empty. No data must be written to the FIFO buffer during the USB communication with this bit set.

When the transfer type of the selected pipe is isochronous transfer, this bit must always be 0.

(4) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 6.5B-15 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 6.5B-16 shows the cases that require this processing.

Table 6.5B-15 Buffer Contents This Core Clears When the ACLRM Bit is Set

No.	Contents to be Cleared by Setting the ACLRM Bit
(1)	Whole contents of the FIFO buffer allocated to the specified pipe (if the double buffer is set, both FIFO buffers are cleared)
(2)	If the transfer type of the specified pipe is Isochronous transfer, the interval count value is cleared.

Table 6.5B-16 Cases Requiring the ACLRM Bit to be Set

No.	Cases when Data Clear is Required
(1)	The whole contents of the FIFO buffer allocated to the specified pipe needs to be cleared.
(2)	The interval count value needs to be reset.
(3)	The value of the BFRE bit is changed.
(4)	The value of the DBLB bit is changed.
(5)	Forced termination of the transaction count function is performed.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQCLR bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(6) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQSET bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the selected pipe. This bit is operated by this module.

When the transfer type of the selected pipe is other than isochronous transfer, this module toggles this bit when a transaction ends normally. This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

(8) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the selected pipe starts. This module changes this bit from 1 to 0 when the transaction ends normally.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(9) Response PID (PID) bits

These bits are used to specify, the type of response of this module for individual pipes.

The default of PID is NAK. When the selected pipe is used for USB transfers, the PID setting muse be changed to BUF. For the basic operations (without communication packet errors involved) of this module depending on the value of the PID bits, see **Table 6.5B-17**.

If you have changed the PID of a selected pipe from BUF to NAK while the selected pipe is performing a USB communication, check that the PBUSY bit is 0 to confirm that the USB transfer through the selected pipe has actually changed to the NAK status. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

This module changes the value of the PID bits in the following cases:

1. When the selected pipe is in the receiving direction and set the SHTNAK bit for the selected pipe, this module sets the PID to NAK when this module recognizes the end of a transfer.
2. When this module has received a data packet of which the payload size is larger than the maximum packet size, this module sets the PID to STALL (PID = 11).
3. If this module detects a USB bus reset, this module sets the PID to NAK.

To change the PID from NAK (PID = 00) to STALL, write 10 to the PID bits. To change the PID from BUF (PID = 01) to STALL, write 11 to the PID bits.

To change the PID from STALL (PID = 11) to NAK, write 10 to the PID bits once, and then write 00 to the PID bits. To change the PID from STALL to BUF, change the PID to NAK once, and then change it to BUF.

Table 6.5B-17 Core Operations Depending on the PID Setting

PID bit Setting Value	Transfer Type (TYPE Bit Setting Value)	Transfer Direction (DIR Bit Setting Value)	Operation of This Core
00 (NAK)	Bulk ("TYPE = 01"), or Interrupt ("TYPE = 10")	Independent of the setting value	Sends a NAK response for a token from the USB host.
	Isochronous ("TYPE = 11")	Receiving direction ("DIR = 0")	Does not respond to a token from the USB host.
		Sending direction ("DIR = 1")	Sends a zero-length packet for a token from the USB host.
01 (BUF)	Bulk ("TYPE = 01")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK or NYET response. If receiving data is not possible, this module sends an NAK response. For a PING Token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Interrupt ("TYPE = 10")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Bulk ("TYPE = 01") or Interrupt ("TYPE = 10")	Sending direction ("DIR = 1")	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends an NAK response.
	Isochronous ("TYPE = 11")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data. If receiving data is not possible, this module discards data.
		Sending direction ("DIR = 1")	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends a zero-length packet.
10 (STALL) or 11 (STALL)	Bulk ("TYPE = 01") or Interrupt ("TYPE = 10")	Independent of the setting value	Sends a STALL response for a token from the USB host.
	Isochronous ("TYPE = 11")	Independent of the setting value	Does not respond to a token from the USB host.

6.5B.2.16.2 PIPE6 Control Register [PIPE6CTR] <Address: H'07A>
PIPE7 Control Register [PIPE7CTR] <Address: H'07C>
PIPE8 Control Register [PIPE8CTR] <Address: H'07E>

5	PBUSY	0	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.
4 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1, 0	PID	All 0	R/W	Response PID These bits specifies the response method for the next transaction in the specified pipe 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

See **6.5B.2.16.1 (2) Transmit buffer monitor (INBUFM) bit**.

(2) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 6.5B-18 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 6.5B-19 shows the cases that require this processing.

Table 6.5B-18 Buffer Contents This Core Clears when the ACLRM Bit is Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	All contents of the FIFO buffer allocated to the selected pipe

Table 6.5B-19 Cases Requiring the ACLRM Bit to be Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	When clearing contents of the FIFO buffer allocated to the selected pipe
(2)	When resetting the interval counter
(3)	When the value of the BFRE bit is changed
(4)	When the transaction count function is terminated forcibly

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit clear (SQCLR) bit

See **6.5B.2.16.1 (5) Sequence toggle bit clear (SQCLR) bit**.

(4) Sequence toggle bit set (SQSET) bit

See **6.5B.2.16.1 (6) Sequence toggle bit set (SQSET) bit**.

(5) Sequence toggle bit monitor (SQMON) bit

See **6.5B.2.16.1 (7) Sequence toggle bit monitor (SQMON) bit**.

(6) Pipe busy (PBUSY) bit

See **6.5B.2.16.1 (8) Pipe busy (PBUSY) bit**.

(7) Response PID (PID) bits

6.5B.2.17 Transaction Counters (PIPExTRE)

6.5B.2.17.1 PIPE1 Transaction Counter Enable Register [PIPE1TRE] <Address: H'090>
PIPE2 Transaction Counter Enable Register [PIPE2TRE] <Address: H'094>
PIPE3 Transaction Counter Enable Register [PIPE3TRE] <Address: H'098>
PIPE4 Transaction Counter Enable Register [PIPE4TRE] <Address: H'09C>
PIPE5 Transaction Counter Enable Register [PIPE5TRE] <Address: H'0A0>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R/W	R(0)/W(1)	R	R	R	R	R	R	R	R

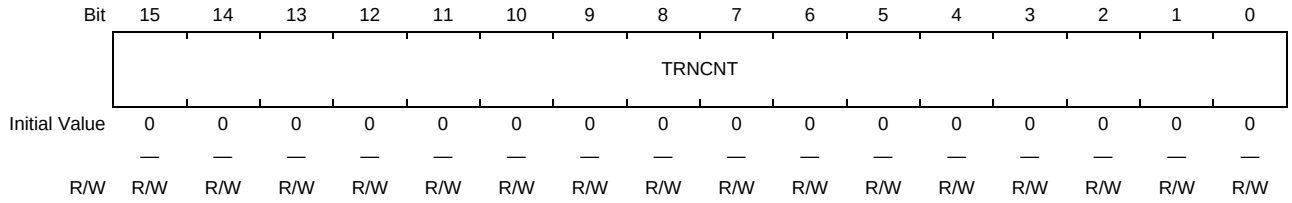
Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
9	TRENB	0	R/W	Transaction counter enable This bit enables or disables the transaction counter. 0: Disables the transaction counter. 1: Enables the transaction counter.
8	TRCLR	0	R(0)/W(1)	Transaction counter clear This bit clears the transaction counter to 0. To clear the counter, write 1 to this bit. 0: Invalid 1: Clears the current transaction counter.
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

Note: Changing values of these register bits for a selected pipe must be done when the PID of the selected pipe is NAK.
If you change the value of a bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of the bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Transaction counter enable (TRENB) bit

When software sets this bit for the selected pipe in the receiving direction after specifying a total number of packets in the TRNCNT bits, this module performs the following control when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits:

1. When the continuous transfer mode is used (CNTMD = 1), this module switches the FIFO buffer to the CPU side at the end of reception even if the FIFO buffer is not full.
2. When the SHTNAK bit is 1, this module changes the PID of the selected pipe to NAK when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits.
3. When the DENDE bit is 1 and the PKTMD bit is 0, this module asserts the DEND signal when reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.
4. When the BFRE bit is 1, this module asserts the BRDY interrupt signal when it finishes reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.



For the pipe in the sending direction, write 0 to this bit (TRENB bit). When not using the transaction count function, write 0 to this bit.

When using the transaction count function, specify a value in the TRNCNT bits before writing 1 to this bit. Also, write 1 to this bit before receiving the first packet among those to be counted by the transaction count function.

(2) Transaction counter clear (TRCLR) bit

When software sets this bit for a selected pipe, this module clears the current value of the transaction counter corresponding to the selected pipe, and then clears this bit.

6.5B.2.17.2 PIPE1 Transaction Counter Register [PIPE1TRN] <Address: H'092>
PIPE2 Transaction Counter Register [PIPE2TRN] <Address: H'096>
PIPE3 Transaction Counter Register [PIPE3TRN] <Address: H'09A>
PIPE4 Transaction Counter Register [PIPE4TRN] <Address: H'09E>
PIPE5 Transaction Counter Register [PIPE5TRN] <Address: H'0A2>

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT	All 0	R/W	When writing: Specifies the total number of packets to be received by the pertinent pipe (number of transactions). When reading: Indicates the specified number of transactions if TRENB is 0. Indicates the number of the currently counted transaction if TRENB is 1.

(1) Transaction counter (TRNCNT) bits

When software writes 1 to the TRENB bit after setting the total number of packets to be received for the selected pipe in the receiving direction, this module performs the control described in **6.5B.2.17.1 (1) Transaction counter enable (TRENB) bit**.

When the TRENB bit is 0, this module indicates, by these bits, the number of transactions set.

When the TRENB bit is 1, this module indicates, by these bits, the current number of transactions counted.

This module increments the value of the TRNCNT bits by 1 when the status of reception meets all the following conditions (a) to (c):

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is not equal to "current count + 1."

(c) The payload size of received packets has reached the value of the MXPS bits.

This module clears the TRNCNT bits to 0 when any of the following conditions (1) to (3) is met:

(1) All the following conditions (a) to (c) are met:

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is equal to "current count + 1."

(c) The payload size of received packets has reached the value of the MXPS bits.

(2) Both of the following conditions (a) and (b) are met:

(a) The TRENB bit is 1.

(b) A short packet has been received.

(3) The following condition is met:

(a) Written 1 to the TRCLR bit.

For the pipe in the sending direction, write 0 to these bits (TRNCNT bits). When not using the transaction count function, write 0 to these bits.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the TRENB bit is 0.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value of these bits, write 1 to the TRCLR bit before writing 1 to the TRENB bit.

6.5B.2.18 Low Power Control Register

6.5B.2.18.1 Low Power Control Register [LPCTRL] <Address: H'100>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	HWUPM	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved Nothing is assigned to these bits. Fix these bits to 0.
7	HWUPM	0	R/W	0: Resumes the PHY from the low-power mode while the internal bus clock (P1ϕ) is operating. 1: Enables resume from the low-power mode while the internal bus clock (P1ϕ) is stopped.
6 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) HWUPM

This bit is used to specify whether to enable resumption from the low-power mode even while the internal bus clock (P1ϕ) is stopped.

0: Disables resumption while the internal bus clock (P1ϕ) is stopped.

1: Enables resumption while the internal bus clock (P1ϕ) is stopped.

This bit specifies whether to detect resume signaling while the internal bus clock (P1ϕ) is stopped. Whether to resume is controlled by the L1EXTMD bit. To resume from the low-power mode (LPM L1 state) while the internal bus clock (P1ϕ) is stopped, set both this bit and the L1EXTMD bit.

6.5B.2.19 Low Power Status Register

6.5B.2.19.1 Low Power Status Register [LPSTS] <Address: H'102>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SUSPM	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	SUSPM	0	R/W	USBPHY Suspend M control This bit controls the Suspend M signal to the USBPHY. 0: USBPHY suspend mode 1: USBPHY normal mode
13 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) USBPHY SuspendM control (SUSPM) bit

This bit is used to control the SuspendM signal to the USBPHY. By default, the value of this bit is 0 and the USBPHY is in suspend mode. To operate this module, write 1 to this bit.

When the SUSPM bit is 0 (that is, when the UTMI clock is stopped), data cannot be written to this module, but can only be read from this module. Note, however, that data can be written to the registers listed in **Table 6.5B-20**.

Table 6.5B-20 Registers That Allow Writing when the SUSPM Bit is 0

Address	Register Name
H'000	SYSCFG0
H'002	BUSWAIT
H'100	LPCTRL
H'102	SUSPMODE

Note that the values written to the SYSCFG0 register while the USBPHY clock is stopped (SUSPM = 0) will be applied after the USBPHY clock starts (SUSPM = 1).

When the L1EXTMD bit is 0, this bit (SUSPM bit) is controlled (set or cleared) by software. When L1EXTMD bit is 1, this bit is controlled by software for the transition to the L1 or L2 state, and controlled by hardware for resumption from the L1 or L2 state, regardless of the level (L1 or L2).

6.5B.2.20 PHY Function Control Register

6.5B.2.20.1 PHY Function Control Register [PHYFUNCTR] <Address: H'104>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	SusMon	0	R	This bit allows reading of the status of the Suspend M signal.
13	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
12 to 8	—	H'01	R	Nothing is assigned to these bits. The read value is unknown.
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) SusMon

SuspendM monitor bit (read only)

The status of the Suspend M signal can be read.

6.5B.2.21 PHY_OTG Control Register (PHYOTGCTR)

6.5B.2.21.1 PHY_OTG Control Register [PHYOTGCTR] <Address: H'10A>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	DmPuDwn	DpPuDwn	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10	DmPuDwn	1	R	Dm Pulldown monitor bit
9	DpPuDwn	1	R	Dp Pulldown monitor bit
8 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) DmPuDwn

DmPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DM side is disabled.

1: 15-kΩ Pulldown resistor control on the DM side is enabled.

(2) DpPuDwn

DpPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DP side is disabled.

1: 15-kΩ Pulldown resistor control on the DP side is enabled.

6.5B.2.22 Peripheral L1 Control Register 1 (PL1CTRL)

6.5B.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: H'144>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	L1EXTMD	—	—	HIRDTHR[3:0]				DVSQ[3:0]				L1NEGOMD	L1RESPMD[1:0]		L1RESPEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	L1EXTMD	0	R/W	USBPHY control mode on resumption from the L1 state This bit controls the USBPHY resume operation on resumption from the L1 state. 0: Does not set the Suspend M bit when the Host K signal is received. 1: Sets the Suspend M bit when the Host K signal is received
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	HIRDTHR[3:0]	All 0	R/W	L1 response negotiation threshold HIRD threshold to be used for the L1NEGOMD bit The format is the same as the HIRD field of the HL1CTRL register.
7	DVSQ[3]	0	R	DVSQ extension bit This bit combined with the device state (DVSQ[2:0]) bit indicates the L1 state. 0000b: Powered state 0001b: Default state 0010b: Address state 0011b: Configured state 01xxb: Suspended state 10xxb: L1 state
6 to 4	DVSQ[2:0]	All 0	R	These bits mirror the DVSQ[2:0] bits in INTSTS0.
3	L1NEGOMD	0	R/W	L1 response negotiation control This bit sets the negotiation function using for the HIRD value. 0: Returns an ACK response if the received HIRD value is larger than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. 1: Returns an ACK response if the received HIRD value is smaller than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. This bit is valid only when the value of the L1RESPMD[1:0] bit is 11b.
2, 1	L1RESPMD[1:0]	All 0	R/W	L1 response mode These bits specify how to respond to an LPM token. 00b: NYET 01b: ACK 10b: STALL 11b: Response according to the value of the L1NEGOMD bit
0	L1RESPEN	0	R/W	L1 response enable This bit enables an L1 response. 0: Does not support LPM. 1: Supports LPM.

(1) L1 EXT mode (L1EXTMD) bit

This bit specifies how to control the SuspendM bit upon receiving the Host K signal when the USBPHY is stopped by setting the SuspendM bit in the L1 state.

0: Does not set the SuspendM bit when this module is resumed from the L1 state.

1: Sets the SuspendM bit when this module is resumed from the L1 state.

NOTES

1. The Host K period lasts a minimum of 50 µs. Therefore, the USBPHY might be unable to be resumed within the Host K period if the software settings for resume same as those for the suspend state are applied. Because the initial value of this bit is controlled by software, set this bit at initialization when the L1 state is to be supported.
2. For the transition to the L1 state, the SuspendM bit is controlled by software regardless of the value of this bit.
3. When this bit is set, the SuspendM bit will be set also at resumption from the L2 state.

(2) HIRD negotiation threshold (HIRDTHR[3:0]) bits

These bits specify the value of HIRD threshold to be used for the negotiation specified by the L1NEGOMD bit.

The format of the value is the same as that of the HIRD field in the HL1CTRL register.

(3) Device state extension (DVSQ[3]) bit

This bit is used as the fourth bit for the device state (DVSQ) bits.

0000b: Powered state

0001b: Default state

0010b: Address state

0011b: Configured state

01xxb: Suspended state

10xxb: L1 state

(4) Device status (DVSQ[2:0]) bits

These bits mirror the DVSQ[2:0] bits in the Interrupt Status Register (INTSTS0).

(5) L1 negotiation mode (L1NEGOMD) bit

This bit is used to specify the negotiation function using the HIRD value.

0: Returns an ACK response when the received HIRD value is larger than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

1: Returns an ACK response when the received HIRD value is smaller than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

This bit is valid only when the value of L1RESPMD[1:0] bits is 11b.

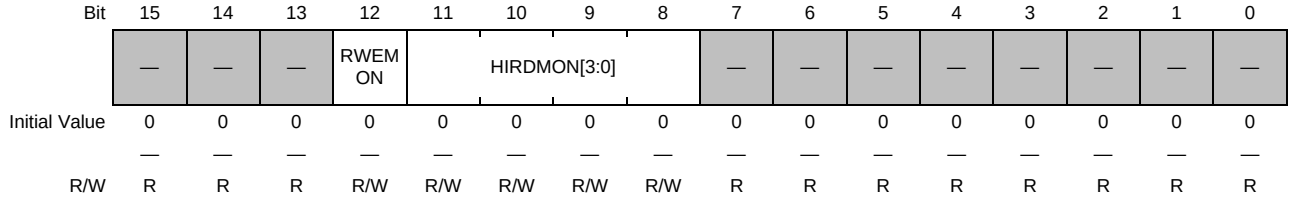
(6) L1 response mode (L1RSPMD[1:0]) bits

When the L1RSPED bit is set, this module respond to an LPM token according to the value of these bits. These bits specify how to respond to the LPM token.

00b: NYET

01b: ACK

10b: STALL



11b: Response according to the value of L1NEGOMD bit

(7) L1 response enable (L1RSPEN) bit

When this bit is 0, this module does not respond to the LPM token it receives. When this bit is 1, this module responds to the LPM token (it receives) according to the value of the LPMRESPMD[1:0] bits.

6.5B.2.23 Peripheral L1 Control Register 2

6.5B.2.23.1 Peripheral L1 Control Register 2 [PL1CTRL2] <Address: H'146>

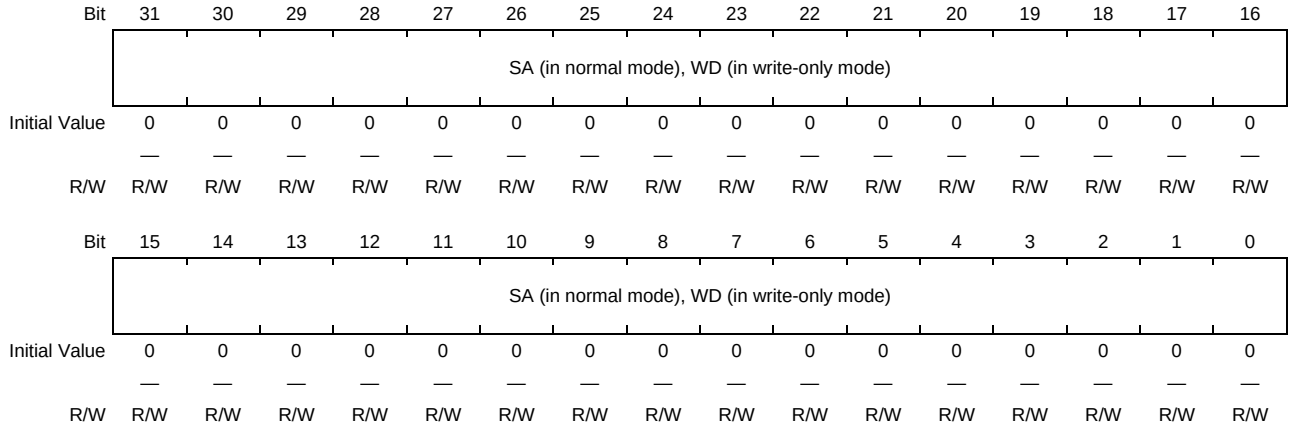
Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
12	RWEMON	0	R/W	This bit reflects the value of the RWE bit in the LPM token received last.
11 to 8	HIRDMON[3:0]	All 0	R/W	These bits reflect the value of the HIRD field in the LPM token received last.
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) RWE value monitor (RWEMON) bit

This bit is referenced to monitor the value of the RWE bit in a received LPM token.

This bit reflects the value of the RWE bit in the LPM token received last.

(2) HIRD value monitor (HIRDMON) bits



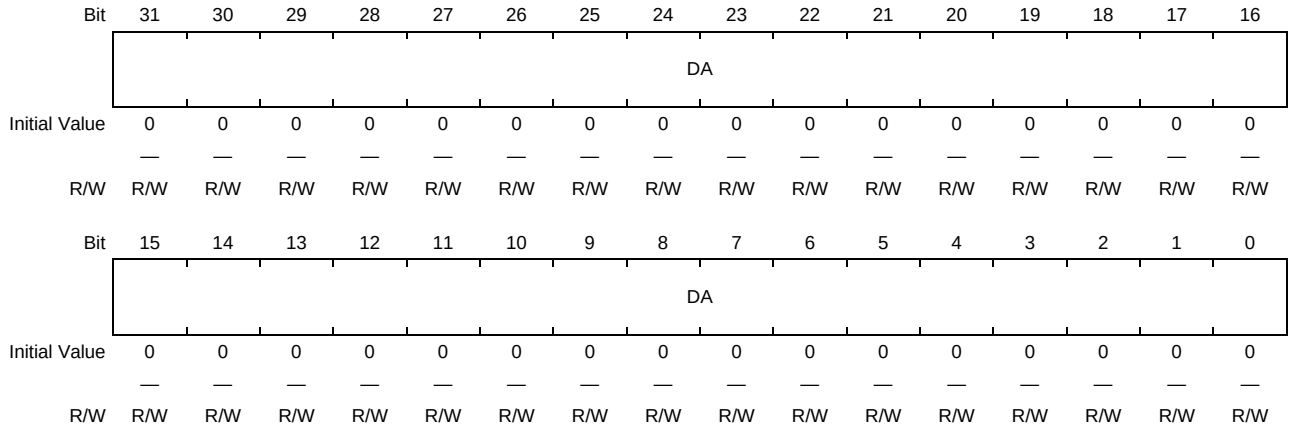
These bits are referenced to monitor the value of the HIRD field in a received LPM token.

These bits reflect the value of the HIRD field in the LPM token received last.

6.5B.3 Next Register Set

6.5B.3.1 Next Source Address Register n

6.5B.3.1.1 Next0 Source Address Register 0 [N0SA_0] <Address: H'400>
Next1 Source Address Register 0 [N1SA_0] <Address: H'40C>
Next0 Source Address Register 1 [N0SA_1] <Address: H'440>
Next1 Source Address Register 1 [N1SA_1] <Address: H'44C>



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA (in normal mode)	All 0	R/W	Source Address These bits specify the start address of the DMA transfer source.
	WD (in write-only mode)	All 0	R/W	Write Data These bits specify the write data in write-only mode.

Note: In a transfer in link mode, the data in the N0SA_n register is overwritten with descriptor read data.

6.5B.3.2 Next Destination Address Register n

6.5B.3.2.1 Next0 Destination Address Register 0 [N0DA_0] <Address: H'404>
Next1 Destination Address Register 0 [N1DA_0] <Address: H'410>
Next0 Destination Address Register 1 [N0DA_1] <Address: H'444>
Next1 Destination Address Register 1 [N1DA_1] <Address: H'450>

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA	All 0	R/W	Destination Address These bits specify the start address of the DMA transfer destination.

Note: In a transfer in link mode, the data in the N0DA_n register is overwritten with descriptor read data.

6.5B.3.3 Next Transaction Byte Register n

6.5B.3.3.1 Next0 Transaction Byte Register 0 [N0TB_0] <Address: H'408>
Next1 Transaction Byte Register 0 [N1TB_0] <Address: H'414>
Next0 Transaction Byte Register 1 [N0TB_1] <Address: H'448>
Next1 Transaction Byte Register 1 [N1TB_1] <Address: H'454>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TB

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB	All 0	R/W	Transaction Byte These bits specify the total number of transfer bytes. *Note*: Do not start a DMA transaction with 0 set in these bits.

Note: The N0TB_n register is overwritten by the descriptor read data during link mode transfer.

6.5B.4 Current Register Set

6.5B.4.1 Current Source Address Register

6.5B.4.1.1 Current Source Address Register 0 [CRSA_0] <Address: H'418>
Current Source Address Register 1 [CRSA_1] <Address: H'458>

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRSA	All 0	R	Current Source Address Register This register indicates the read address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the SAD bit in the CHCFG_n register is 1, the value of this register is fixed. When the WONLY bit in the CHCFG_n register is 1, the value of this register is undefined.) The initial value of this register is loaded from the following register: In register mode: A transfer source address is loaded from the Next0/1 Register Set. In link mode: A transfer source address is loaded from the descriptor. (The descriptor read data is input to the N0SA_n register, and is loaded into the CRSA_n register when a transfer starts.) The value of this register is incremented when a read transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

6.5B.4.2 Current Destination Address Register

6.5B.4.2.1 Current Destination Address Register 0 [CRDA_0] <Address: H'41C>
Current Destination Address Register 1 [CRDA_1] <Address: H'45C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRDA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRDA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRDA	All 0	R	Current Destination Address Register This register indicates the write address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the DAD bit in the CHCFG_n register is 1, the value of this register is fixed.) The initial value of this register is loaded from the following register: In register mode: A transfer destination address is loaded from the Next0/1 Register Set. In link mode: A transfer destination address is loaded from the descriptor. (The descriptor read data is input to the N0DA_n register, and is loaded into the CRDA_n register when a transfer starts.) The value of this register is incremented when a write transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

6.5B.4.3 Current Transaction Byte Register

6.5B.4.3.1 Current Transaction Byte Register 0 [CRTB_0] <Address: H'420>
Current Transaction Byte Register 1 [CRTB_1] <Address: H'460>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTB	All 0	R	Current Transaction Byte Register This register indicates the remaining number of transfer bytes in the ongoing DMA transaction. The value of this register is decremented automatically while the DMA transaction is in process. The initial value of this register is loaded from the following register: In register mode: The number of transfer bytes is loaded from the Next0/1 Register Set. In link mode: The number of transfer bytes is loaded from the descriptor. (The descriptor read data is input to the N0TB_n register, and is loaded into the CRTB_n register when a transfer starts.) The value of this register is decremented when a write transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

6.5B.5 Channel Register Set

6.5B.5.1 Channel Status Register n

6.5B.5.1.1 Channel Status Register 0 [CHSTAT_0] <Address: H'424>
Channel Status Register 1 [CHSTAT_1] <Address: H'464>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DNUM								—	—	—	—	—	SWPRQ	DMARQM	INTM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DNUM	All 0	R	Data Number These bits indicate the amount of valid data in the buffer. The indicated amount of data is the amount of the data that was read from the source but has not yet been written to the destination. (Unit: byte) Incrementing condition: • A DMA read transfer ends. Decrementing condition: • A DMA write transfer ends. Clearing conditions: • A condition for clearing the EN bit is met. • "1" is written to the SWRST bit in the CHCTRL_n register.
23 to 19	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
18	SWPRQ	0	R	Sweep Request This bit indicates the state of sweep request. This bit indicates the state of software sweep request (which has been activated by the SETSSWPRQ bit in the CHCTRL_n register). 1: The sweep request signal has been asserted. 0: The sweep request signal has not been asserted. Setting condition: • The SETSSWPRQ bit in the CHCTRL_n register is asserted. Clearing conditions: • The buffer becomes empty because of sweep. • "1" is written to the CLRHSWPRQM bit in the CHCTRL_n register. • "1" is written to the SWRST bit in the CHCTRL_n register.

Bit	Bit Name	Initial Value	R/W	Description
17	DMARQM	0	R	DMAREQ Mask This bit indicates the state of temporary masking of the DMA transfer request from the USB control. 1: The request is temporarily masked. 0: The request is released from temporary masking. Setting condition: ● The SETDMARQM bit in the CHCTRL_n register is set. Clearing conditions: ● “1” is written to the CLRDMARQM bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
16	INTM	0	R	Interrupt Mask This bit indicates the state of temporary masking of the output from the USBFDMAmn interrupt. 1: The output is temporarily masked. 0: The output is released from temporary masking. Setting condition: ● “1” is written to the SETINTM bit in the CHCTRL_n register. Clearing conditions: ● “1” is written to the CLRINTM bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
15 to 12	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
11	MODE	0	R	DMA Mode This bit indicates the DMA mode. The indicated value is the value of the DMS bit in the CHCFG_n register. 0: Register mode 1: Link mode
10	DER	0	R	Descriptor Error This bit indicates whether the data read from the descriptor is invalid (LV = 0) (regardless of the value of the DIM bit in the CHCFG_n register). 0: No descriptor error has occurred. 1: A descriptor error has occurred. Setting condition: ● In link mode, when the DRRP bit in the CHCFG_n register is 0, the LV bit value read from the descriptor is 0. Clearing conditions: ● “1” is written to the CLRDER bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
9	DW	0	R	Descriptor WriteBack This bit indicates whether data is being written back to the descriptor. If a bus error occurs during write-back to the descriptor, this bit retains 1. 0: Status other than write-back to the header in link mode 1: (When the ER bit in the CHSTAT_n register is 0) Data is being written back to the header in link mode. (When the ER bit in the CHSTAT_n register is 1) A bus error has occurred during write-back to the header in link mode. Setting condition: ● Write-back to the header is started in link mode. Clearing conditions: ● Write-back to the header in link mode ends with an OK response. ● “1” is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit.

Bit	Bit Name	Initial Value	R/W	Description
8	DL	0	R	Descriptor Load This bit indicates whether data is being read from the descriptor. If a bus error occurs during descriptor reading, this bit retains 1. 0: Status other than descriptor reading 1: (When the ER bit is 0) Descriptor reading is in process in link mode. (When the ER bit is 1) A bus error has occurred during descriptor reading in link mode. Setting condition: ● Descriptor reading is started in link mode. Clearing conditions: ● Descriptor reading in link mode ends with an OK response. ● “1” is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit.
7	SR	0	R	Selected Register Set In register mode, this bit indicates the register set that is selected. 0: Next0 Register Set 1: Next1 Register Set Setting condition: ● The RSEL bit in the CHCFG_n register is set. Clearing condition: ● The RSEL bit in the CHCFG_n register is cleared.
6	TC	0	R	Terminal Count This status bit indicates whether the DMA transaction has ended. This bit is set only when the TCM bit in the CHCFG_n register is 0. 0: The DMA transfer has not ended. 1: The DMA transfer has ended. Setting conditions: ● In register mode, transfer of the total number of transfer bytes specified in the CRTB bits ends. ● In link mode, when the WBD bit in the header of the descriptor is 1, transfer of the total number of transfer bytes specified in the CRTB bits ends. ● In link mode, when the WBD bit in the header of the descriptor is 0, write-back to the descriptor ends. Clearing conditions: ● “1” is written to the CLRTC bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
5	END	0	R	USBFDMAmn Interrupted This bit indicates whether the DMA transaction has ended and an USBFDMAmn interrupt has occurred. 0: The DMA transfer has not ended. 1: The DMA transfer has ended. Setting conditions: ● The condition for setting the TC bit is met, and the DEM bit in the CHCFG_n register is 0. ● In link mode, when the descriptor is read, the LV bit in the header is 0, and the DRRP and DIM bits in the CHCFG_n register are 0. Clearing conditions: ● “1” is written to the CLREND bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.

Bit	Bit Name	Initial Value	R/W	Description
4	ER	0	R	Error This bit indicates whether an error response has been received and a DMAERR interrupt has occurred during the DMA transfer. 0: No error response has been received. 1: An error response has been received. Setting condition: ● An error response is received in a bus cycle. Clearing condition: ● “1” is written to the SWRST bit in the CHCTRL_n register.
3	SUS	0	R	Suspend This bit indicates whether the channel is suspended. For details, see **6.5B.9.13.8 (2) Suspension**. 0: Channel_n is not suspended. 1: Channel_n is suspended. Setting condition: ● “1” is written to the SETSUS bit in the CHCTRL_n register during the DMA transfer using channel_n, and, thereby, the inside of the channel is suspended. Clearing conditions: ● “1” is written to the CLRSUS bit in the CHCTRL_n register. ● “1” is written to the CLREN bit in the CHCTRL_n register. ● A condition for clearing the EN bit in the CHSTAT_n register.
2	TACT	0	R	Transaction Active This bit indicates whether the DMAC is operating. This bit is used to check whether the channel is stopped fully. For details, see **6.5B.9.13.8 Transfer state**. 0: The DMA in channel_n is stopped. 1: The DMA in channel_n is operating. Setting condition: ● “1” is written to the SETEN bit in the CHCTRL_n register (to start descriptor reading or wait for a DMA request). Clearing condition: ● The internal state is the idle state (the EN bit in the register has been cleared, and all transfers have ended).
1	RQST	0	R	Request This bit indicates whether a transfer request has been received. 0: No DMA transfer request has been received. 1: A DMA transfer request has been received. Setting conditions: ● “1” is written to the STG bit in the CHCTRL_n register. ● A DMA transfer request is received from the USB control. Clearing conditions: ● “1” is written to the SWRST bit in the CHCTRL_n register. ● “1” is written to the CLRRQ bit in the CHCTRL_n register. ● In single transfer mode (the TM bit in the CHCFG_n register is 0), a transfer is executed on the side specified by the REQD bit in the CHCFG_n register ● In register mode, all DMA transactions are complete (the REN bit in the CHCFG_n register is 0). ● In link mode, the DMA transfer of the last descriptor (LE = 1) ends. ● In link mode, a DMA transfer is stopped during descriptor reading (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0). ● In link mode, when the DEM bit in the CHCFG_n register is 0, a DMA transaction ends. ● The master interface receives a bus error signal.

Bit	Bit Name	Initial Value	R/W	Description
0	EN	0	R	Enable This bit indicates whether the operation of DMA channel n is enabled or stopped. 0: Operation is stopped. 1: Operation is enabled. Setting conditions: • “1” is written to the SETEN bit in the CHCTRL_n register. Clearing conditions: • “1” is written to the SWRST bit in the CHCTRL_n register. • “1” is written to the CLREN bit in the CHCTRL_n register. • An error response is received during transfer. • In register mode, all DMA transactions are completed (the REN bit in the CHCFG_n register is 0). • In link mode, DMA transfer of the last descriptor (the LE bit is 1) ends (if the WBD bit is 0, write- back to the descriptor ends). • In link mode, reading of a descriptor is stopped (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0).

Note 1. When the ER bit in the CHSTAT_n register is set, treat the corresponding series of transfers as invalid transactions.

Note 2. To interrupt a DMA transaction, mask or clear transfer requests or clear the EN bit in the CHSTAT_n register. (For the procedure to interrupt, see **6.5B.9.13.8 (3) Transfer suspension**.)

Note 3. If the DMA transfer request from the USB control and the transfer request by software (setting the STG bit in the CHCFG_n register) are used together, the cause of activating the request that takes effect cannot be identified. Therefore, design the system so that only one type of transfer requests is used.

Note 4. When using the transfer request by software, operate the STG bit for a new transfer request only after the DMA transfer requested last ends (after checking the end of the last DMA transfer by referencing the Current Register Set or another method).

6.5B.5.2 Channel Control Register n

6.5B.5.2.1 Channel Control Register 0 [CHCTRL_0] <Address: H'428>
Channel Control Register 1 [CHCTRL_1] <Address: H'468>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLRDMARQM	SETDMARQM	CLRINTM	SETINTM

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SETSSWPRQ	—	SETREN	—	—	CLRSUS	SETUSS	CLRDER	CLRTC	CLREND	CLRRQ	SWRST	STG	CLREN	SETEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read
19	CLRDMARQM	0	R/W	Clear DMAREQ Mask Writing 1 to this bit releases the DMA transfer requests from the USB control from temporary masking. Writing 1 to this bit also clears the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Releases the DNA transfer requests from masking set by using the SETDMARQM bit. 0: Has no effect on operation.
18	SETDMARQM	0	R/W	SET DMAREQ Mask Writing 1 to this bit temporarily masks the DMA transfer requests from the USB control. Writing 1 to this bit also sets the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the DMA transfer requests from the USB control. 0: Has no effect on operation.
17	CLRINTM	0	R/W	Clear Interrupt Mask Writing 1 to this bit releases the USBFDMAmn interrupt from masking. Writing 1 to this bit also clears the INTM bit in the CHSTATn register. Releasing the INT_DMA[n] pin output from masking when the LVINT bit in the DCTRL register and the END bit in the CHSTAT_n register are 1 activates the INT_DMA[n] pin output. (The pin output is not activated if the LVINT bit is 0.) When this bit is read, 0 is read. 1: Releases the pin output from masking set by using the SETINTM bit. 0: Has no effect on operation.
16	SETINTM	0	R/W	SETINTMSet Interrupt Mask Writing 1 to this bit temporarily masks the USBFDMAmn interrupt. Writing 1 to this bit also sets the INTM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the USBFDMAmn interrupt. 0: Has no effect on operation.
15	—	0	R	Reserved area. Write 0 to this bit. When this bit are read, 0 is read.

Bit	Bit Name	Initial Value	R/W	Description
14	SETSSWPRQ	0	R/W	Set Software Sweep Request Writing 1 to this bit sweeps out the data stored in the buffer to the destination (see **6.5B.9.13.3 (1) Forced software sweeping request**). When this bit is read, 0 is read. 1: Writes, to the destination, the data that is stored in the buffer and has not yet been written to the destination. 0: Has no effect on operation. If the destination asserts a hardware request (REQD = 1), the sweep operation cannot be used.
13	—	0	R	Reserved area. Write 0 to this bit. When this bit are read, 0 is read.
12	SETREN	0	R/W	Set Register Set Enable Writing 1 to this bit sets the REN bit in the CHCFG_n register. When this bit is read, 0 is read. 1: Sets the REN bit in the CHCFG_n register. 0: Has no effect on operation.
11, 10	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
9	CLRSUS	0	R/W	Clear Suspend Writing 1 to this bit when the SUS bit in the CHSTAT_n register is 1 releases the ongoing DMA transfer from the suspended state. When this bit is read, 0 is read. 1: Releases the ongoing DMA transfer from the suspended state. 0: Has no effect on operation.
8	SETSUS	0	R/W	Set Suspend Writing 1 to this bit when the EN bit in the CHSTAT_n register is 1 suspends the ongoing DMA transfer. When this bit is read, 0 is read. 1: Suspends the ongoing DMA transfer. 0: Has no effect on operation.
7	CLRDER	0	R/W	Clear DER Writing 1 to this bit clears the DER bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0 is read. 1: Clears the DER bit. 0: Has no effect on operation.
6	CLRTC	0	R/W	Clear TC Writing 1 to this bit clears the TC bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the TC bit. 0: Has no effect on operation.
5	CLREND	0	R/W	Clear End Writing 1 to this bit clears the END bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0 is read. 1: Clears the END bit. 0: Has no effect on operation.
4	CLRRQ	0	R/W	Clear Request Writing 1 to this bit clears the RQST bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the RQST bit in the CHSTAT_n register. 0: Has no effect on operation.

Bit	Bit Name	Initial Value	R/W	Description
3	SWRST	0	R/W	Software Reset Writing 1 to this bit clears individual bits in the CHSTAT_n register (for the bits to be cleared, see the description of each bit). Setting this bit must be done when the EN and TACT bits are 0. When this bit is read, 0 is read. 1: Clears individual bits in the CHSTAT_n register. 0: Has no effect on operation.
2	STG	0	R/W	Software Trigger Writing 1 to this bit makes software set an internal transfer request. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority. When this bit is read, 0 is read. 1: Makes software set a transfer request (set the RQST bit in the CHSTAT_n register). 0: Has no effect on operation.
1	CLREN	0	R/W	Clear Enable Writing 1 to this bit clears the EN bit in the CHSTAT_n register (for details, see **6.5B.9.13.8 (3) Transfer suspension**). When this bit is read, 0 is read. 1: Disables DMA transfers (clears the EN bit in the CHSTAT_n register). 0: Has no effect on operation.
0	SETEN	0	R/W	Set Enable Writing 1 to this bit enables DMA transfers in DMA channel n. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority, and DMA transfers do not start. When this bit is read, 0 is read. 1: Enables DMA transfers (sets the EN bit in the CHSTAT_n register). 0: Has no effect on operation.

Note: Temporary masking (using the CLRDMARQM, and SETDMARQM bits) of the DMA transfer requests from the USB control applies to only the resources for channel n. Setting the SETDMARQM bit for channel n does not affect the operation of channel m.

6.5B.5.3 Channel Configuration Register

6.5B.5.3.1 Channel Configuration Register 0 [CHCFG_0] <Address: H'42C>
Channel Configuration Register 1 [CHCFG_1] <Address: H'46C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMS	REN	RSW	RSEL	SBE	DIM	TCM	DEM	WONLY	—	DAD	SAD	DDS

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDS				DRRP	—	—	—	—	—	—	—	REQD	—	—	SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	DMS	0	R/W	DMA Mode Select This bit specifies the DMA mode to be used. 0: Register mode (default) 1: Link mode
30	REN	0	R/W	Register Set Enable This bit specifies whether to successively perform, after a DMA transaction ends, another DMA transaction using the Next Register Set selected by the RSEL bit. This bit is valid only in register mode. 0: Does not perform the DMA transaction successively. 1: Performs the DMA transaction successively. Setting conditions: • "1" is written to this bit. • "1" is written to the SETREN bit in the CHCTRL_n register. Clearing conditions: • "0" is written to this bit. • The REN bit is 1, and a DMA transaction ends. To re-set the REN bit during a transaction, we recommend to use the SETREN bit in the CHCTRL_n register.
29	RSW	0	R/W	Register Select Switch This bit specifies whether to automatically invert the RSEL bit after a DMA transaction ends. This bit is valid only in register mode. 0: Does not invert the RSEL bit after a DMA transaction ends. (Default) 1: Inverts the RSEL bit after a DMA transaction ends.
28	RSEL	0	R/W	Register Set Select This bit is used to select the Next Register Set to be used for the next DMA transaction. This bit is valid only in register mode. When the RSW bit is 1, this bit is inverted automatically at the end of a DMA transaction. 0: Uses the Next0 Register Set. (Default) 1: Uses the Next1 Register Set. Transition condition: A DMA transaction ends with the RSW bit set.

Bit	Bit Name	Initial Value	R/W	Description
27	SBE	0	R/W	Sweep Buffer Enable This bit specifies whether to sweep (write) the data already read and stored in the buffer and stop transfer when the EN bit in the CHSTAT_n register is cleared during a DMA transaction. The sweep mode can be used only when the REQD bit is 0. 0: Stops transfer without sweeping out the buffer. (Default) 1: Stops transfer after sweeping out the buffer.
26	DIM	0	R/W	Descriptor Interrupt Mask This bit specifies whether to mask the USBFDMAmn interrupt when the LV bit value read from descriptor header is 0. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Mask the USBFDMAmn interrupt.
25	TCM	0	R/W	DMATC Mask This bit is used to mask the DMATC signal, which is sent from the DMAC to USB control. When this bit is 1 at the time the DMATC signal is to be output, the DMATC signal is not asserted. Also, the TC bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is automatically cleared. In link mode, this bit is not cleared automatically. Use this bit when you control DMA transfers by software. 0: Does not mask the DMATC signal. (Default) 1: Masks the DMATC signal. Clearing condition: A DMA transaction ends with the TCM bit set.
24	DEM	0	R/W	USBFDMAmn Mask When this bit is 1 at the time the USBFDMAmn interrupt is not asserted. Also, the END bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is not cleared automatically. In link mode, this bit is automatically cleared. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Masks the USBFDMAmn interrupt. Clearing condition: A DMA transaction ends with the DEM bit set.
23	WONLY	0	R/W	Write Only Mode This bit is used to switch the transfer operation mode to the write-only mode (see **6.5B.9.12.2 Write only mode**). 0: Normal operation (default) 1: Write-only mode
22	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
21	DAD	0	R/W	Destination Address Direction This bit specifies the direction of counting the transfer-destination address in DMA channel n. If the transfer destination is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer destination uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit.
20	SAD	0	R/W	Source Address Direction This bit specifies the direction of counting the transfer-source address in DMA channel n. If the transfer source is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer source uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit.

Bit	Bit Name	Initial Value	R/W	Description
19 to 16	DDS[3:0]	All 0	R/W	Destination Data Size These bits specify the size of DMA transfer data. When the transfer destination is on the USB control side, select the normal mode. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 6.5B-21**.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited
15 to 12	SDS[3:0]	All 0	R/W	Source Data Size These bits specify the size of DMA transfer data. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 6.5B-21**.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited
11	DRRP	0	R/W	Descriptor Read Repeat This bit switches the operation to be performed when the LV value in the header read from the descriptor is 0. (See **6.5B.9.12.1(2) (a) Operation flow of link mode**.) • 0: This module sets the DER bit in the CHSTAT_n register, and then stops descriptor reading. (Default) • 1: This module keeps reading the same descriptor until the LV value changes to 1, and, when the LV value becomes 1, starts the DMA transfer using the values in the descriptor. The interval of descriptor reading is controlled by using the DSCITVL register.
10 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6, 5	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 1.
4	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
3	REQD	0	R/W	Request Direction This bit specifies whether the USB control is on the transfer source side or it is on the transfer destination side. 0: The USB control is on the transfer source side. (Default) 1: The USB control is on the transfer destination side.
2, 1	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
0	SEL	0	R/W	Terminal Select This bit selects the FIFO channel to be used on the USB control side. 0: D0FIFO 1: D1FIFO

The range of values specifiable in the SDS[2:0] and DDS[2:0] bits depends on the data bus width, number of implemented buffer stages, and whether the address to be accessed is beat-aligned or not (beat-unaligned). The table below shows the range of specifiable values.

Table 6.5B-21 Range of Sizes That Can Be Specified in SDS and DDS Bits

Transfer Address	REQD	SDS[2:0]	DDS[2:0]
Beat aligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)
	1	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.
Beat unaligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)
	1	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.

Note: When the destination is beat-unaligned with REQD = 0 or the source is beat-unaligned with REQD = 1, specify values in the range of specifiable values for beat-unaligned transfer addresses in both of the SDS[2:0] and DDS[2:0] bits.
Even if the transfer source and destination are beat-aligned when a DMA transaction starts, they might become beat-unaligned in the middle of the transaction when a skip transfer is used. If this might occur, perform settings in the first place on the assumption that the transfer source and destination are beat-unaligned.
If software cannot determine whether the transfer source and/or destination is beat-aligned, use values in the range of specifiable values for beat-unaligned transfer addresses.

6.5B.5.4 Channel Interval Register n

For details, see **6.5B.9.13.6 Interval Count Function**.

6.5B.5.4.1 Channel Interval Register 0 [CHITVL_0] <Address: H'430>
Channel Interval Register 1 [CHITVL_1] <Address: H'470>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	DPR				—	—	—	—	SPR			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

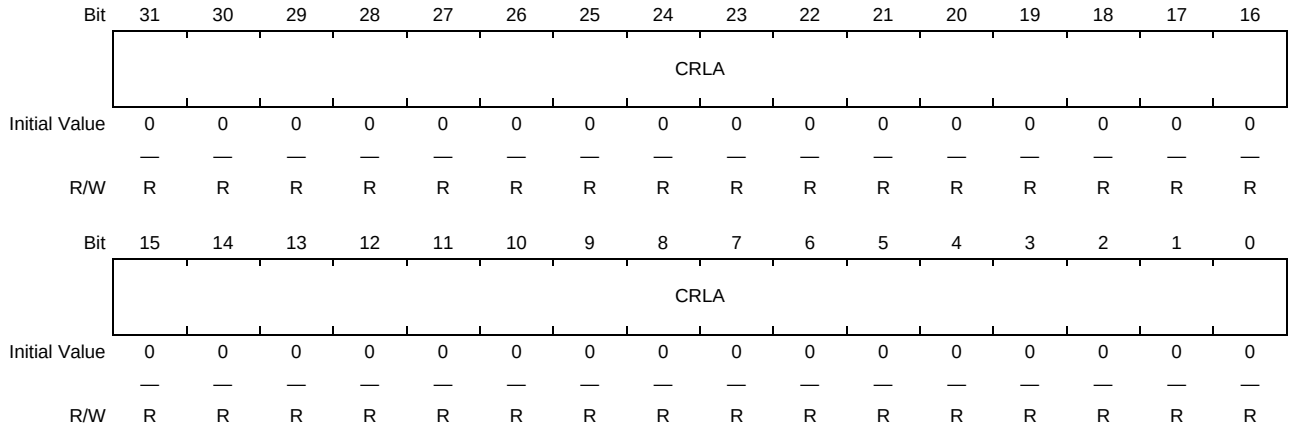
Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	DPR	All 0	R/W	Destination PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA write transfer. The initial value of these bits is H'0.
7 to 4	—	All 0	R/W	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	SPR	All 0	R/W	Source PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA read transfer. The initial value of these bits is H'0.

6.5B.6 Link Register Set

When software sets a descriptor address in the NXLA_n register and starts the DMAC, hardware loads the value set in the NXLA_n register into the CRLA_n register. Then, the descriptor is read, and the DMAC starts a DMA transaction according to the values read from the descriptor. The value in the NXLA_n register is automatically updated to the Next Link Address value read from the descriptor, and the updated value is used as the descriptor address in the next DMA transaction.

6.5B.6.1 Next Link Address Register n (NXLA_n)

6.5B.6.1.1 Next Link Address Register 0 [NXLA_0] <Address: H'438>
Next Link Address Register 1 [NXLA_1] <Address: H'478>



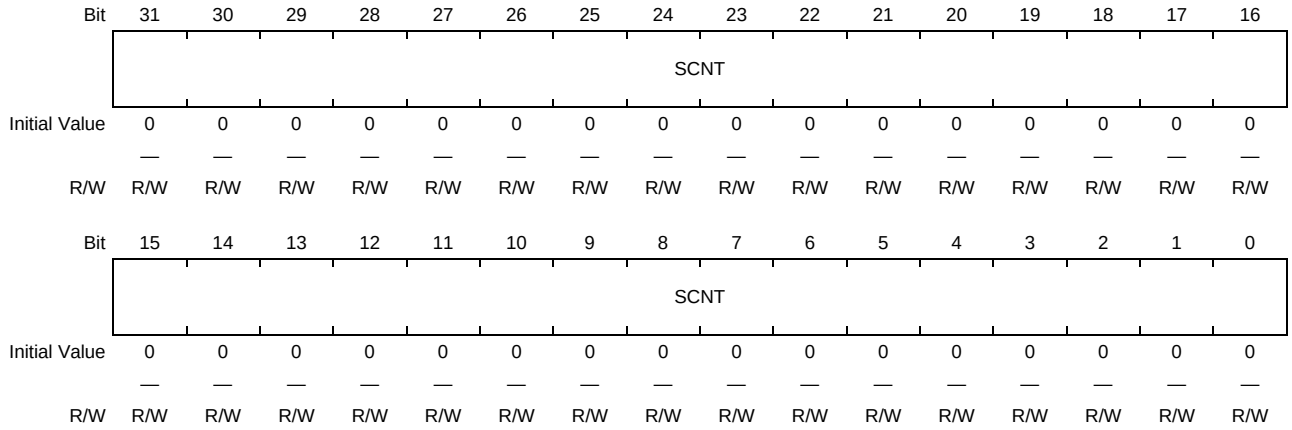
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NXLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NXLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	NXLA	All 0	R/W	Next Link Address
1, 0		All 0	R	These bits specify the link-destination address. Upper two bits are fixed to 0, and only the address aligned with a word boundary can be set.

6.5B.6.2 Current Link Address Register n (CRLA_n)

6.5B.6.2.1 Current Link Address Register 0 [CRLA_0] <Address: H'43C>
Current Link Address Register 1 [CRLA_1] <Address: H'47C>



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRLA	All 0	R	Current Link Address These bits indicate the address of the descriptor being used for current transaction.

6.5B.7 Skip Register Set

This register set is used to specify settings for a skip (scatter/gather) transfer.

6.5B.7.1 Source Continuous Register n

6.5B.7.1.1 Source Continuous Register 0 [SCNT_0] <Address: H'600>
Source Continuous Register 1 [SCNT_1] <Address: H'620>

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SCNT	All 0	R/W	Source Continuous These bits specify the size of the space to be accessed continuously by source address access. (Unit: byte)

Note: This register is used in pair with the SSKP_n register (see **Figure 6.5B-3**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the SCNT bits set to 0.

6.5B.7.2 Source Skip Register n

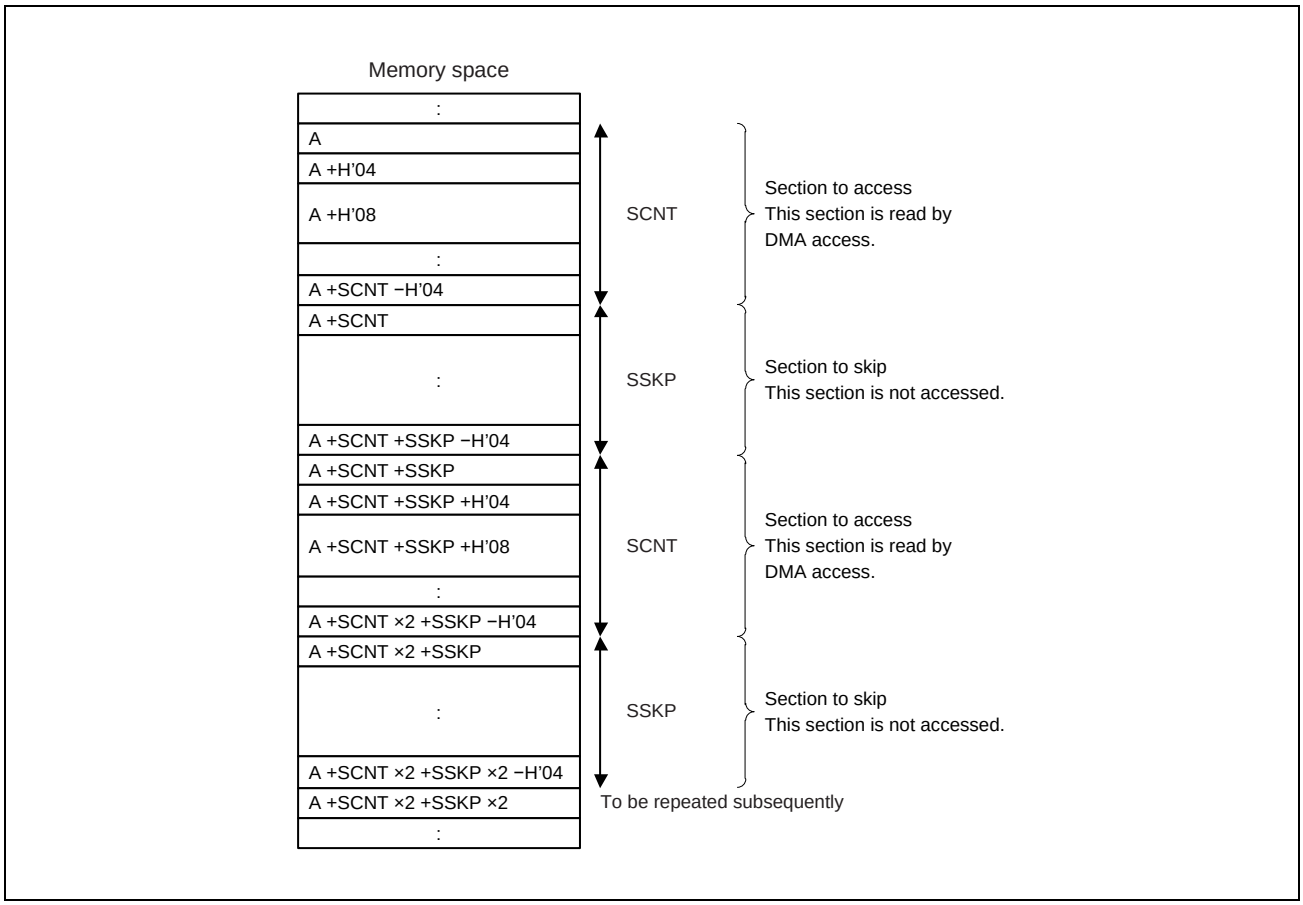
6.5B.7.2.1 Source Skip Register 0 [SSKP_0] <Address: H'604>
Source Skip Register 1 [SSKP_1] <Address: H'624>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSKP															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSKP															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSKP	All 0	R/W	Source Skip These bits specify the size of area to be skipped in a source address access. (Unit: byte)

Note: This register is used in pair with the SCNT_n register (see **Figure 6.5B-3**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not set to 1 (Fixed).



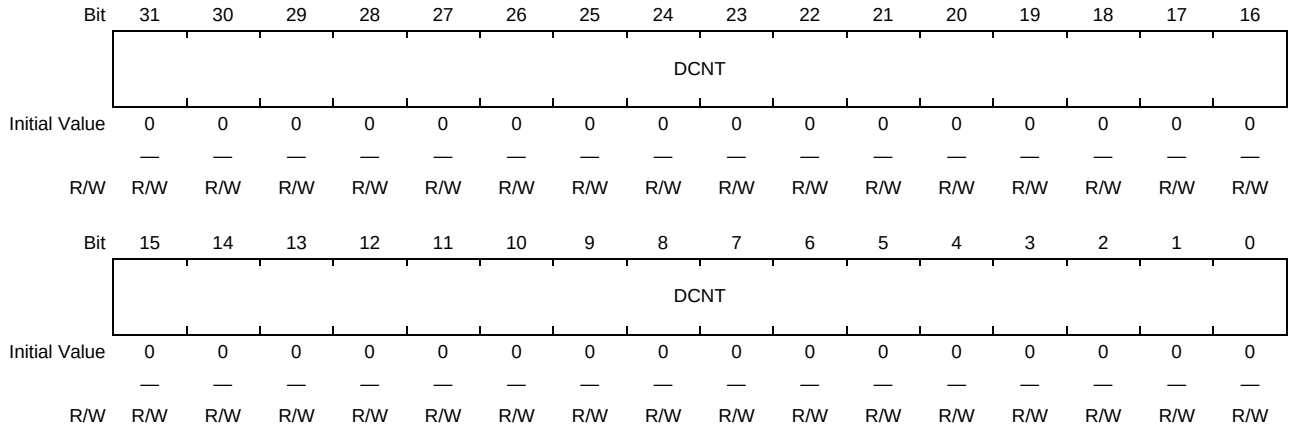


Figure 6.5B-3 Relationship between SSKP and SCNT

You can specify values of the SCNT and SSKP bits regardless of the source address and the value of the SDS field in the CHCFG_n register. The DMAC performs access based on the size specified in the SDS field, and fetches only valid data into the buffer (see **6.5B.9.14.1 (1) Read access**).

6.5B.7.3 Destination Continuous Register n

6.5B.7.3.1 Destination Continuous Register 0 [DCNT_0] <Address: H'608>
Destination Continuous Register 1 [DCNT_1] <Address: H'628>

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DCNT	All 0	R/W	Destination Continuous These bits specify the size of the space to be accessed continuously by destination address access. (Unit: byte)

Note: This register is used in pair with the DSKP_n register (see **Figure 6.5B-4**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the DCNT bits set to 0.

6.5B.7.4 Destination Skip Register n

6.5B.7.4.1 Destination Skip Register 0 [DSKP_0] <Address: H'60C>
Destination Skip Register 1 [DSKP_1] <Address: H'62C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSKP															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSKP															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSKP	All 0	R/W	Destination Skip These bits specify the size of area to be skipped in a destination address access. (Unit: byte)

Note: This register is used in pair with the DCNT_n register (see **Figure 6.5B-4**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed).

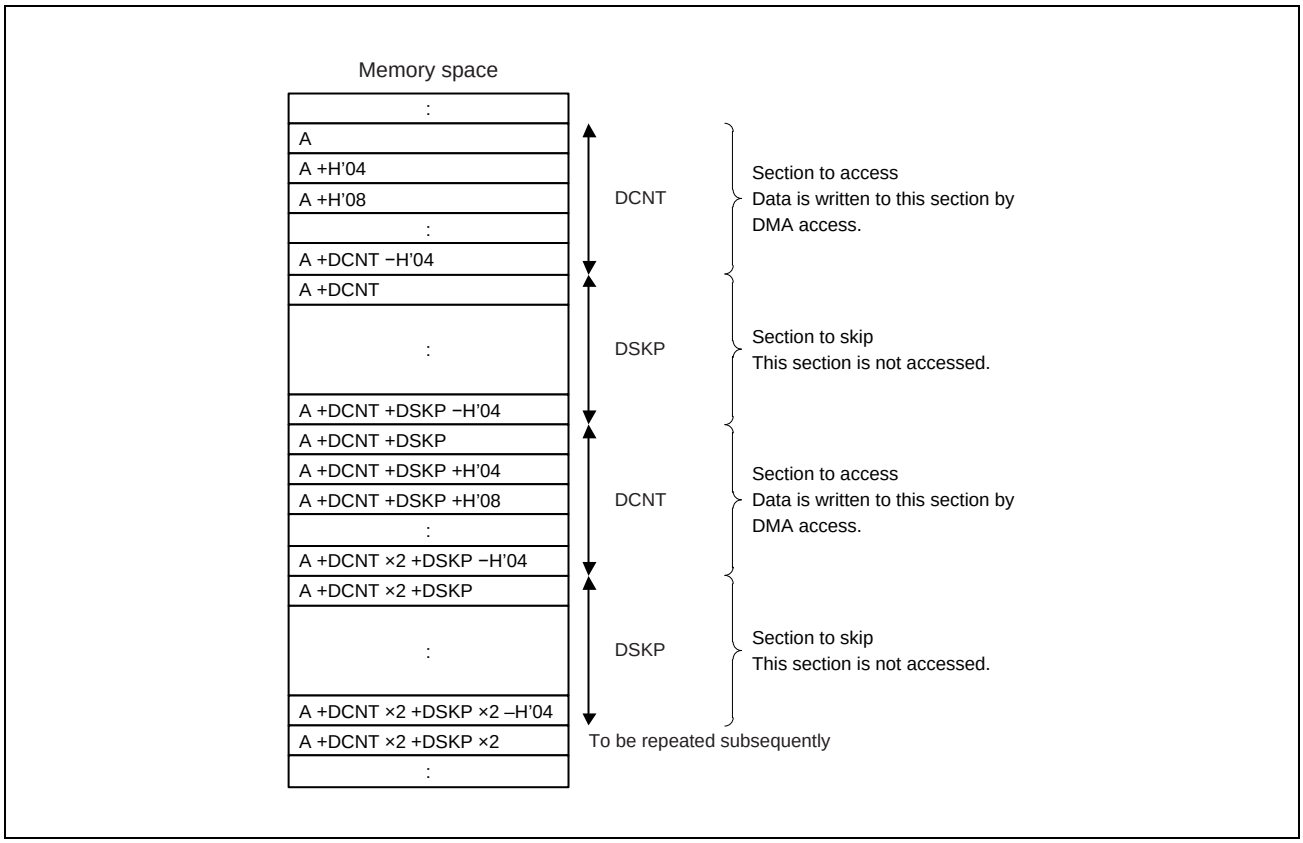

Figure 6.5B-4 Relationship between DSKP and DCNT

You can specify values of the DCNT and DSKP bits regardless of the destination address and the value of the DDS field in the CHCFG_n register. The DMAC performs write access to only the specified space that has a combined size not more than the size specified in the DDS field (see **6.5B.9.14.1 (1) Read access**).

6.5B.8 DMA Register Set

The registers described below are shared by all channels.

6.5B.8.1 DMA Control Register

6.5B.8.1.1 DMA Control Register [DCTRL] <Address: H'700>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	LWPR				—	—	—	—	LDPR			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LVINT	PR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
27 to 24	LWPR	All 0	R/W	Link WriteBack PROT These bits specify the value to be output to the MHPROT[3:0] pin at write-back to the descriptor in link mode.
23 to 20	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
19 to 16	LDPR	All 0	R/W	Link Descriptor PROT These bits specify the value to be output to the MHPROT[3:0] pin at reading of the descriptor in link mode.
15 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	LVINT	0	R/W	Level Interrupt To use this module, be sure to set this bit to 1.
0	PR	0	R/W	Priority This bit specifies the transfer priority control mode (see **6.5B.9.13.2 DMA channel priority control**). 0: Fixed priority mode 1: Round-robin mode

6.5B.8.2 Descriptor Interval Register n

6.5B.8.2.1 Descriptor Interval Register [DSCITVL] <Address: H'704>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	SUS1	0	R	This bit indicates the state of the SUS bit for DMA channel 1.
0	SUS0	0	R	This bit indicates the state of the SUS bit for DMA channel 0.

6.5B.9 Functions

6.5B.9.1 System Control and Oscillation Control

This chapter describes register manipulations required to perform initial setup of this module. This chapter also describes the registers required to control power consumption.

For the parts of the sequence that are required in both host and peripheral modes, see **6.5A.9.1 Host/Peripheral Common Setting Sequence**.

6.5B.9.1.1 USB data bus resistor control

This module controls switchover between the pull-up resistors for the D+ signal and the pull-down resistors for the D- signal of the USBPHY. Use the DPRPU bit and DRPD bit in the SYSCFG0 register to set pull-up or pull-down of each signal.

Recognize that a connection to the USB host is established, and then set 1 for the DPRPU bit in the SYSCFG0 register to pull up the D+ signal.

After connected to the host, this module automatically switches the resistor when the state changes to reset handshake, suspend, or resume.

If 0 is set for the DPRPU bit in the SYSCFG0 register during communication with the host, the pull-up resistor (or termination resistor) for the USB data line is disabled. This can notify the host controller of disconnection of a device.

6.5B.9.2 Interrupt Function

6.5B.9.2.1 Overview of Interrupt Function (other than DMA Master)

The following shows a list of interrupt functions of this module. An interrupt is notified as U2P_IXL_INT. Check the status register to identify the interrupt factor. The interrupt from this module is not asserted when the supply of the internal bus clock (P1ϕ) is stopped.

Table 6.5B-22 List of Interrupt functions

Bit	Interrupt name	Interrupt factor	Related status
VBINT	VBUS interrupt	The status change of the VBUS input pin is detected. (Changes from L to H and from H to L are detected.)	VBSTS
RESM	Resume interrupt	In the suspended state, a change of the USB bus status is detected (from J-State to K-State or from J-State to SE0).	—
SOFR	Frame number update interrupt	If SOFRM is 0: An SOF packet with a different frame number is received. If SOFRM is 1: An SOF with µframe number 0 cannot be received due to a problem such as packet corruption.	—
DVST	Device state transition interrupt	A transition of a device state is detected. USB bus reset detected Suspended state detected Set Address request received Set Configuration request received	DVSQ
CTRT	Control transfer stage transition interrupt	A transition of a control transfer stage is detected. Setup stage completed ControlWrite transfer status stage transition ControlRead transfer status stage transition Control transfer completed Control transfer sequence error	CTSQ
BEMP	Buffer empty interrupt	All data in the buffer memory is sent and the buffer becomes empty. A packet exceeding the maximum packet size is received.	PIPEBEMP
NRDY	Buffer not ready interrupt	A token is received when the PID setting is BUF and the buffer memory is not available for sending and receiving data. A CRC error or bit stuff error occurs when data is received in isochronous transfer. An interval error occurs when data is received in isochronous transfer.	PIPENRDY
BRDY	Buffer ready interrupt	The buffer becomes ready (available for reading or writing data).	PIPEBRDY

The following shows the relationship between interrupts of this module.

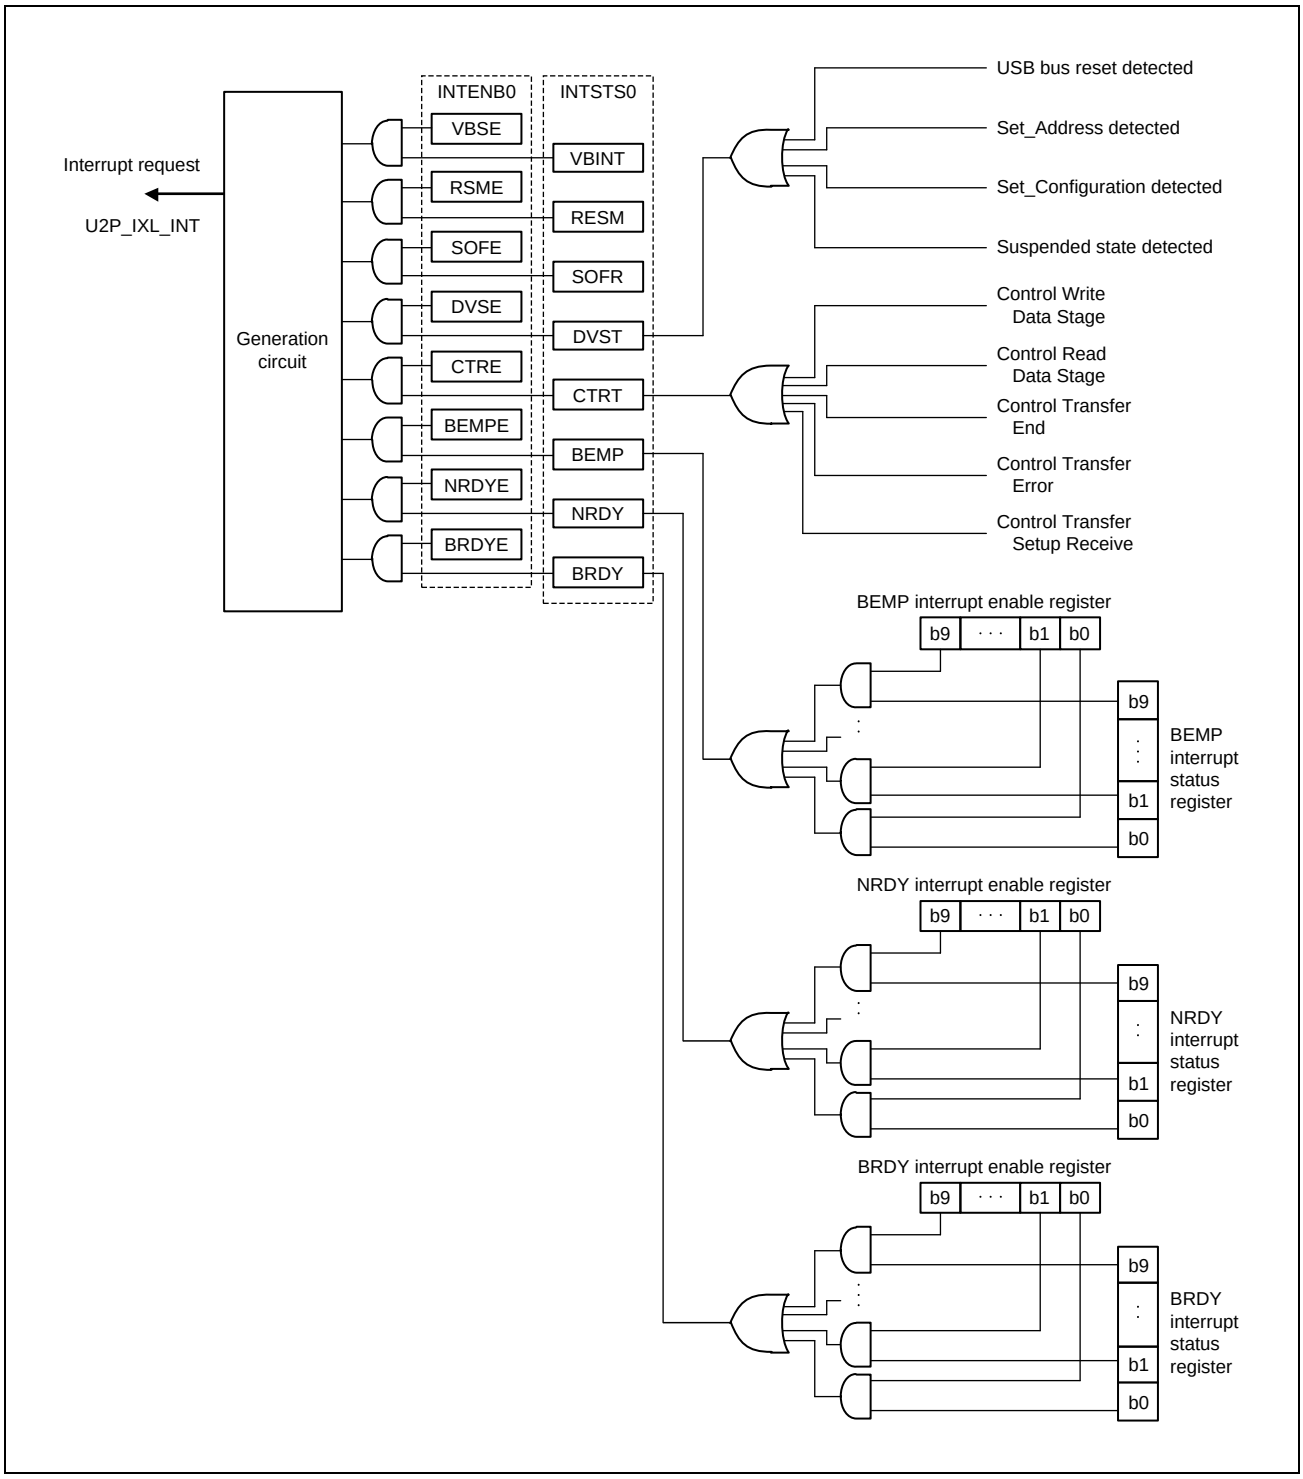

Figure 6.5B-5 Interrupt Association Diagram

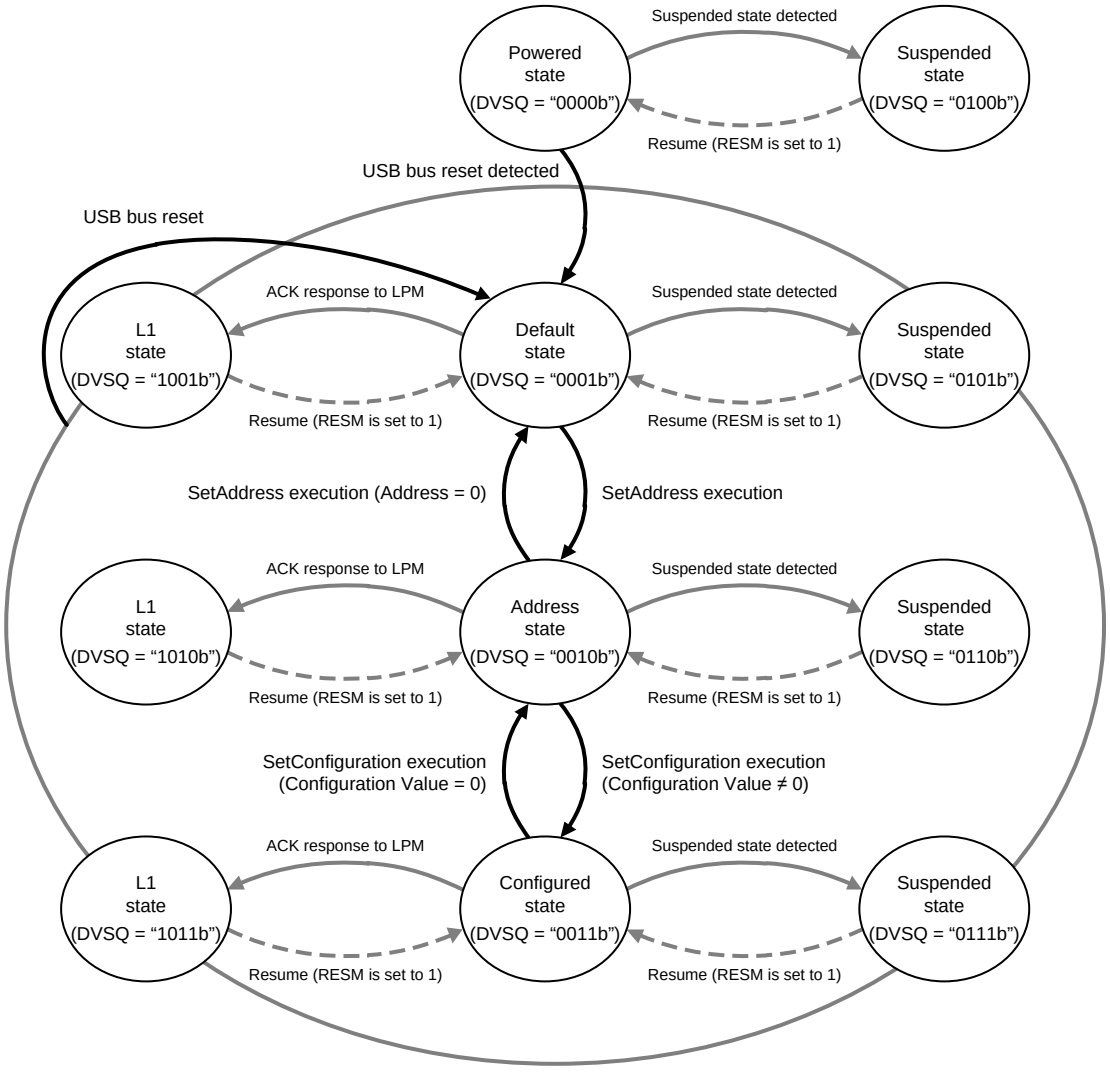


6.5B.9.2.2 Device State Transition Interrupts

Figure 6.5B-6 shows the device state transition diagram of this module.

This module manages device states and generates device state transition interrupts. However, resumption from the suspended state (resume signal detection) is detected by a resume interrupt.

Device state transition interrupts can be enabled and prohibited by using the INTENB0 register. A device state for which a transition has occurred can be checked in the DVSQ bits in the INTSTS0 register.

To trigger a transition to the default state, a device state transition interrupt is generated after a reset hand-shake protocol ends.

Note: When a transition indicated by a solid line occurs, the DVST bits are set to 1.
When a transition indicated by a broken line occurs, the RESM bit is set to 1.

Figure 6.5B-6 Device State Transition Diagram

6.5B.9.2.3 Control Transfer Stage Transition Interrupts

Figure 6.5B-7 shows the control transfer stage transition diagram of this module. This module manages a sequence of control transfers, and generates a control transfer stage transition interrupt. Control transfer stage transition interrupts can be enabled and prohibited by using the INTENB0 register. A transfer stage for which a transition has occurred can be checked in the CTSQ bits in the INTSTS0 register.

The following describes sequence errors that can occur during control transfer. If an error occurs, the PID bits in the DCPCTR register are set to 1X (STALL).

(1) For Control Read transfer

(a) An OUT or PING token is received in a situation where data has not been transferred yet for an IN token of the data stage.

(b) An IN token is received in the status stage.

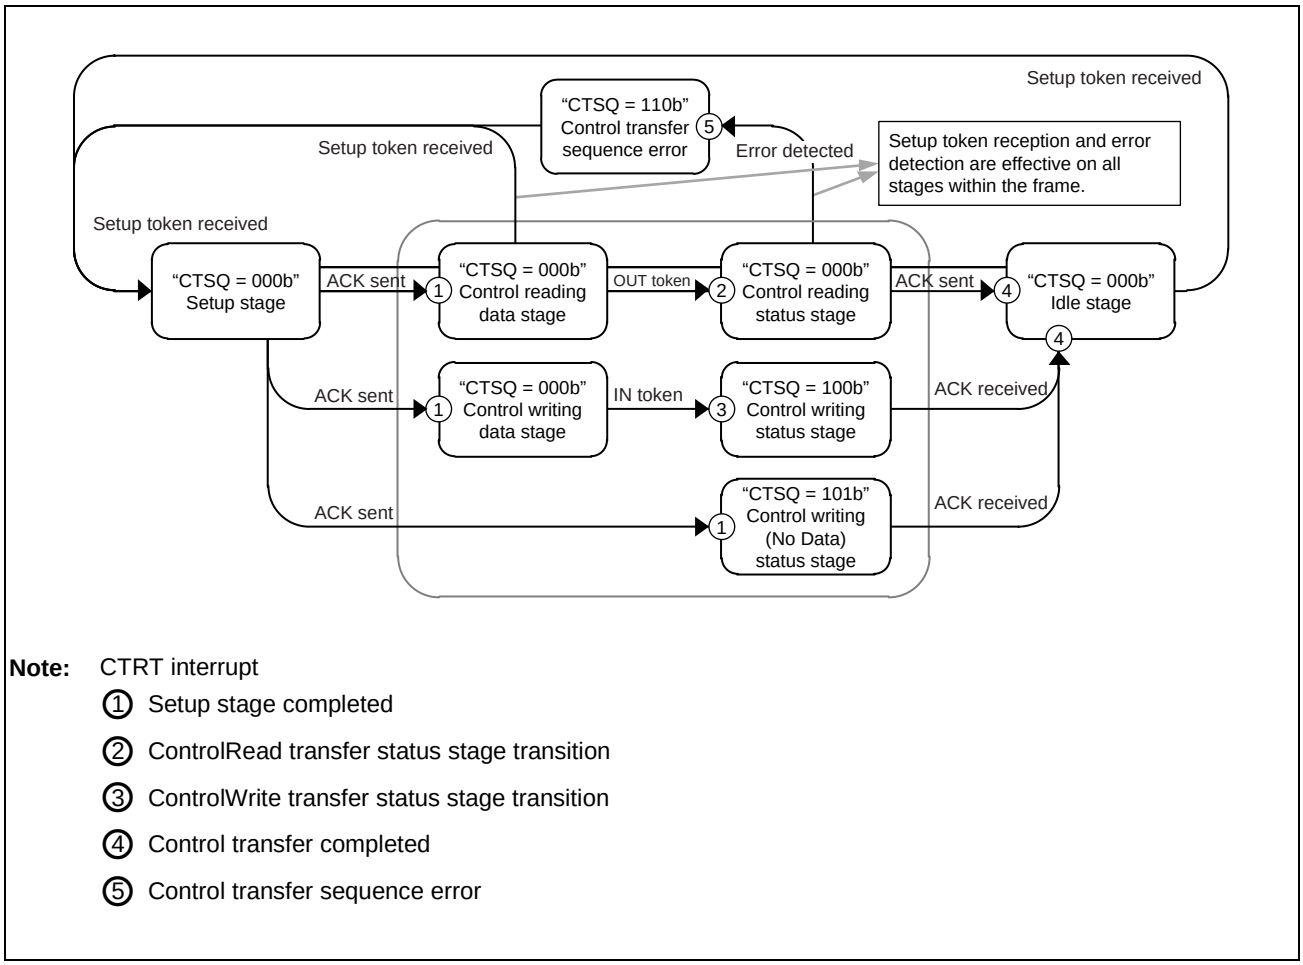
(c) A data packet "DATAPID = DATA0" is received in the status stage.

(2) For Control Write transfer

(a) An IN token is received in a situation where an ACK response has not been sent yet for an OUT token of the data stage.

(b) The first data packet ”DATAPID = DATA0” is received in the data stage.

(c) An OUT or PING token is received in the status stage.



(3) For Nodata Control transfer

(a) An OUT or PING token is received in the status stage.

If the amount of received data exceeds the value of the wLength field in a USB request in the Control Write transfer data stage, this module cannot identify this situation as a control transfer sequence error. If a packet other than a zero-length packet is received in the Control Read transfer status stage, this module sends an ACK response and then terminates processing normally.

If a CTRT interrupt is generated (SERR bit is set to 1) due to a sequence error, the CTSQ bits retain 110 until the system writes 0 to the CTRT bits to clear the interrupt status.

Therefore, as long as the CTSQ bits retain 110, even if a new USB request is received, a CTRT interrupt that reports completion of a setup stage is not generated. (Information on completion of the setup stage is retained by this module, and a CTRT interrupt is generated after the interrupt status is cleared.)

Note: CTRT interrupt

① Setup stage completed

② ControlRead transfer status stage transition

③ ControlWrite transfer status stage transition

④ Control transfer completed

⑤ Control transfer sequence error

Figure 6.5B-7 Control Transfer Stage Transition Diagram

6.5B.9.2.4 Interrupts Relating to DMA Master

Table 6.5B-23 List of Interrupts

Interrupt Name	Interrupt Type
USBFDMAmn (m, n = 0, 1)	A DMA transaction ends.
	An invalid descriptor is read in link mode.
USBFDMAERRm (m = 0, 1)	An error response is returned for a transfer issued by the master interface.

This module has two types of DMA interrupts USBFDMAmn and USBFDMAERRm.

(1) USBFDMAmn interrupt (m, n = 0, 1)
This interrupt occurs when a DMA transaction ends or when an invalid descriptor is read in link mode.
An interrupt is divided for each DMA channel. USBFDMAm0 corresponds to the interrupt for DMA 0ch, and USBFDMAm1 corresponds to the interrupt for DMA 1ch.

(2) USBFDMAERRm interrupt
This interrupt occurs when an error response is returned for a transfer issued by the master interface. This interrupt applies to all DMA channels.

USBFDMAmn interrupt output can be temporarily masked by setting a register.

Interrupt detection can also be masked by setting the register. If interrupt detection is masked, the status register that indicates generation of an interrupt does not change.

On the other hand, a USBFDMAERRm interrupt signal does not have the masking function.

6.5B.9.3 Pipe Control

Table 6.5B-24 lists the pipe settings for this module. For USB data transfer, logical pipes called endpoints are used to enable data communication. This module provides 16 pipes for data transfer. Set each pipe according to the specification of the system.

Table 6.5B-24 PIPE Settings

Register Name	Bit Name	Setting	Comment
DCPCFG	TYPE	Specifies the transfer type.	Pipes 1 to 9: Settable
PIPECFG	BFRE	Selects BRDY interrupt mode.	Pipes 1 to 5: Settable
	DBLB	Selects double-buffer configuration.	Pipes 1 to 5: Settable
	CNTMD	Selects continuous transfer or non-continuous transfer.	DCP: Settable Pipes 1, 2: Settable only in bulk transfers Pipes 3 to 5: Settable
	DIR	Selects transfer direction.	Settable to IN or OUT
	EPNUM	Endpoint number	Pipes 1 to 9: Settable Set to a value other than “0000” when a pipe is in use.
	SHTNAK	Disables pipes when transfer is completed.	DCP: Settable Pipes 1, 2: Settable only in bulk transfers Pipes 3 to 5 Settable
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Unsettable (fixed to 64/256 (CNTMD = 1) bytes) Pipes 1 to 5: Settable (up to 2 Kbytes specifiable) Pipes 6 to 9: Unsettable (fixed to 64 bytes)
	BUFNMB	Buffer memory number	DCP: Unsettable (fixed to area 0 to 3 hex) Pipes 1 to 5 Settable (area 8 to 87 hex specifiable) Pipes 6 to 9: Unsettable (fixed to area 4 to 7 hex)
DCPMAXP PIPEMAXP	MXPS	Maximum packet size	Setting conforming to the USB specification.
PIPEPERI	IFIS	Buffer flush	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 5: Unsettable Pipes 6 to 9: Unsettable
	IITV	Interval counter	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 5: Unsettable Pipes 6 to 9: Unsettable
DCPCTR PIPExCTR	BSTS	Buffer status	DCP state switched between receive and transmit buffer by ISEL bit
	INBUFM	IN buffer monitor	Available only for pipes 3 to 5
	ACLRM	Auto buffer clear	Pipes 1 to 9: Settable
	SQCLR	Sequence clear	Clears data toggle bit.
	SQSET	Sequence set	Sets data toggle bit.
	SQMON	Sequence monitor	Monitors data toggle bit.
	PBUSY	Pipe busy monitor	
	PID	Response PID	
DCPCTR PIPExCTR	ATREPM	Auto response mode	Pipes 1 to 5: Settable
PIPExTRE	TRENB	Transaction count enable	Pipes 1 to 5: Settable
	TRCLR	Current transaction counter clear	Pipes 1 to 5: Settable
PIPExTRN	TRNCNT	Transaction counter	Pipes 1 to 5: Settable

6.5B.9.3.1 Maximum packet size setting

Use the MXPS bits in the DCPMAXP and PIPEMAXP registers to specify the maximum packet size for each pipe. The default control pipe (DCP) and pipes 1 to 5 can be set to any of the maximum packet sizes defined by the USB specification. For pipes 6 to 9, 64 bytes are the upper limit of the maximum packet size. Set the maximum packet size before starting transfer (by setting “PID = BUF”).

DCP: Set 64 for high-speed operation.

DCP: Set 8, 16, 32, or 64 for full-speed operation. Pipes 1 to 5: Set 512 for high-speed bulk transfer.

Pipes 1 to 5: Set 8, 16, 32, or 64 for full-speed bulk transfer.

Pipes 1, 2: Set a value from 1 to 1024 for high-speed isochronous transfer.

Pipes 1, 2: Set a value from 1 to 1023 for full-speed isochronous transfer.

Pipes 6 to 9: Set 64.

High-bandwidth transfers used for interrupt transfers and isochronous transfers are not supported.

6.5B.9.3.2 Response PID

Set the response PID for each pipe with the PID bits in the DCPCTR and PIPExCTR registers.

(1) Response PID setting
The response PID specifies the response to a transaction from the host.

a) NAK: Always sends a NAK response to a generated transaction.

b) BUF: Responds to a transaction in accordance with the buffer memory state.

c) STALL: Always sends a STALL response to a generated transaction.

Regardless of the value set in the PID bits, an ACK is always sent as a response to a setup transaction and a USB request is stored in corresponding registers.

This module might write data to the PID bits depending on the transaction result. This module writes data to the PID bits in the following cases:

a) NAK:

(A) The SETUP token is received normally (for the DCP only).

(B) If 1 is set for the SHTNAK bit in the PIPECFG register during bulk transfer, a short packet is received.

(C) If 1 is set for the SHTNAK bit during bulk transfer, the transaction counter finishes.

b) BUF:

This module does not write "BUF".

c) STALL:

(A) When a maximum packet size over error is detected in a received data packet

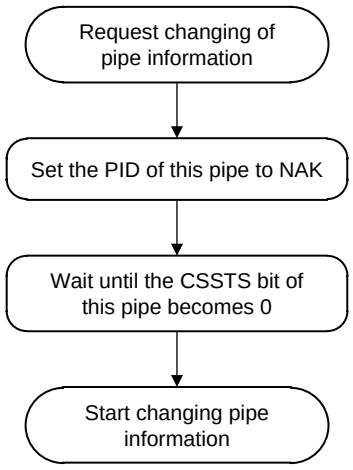
(B) When a control transfer sequence error is detected

6.5B.9.3.3 Pipe control register switching procedure

The following bits in the pipe control registers can be modified only when USB transmission is disabled (PID = NAK).

Figure 6.5B-8 shows the procedure for changing the pipe control register state from the USB transmission enabled (PID = BUF) state.

The registered that cannot be manipulated in the USB transmission enabled (PID = BUF) state are as follows:



(1) All bits in the DCPCFG and DCPMAXP registers

(2) SQCLR and SQSET bits in the DCPCTR register

(3) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(4) ATREPM, ACLRM, SQCLR, and SQSET bits in the PIPExCTR register

(5) All bits in the PIPExTRE and PIPExTRN registers

Note: If the pipe is detached during a USB transaction, the PBUSY bit might remain 1.

Figure 6.5B-8 Procedure for Changing Pipe Information from USB Transmission Enabled (PID = BUF) State

In addition, for the settings of the following bits in pipe control registers, only the pipe information that is not set for the CURPIPE bit in the CPU, DMA0, or DMA1 FIFO port can be changed.

Registers that cannot be set with pipe information that is set for the CURPIPE bit in a FIFO port:

(6) All bits in the DCPCFG and DCPMAXP registers

(7) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(8) ACLRM bit in the PIPExCTR register

If you change the pipe information, make sure that the setting of CURPIPE is different from the new pipe number. For the default control pipe (DCP), after modifying the pipe information, use the BCLR bit to clear the buffer.

6.5B.9.3.4 Data PID sequence bit

When a normal data transfer is performed during bulk transfer or interrupt transfer, or in the data stage of control transfer, this module automatically toggles the sequence bit of a data PID. The sequence bit of the next data PID to be transferred can be confirmed with the SQMON bit in the DCPCTR or PIPExCTR registers. For data transmission, the sequence bit is switched when an ACK handshake is received. For data reception, the sequence bit is switched when an ACK handshake is sent. The data PID sequence bit can be changed by using the SQCLR and SQSET bits in the DCPCTR and PIPExCTR registers.

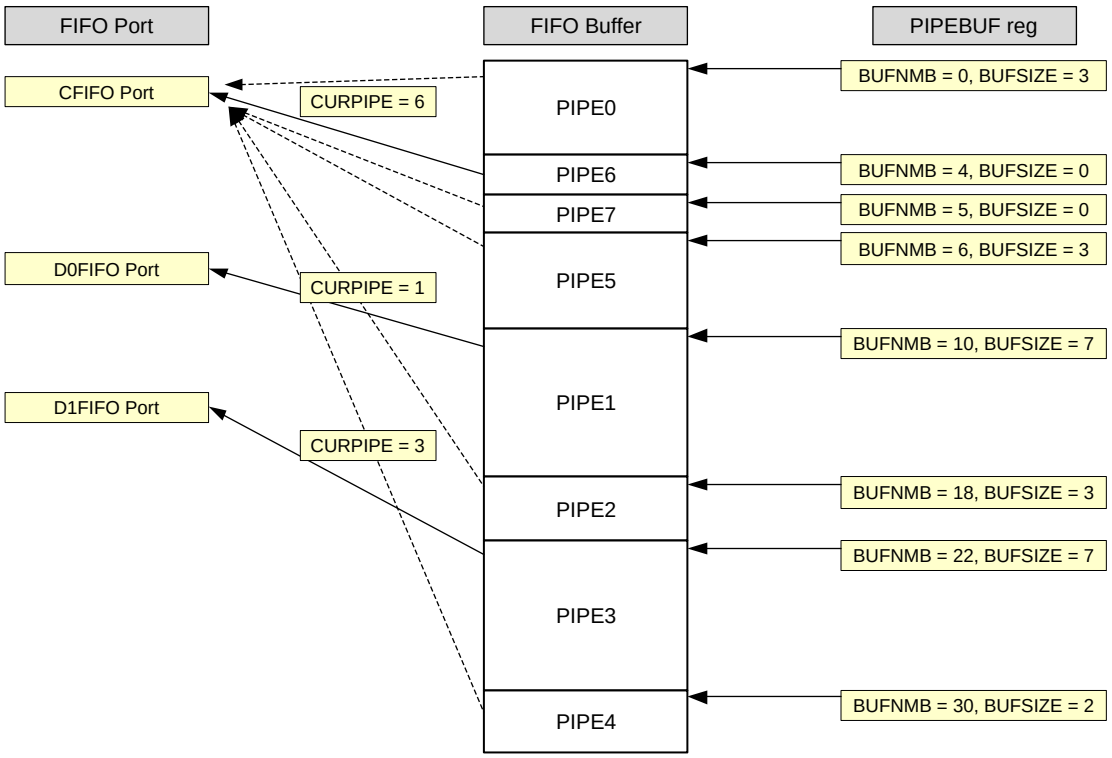
During control transfer, this module automatically sets the sequence bit when the stage changes. When the setup stage finishes, the data PID is set to DATA1. In the status stage, this module responds with “PID = DATA1” without referencing the sequence bit.

Note that, the data PID sequence bit must set, when a clear feature request is sent or received.

Also note that for isochronous transfer setting pipes, you cannot use the SQSET bit to manipulate the sequence bit.

6.5B.9.4 FIFO Buffer

This section describes the processing related to the FIFO buffer of this module.



6.5B.9.4.1 FIFO buffer allocation

Figure 6.5B-9 shows an example of FIFO buffer memory mapping of this module. The FIFO buffer area is shared by the CPU and this module. The FIFO buffers can be accessed by either the system (CPU) or this module (SIE).

An independent FIFO buffer area is allocated for each pipe. The memory area is made up of memory blocks (1 block = 64 bytes) and is specified by the starting block number and the number of blocks (specified by the BUFNMB and BUFSIZE bits in the PIPEBUF register). When the CNTMD bit in the PIPExCFG register is used to set "continuous transfer mode", the value set with the BUFSIZE bit must be an integral multiple of the maximum packet size. If the double-buffer configuration is selected by the DBLB bit in the PIPExCFG register, two memory areas the size of which is specified by the BUFSIZE bit in the PIPEBUF register are allocated to a single pipe.

FIFO ports are used to access the FIFO buffer (data read/write). The pipe number of a pipe to be assigned to a FIFO port is specified by the CURPIPE bits in the CFIFOSEL/DxFIFOSEL register.

The FIFO buffer status of each pipe can be confirmed by using the BSTS and INBUFM bits in the DCPCTR and PIPExCTR registers. The access right of a FIFO port can be confirmed by using the FRDY bit in the CFIFOCTR/ DxFIFOCTR register.

Note: If pipes 8 and 9 are not in use: Settings such as BUFSIZE are unspecified.

Figure 6.5B-9 Example of FIFO Buffer Memory Mapping

6.5B.9.4.2 Clearing FIFO buffers

Table 6.5B-25 lists the modes in which this module can clear the FIFO buffer. Clearing of the FIFO buffer is controlled by the following bits.

Table 6.5B-25 List of FIFO Buffer Clearing Modes

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR register DxFIFOCTR register	DxFIFOSEL register	PIPExCTR register
Function	The FIFO buffer on the CPU side is cleared.	The FIFO buffer is automatically cleared after the data is read from the specified pipe.	The buffer is automatically cleared to discard all the received packets.
Clearing method	Write “1” to clear.	1: Mode enabled 0: Mode disabled	1: Mode enabled 0: Mode disabled

6.5B.9.5 FIFO Port Functions

This section describes FIFO port functions. **Table 6.5B-26** shows the FIFO port function settings for this module.

If data write access is enabled and data is written up to buffer full state (in non-continuous transfer: maximum packet size), the port automatically goes to the USB bus transmittable state. To enable transmission of data smaller than the buffer full (in non-continuous transfer: less than the maximum packet size), the BVAL bit in the CFIFOCTR/ DxFIFOCTR register must be used to set write end.

To send a zero-length packet, the BCLR bit of that register must be used to clear the buffer before the BVAL bit is used to write end.

When all the data is read in a read access, the port automatically enters the state in which new packets can be received. However, when a zero-length packet is received (DTLN = 0), no data can be read, and therefore the buffer must be cleared by using the BCLR bit.

The receive data length is confirmed with the DTLN bits in the CFIFOCTR/DxFIFOCTR register.

Table 6.5B-26 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
C/DxFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Rewinds buffer memory (re-read, re-write)	
	DCLRM	Reads received data of the specified pipe, and then automatically clears the received data	DxFIFO only
	DREQE	Asserts DREQ signal	DxFIFO only
	MBW	Specifies FIFO port access bit width	
	BIGEND	Selects FIFO port endian	CFIFO only
	ISEL	Specifies FIFO port access direction	DCP only
	CURPIPE	Selects current pipe	
C/DxFIFOCTR	BVAL	Finishes buffer memory write	
	BCLR	Clears CPU-side buffer memory	
	FRDY	Monitors FIFO port ready	
	DTLN	Confirms received data length	

6.5B.9.5.1 FIFO port selection

Table 6.5B-27 lists pipes that can be selected for each FIFO port.

Use the CURPIPE bits in the C/DxFIFOSEL register to select the pipe to be accessed. After selecting the pipe, confirm that the value written to the CURPIPE bits can be read correctly (if the previous pipe number is read out, this module is currently changing the pipe), confirm that FRDY = 1, and then access the FIFO port.

Figure 6.5B-10 shows the procedure for switching the pipe when accessing a FIFO port.

In addition, use the MBW bit to select the bus width with which to access the FIFO port. If the target pipe is the default control pile (DCP), the ISEL bit determines the buffer memory access direction. If the target pipe is not the DCP, the DIR bit in the PIPExCFG register determines the buffer memory access direction.

Table 6.5B-27 FIFO Port Access for Each Pipe

Pipe	Access Method	Usable Port
DCP	CPU access	CFIFO port register
Pipes 1 to 9	CPU access	CFIFO port register
	DMA access	DxFIFO port register

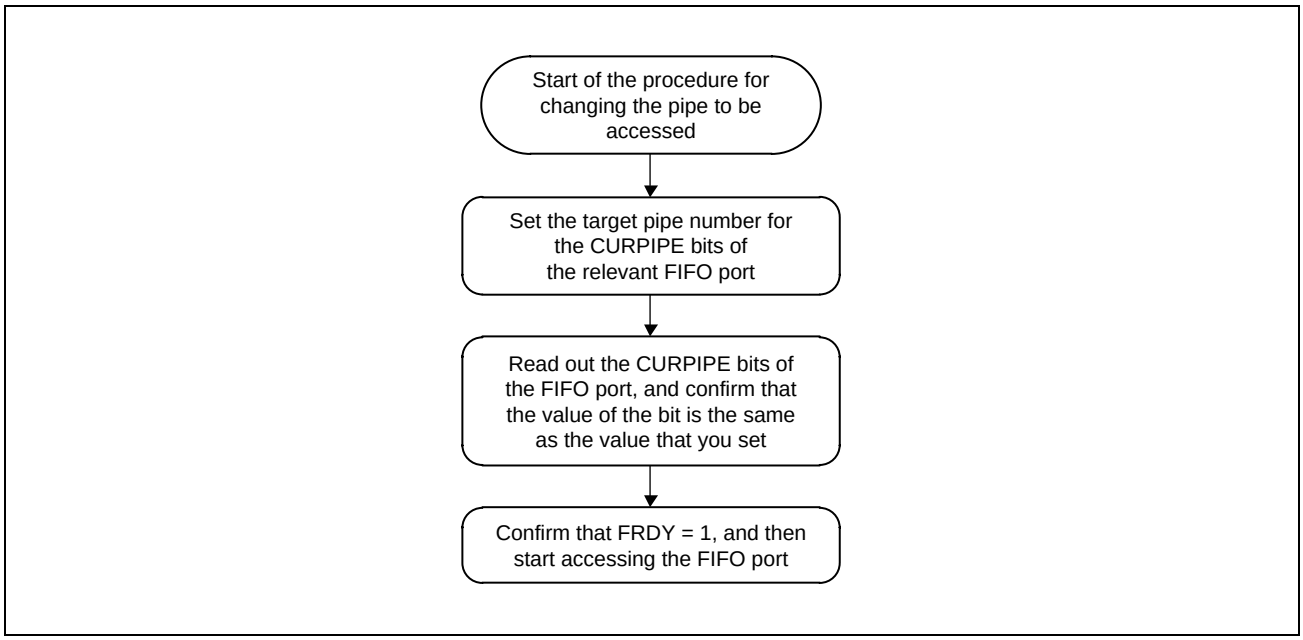


Figure 6.5B-10 Pipe Switching Procedure for FIFO Port Access

6.5B.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction)

This module automatically clears the buffer memory for a pipe when data is read out from the buffer memory if the DCLRM bit in the DxFIFOSEL register is set to 1.

Table 6.5B-28 shows the correspondence between packet reception and buffer memory clear processing by the software for each setting.

As shown in **Table 6.5B-28**, the buffer clearing conditions vary with the value that is set for the BFRE bit. However, using the DCLRM bit eliminates the need for buffer clear by the software even in states where clearing is required, which enables DMA transfers without using the software.

Note that for this function, only the buffer memory read direction can be set.

Table 6.5B-28 Relationship between Packet Reception and Buffer Memory Clear Processing by the Software

	Register Setting			
	DCLRM = 0		DCLRM = 1	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Clearing unnecessary		Clearing unnecessary	
Zero-length packet received	Clearing necessary			
Normal short packet received	Clearing unnecessary	Clearing necessary		
Transaction count end				

6.5B.9.5.3 BRDY interrupt timing selection function

The BFRE bit in the PIPECFG register can be set so that a BRDY interrupt is not generated when a data packet of maximum packet size is received.

When using a DMA transfer, this function enables an interrupt to be generated only when the last data is received. The “last data” here indicates either a short packet reception or the transaction count end. If the BFRE bit is set to 1, a BRDY interrupt is generated after the received data is read. By reading the DTLN bits in the DxFIFOCTR register, the receive data length of last data packet received just before the BRDY interrupt is generated can be confirmed.

Table 6.5B-29 shows when this module generates a BRDY interrupt.

Table 6.5B-29 BRDY Interrupt Generation Timing

	Register Setting	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1
Buffer full (normal packet received)	When packet is received	No interrupt generated
Zero-length packet received	When packet is received	When packet is received
Normal short packet received	When packet is received	When received data has been read from the buffer memory
Transaction count end	When packet is received	When received data has been read from the buffer memory

The BFRE bit function is valid only in the reading direction from the buffer memory. For the writing direction, fix the BFRE bit to 0.

6.5B.9.6 Control Transfer (DCP)

In the data stage of control transfer, the default control pipe (DCP) is used to transfer data. For the DCP, a single 64-byte buffer is allocated as a fixed area that is used for both control reading and writing (in continuous transfer mode (CNTMD = 1), the size of this area is fixed to 256 bytes). The buffer memory can be accessed through the CFIFO port only.

6.5B.9.6.1 Control transfer

(1) Setup stage

This module always responds with ACK to any normal setup packet for this module. The following shows the behavior of this module in the setup stage:

1. When this module receives a new setup packet, this module sets the following bits:
   (a) VALID bit in the INTSTS0 register: 1
   (b) PID bit in the DCPCTR register: NAK
   (c) CCPL bit in the DCPCTR register: 0

2. When this module receives a data packet after receiving a setup packet, this module stores USB request parameters in the USBREQ, USBVAL, USBINDX, and USBLENG registers.

Response processing for control transfer must be performed after VALID is set to 0. While VALID is 1, PID cannot be set to BUF, and therefore the data stage cannot end.

By using a function of the VALID bit, when this module receives a new USB request during control transfer, this module can respond to the newest request, canceling the request that is being processed.

This module also automatically recognizes the type of transfer (ControlRead, ControlWrite, or NodataControl) from the direction bit (bit 8 of bmRequestType) and request data length (wLength) of the received USB request to manage stage transition. For an incorrect sequence, a control transfer stage transition interrupt occurs to report a sequence error to software. For details about stage management by this module, see **Figure 6.5B-7**.

(2) Data stage

Use the DCP to transfer data in response to the received USB request. Before the DCP buffer memory is accessed, use the ISEL bit in the CFIFOSEL register to specify the access direction.

A transaction is executed by setting the PID bit in the DCPCTR register to BUF.

The end of data transfer is detected with a BRDY or BEMP interrupt. For ControlWrite transfer, use a BRDY interrupt. For ControlRead transfer, use a BEMP interrupt.

For ControlWrite transfer in high-speed operation mode, an NYET handshake response is performed in accordance with the buffer memory state.

(3) Status stage

If the PID bit in the DCPCTR register is BUF, setting the CCPL bit to 1 terminates control transfer.

After control transfer is terminated by the above setting, this module automatically executes the status stage according to the data transfer direction determined in the setup stage, as shown below:

(a) For ControlRead transfer

Upon receiving a zero-length packet from the USB Host Controller, this module sends an ACK response.

(b) For ControlWrite or NodataControl transfer

This module sends a zero-length packet, and then receives an ACK response from the USB Host Controller.

(4) Control transfer automatic response function

This module automatically responds to any normal SET_ADDRESS request. However, if a SET_ADDRESS request has any of the following errors, software must respond, instead of this module:

(a) bmRequestType ≠ “H’00”

(b) wIndex ≠ “H’00”

(c) wLength ≠ “H’00”

(d) wValue > “H’7F”

(e) DVSQ = “011 (Configured) ”

Software must respond to all requests other than SET_ADDRESS.

6.5B.9.7 Bulk Transfer (Pipes 1 to 5)

The user can select the buffer memory usage method (single/double buffer, continuous/non-continuous transfer mode) for bulk transfers. The buffer memory size can be set up to 2 KB. The controller manages the buffer memory state and automatically responds to PING packets and NYET handshakes.

6.5B.9.7.1 NYET handshake control

Table 6.5B-30 lists responses to tokens received in a bulk or control transfer.

When an OUT token is received in a bulk or control transfer and there is only an open space for one packet in the buffer memory, this module sends a NYET response. However, when a short packet is received, this module sends an ACK response instead of a NYET response even under these conditions.

Table 6.5B-30 List of Responses to Received Tokens

PID bit value	Buffer memory state*1	Received token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY	OUT/PING	ACK	Receives data packet when OUT token is received*1
	RCV-BRDY	OUT	NYET	Receives data packet*2
	RCV-BRDY	OUT (Short)	ACK	Receives data packet*2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/1	Sends data packet
	TRN-NRDY	IN	NAK	

Note: Details are described below.
RCV-BRDY*1: Buffer memory has a space for 2 packets or more when an OUT or PING token is received.
RCV-BRDY*2: Buffer memory has only a space for one packet when an OUT token is received.
RCV-NRDY: Buffer memory has no space for any packet when a PING token is received.
TRN-BRDY: Buffer memory has sent data when an IN token is received.
TRN-NRDY: Buffer memory has no send data when an IN token is received.

6.5B.9.8 Interrupt Transfer (Pipes 6 to 9)

This module performs an interrupt transfer in accordance with the period managed by the host controller. This module ignores (no response) PING packets in interrupt transfers. In addition, this module does not send a NYET handshake, but sends an ACK, NAK or STALL response.

Note that this module does not support high-bandwidth interrupt transfers.

6.5B.9.9 Isochronous Transfer (Pipes 1 and 2)

This module is provided with the following functions for isochronous transfers:

1. Notification of error information about isochronous transfers
2. Interval counter (IITV bit)
3. Data setup control for isochronous IN transfers (IDLY function)
4. Buffer flush function for isochronous IN transfers (IFIS bit)
5. SOF pulse output function

This module does not support high-bandwidth Isochronous transfers.

6.5B.9.9.1 Isochronous transfer error detection

This module has the following error information detection functions for the software to manage errors that occur during isochronous transfer.

Table 6.5B-31 and **Table 6.5B-32** describe the error checking procedure and interrupts that are generated.

1. PID error
   The PID of the received packet is invalid.
2. CRC error and bit stuffing error
   The received packet has a CRC error or invalid bit stuffing.
3. Max packet size over
   The data size of the received packet is larger than the preset maximum packet size.
4. Overrun error and underrun error
   (a) The buffer memory has no data when an IN token is received during IN-direction (send) transfer.
   (b) The buffer memory has no space although an OUT token is received during OUT-direction (receive) transfer.
5. Interval error
   An interval error occurs in the following cases:
   (a) An IN token cannot be received within the interval frame during isochronous IN transfer.
   (b) An OUT token cannot be received within the interval frame during isochronous OUT transfer.

Table 6.5B-31 Error Detection during Transmission/Reception of Token

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	No interrupt is generated (ignored as a corrupted packet).
3	Overrun error, underrun error	An NRDY interrupt is generated and the OVRN bit is set. A zero-length packet is sent in response to an IN token. A data packet is not received in response to an OUT token.
4	Interval error	An NRDY interrupt is not generated.

Table 6.5B-32 Error Detection during Reception of Data Packet

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	An NRDY interrupt is generated and the CRCE bit is set.
3	Packet size error (too large packet)	A BEMP interrupt is generated and the PID bit is set to STALL.

6.5B.9.9.2 DATA-PID

This module does not support high-bandwidth transfers.

The following shows actions that can be taken in response to a received PID.

1. IN direction:

(a) DATA0: Used to send packets.

(b) DATA1: Not used to send packets.

(c) DATA2: Not used to send packets.

(d) mDATA: Not used to send packets.

2. OUT direction (in full-speed operation):

(a) DATA0: Packets are received normally.

(b) DATA1: Packets are received normally.

(c) DATA2: Packets are ignored.

(d) mDATA: Packets are ignored.

3. OUT direction (in high-speed operation):

(a) DATA0: Packets are received normally.

(b) DATA1: Packets are received normally.

(c) DATA2: Packets are received normally.

(d) mDATA: Packets are received normally.

6.5B.9.9.3 Interval counter

(1) Outline of operation

The IITV bit in the PIPEPERI register can be used to set the interval of isochronous transfer. The interval counter enables the functions listed in **Table 6.5B-33**.

Table 6.5B-33 Functions of the Interval Counter

Transfer Direction	Function	Detecting Condition
IN	Transmit buffer flush function	An IN token cannot successfully be received within the interval frame during isochronous IN transfer.
OUT	Notification of unreceived token	An OUT token cannot successfully be received within the interval frame during isochronous OUT transfer.

Counting of intervals is based on received SOF packets or interpolated SOFs. Therefore, even if SOF packets are damaged, the isochronism can still be maintained. Frame intervals are set as 2n (micro) frames, where n is the value of the IITV bit.

(2) Interval counter initialization

This module initializes the interval counter under the following conditions:

(a) Power on reset
The IITV bit is initialized.

(b) Clearing of the buffer memory by the ACLRM bit
The IITV bit is not initialized but the counter is initialized.

(c) USB bus reset

After the interval counter is initialized and a packet is successfully transferred, counting of intervals starts under the following conditions:

1) An SOF packet is received after data is sent in response to an IN token when PID = BUF.

2) An SOF packet is received after data is received in response to an OUT token when PID = BUF.

Note that the interval counter is not initialized in the following conditions:

(a) The PID bit is set to NAK or STALL.
The interval timer is not stopped at this interval. The transaction will be attempted at the next interval.

(b) USB bus reset or USB suspension
The IITV bit is not initialized. When an SOF packet is received, counting starts from the value existing before reception.

6.5B.9.9.4 Send data setup for isochronous transfer

This module becomes able to send data packets by isochronous transfer from the next frame after data is written to the buffer memory and then an SOF packet is detected. This is called “send data setup for isochronous transfer”.

This function can identify the frame with which data sending started.

If the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, only the buffer to which writing finished earlier can transfer data. Therefore, even when several IN tokens are received within the same frame, only one packet of data is sent from the buffer memory.

When an IN token is received, if the buffer memory is ready for sending data, the data is transferred and a normal response is returned. However, if the buffer memory is not ready for sending data, a zero-length packet is sent and an underrun error occurs.

Figure 6.5B-11 shows examples of sending using the send data setup function for isochronous transfer by setting “IITV = 0” (each frame) in this module.

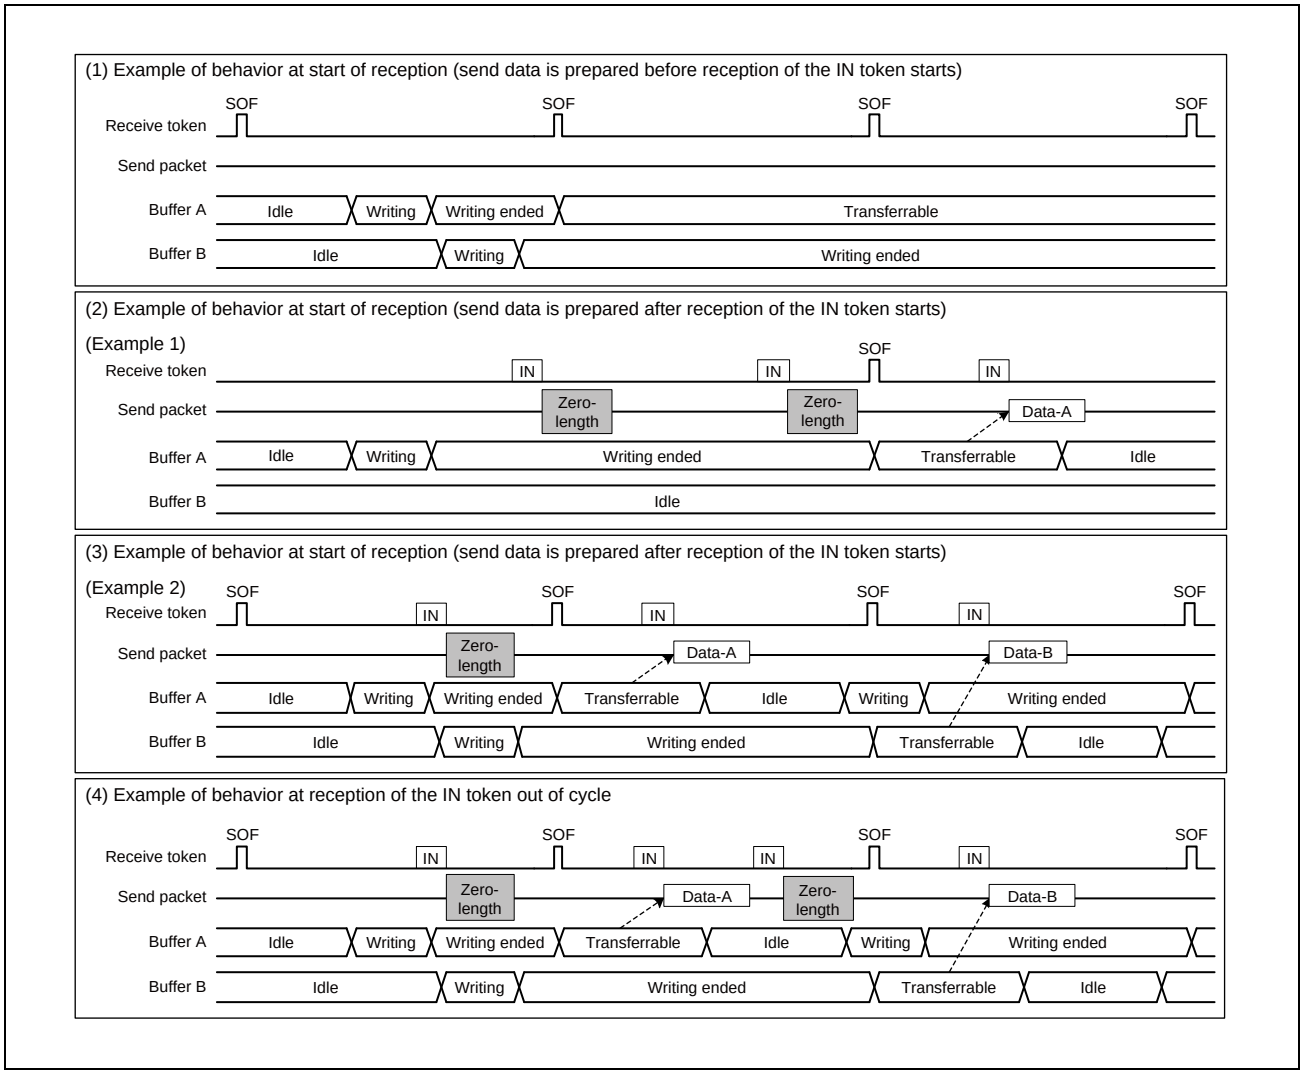

Figure 6.5B-11 Examples of Data Setup Function Behavior

6.5B.9.9.5 Transmit buffer flush for isochronous transfer

If this module does not receive an IN token in an interval frame and receives a (micro) SOF packet in the next frame during isochronous data transfer, this module handles the IN token as a corrupted token and clears the buffer that can send data to make the buffer writable.

At this time, if the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, this module assumes the discarded buffer memory to be sent within the same interval frame. As a result, the buffer memory that is not discarded by reception of a (micro) SOF packet becomes to be able to transfer data.

The operation start timing of the buffer flush function varies with the value of the IITV bit.

1. If IITV is 0
   Buffer flush operation is performed from the first frame after the pipe is enabled.
2. If IITV is not 0
   Buffer flush operation is performed after the first successful transaction.

Figure 6.5B-12 shows an example of how the buffer flush function of this module behaves. For a token outside the set interval (token prior to the interval frame), however, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

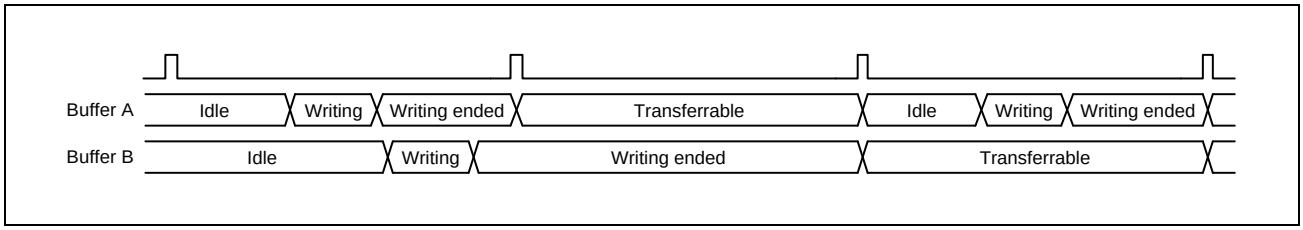

Figure 6.5B-12 Example of Buffer Flush Function Behavior

Figure 6.5B-13 shows an example of an interval error that occurs in this module.

There are five types of interval errors, as listed below. At timing (1) in the figure, an interval error occurs and the buffer flush function operates.

If an interval error occurs during IN transfer, the buffer flush function starts. If an interval error occurs during OUT transfer, an NRDY interrupt occurs.

Use the OVRN bit to determine whether an error is an NRDY interrupt (such as a receive packet error) or an overrun error.

In the figure, responses to tokens indicated as shaded boxes are made in accordance with the buffer memory state.

1. IN direction:

(a) If the buffer is ready to transfer data, data is transferred and a normal response is returned.

(b) If the buffer is not ready to transfer data, a zero-length packet is sent and an underrun error occurs.

2. OUT direction:

(a) If the buffer is ready to receive data, data is received and a normal response is returned.

(b) If the buffer is not ready to receive data, data is discarded and an overrun error occurs.

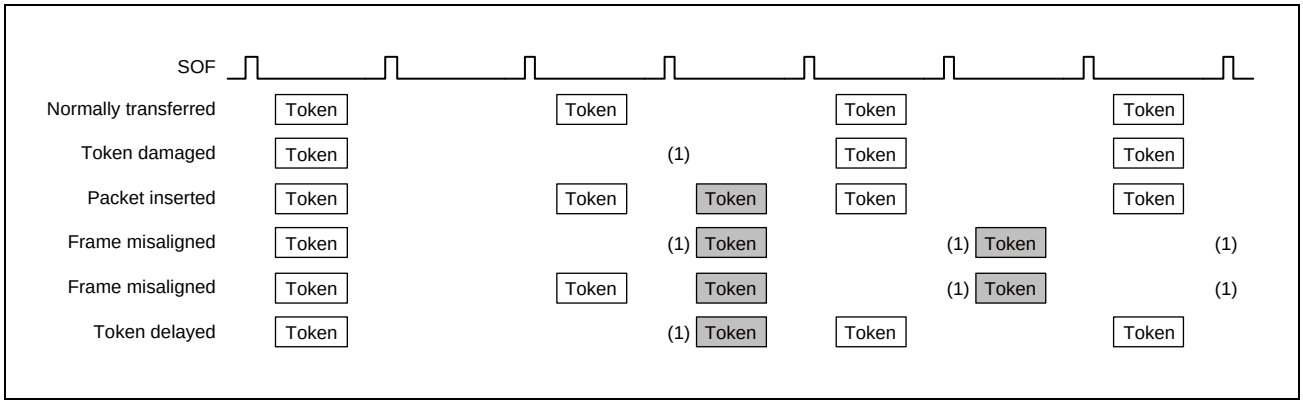

Figure 6.5B-13 Example of Occurrence of Interval Error (when IITV is 1)

6.5B.9.10 SOF Interpolation Function

If the controller cannot receive data at intervals of 1 ms (in full-speed operation) or 125 µs (in high-speed operation) due to corruption or missing of an SOF packet, the controller internally interpolates the SOF. The controller starts SOF interpolation upon receiving an SOF packet when both the USBE bit and SUSPM bit are set to 1.

The interpolation function is initialized under the following conditions:

(1) Power on reset

(2) USB bus reset

(3) Suspended state detected

The SOF interpolation operates according to the following specifications:

(1) Frame interval (125 µs or 1 ms) is based on the results of the reset handshake protocol.

(2) The interpolation function does not operate until an SOF packet is received.

(3) After receiving the first SOF packet, this module interpolates the SOF by using the 60-MHz internal clock to measure 125 µs or 1 ms.

(4) After receiving the second or a subsequent SOF packet, this module interpolates the SOF by using the previous reception interval.

(5) Interpolation is not performed in the suspended state or while a USB bus reset is being received.
(If this module enters the suspended state in high-speed operation, interpolation continues for 3 ms after receiving the last packet.)

The SOF interpolation function operates with the following functions:

(1) Updating of frame number or micro-frame number

(2) SOFR interrupt and micro SOF lock

(3) SOF pulse output

(4) Counting of isochronous transfer intervals

If an SOF packet is lost in full-speed operation, the FRNM bit in the FRMNUM register is not updated.

If a micro SOF packet is lost in high-speed operation, the UFRNM bit in the uFRMNUM register is updated.

However, if a micro SOF packet for which “micro-FRNM = 000” is set is lost, the FRNM bit is not updated. In this case, the FRNM bit is not updated even if subsequent micro SOF packets for which “micro-FRNM = 000” is not set are successfully received.

6.5B.9.11 Link Power Management Processing

According to the Link Power Management specification, the existing suspend state is redefined as the L2 state and a new L1 state is defined as a state where transition and resumption at a lower latency than L2 (suspend) are possible.

The table below compares the features of the L2 (suspend) state and L1 state.

Table 6.5B-34 Comparison Between Suspend (L2) State and L1 State

Item	L1	Suspend (L2)
Transition	LPM Transaction	3-ms idle period
Host-activated resumption	(Host) Minimum drive period specifiable by the host. Specified between 75 µs to 1.175 ms (Device) 10-µs K drive	(Host) Min. 20-ms K drive (Device) 10-ms K drive
Device-activated resumption	(Device) 50-µs K drive (Host) 60- to 990-µs K drive (Device) 10-µs K drive	(Device) 1-ms to 15-ms K drive (Host) Min. 20-ms K drive (Device) 10-ms K drive
Signaling	Low and Full Speed Idle	Low and Full Speed Idle

The following describes the processing for transition to and resumption from the L1 state.

6.5B.9.11.1 Descriptor

This module must return its own descriptor when receiving the GetDescriptor command.

Whether the contents of the descriptor to be returned need to be modified is dependent on whether this module responds to the transition to and resumption from the L1 state with an LPM transaction. The details are summarized in the table below.

Table 6.5B-35 Relationship between LPM Response and Descriptor

LPM Response	bcdUSB	Presence of USB 2.0 Ex.Desc	USB 2.0 Ex.Desc LPM	Response When LPM Is Received	Remarks
Not respond	0200	Not present	—	Not Respond	Standard action in the case where this module does not respond to LPM
	0201	Present	LPM = 0	STALL	This is when rejection of response to LPM is explicitly declared. In this case, it is necessary to send a STALL response instead of making no response.
Respond	0201	Present	LPM = 1	ACK or NYET	Standard action in the case where this module responds to LPM

Whether to respond to transition to and resumption from L1 is declared by the LPM bit of the USB 2.0 extension descriptor. To provide this module with the USB 2.0 extension descriptor, it is necessary to set the bcdUSB field of the device descriptor to 0201 or greater.

When not responding to LPM, set the bcdUSB value to 0200 without providing this module with the USB 2.0 extension descriptor. In this case, it is necessary to ignore any LPM token received.

When not responding to LPM, it is also possible to set bcdUSB to 0201 and set the LPM bit of the USB 2.0 extension descriptor to 0 (noncompliant). In this case, however, it is not allowed to ignore LPM and is necessary to send a STALL response.

When responding to LPM, set bcdUSB to 0201 and the LPM bit of the USB 2.0 extension descriptor to 1 (compliant). This grants this module to send an NYET or ACK in response to an LPM token.

6.5B.9.11.2 Basic processing

This module needs to execute the following processing.

1. Responds to the LPM token received from the host with “No response”, “ACK”, “NYET”, or “STALL” according to this module's own state.
2. Transitions to the L1 state if it fails to detect the retransmission of an LPM token for 8 µs after making an ACK response.
3. Detects a K drive of the host and performs resume processing to the idle state.
4. Performs resume processing to the idle state based on the Remote Wake signal.

For 1, the software specifies the response method according to the values of the L1RESPEN, L1RESPMD, and L1NEGOMD bits in the PL1CTRL register. The hardware makes the response that is designated by the software upon receiving an LPM token.

For 2, both retransmission control and transition to the L1 state are processed by the hardware. Transition to the L1 state can be identified through a DVST interrupt.

For 3, a RESM interrupt occurs on detection of host K in the L1 state.

For 4, starting the Remote Wake processing can be instructed to the hardware by setting the WKUP bit by the software. The specification stipulates that the software clears this bit on resumption from the L2 state. On the other hand, the hardware clears this bit on resumption from the L1 state.

6.5B.9.11.3 HIRD value negotiation

The HIRD value contained in the LPM token is the K period of the host on resumption from the L1 state.

This module can respond with ACK if the received HIRD value falls within the desired range as specified by the L1NEGOMD and HIRDTHR bits in the L1CTRL register; otherwise, this module can respond with NYET and request the host to modify the HIRD value.

NOTE

This HIRD value negotiation function must also be supported on the host side.

6.5B.9.12 DMA Mode

6.5B.9.12.1 Register mode/link mode

The DMS bit in the CHCFG_n register can be used to switch between register mode and link mode.

Table 6.5B-36 DMA mode settings

DMS (CHCFG)	Mode	Description
0	Register mode	Performs DMA transfer based on the values set by Next Register Set.
1	Link mode	Accesses the descriptor area, and executes DMA transfer based on the values set by descriptors. This module repeats descriptor reading and DMA transfer unless the descriptor settings are changed or the control register is used to stop the processing.

(1) Register mode

In register mode, this module executes DMA transfer based on the values set in internal registers.

Two sets of the transfer-source address, transfer-destination address, and number of bytes to be transferred can be held (in Next0 Register Set and Next1 Register Set registers). One of these Next registers can be used to execute transfer, and both Next registers can be used to execute continuous transfer.

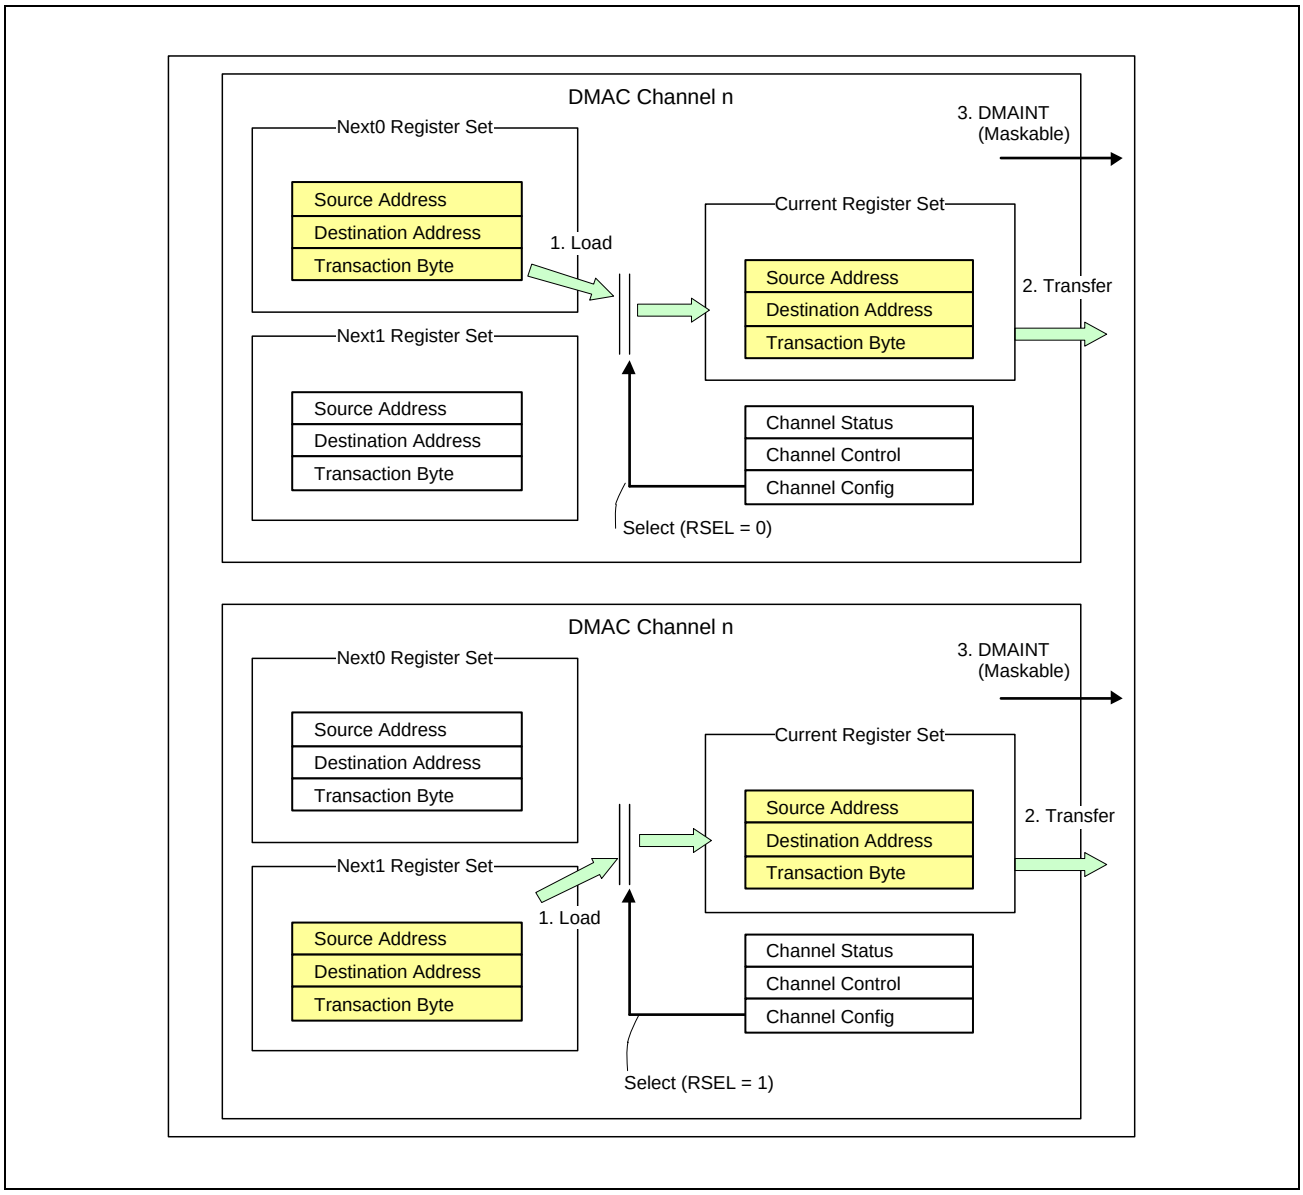

Figure 6.5B-14 Overview of Normal Behavior of Register Mode

The upper part of the above figure indicates a case when Next0 Register Set is processed. The lower part of the above figure indicates a case when Next1 Register Set is processed.

(a) Operation flow of register mode

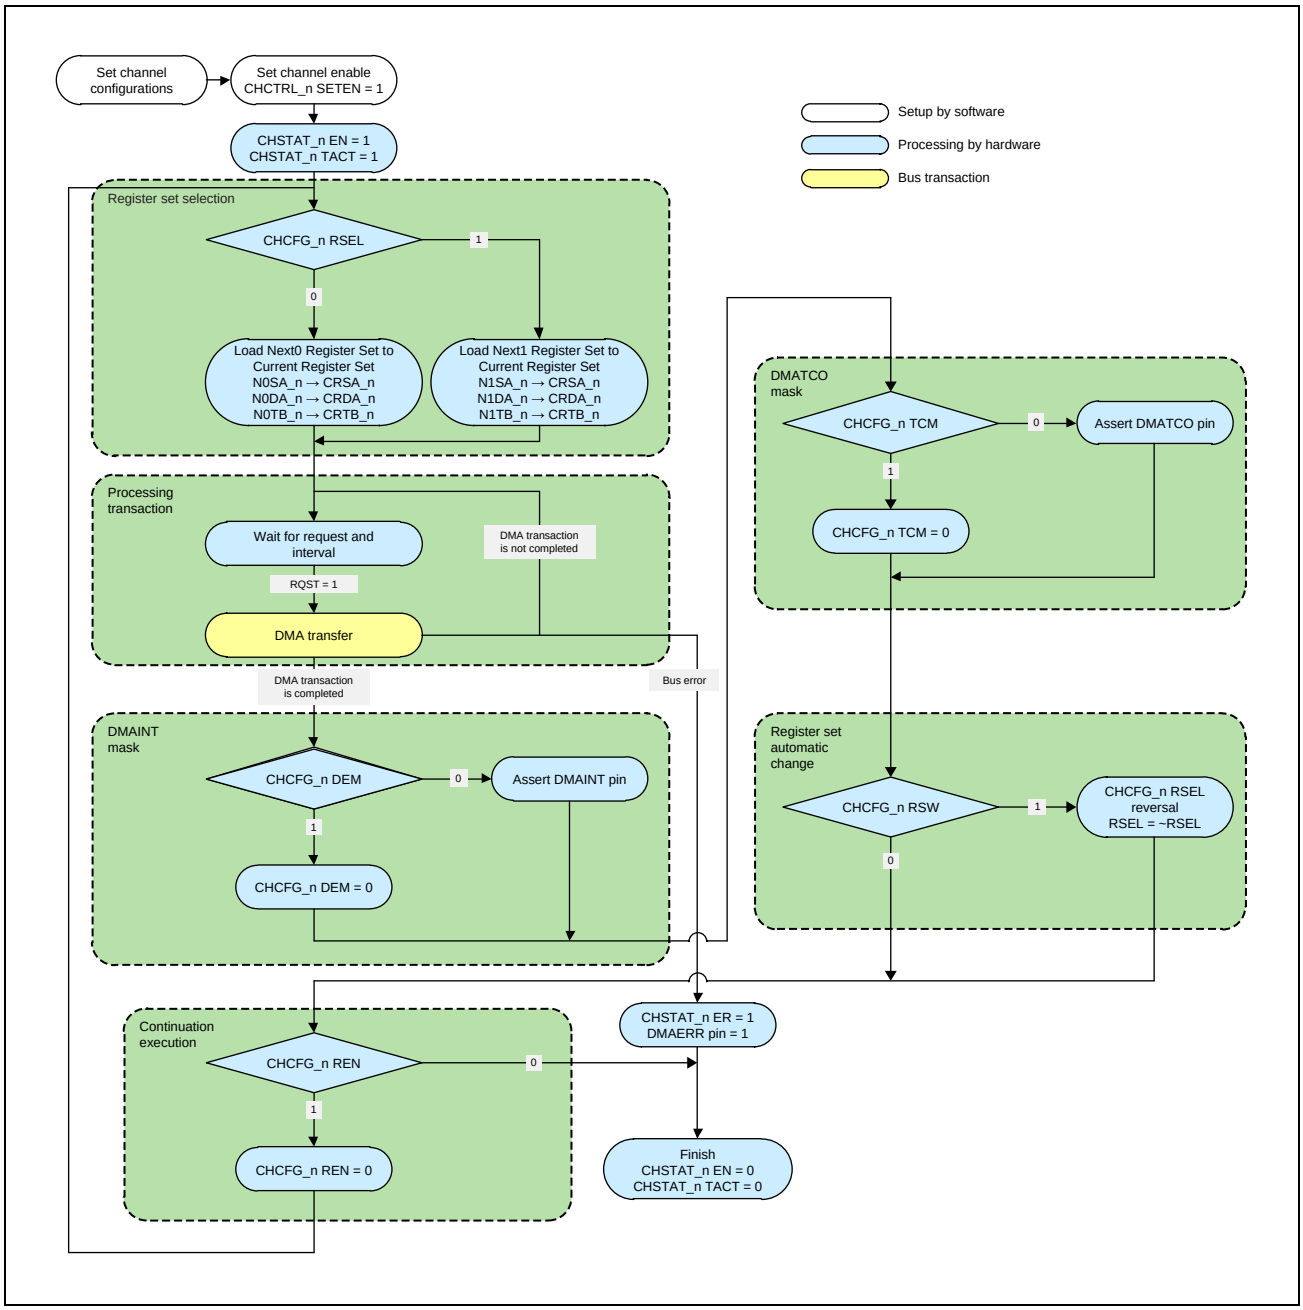

Figure 6.5B-15 Register Mode Operation Flow

Description of the register mode operation flow:

1. Channel setting
   The Next0 Register Set or Next1 Register Set register is set (transfer-destination address, transfer-source address, and total number of bytes to be transferred). In addition, the FIFO channel, volume of transfer data, and other items are set for USB control that is used for the Channel Register Set register.
   No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.
   (see **6.5B.9.13 DMA Transfer**).

2. Register set selection
   When 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits in the CHSTAT_n register are set to 1. As a result, the values set by the Next Register Set register selected by the RSEL bit in the CHCFG_n register are loaded to the Current Register Set register.

3. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, **6.5B.9.13 DMA Transfer**.

4. The USBFDMAmn masking
   The USBFDMAmn interrupt is masked depending on the value of the DEM bit in the CHCFG_n register. If DEM = 1, the USBFDMAmn interrupt is masked, and the DEM bit is automatically cleared to 0.

5. DMATC masking
   DMATC from DMAC control to USB control is masked depending on the value of the TCM bit in the CHCFG_n register. If TCM = 1, DMATC is masked, and the TCM bit is automatically cleared to 0.

6. Automatic register set switchover
   Whether the current Next register set is to be switched to the other Next register set is determined by the value of the RSW bit in the CHCFG_n register.

7. Continuation of execution
   Whether to continue DMA transfer is determined by the value of the REN bit in the CHCFG_n register. If REN = 0, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC operation stops. If REN = 1, DMAC operation continues, and the REN bit is automatically cleared to 0.

(b) Register mode setting

- Register mode setting

  The register set to be processed is selected.

Table 6.5B-37 Register Mode Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0	0	Processes Next0 Register Set.
	1	Processes Next1 Register Set.

- USBFDMAmn masking

  The USBFDMAmn interrupt can be masked.

Table 6.5B-38 USBFDMAmn Mask Setting

DEM (CHCFG_n)	Description
0	Asserts the USBFDMAmn interrupt when the DMA transaction is completed.
1	Does not assert the USBFDMAmn interrupt even when the DMA transaction is completed. After the DMA transaction is completed, the DEM bit is cleared to 0.

- DMATC mask setting

  DMATC from DMAC control to USB control can be masked.

Table 6.5B-39 DMATC Mask Setting

DEM (CHCFG_n)	Description
0	Asserts DMATC when the DMA transaction is completed.
1	Does not assert DMATC even when the DMA transaction is completed. After the DMA transaction is completed, the TCM bit is cleared to 0.

- Automatic transaction execution for a register set

  After a DMA transaction finishes, another DMA transaction can be executed.

Table 6.5B-40 Automatic Execution Setting for a Register Set

REN (CHCFG_n)	Behavior	Remarks
0	The EN bit is cleared and DMA operation is terminated when the DMA transaction for the register set that is set by RSEL finishes.	Use this setting to execute a DMA transaction only once.
1	After a DMA transaction finishes, DMA transfer of the contents of the next register set continues. The REN bit is cleared to 0 when continuous transfer is successful.	Use this setting to continue processing of register set contents.

- Automatic register set switchover setting

  After a DMA transaction finishes, the next register set to be processed can be switched.

Table 6.5B-41 Automatic Execution Setting for a Register Set

RSW (CHCFG_n)	Behavior	Remarks
0	The register set is not switched when a DMA transaction finishes.	Use this setting to use only one register set.
1	When REN = 1 and a DMA transaction finishes, the RSEL setting is automatically reversed to select the other register set.	Use this setting to switch the register set.

(c) Example of setting the register mode

- Example of setting the register mode when using only the Next0 register set

Table 6.5B-42 Register Mode Setting Example

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0	0	0	0	0	0
(register mode)	(Next0)	(not masked)	(not masked)	(not switched)	(continuous execution disabled)

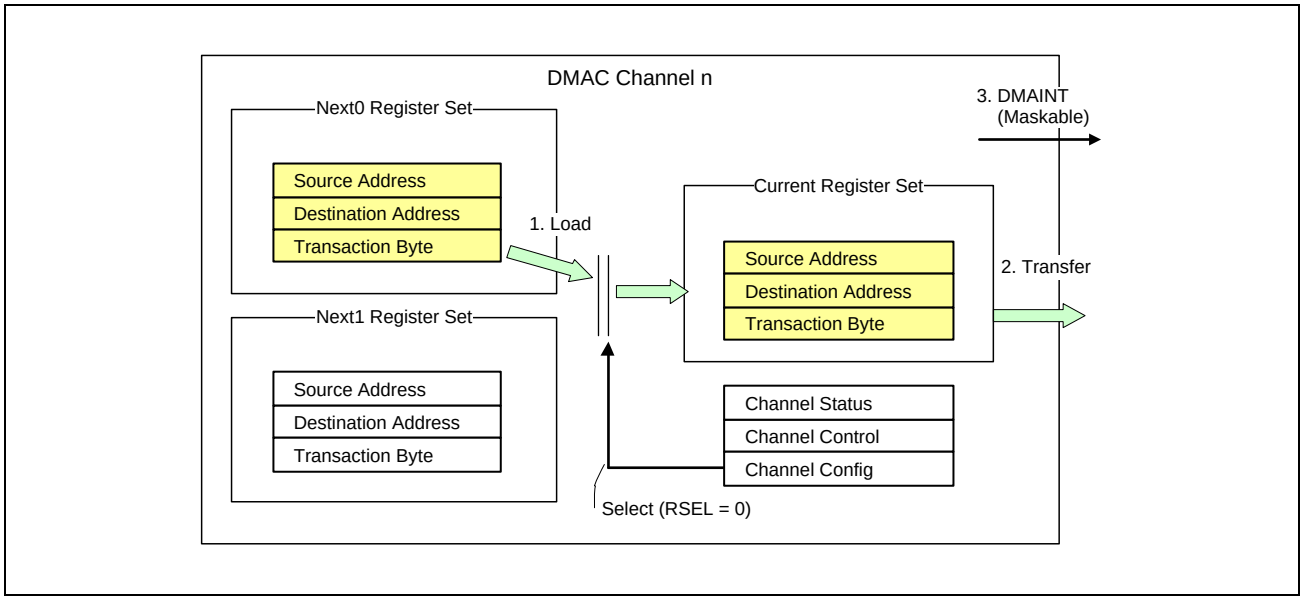

Figure 6.5B-16 Register Mode Setting Example 1

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
4. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

- Example of setting the register mode when using two register sets continuously

Table 6.5B-43 Automatic Register Set processing Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (register mode)	0 (Next0)	1 (masked)	0 (not masked)	1 (switched)	1 (continuous execution enabled)

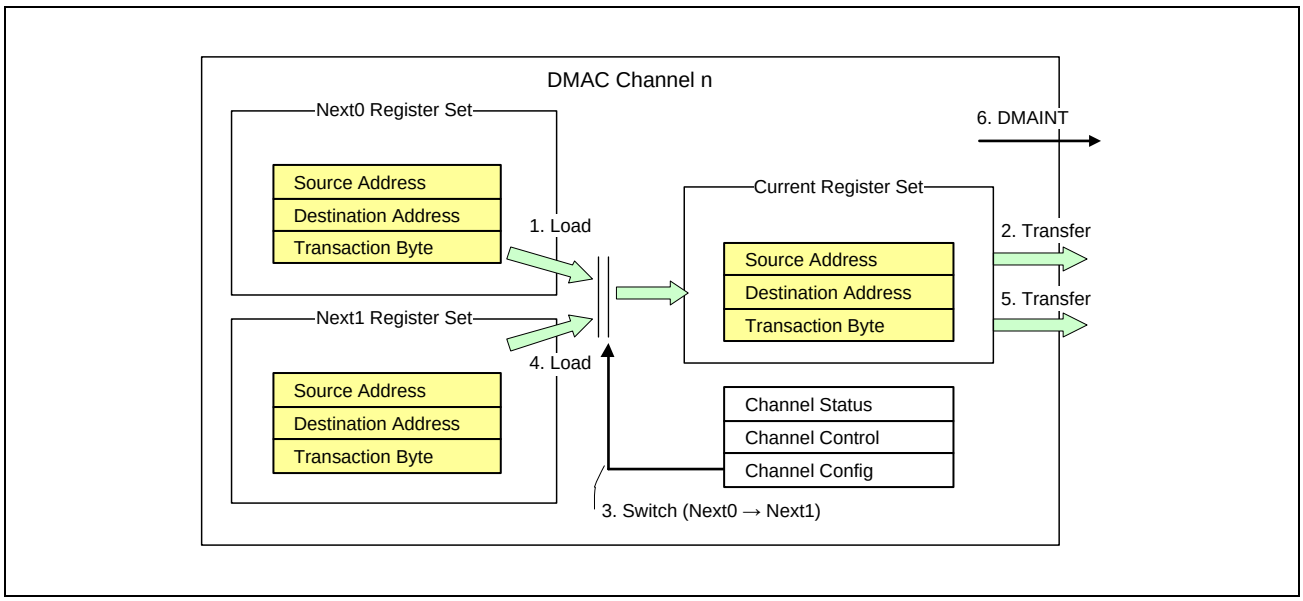

Figure 6.5B-17 Register Mode Setting Example 2

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 1, the USBFDMAmn interrupt is not asserted after the DMA transaction finishes.
4. Because the REN bit in the CHCFG_n register is 1, operation continues. The REN bit is automatically cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the next register set to be processed is switched (RSEL = 0 to 1).
6. The contents of Next1 Register Set are loaded to Current Register Set.
7. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
8. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
9. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

(2) Link mode

In link mode, this module reads the value set in a descriptor placed in an external storage area to execute a DMA transaction. In DMAC, there are Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers for each channel. The Next Link Address (NXLA_n) register is used to set the address of the descriptor to be read the next time. The Current Link Address (CRLA_n) register is used to display the descriptor address for the current DMA transaction.

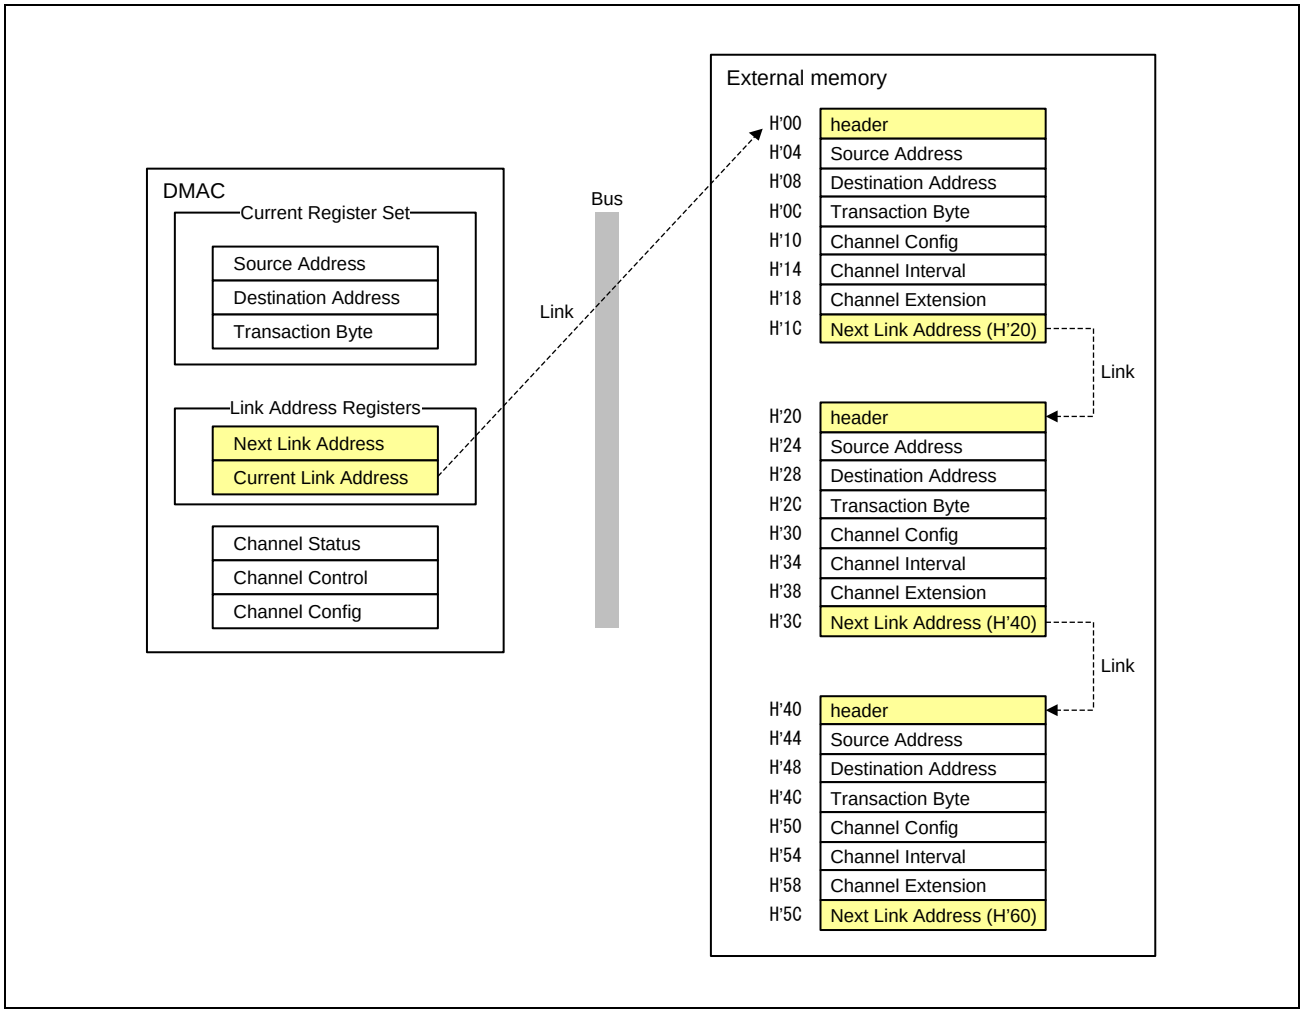

Figure 6.5B-18 Overview of Link Mode

(a) Operation flow of link mode

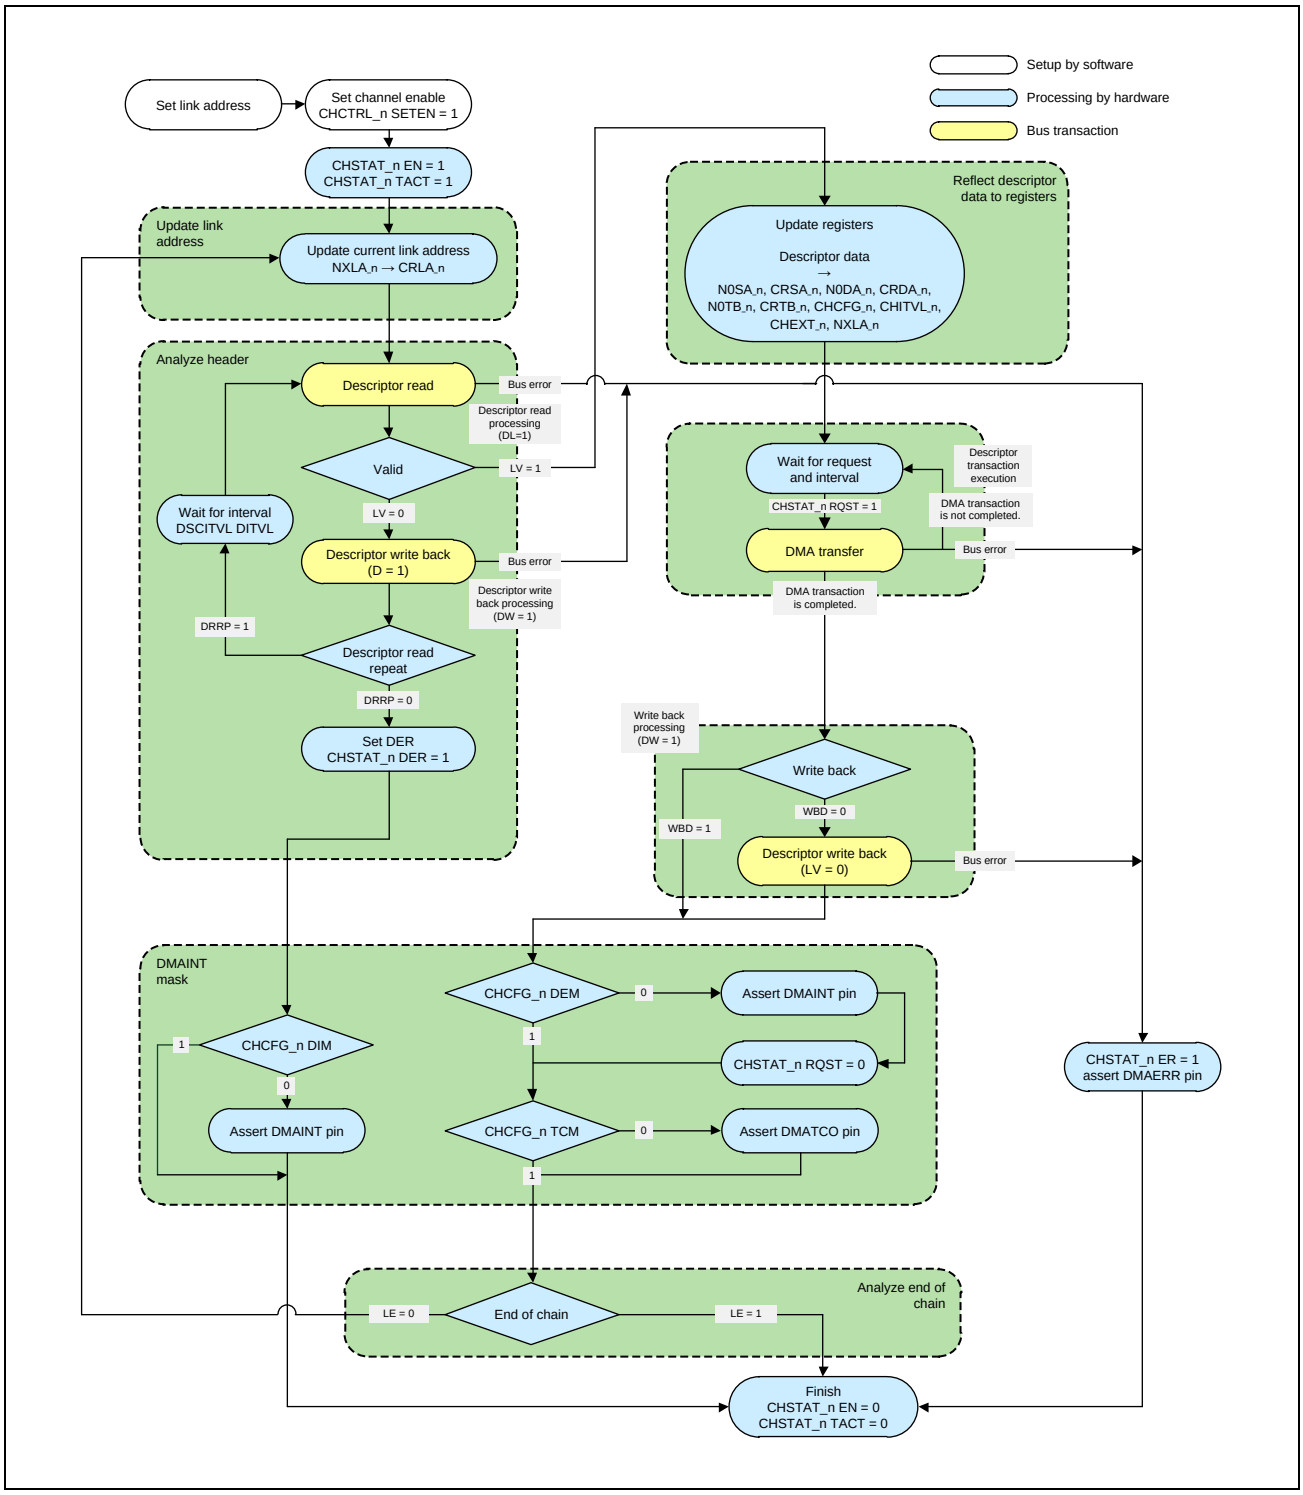

Figure 6.5B-19 Link Mode Operation Flow

Description of the link mode operation flow:

1. Channel setting
   The beginning address of the link destination is set in the NXLA_n register.

2. Link address updating
   If 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits of the CHSTAT_n register are set to 1. As a result, the address set in the NXLA_n register is loaded to the CRLA_n register.

3. Descriptor reading and header judgment
   A read of the descriptor starts, and DMAC checks the contents of header. If LV = 0, this module writes 1 back to the D bit of header. After that, if the DRRP bit in the CHCFG_n register is 1, this module waits for the time intervals set by the DSCITVL register, and then reads the same descriptor again. If DRRP = 0, the DER bit in the CHSTAT_n register is set to 1, and this module is placed in the end state (both EN and TACT bits in the CHSTAT_n register are 0). At this time, if the DIM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

4. Descriptor setting
   If LV = 1, the data read from the descriptor is loaded to Current Register Set and Channel Register Set. In addition, the next link target is loaded to the NXLA_n register.

5. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, see **6.5B.9.13 DMA Transfer**.

6. Header write-back
   If WBD of header is 0, DMAC writes LV = 0 to the header area.

7. USBFDMAmn masking
   If the DEM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

8. DMATC masking
   If the TCM bit in the CHCFG_n register is 0, this module asserts DMATC.

9. Link end judgment
   If LE of header is 1, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC terminates operation. If LE is 0, this module updates Current Register Set, and then restarts reading the next descriptor.

(b) Register setting

- Link mode setting

  To use link mode, set the DMS bit in the CHCFG_n register to 1.

Table 6.5B-44 Link Mode Setting

DMS (CHCFG_n)	Description
1	This module operates in link mode. The setting of this bit cannot be changed by using a descriptor.

- Link address setting

  The Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers are used to indicate a link target. Before starting link mode, set the link target in the NXLA_n register.
  After reading a descriptor, this module updates the NXLA_n register to the next link. Note that the CRLA_n register indicates the address of the link target that is being executed.

Table 6.5B-45 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n)	This register is used to set and display the next link target. Before starting link mode, set the address of the link target in this register.
Current Link Address Register (CRLA_n)	This register is used to display the link target that is being executed. This is a read-only register.

(c) Descriptor setting

DMAC supports multiple descriptor formats.

A switchover between formats is specified by using the DSCFM field of bits [31:28] of the 1st word (header) of the descriptor.

The following table shows the relationship between DSCFM values and descriptor formats.

Table 6.5B-46 Descriptor Formats

DSCFM	Descriptor Size	Next Link Address	Channel Extension	Channel Interval	Channel Config	Transaction Size	Destination Address	Source Address	header
3	4 words	✓	— (reload)	— (reload)	— (reload)	— (header)	✓	✓	✓ (with STS)
1	8 words	✓	✓	✓	✓	✓	✓	✓	✓ (no STS)
Other than the above	If DSCFM is set to a value that is not 1 or 3, operation cannot be guaranteed. Make sure that DSCFM is set to 1 or 3.								

Table 6.5B-47 Explanation of the Marks in **Table 6.5B-46**

Field	Mark	Description	Remarks
Header	✓ (with STS)	The STS field of bits [15:0] in the header is valid. The value set in the STS field is used as the total number of transfer bytes (Transaction Size).	—
	✓ (no STS)	The STS field of bits [15:0] in the header is invalid. The value of "Transaction Size" in the descriptor is used as the total number of bytes.	
Source Address	✓	Specify the source address.	—
Destination Address	✓	Specify the destination address.	—
Transaction Size	✓	Specify the transaction size.	—
	— (header)	Omit the transaction size. The value set in the STS field is used as the total number of transfer bytes (Transaction Size)	Because the STS field is of 16 bits, a maximum of 65,535 bytes can be set.
Channel Config Channel Interval Channel Extension	✓	Specify Channel Config, Channel Interval, and Channel Extension.	—
	— (reload)	Omit Channel Config, Channel Interval, and Channel Extension. The previous settings (the values of the CHCFG_n, CHITVL_n, and CHEXT_n registers of the last time) are inherited.	—
Next Link Address	✓	Specify the next descriptor address (Next Link Address) to be read after DMA transfer of the descriptor.	—

DMAC sequentially interprets data read from descriptors. If the number of words specified for DSCFM is less than 8, place the data of descriptors that are indicated by "✓" in **Table 6.5B-46** on memory.

No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.

Table 6.5B-48 Example of Placing Descriptors

	Address							
DSCFM	Link Address + H'1C	Link Address + H'18	Link Address + H'14	Link Address + H'10	Link Address + H'0C	Link Address + H'08	Link Address + H'04	Link Address + H'00
H'3	—	—	—	—	Next Link Address	Destination Address	Source Address	header
H'1	Next Link Address	Extension	Interval	Config	Transaction Byte	Destination Address	Source Address	header

- header

The header area provides the descriptor status and other information as shown below.

DMAC reads this area before DMA transfer in link mode starts. After a DMA transaction terminates, DMAC writes the transfer status back to this area.

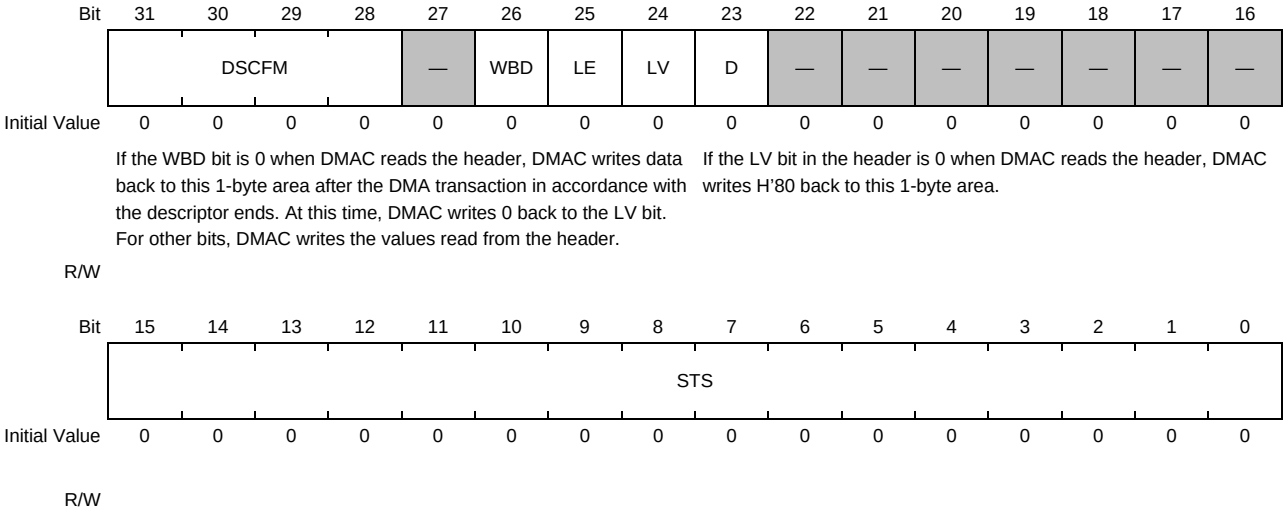

Figure 6.5B-20 Header Area

Table 6.5B-49 Header Area (1/2)

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DSCFM			Descriptor Format Specifies the descriptor format (length and combination of descriptors). For details see **Table 6.5B-46**.
27	—			Reserved area. Set 0.
26	WBD			Write Back Disable Masks a write-back operation for the LV bit. If this bit is 1, DMAC does not perform a write-back operation. 0: Writes 0 back to the LV bit. 1: Does not perform a write-back operation for the LV bit.
25	LE			Link End Indicates that the link will end with the DMA transaction for this descriptor. Set this bit to 1 to indicate the end of link. 0: The link continues. 1: The link ends.

Table 6.5B-49 Header Area (2/2)

Bit	Bit Name	Initial Value	R/W	Description
24	LV			Link Valid Indicates that this descriptor is valid. If WBD = 0, after DMAC executes the DMA transaction written in the descriptor, DMAC writes 0 to this bit. When header is set, set 1 to this bit. 0: This descriptor is invalid. 1: This descriptor is enabled.
23	D			Descriptor Error Indicates a descriptor access error. If LV is 0 when the descriptor is read, DMAC writes 1 back to this bit. 0: A descriptor error has not occurred. 1: LV was 0 when the descriptor was read.
22 to 16	—			Reserved area. Set 0.
15 to 0	STS			Short Transaction Size If DSCFM is 3, the transaction size is set (in bytes). The maximum number of transfer bytes that can be set is 65,535. If DSCFM is 3, Do not set 0 for STS. If 0 is set, operation cannot be guaranteed.

If descriptors are added sequentially while DMAC is operating, the access that the CPU sets 0 to the LV bit and the access that DMAC writes 1 back to the D bit might contend with each other. If this contention occurs, prior-written data is overwritten by latter-written data.

To prevent this problem from occurring, DMAC performs a write-back operation for the D bit in a byte-write manner. Therefore, the CPU must also set LV to 1 in a byte-write manner. Because the byte lanes for the D and LV bits are different, by writing data to different areas, occurrence of this problem can be prevented.

- Settings of descriptors other than header

  The specifications of data of the descriptors other than header are the same as the specifications of internal registers.

- Settings specified when descriptors are accessed

  The MHPROT pin output can be set for the LWPR and LDPR fields of the DCTRL register when descriptors are accessed. Set it according to the access target in which descriptors are deployed.

- Descriptor areas and DMA transfer areas

  The following provides an overview of the descriptor areas and DMA transfer areas that are accessed by DMAC.

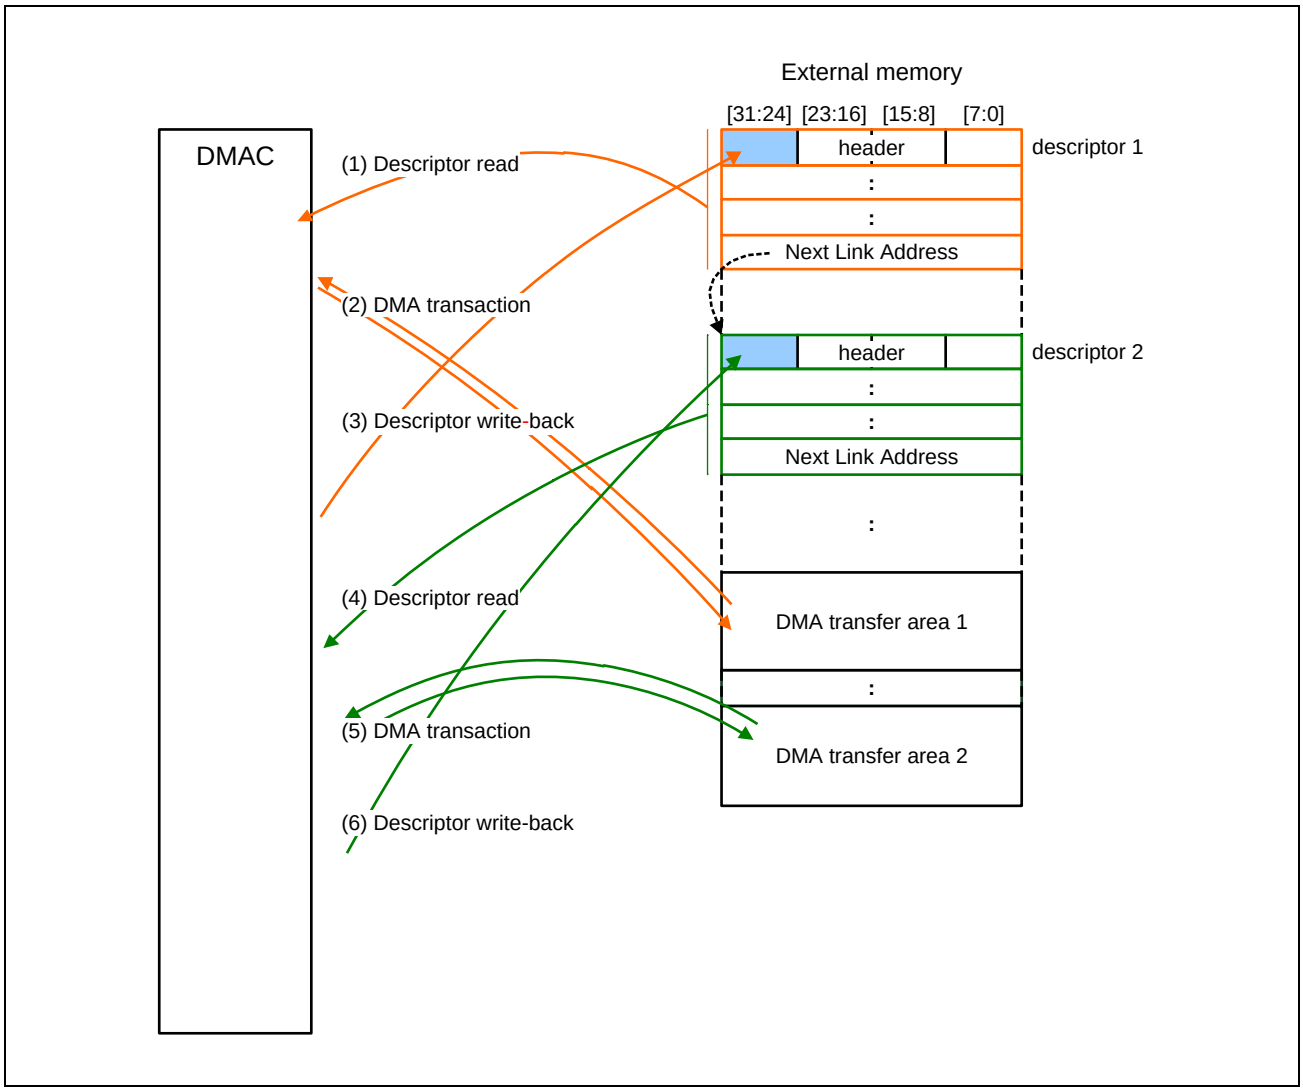

Figure 6.5B-21 Overview of Descriptor Areas and DMA Transfer Areas

(1) Descriptor read
DMAC loads a value from the internal NXLA_n register to the CRLA_n register, and then reads a descriptor from the external memory space indicated by the CRLA_n register (descriptor 1).

(2) DMA transfer
If the LV bit of the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(3) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 1. For the LV field, 0 is written back. For other fields, the values read in (1) are written back on a byte size basis.

(4) Descriptor read
If the value of the LE bit in the header descriptor that was read previously (in (1)) is 0, DMAC reads the next descriptor from the address (descriptor2) indicated by Next Link Address in the current descriptor.

(5) DMA transfer
If the LV bit in the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(6) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 2. For the LV field, 0 is written back. For other fields, the values read in (4) are written back on a byte size basis.

(Steps (4) to (6) are repeated.)

If LE = 1 and WBD = 0 in header, DMAC performs a DMA transfer with the descriptor settings, writes 0 back to the LV bit in header, and then terminates processing.

If LE = 1 and WBD = 1 in header, DMAC performs a DMA transfer with the descriptor settings, and then terminates processing (without performing write-back).

If LV = 0 in header, DMAC writes 1 back to the D bit in header, and then, if the DRRP bit in the CHCFG_n register is 1, DMAC waits for the number of intervals specified by the DITVL field of the DSCITVL_n register, and then reads the descriptor again. If DRRP = 0, DMAC terminates processing.

- Notes on descriptors
  - In link mode, settings can be changed by reading descriptors. However, it is impossible to synchronize the setting change times and hardware requests. Therefore, to use hardware requests, before setting the SETEN bit in the CHCTRL_n register, set the AM, LVL, HIEN, LOEN, and SEL bits in the CHCFG_n register. Note that these setting bits must not be changed in descriptors.
  - Descriptors cannot be used to change the DMS field in the CHCFG_n register (DMAC is always placed in link mode). Although descriptors can be used to change the settings of the REN, RSW, and RSEL fields in the CHCFG_n register, changes of those fields do not affect operation.
  - The descriptor can be initialized by overwriting the memory area corresponding to the descriptor you intend to initialize while the DMAC is not operating. The DMAC determines whether or not the descriptor is valid by referring to the DSCFM field and LV bit in the header. Accordingly, set the areas in memory corresponding to the DSCFM field and LV bit to 1 or 3, and to 1, respectively, before enabling DMAC operation.
  - To set the next descriptor on memory while DMAC is operating, make sure that 1 is written to the LV bit after the descriptors subsequent to header (Source Address, Destination Address, ..., Next Link Address) are set. If this is not performed and descriptor setting by the CPU and descriptor reading by DMAC contend, DMAC performs a DMA transfer using the previous values of those descriptors (Source Address, Destination Address, ..., Next Link Address).
  - To leave the write-back information for the D bit of header, make sure that 1 is written to the LV bit of header in a byte-access manner.

(d) Link configuration example

In link mode, descriptors can be configured as shown below.

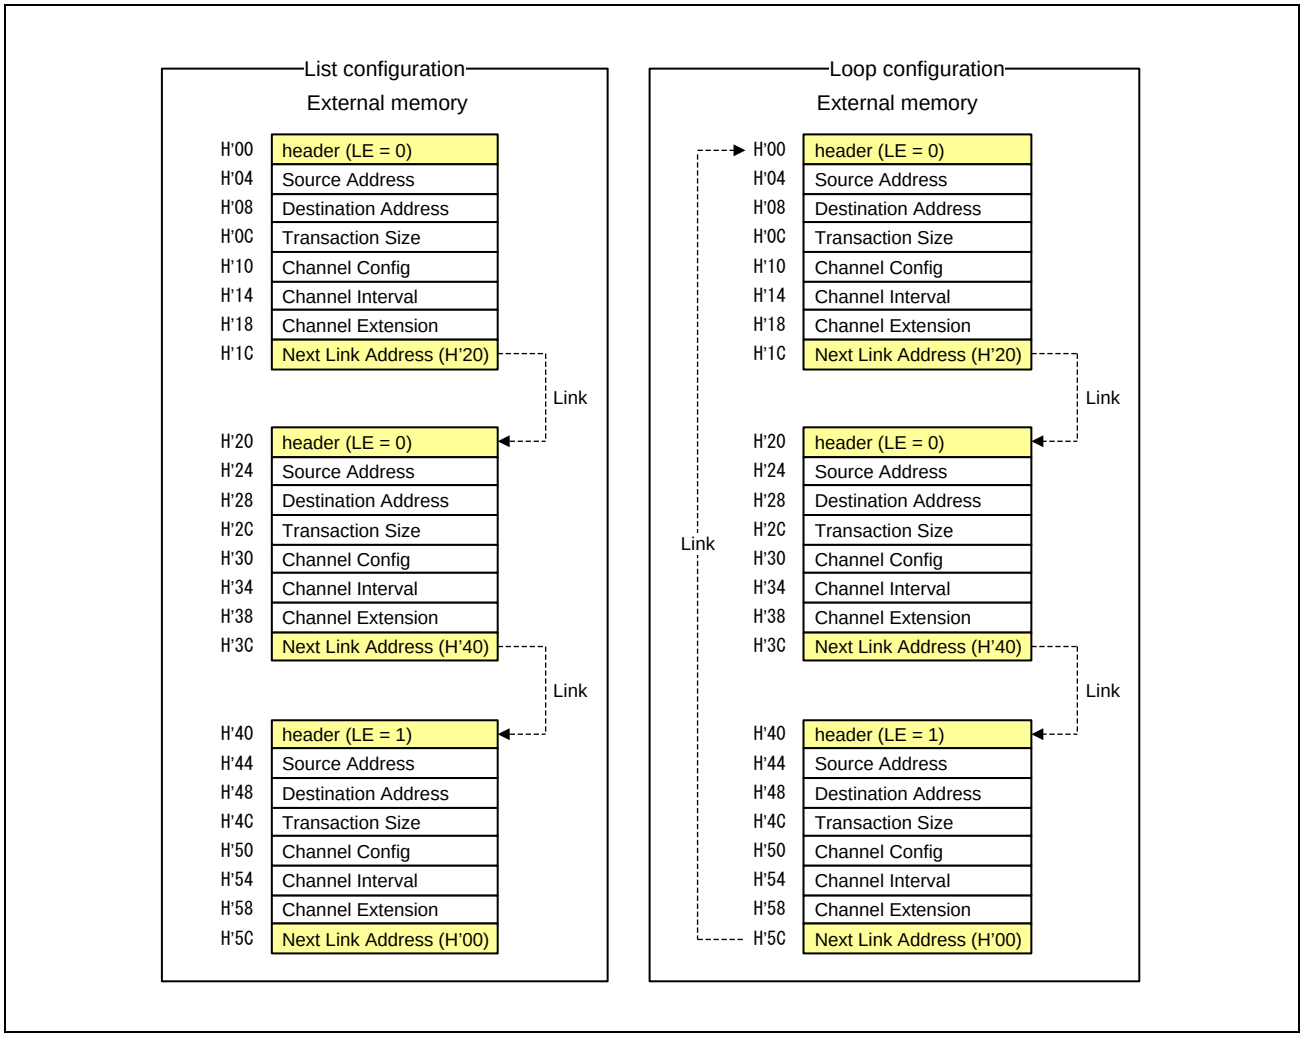

Figure 6.5B-22 Link Mode Configuration Example

- List configuration

  The link ends by setting 1 for the LE bit in the header of the last descriptor.

- Loop configuration

  A loop of descriptors can be created by setting the link target of the last descriptor to the address of the first descriptor. To end the loop, change the value of the LE bit of header to 1 or use the transfer interrupt procedure.

6.5B.9.12.2 Write only mode

Write-only mode is enabled by setting 1 for the WONLY bit in the CHCFG_n register.

Table 6.5B-50 Write-Only Mode Setting

WONLY (CHCFG)	Mode	Description
0	Normal mode	A DMA transfer is performed using the values set in Next Register Set.
1	Write-only mode	A DMA write transfer is performed without performing a DMA read transfer.

In write-only mode, no DMA read transfer is performed (note that descriptors are read in the same way as in normal mode). In register mode, the values set in the NxSA_n register (if RSEL = 0, x = 0; if RSEL = 1, x = 1) are used as write data. In link mode, the values of the SA fields of descriptors are used as write data.

Use this mode to, for example, initialize the memory area.

6.5B.9.13 DMA Transfer

This chapter describes the basic operation of DMA transfer.

6.5B.9.13.1 Transfer modes

DMAC supports only single transfer mode.

Upon receiving a DMA transfer request from USB control, DMAC executes a single DMA transfer on the side (source or destination) indicated by the REQD bit in the CHCFG_n register. DMAC then asserts internal DMA permission from internal USB control to DMAC control. DMAC performs a single transfer each time a transfer is received. DMAC continues this operation by the transfer size loaded to the CRTB_n register (arbitration between channels is performed for each DMA transfer).

The timing of internal DMA permission from internal USB control to DMAC control differs depending on the setting of the REQD bit in the CHCFG_n register and the setting of the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register). For details, see **6.5B.9.13.7 Operational difference depending on the transfer size**.

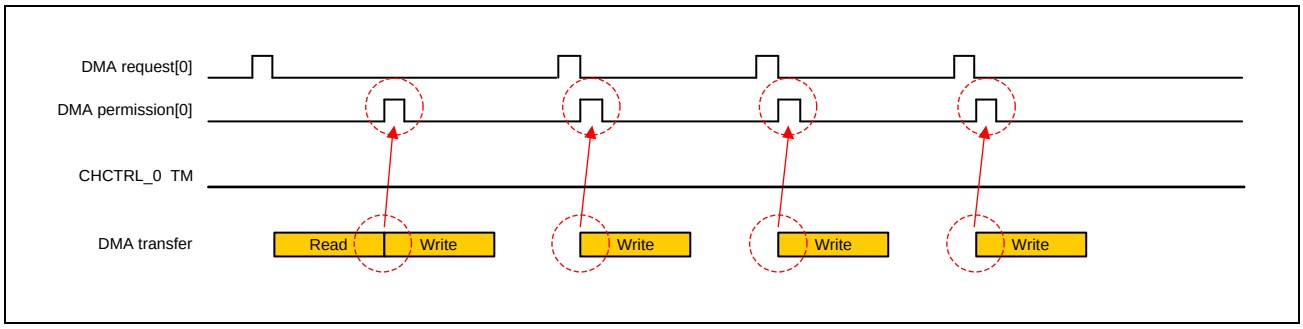

Figure 6.5B-23 Single Transfer Mode (REQD = 1, SDS > DDS)

6.5B.9.13.2 DMA channel priority control

DMAC supports fixed-priority mode and round-robin mode as methods of arbitration between channels. The mode is selected by using the PR bit in the DCTRL register. If the PR bit is 0, fixed-priority mode is selected. If the PR bit is 1, round-robin mode is selected.

Table 6.5B-51 Priority Control Setting

Mode	PR (DCTRL)	Description	Remarks
Fixed-priority	0	Controls requests based on fixed priority (CH0 > CH1 > ...).	Use this mode if channels have priority.
Round-robin	1	Controls requests in a round-robin manner.	Use this mode to execute requests equally.

(1) Fixed-priority mode

In fixed-priority mode, a fixed priority level is assigned to each channel as shown below.

(High) CH0 > CH1 (Low)

If DMA transfer requests simultaneously occur over multiple channels, the DMA transfer over the channel whose number is smallest is performed first.

The transfer over channel 0 is performed first. However, while a transfer switches to another transfer over channel 0, a transfer over the channel with the next highest priority level is performed in order to increase the bus usage rate.

(2) Round-Robin Mode

In round-robin mode, each time a transfer over a channel is received, the priority level of the channel that was used for the previous transfer is changed to the lowest level.

In the status immediately after the mode is reset, channels are assigned priority levels in the same way as fixed-priority mode as shown below.

(High) CH0 > CH1 (Low)

In this status, if a transfer request for DMA channel 0 does not occur and a transfer request for DMA channel 1 occurs, the transfer over DMA channel 1 is performed. When the transfer finishes, the channel priority is changed as follows.

(High) CH1 > CH0 (Low)

The following shows an example of DMA transfer in round-robin mode.

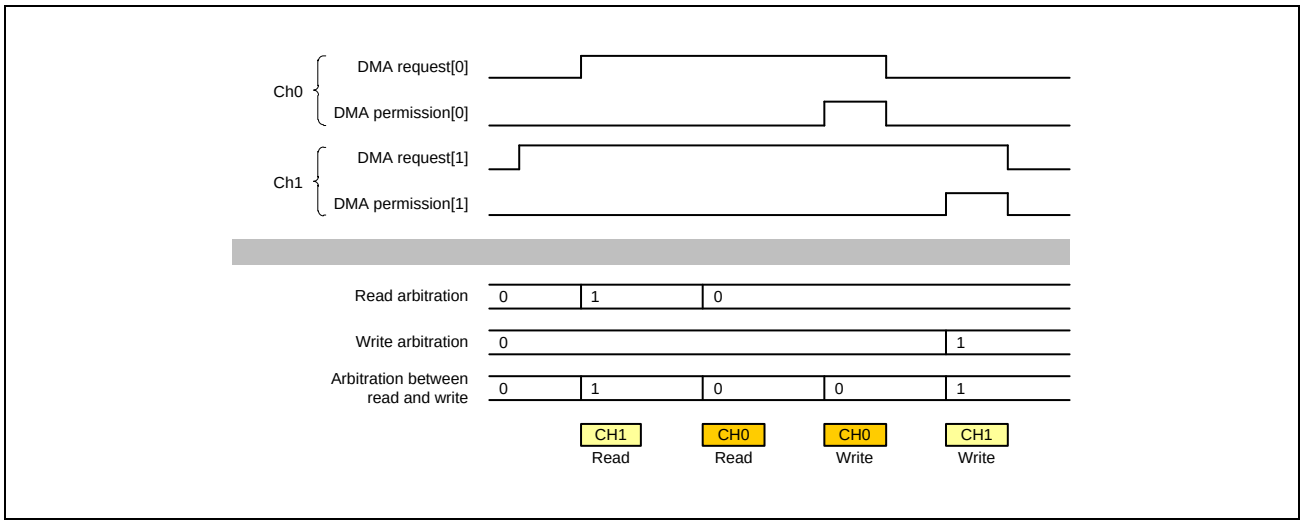

Figure 6.5B-24 Example of Operation in Round-Robin Mode (with 4 channels, REQD = 1)

DMAC internally performs arbitration between read channels and arbitration between write channels, further performs arbitration between the arbitration results, and then issues bus access.

6.5B.9.13.3 Forced sweeping request

When a forced sweeping request is entered, DMAC transfers the data that is left untransferred in the buffer to the destination address. After the sweep processing finishes, DMAC continues DMA transfer.

The following provides notes on forced sweeping requests:

(1) If a forced sweeping request and a transfer request from USB control contend, DMAC performs forced sweeping first, and then performs a DMA transfer.

(2) If the USB-control-side system is the destination (REQD bit in the CHCFG_n register is 1) register REQD = 1, buffer overflow or another error might occur on the destination unit because data is transferred although no DMA transfer request is made on the USB control side. Therefore, the specifications physically prohibit DMAC from using forced sweeping if REQD = 1.

(3) The difference from ordinary sweeping mode described in **6.5B.9.13.8(3) (b) Transfer suspension (buffer sweeping enabled: SBE = 1)** (EN is cleared by setting 1 for the SBE bit in the CHCFG_n register) is as follows: DMAC stops operation after writing data in the buffer in ordinary sweeping mode, whereas DMAC can continue DMA transfer after sweeping the buffer in forced sweeping mode.

(1) Forced software sweeping request

The SETSSWPRQ bit in the CHCTRL_n register determines whether software-based forced sweeping requests can be used. To perform a forced sweeping request, write 1 to the SETSSWPRQ bit. DMAC then outputs the data in the buffer to the destination.

6.5B.9.13.4 DMA transfer completion interrupt (USBFDMAmn)

USBFDMAmn (m, n = 0, 1) is an interrupt signal that indicates termination of a DMA transaction.

If a transfer for the total number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response, the END bit in the CHSTAT_n register is set to 1. At this time, if the DEM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn (m, n = 0, 1) interrupt.
(If a write-back operation is performed in link mode, the interrupt is generated after the write-back operation finishes.)

In link mode, when the DRRP bit in the CHCFG_n register is 0, if the LV bit of the header of the descriptor that is read is 0, the DER bit in the CHSTAT_n register is set to 1. At this time, if the DIM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn interrupt.

Use this signal to detect a transfer completion interrupt performed by the interrupt controller.

Table 6.5B-52 USBFDMAmn Assertion Conditions

Cause	Condition	INT_DMA[n] mask signal
DMA transaction ended	A transfer of data by the number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response (if a write-back operation is performed in link mode, after the operation finishes)	DEM bit in the CHCFG_n register
Descriptor was invalid	LV of header of the descriptor that is read is 0 when DRRP and DIM in the CHCFG_n register are both 0 in link mode	DIM bit in the CHCFG_n register

6.5B.9.13.5 DMA error interrupt (USBFDMAERRm)

If an error response is received for DMA transfer or descriptor access, this module stops transfer, assuming that an error occurred. When an error response is received, the EN bit in the CHSTAT_n register for channel n that is being used for transfer is cleared to 0, and the ER bit is set to 1 (n = 1, 0). Also, the USBFDMAERRm interrupt is asserted.

The USBFDMAERRm signal cannot be masked.

For a sequence of transfers for which an error occurred, data integrity cannot be guaranteed. Always use the following procedure to restart the transfer sequence from the beginning.

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Reset each register.

6.5B.9.13.6 Interval Count Function

The execution interval of a DMA transfer can be adjusted by using the ITVL field in the CHITVL_n register. This function prevents DMAC from continuously occupying the bus. If this function is enabled, DMAC does not perform a DMA transfer for the next request until the counter value becomes 0.

The following shows an operation example.

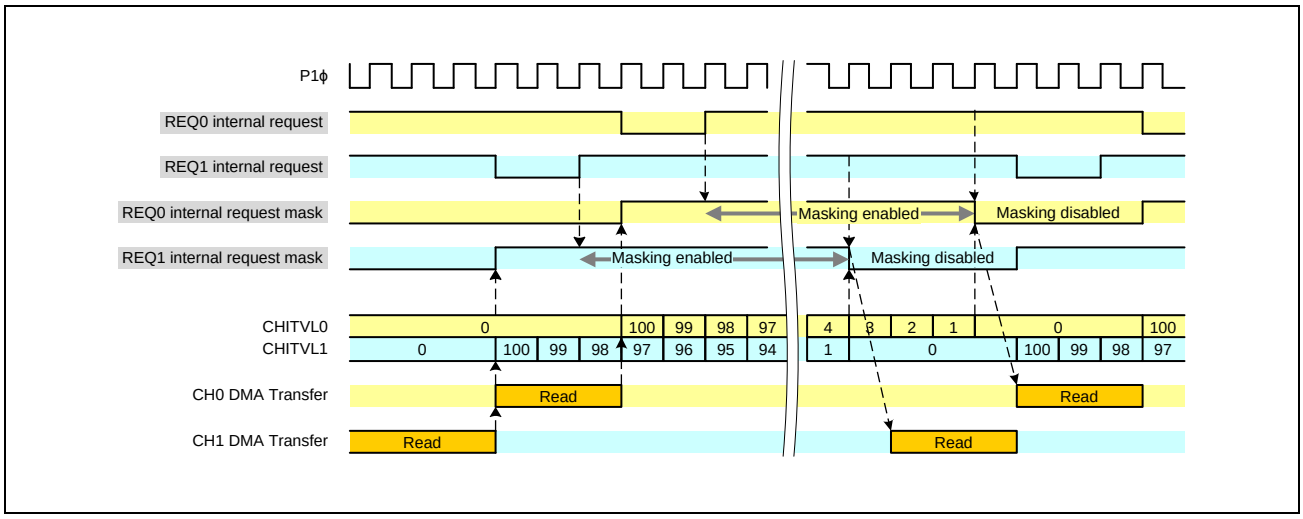

Figure 6.5B-25 Example of Counting Intervals (REQD = 0, SDS < DDS)

An interval is inserted after a transfer is performed on the side specified by the REQD bit in the CHCFG_n register. The following shows how the REQD, SDS, and DDS values of the CHCFG_n register are related with the interval.

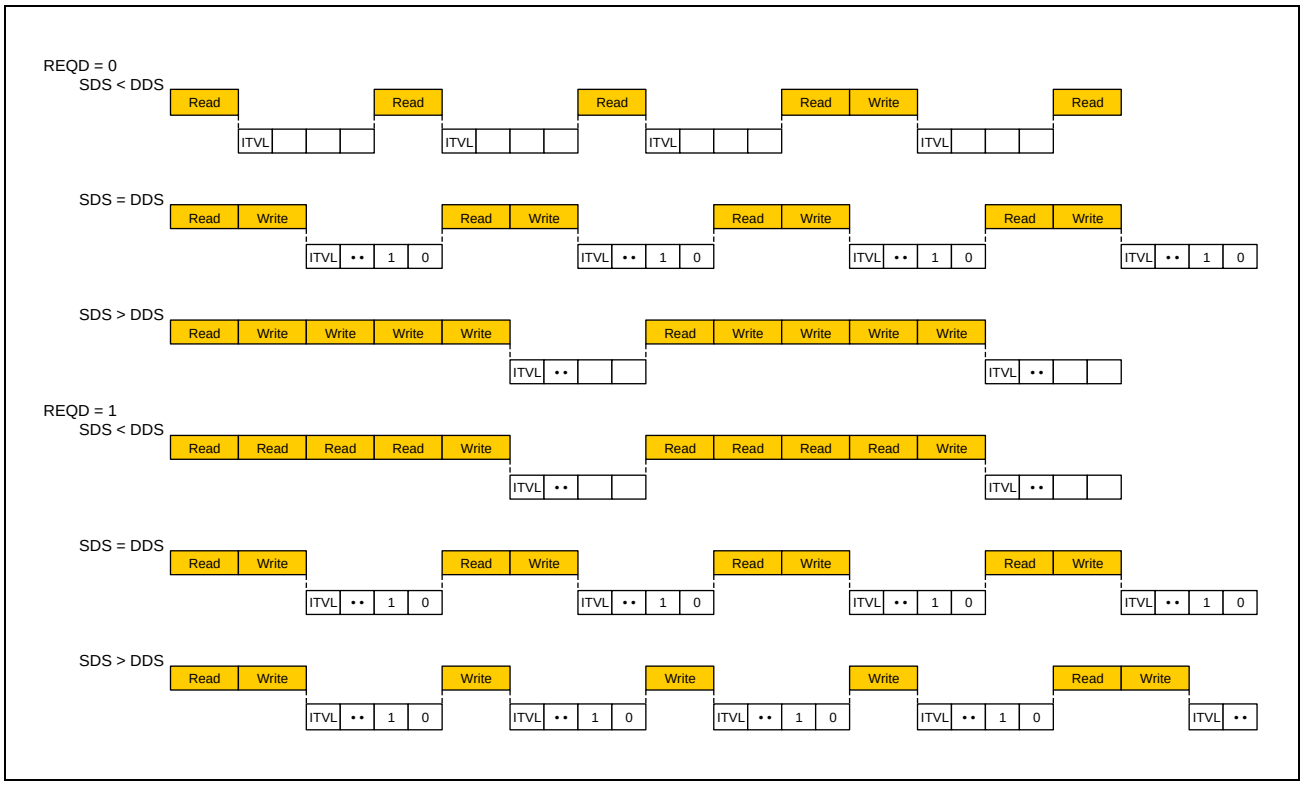

Figure 6.5B-26 DMA Transfer Settings and Interval Count

6.5B.9.13.7 Operational difference depending on the transfer size

(1) If the transfer size on the source side is smaller

When reading of as much data as the destination data size finishes, a write to the destination starts.

The following figure is an example of the timing chart in the case where the source is an 8-bit field and the destination is a 32-bit field (SDS = 0 and DDS = 2 in the CHCFG_n register) (when the rising edge is detected).

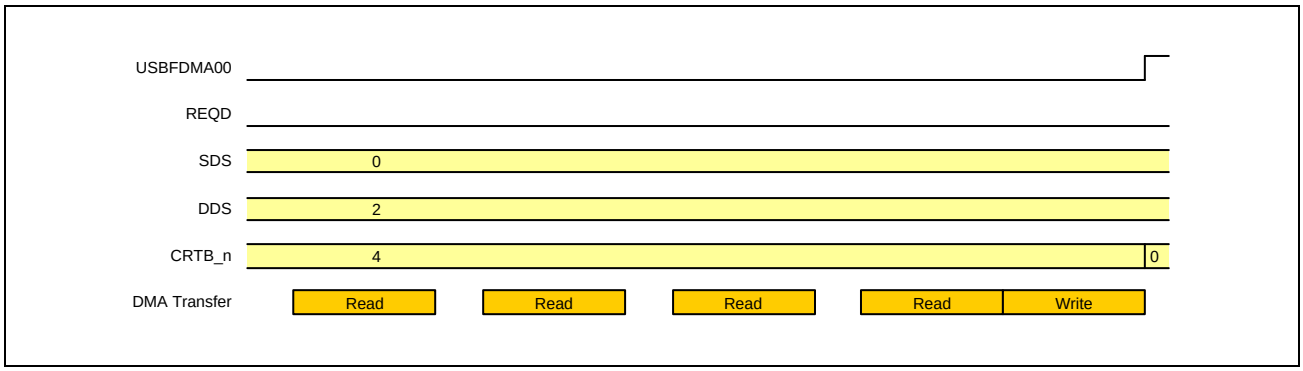

Figure 6.5B-27 Example of Timing Chart in the Case Where the Source is Smaller
(LVL = 0, HIEN = 1, REQD = 0, and SDS < DDS)

(2) If the transfer size on the destination side is smaller

Because the source side is larger than the destination side, two or more destination write operations occur for one source read operation. The following is an example of the timing chart in the case where the source is a 64-bit field and the destination is a 16-bit field (SDS = 3 and DDS = 1 in the CHCFG_n register) (when the rising edge is detected).

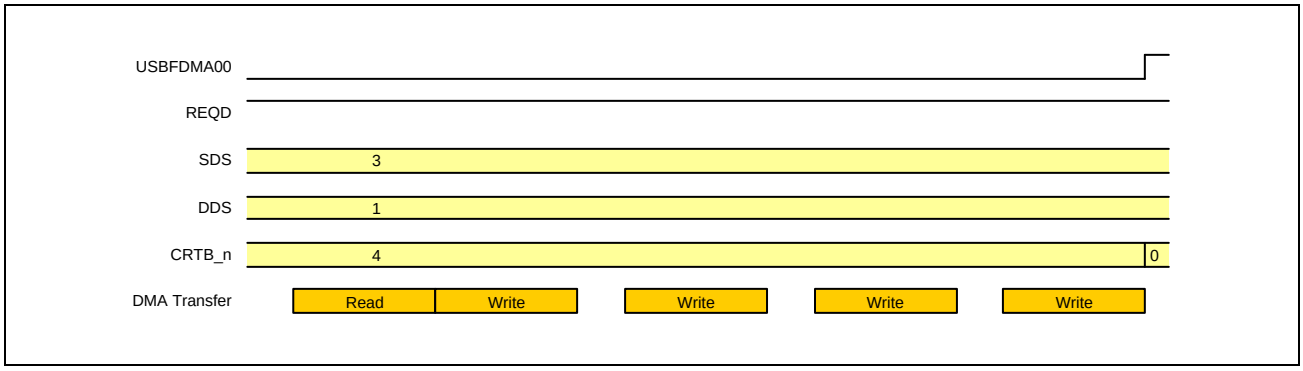

Figure 6.5B-28 Example of Timing Chart in the Case Where the Destination Is Smaller
(LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in the CHCFG_n Register)

(3) If the Source and Destination Transfer Sizes Are the Same

Each time a DMA transfer request is detected, a source read operation and a destination write operation occur.

The following is an example of the timing chart in the case where the source and destination are 8-bit fields (SDS = 0 and DDS = 0 in the CHCFG_n register) (when the rising edge is detected).

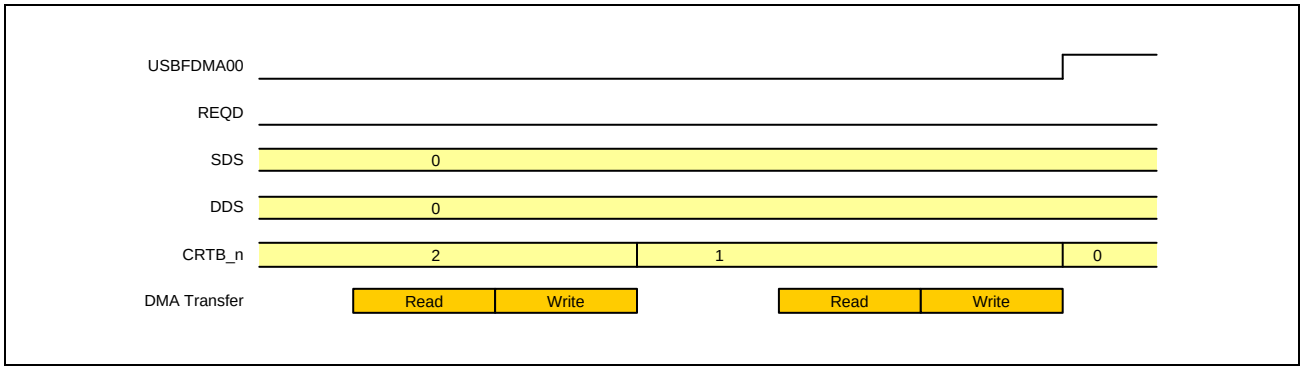

Figure 6.5B-29 Example of Timing Chart in the Case where the Source and Destination Sizes are the Same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in the CHCFG_n Register)

6.5B.9.13.8 Transfer state

The CHSTAT_n register indicates the transfer state of a channel.

(1) Transfer state

The TACT bit in the CHSTAT_n register indicates that channel n is operating. When 1 is written to the SETEN bit in the CHCTRL_n register, the TACT bit is set to 1. The TACT bit continues to be 1 while DMAC is accessing a descriptor or waiting for a DMA request.

The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details about the conditions in which the EN bit is cleared, see **6.5B.4.1 Current Source Address Register**) and the DMA transfer ends.

If the EN bit is not cleared when the DMA transaction ends (for example, when the REN bit of the CHCFG_n register is 1 in register mode or when DMAC accesses the next descriptor in link mode), the TACT bit is not cleared.

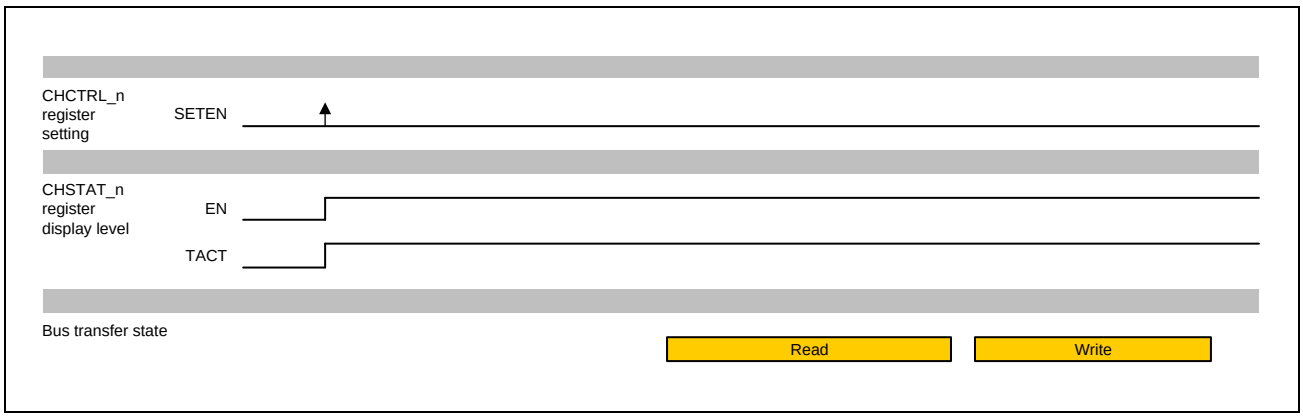

Figure 6.5B-30 DMAC State Example 1 (Hardware Request)

(2) Suspension

The SETSUS bit in the CHCTRL_n register can be used to suspend a DMA transfer. If suspension of a DMA transfer is attempted when a bus cycle is running, the DMA transfer is suspended after the bus cycle finishes. The suspended transfer can be resumed by writing 1 to the CLRSUS bit in the CHCTRL_n register.

To check whether a DMA transfer is suspended, after setting the SETSUS bit in the CHCTRL_n register, check the SUS bit in the CHSTAT_n register or the SUS bit for the relevant channel in the DSTAT_SUS register. If The SUS bit is 1, the DMA transfer is currently suspended.

(3) Transfer suspension

By writing 1 to the CLREN bit in the CHCTRL_n register during a DMA transaction, the DMA transaction of the channel can be suspended. As the post-processing for suspension, the SBE bit in the CHCFG_n register can be used to select whether to sweep the data remaining in the buffer when the transaction is suspended. The default is SBE = 0 (do not sweep remaining data).

If the sweep mode is enabled and a transfer is suspended by setting 1 for the CLREN bit in the CHCTRL_n register, DMAC sweeps any data remaining in the buffer and stops operation.

(a) Transfer suspension (buffer sweeping disabled: SBE = 0)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer and then stops. The timing of stoppage depends on the value set for the REQD bit. After DMAC stops, write 1 to the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

If DMA transfer is suspended before it is completed, the USBFDMAmn interrupt is not asserted.

If the REQD bit in the CHCFG_n register is 0, DMAC stops when the next read operation is completed. However, if data that can be written exists in the buffer, DMAC writes the data and then stops.

If the REQD bit in the CHCFG_n register is 1, DMAC stops when the next read operation is completed.

(b) Transfer suspension (buffer sweeping enabled: SBE = 1)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer. If the REQD bit in the CHCFG_n register is 0, DMAC sweeps (writes) the already read data, and then stops DMA transfer. If the REQD bit is 1, sweep mode cannot be used physically.

After DMAC stops, set the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

(c) How to confirm deactivation of the channel

Even when the EN bit of the CHSTAT_n register is cleared to 0 by writing 1 to the CLREN bit in the CHCTRL_n register, if a transfer has already been executed over the bus, DMAC cannot immediately stop. To check whether DMAC has stopped completely, check the EN and TACT bits in the CHSTAT_n register. If both bits are 0, DMAC has stopped completely.

(d) Procedure for suspending transfer

To suspend transfer:

1. Write 1 to the CLREN bit in the CHCTRL_n register.
2. If the SBE bit in the CHCFG_n register is 0, DMAC stops according to the value of the REQD bit in the CHCFG_n register. If the SBE bit is 1, DMAC is placed in sweep mode.
3. Read the CHSTAT_n register to check whether the TACT bit is 0. If the TACT bit is 0, DMAC has stopped completely. If the TACT bit is 1, continue polling until the bit changes to 0.
4. To perform the next DMA transfer after it is suspended, make sure that the SWRST (software reset) bit in the CHCTRL_n register is turned on before the next DMA transfer starts.

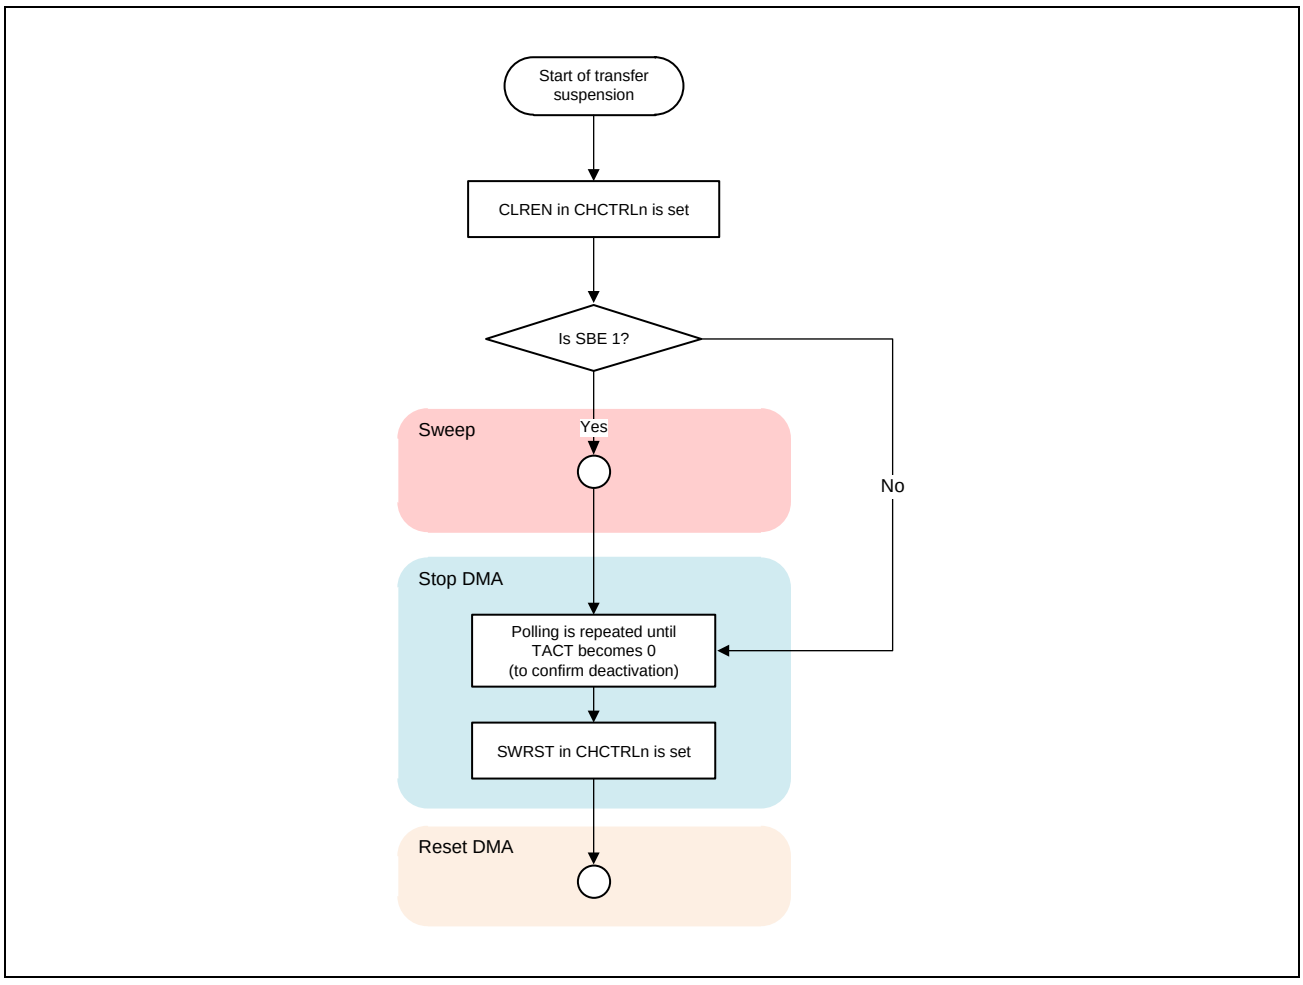

Figure 6.5B-31 Transfer Suspension Flowchart

6.5B.9.14 Access Type

6.5B.9.14.1 DMA master transfer combination list

(1) Read access

The following describes characteristics of the issuance type for DMA read access.

- An access is performed for a beat align space whose size is set by SDS[2:0] in the CHCFG_n register, including the source address indicated in the CRSA_n register. A beat unaligned transfer for the bus is not performed. An excess area is sometimes read depending on CRSA_n or SKIP settings. In this case, the necessary data is imported into the buffer from the read data.
- The size and burst length are determined based on the value set in the SDS[2:0] field.
  If the value set in the SDS[2:0] field is equal to or less than the bus width
  Size: Value set in SDS[2:0]
  Burst type: SINGLE
  If the value set in the SDS[2:0] field is larger than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = SDS[2:0] value/bus width)

The following indicates the access types for the bus.

Table 6.5B-53 DMA Read Transfer Combination List

SDS	Source Address	AHB transfer					
		First transfer			Second transfer		
		Address	Data Size	Burst Type	Address	Data Size	Burst Type
0 (8 bits)	-	addr	8	SINGLE			
1 (16 bits)	2 byte align	{addr[31:1], 0b}	16	SINGLE			
	2 byte unalign				{addr[31:1], 0b} + H'2	16	SINGLE
2 (32 bits)	4 byte align	{addr[31:2], 00b}	32	SINGLE			
	4 byte unalign				{addr[31:2], 00b} + H'4	32	SINGLE
4 (128 bits)	16 byte align	{addr[31:4], H'0}	32	INCR4			
	16 byte unalign				{addr[31:4], H'0} + H'10	32	INCR4
5 (256 bits)	32 byte align	{addr[31:5], H'00}	32	INCR8			
	32 byte unalign				{addr[31:5], H'00} + H'20	32	INCR8
6 (512 bits)	64 byte align	{addr[31:6], H'00}	32	INCR16			
	64 byte unalign				{addr[31:6], H'00} + H'40	32	INCR16

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

The following describes characteristics of the issuance type for DMA write access.

- An access is performed from the destination address indicated by the CRDA_n register to the beat align boundary whose size is set by DDS[2:0] in the CHCFG_n register.
- The size and burst length are determined based on the value set in the DDS[2:0] field.
  If the value set in the DDS[2:0] field is equal to or less than the bus width
    Size: Value set in DDS[2:0]
    Burst type: SINGLE
  If the value set in the DDS[2:0] field is greater than the bus width
    Size: Bus width
    Burst type: Fixed-length burst (burst length = DDS[2:0] value/bus width)
- In write access, only the specified space is accessed. In the following cases, the combination of values smaller than the value set in the DDS[2:0] field is used for access.
  - The destination address is beat-unaligned for the value set in the DDS[2:0] field.
  - An access specified in the DDS field will be across the SKIP boundary.
  - The size specified in the DDS[2:0] field is too large for the number of remaining bytes to be transferred.

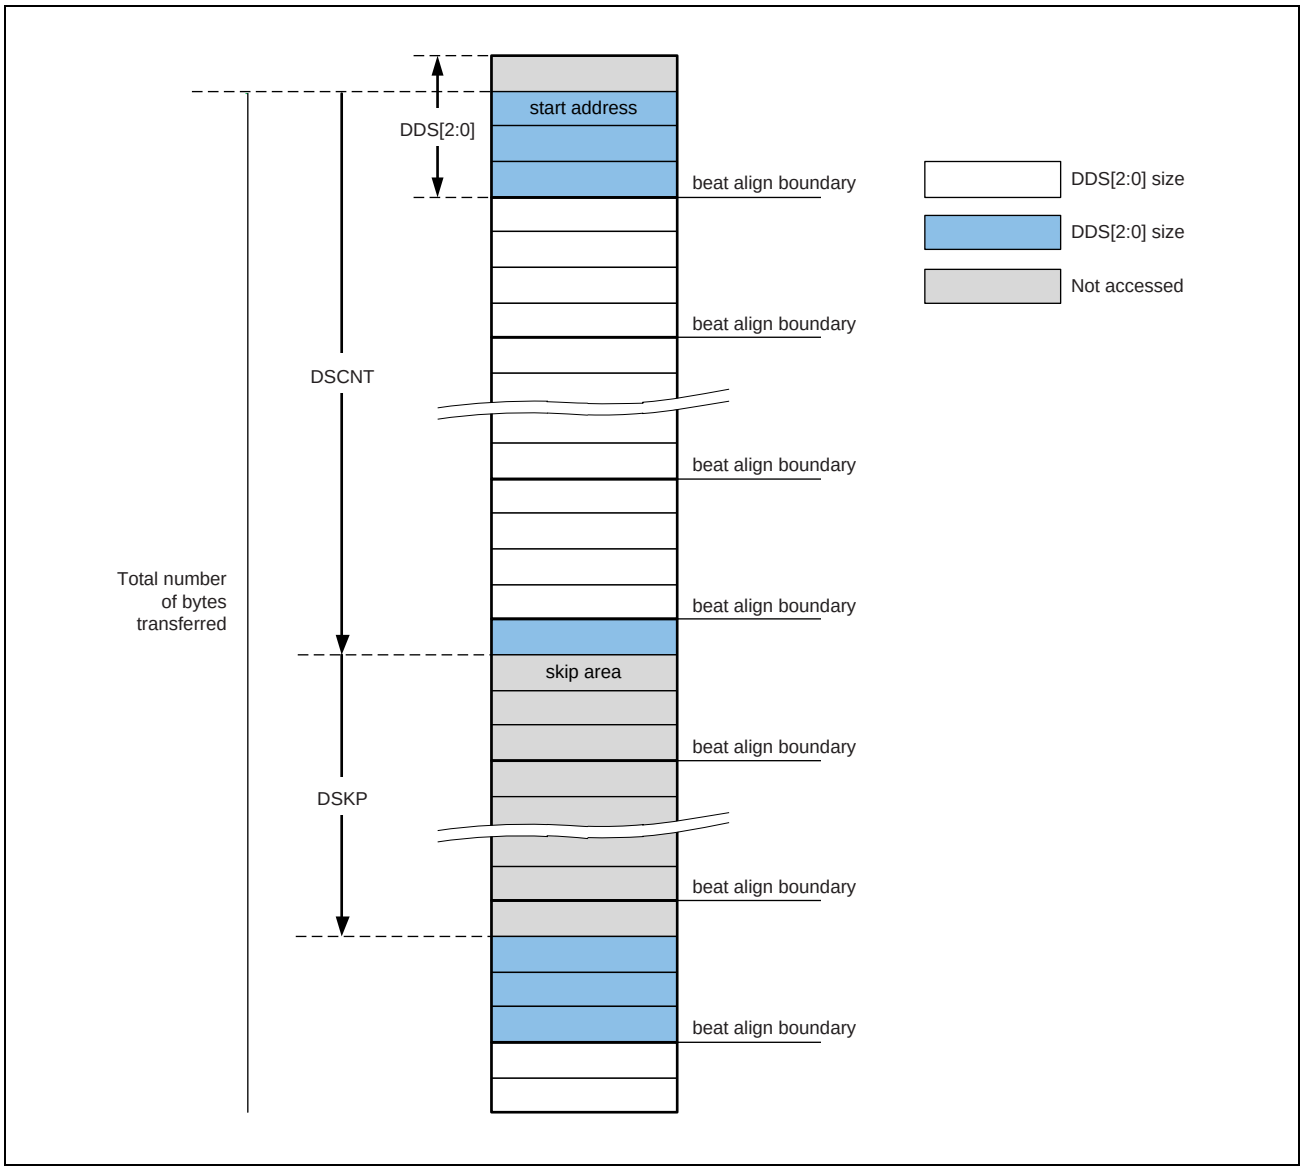

Figure 6.5B-32 Example of DMA Write Access Space and Access Types

The following shows the access types for the bus in the case of beat-aligned.

Table 6.5B-54 DMA Write Transfer Combination List

	AHB transfer		
	First transfer		
DDS[2:0]	Address	Data Size	Burst Type
0 (8 bits)	addr	8	SINGLE
1 (16 bits)	{addr[31:1], 0b}	16	SINGLE
2 (32 bits)	{addr[31:2], 00b}	32	SINGLE
4 (128 bits)	{addr[31:4], H'0}	32	INCR4
5 (256 bits)	{addr[31:5], H'00}	32	INCR8
6 (512 bits)	{addr[31:6], H'00}	32	INCR16

6.5B.9.14.2 DMA master descriptor combination list

(1) Read access

The following describes characteristics of a descriptor access.

- Accesses are performed for 8-word beat align space including the LINK address (the address indicated in the CRLA_n register). A beat unaligned transfer is not performed.
- The size and burst length set by INCR8 are used.
- The descriptor format (DSCFM) of the read header is analyzed, and then the descriptor data is set in an internal register.
- If the descriptor extends over the 8-word boundary, an additional read is performed on the succeeding eight words.

The following indicates the types of access to the bus.

Table 6.5B-55 Descriptor Read Transfer Combination List

Descriptor Format	Address	AHB Transfer					
		First Transfer			Second Transfer		
	addr[4:0]	Address	Size	Burst	Address	Size	Burst
4 words	H'00	{addr[31:4], 0000b}	32	INCR8			
	H'04						
	H'08						
	H'0C						
	H'10						
	H'14				{addr[31:4], 0000b} + H'20	32	INCR8
	H'18						
	H'1C						
8 words	H'00						
	H'04				{addr[31:4], 0000b} + H'20	32	INCR8
	H'08						
	H'0C						
	H'10						
	H'14						
	H'18						
	H'1C						

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

Use single transfer as the issuance type for writing data back to a descriptor. The following indicates the types of access to the bus.

Table 6.5B-56 Descriptor Write Transfer Combination List

Type	AHB transfer		
	Address	Size	Burst
Write-back in normal mode	{addr[31:2], 00b} + H'3	8	SINGLE
Write-back in the case of an error	{addr[31:2], 00b} + H'2	8	SINGLE

6.5B.9.15 Arbitration between DMACs

Arbitration between internal DMACs is performed in round-robin mode.

In round-robin mode, the highest priority is given to the DMAC whose DMAC number is the DMC number being used for transfer + 1. Immediately after a reset, DMAC0 has the highest priority.

Table 6.5B-57 Priority of a transfer request for DMACs that are performing transfer

	Next DMAC	
Current DMAC	DMAC0	DMAC1
DMAC0	2	1
DMAC1	1	2

Note: Priority: 1 (high), 2 (low)

6.5B.9.16 Notes

6.5B.9.16.1 Access

During read access, a beat align area is accessed by one transfer. Therefore, if beat unaligned is set, the beat align area including the specified area is accessed.

For example, if the Source Address is H’0000_1038 and SDS is 5 (256-bit), read starts from area H’0000_1020, not from address H’0000_1038. At this time, if the area from H’0000_1020 to H’0000_1037 contains a register whose value changes by read, the operation might be disrupted.

To prevent problems, use the beat align setting to access a register whose value changes by read access or access to an area adjacent to FIFO.

6.5B.9.16.2 Level Interrupt bit

This is a DMA interrupt output enable bit. Always set this bit to 1 irrespective of whether peripheral module interrupt USBFDMAmn (m, n = 0, 1) or USBFDMAERRm (m = 0, 1) is used.

To use peripheral module interrupt USBFDMAmn or USBFDMAERRm, set this bit to 1, and then set up the interrupt controller.

SECTION 6 HIGH-SPEED INTERFACE

6.6 PCI Express Interface (PCIe)

This section describes the functions of the PCI Express interface (PCIe).

NOTE

This LSI does not support CLKREQ# function.

Related descriptions of the CLKREQ# in this section should be ignored.

6.6.1 Overview

This module complies with PCI Express Base Specification 4.0 and supports up to 5.0 GT/s (Gen2).

It works as only a root complex and includes Type1 Configuration Register. It also has a built-in DMA controller function.

6.6.1.1 Features

■ **AXI Interface Specification**

Little endian is only supported.

- Master interface
  - 1 port
  - Bus width:128 bits
  - ID width: 4 bits (fixed value)
  - Interleave not supported
  - Burst type: Incremental (INCR 1 beat (MAxSIZE = 1/2/4 bytes), INCR 2 to 16 beats (MAxSIZE = 16 bytes))
  - Byte-lane transfer and narrow transfer (8 bits/16 bits/32 bits MAxLEN = only in 1beat) are supported. Unaligned transfer is not supported.
  - Allowable number of read/write requests: Variable (1 to 16)
  - Write interleave depth: 1
  - Protection (data/user/non-secure) can be set by using registers.
  - Access type: Normal only (exclusive or locked access not supported)

- Slave interface
  - 1 port
  - Bus width:128 bits
  - ID width: 20 bits
  - Burst type: Incremental (1 to 16 beats (SAxSIZE = 1/2/4/8/16 bytes))

- Support for byte-lane transfer (only when valid bytes are consecutive), unaligned transfer, and narrow transfer (1, 2, 4, 8 bytes)
- Number of read transactions which can be accepted: 1 to 8
- Number of write transactions which can be accepted: 1
- Read data reordering depth: 1 to 8
- Write interleave depth: 1
- Required memory area: 16 Kbytes or larger (variable)
- Protection is not distinguished (reception is possible)
- Access type: Normal only (exclusive or locked access not supported)
- Cache signals (ARCACHE/AWCACHE) are only supported for bufferable bits for writing.

- DMAC
  - DMA method: Register control, descriptor control
  - Number of channels: 8
  - Allowable number of requests to be issued (the maximum total number: 8. When DMAC-ch1 issues eight PCIe MRd/MW requests, other channels cannot issue requests)
  - Outstanding: 8

    PCIe MRd: Up to 8/ch PCIe MWr: 1/ch

    AXI Read: 1/ch AXI Write: 1/ch

■ PCI Express Specification (Compliant with the PCI Express Base Specification 4.0)

- PCI Express Gen1(2.5[GT/s])/Gen2(5.0[GT/s])
- Root Complex Applications, Type1 Configuration Register
- Lane implementation x1
- Support Polarity inversion
- Maximum data payload of 256 bytes, Maximum read request size 512 bytes
- Not support for Virtual channels (support VC0 only)
- Number of outstanding 1-8
- Dynamic control of speed/width up/down configuration
- Not support for Clock Power Management (not support P1.CPM, P2.CPM)
- Power Management (ASPM is supported; L1-Substate is not supported.)
- Error handling/logging (AER Support)
- Replay FIFO with ECC
- Internal Memory without Parity
- Number of Support Functions 1
- Supported reference clock architecture
  - Common and SRNS

6.6.1.2 External Pins

The following table shows the external pins of PCIe.

Table 6.6-1 External Pin List

Pin Name	Signal Name in This Section	Input/ Output	Functional Description
PCIE_RX_P	PCIE_RX_DP	Input	Serial data input (Positive)
PCIE_RX_N	PCIE_RX_DN	Input	Serial data input (Negative)
PCIE_TX_P	PCIE_TX_DP	Output	Serial data output (Positive)
PCIE_TX_N	PCIE_TX_DN	Output	Serial data output (Negative)
PCIE_REFCLK_P	PCIE_REFCLKP0	Input	Reference clock input (Positive) (Differential: 100 MHz ±300 ppm)*1
PCIE_REFCLK_N	PCIE_REFCLKN0	Input	Reference clock input (Negative) (Differential: 100 MHz ±300 ppm)*1
PCIE_RST_OUT#	PCI_RST_OUT#	Output	Reset output (Low active) When used as RC, this pin is connected to the PERST# pin of the endpoint (opposing device) and it is used when RC controls the initialization of the endpoint. When used as EP, this pin is unused and should be left open.

Note 1. A jitter of the reference clock input is defined by the PCI Express Card Electromechanical (CEM) Specification.
Tccjitter < 150 ps (Cycle to Cycle jitter)

6.6.1.3 Block Diagram

The following figure shows the block diagram of PCIe.

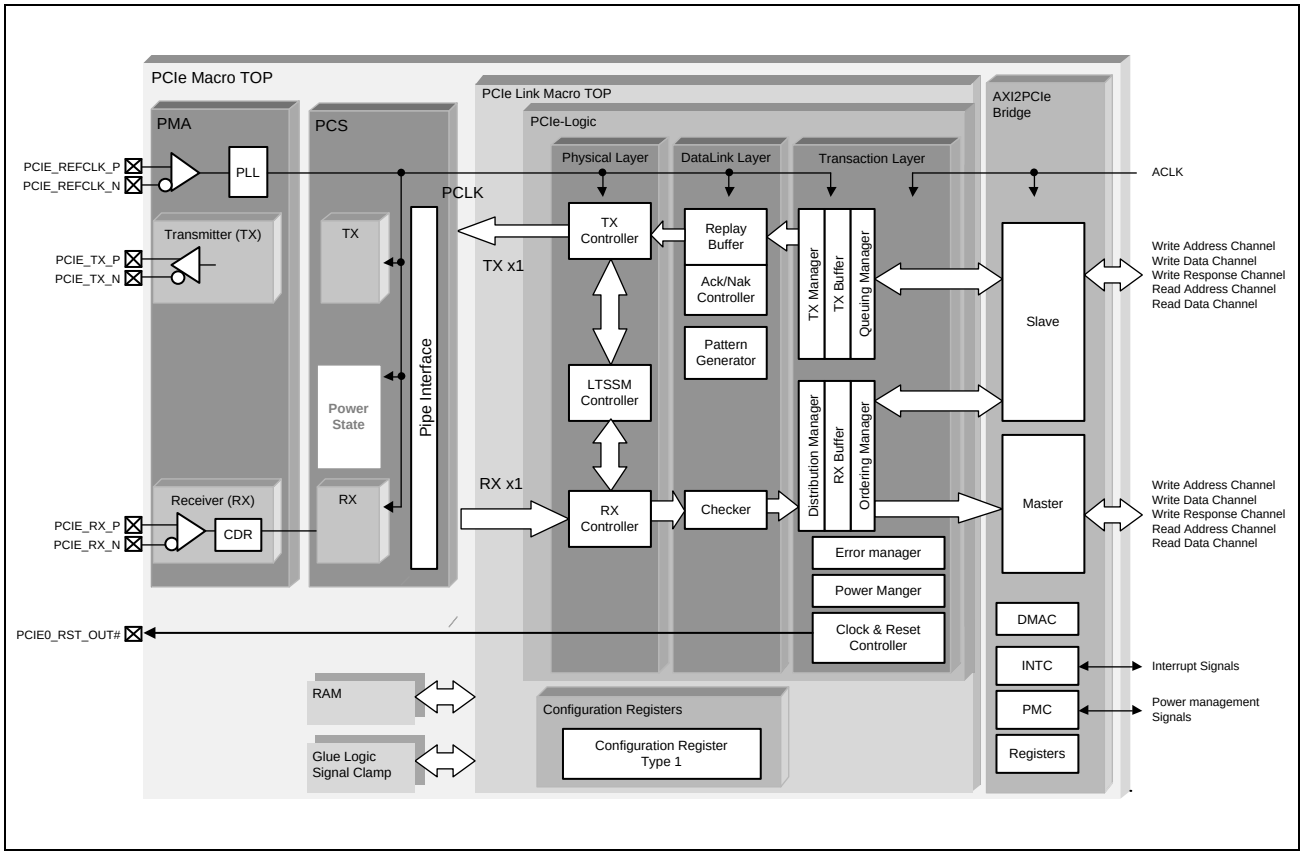

Figure 6.6-1 Block Diagram of PCIe

6.6.1.4 Reset

This module has the following reset signals.

These reset signals are controlled by the CPG_RST_PCI register. Refer to **4.4.4 Register Descriptions**.

Table 6.6-2 Reset Signals

Reset Signal	Description	CPG_RST_PCI Register	PCI_RESET Register
ARESETn	Reset for AXI2PCIe Bridge	Bit [0]: UNIT0_RSTB	—
RST_B	Reset for Data Link layer/Transaction layer	—	Bit [0]: RST_B
PCI_RST_OUT#	Reset for Endpoint device	—	Bit [6]: RST_OUT_B
RST_GP_B	Reset for Transaction layer (ACLK domain)	—	Bit [1]: RST_GP_B
RST_PS_B	Reset for Transaction layer (PCLK domain)	—	Bit [5]: RST_PS_B
RST_RSM_B	Reset for Physical layer	—	Bit [2]: RST_RSM_B
RST_CFG_B	Reset for Configuration register	—	Bit [3]: RST_CFG_B
RST_LOAD_B	Reset for Configuration register	—	Bit [4]: RST_LOAD_B

6.6.1.4.1 Reset Sequence for Power-On Reset

The following figure shows the reset sequence for power on reset.

ARESETn, RST_CFG_B and RST_LOAD_B signals should be de-asserted more than 1[ms] later after SYS_RST# is de-asserted.

RST_B, RDT_PS_B, RST_GP_B and RST_RSM_B signals should be de-asserted after loading values into the Configuration Register.

If loading values into the Configuration Register are not needed, all reset signals (ARESETn, RST_CFG_B, RST_LOAD_B RST_B, RDT_PS_B, RST_GP_B and RST_RSM_B) can be de-asserted at the same timing.

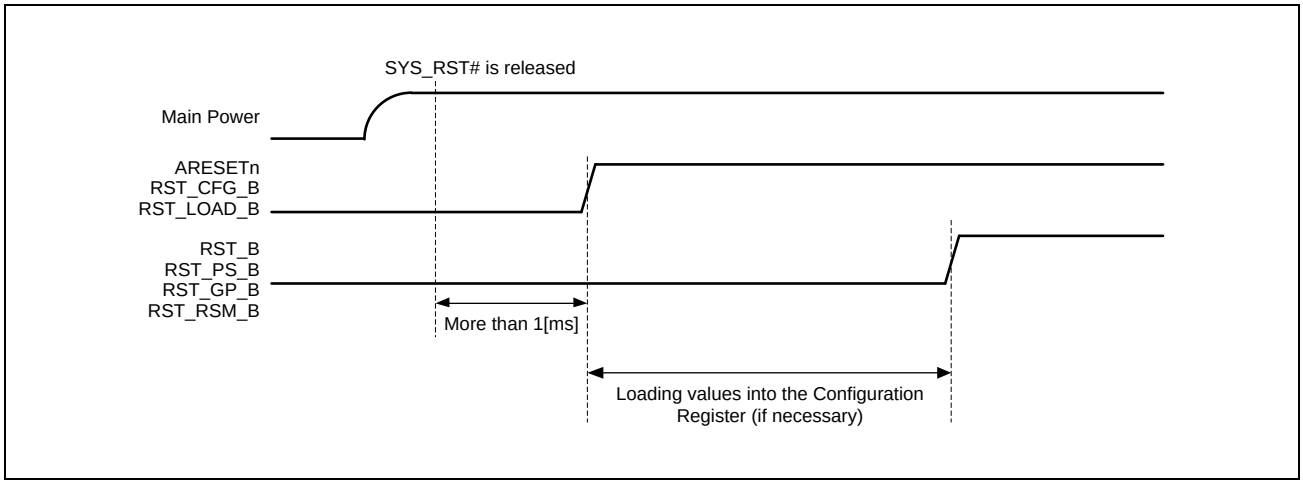

Figure 6.6-2 Reset Sequence for Power-On Reset

6.6.2 Register Configuration

6.6.2.1 Register Type

Table 6.6-3 Register Type

Register Attribute	Description
HwInit	Hardware Initialized*1
R	Read-only This register can only be read.
R/W	Read-Write This register can be read/written.
R/W1C	Write-1-to-clear status It can be cleared to 0b by writing 1b with a readable register. Writing 0b does not change anything.
RS	Sticky - Read-only Read-only registers that are reset with Resume Reset.*2
R/WS	Sticky - Read-Write A read-write register that is reset with Resume Reset.*2
R/W1CS	Sticky - Write-1-to-clear status Readable registers can be cleared to 0b by writing 1b. In addition, Resume reset indicates that this is a register that will be reset.*2

Note 1. HwInit attribute register.
Some registers with the RO attribute stated in the PCI Express Base Specification are writable at the time of initialization. When writing to these registers, CFG_HWINIT_EN (Permission Register (offset: H'300) bit[2]) must be set to 1b.

Note 2. The results of access to reserved bit areas, debug bit areas, and undefined areas are not guaranteed. The combination of reserved, debug, and undefined areas includes cases where the initial values will be non-zero, and the results of changes to such values are not guaranteed.

6.6.2.2 Register List

The base address of PCIe is as follows.

Base Address: H'0_11E4_0000 (Cortex-A55 Address Space)
Base Address: H'51E4_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'41E4_0000 (Cortex-M33 Address Space Secure)

The following is a summary classification of the register space in PCIe.

Table 6.6-4 Register Space

Register	Address Range
AXI Bridge Registers	H'0000 to H'1FFC
PHY Setting Registers	H'2000 to H'5FFC
PCI Express Configuration Registers (Type1)	H'6000 to H'6FFC
Reserved	H'7000 to H'7FFC

Note: The reserved space that corresponds to the above is not accessible.

6.6.2.2.1 AXI Bridge Registers

Table 6.6-5 AXI Bridge Registers (1/6)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
Reserved H'00 to H'7C					
Reserved	—	—	—	H'00 to H'7C	—
Request Issuing H'80 to H'FC					
Request Data Register 0	PCI_REQDATA0	R/W	H'xxxx_xxxx	H'80	32, 16, 8
Request Data Register 1	PCI_REQDATA1	R/W	H'xxxx_xxxx	H'84	32, 16, 8
Request Data Register 2	PCI_REQDATA2	R/W	H'xxxx_xxxx	H'88	32, 16, 8
Request Receive Data Registers	PCI_REQRCVDAT	R	H'xxxx_xxxx	H'8C	32, 16, 8
Request Address Registers 1	PCI_REQADR1	R/W	H'xxxx_xxxx	H'90	32, 16, 8
Request Address Registers 2	PCI_REQADR2	R/W	H'xxxx_xxxx	H'94	32, 16, 8
Request Byte Enable Registers	PCI_REQBE	R/W*1	H'0000_000F	H'98	32, 16, 8
Request Issue Registers	PCI_REQISS	R/W*1	H'0000_0000	H'9C	32, 16, 8
Reserved	—	—	—	H'A0 to FC	—
PCI Interruption H'100 to H'11C					
MSI Receive Window Address (Lower) Registers	PCI_MSIRCVWADRL	R/W*1	H'0000_0000	H'100	32, 16, 8
MSI Receive Window Address (Upper) Registers	PCI_MSIRCVWADRU	R/W	H'0000_0000	H'104	32, 16, 8
MSI Receive Window Mask (Lower) Registers	PCI_MSIRCVWMSKL	R/W*1	H'0000_0003	H'108	32, 16, 8
MSI Receive Window Mask (Upper) Registers	PCI_MSIRCVWMSKU	R/W	H'0000_0000	H'10C	32, 16, 8
PCI INTx Receive Interrupt Enable Registers	PCI_PINTRCVIE	R/W*1	H'0000_0000	H'110	32, 16, 8
PCI INTx Receive Interrupt Status Registers	PCI_PINTRCVIS	R/W1C*1	H'0000_0000	H'114	32, 16, 8
Reserved	—	—	—	H'118 to 11C	—
Message Interruption H'120 to H'13C					
Message Receive Interrupt Enable Registers	PCI_MSGRCVIE	R/W*1	H'0000_0000	H'120	32, 16, 8
Message Receive Interrupt Status Registers	PCI_MSGRCVIS	R/W1C*1	H'0000_0000	H'124	32, 16, 8
Reserved	—	—	—	H'128 to 12C	—
Message Code Registers	PCI_MSGCODE	R	H'0000_0000	H'130	32, 16, 8

PCIe Event Interrupt Status 1 Registers	PCI_PEIS1	R/W1C*1	H'0000_0000	H'20C	32, 16, 8
AXI Master Error Interrupt Enable Registers	PCI_AMEIE	R/W*1	H'0000_0000	H'210	32, 16, 8
AXI Master Error Interrupt Status Registers	PCI_AMEIS	R/W1C*1	H'0000_0000	H'214	32, 16, 8
Reserved	—	—	—	H'218 to 21C	—
AXI Slave Error Interrupt Enable 1 Registers	PCI_ASEIE1	R/W*1	H'0000_0000	H'220	32, 16, 8
AXI Slave Error Interrupt Status 1 Registers	PCI_ASEIS1	R/W1C*1	H'0000_0000	H'224	32, 16, 8
Reserved	—	—	—	H'228 to 22C	—
AXI Slave Error Interrupt Status 3 Registers	PCI_ASEIS3	R	H'0000_0000	H'230	32, 16, 8

Table 6.6-5 AXI Bridge Registers (2/6)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
Reserved	—	—	—	H'234 to 2FC	—
Macro Control H'300 to H'7FC					
Permission Registers	PCI_PERM	R/W*1	H'0000_0000	H'300	32, 16, 8
Reserved	—	—	—	H'304 to 30C	—
Reset Register	PCI_RESET	R/W*1	H'0000_00xx	H'310	32, 16, 8
Mode Set 0 Registers	PCI_MSET0	R/W*1	H'2001_2000	H'314	32, 16, 8
Mode Set 1 Registers	PCI_MSET1	R/W*1	H'0000_33F2	H'318	32, 16, 8
Reserved	—	—	—	H'31C to 37C	—
Mode Set 3 Registers	PCI_MSET3	R/W*1	H'0000_0000	H'380	32, 16, 8
Reserved	—	—	—	H'384 to 3FC	—
PCIe Core Mode Set 1 Registers	PCI_PCMSET1	R/W*1	H'07D0_00F2	H'400	32, 16, 8
PCIe Core Control 1 Registers	PCI_PCCTRL1	R/W*1	H'0000_0000	H'404	32, 16, 8
PCIe Core Status 1 Registers	PCI_PCSTAT1	R	H'000x_xxxx	H'408	32, 16, 8
Reserved	—	—	—	H'40C	—
PCIe Core Control 2 Registers	PCI_PCCTRL2	R/W*1	H'003E_0000	H'410	32, 16, 8
PCIe Core Status 2 Registers	PCI_PCSTAT2	R	H'xxxx_xxxx	H'414	32, 16, 8
Reserved	—	—	—	H'418 to 428	—
PCIe Core Status 5 Registers	PCI_PCSTAT5	R	H'0000_0x00	H'42C	32, 16, 8
Reserved	—	—	—	H'430 to 46C	—
LTR Reported value Registers	PCI_LTRRV	R	H'0000_0000	H'470	32, 16, 8
Reserved	—	—	—	H'474 to 4CC	—
DMA Interrupt Vector 0 Registers	PCI_DMAINTVEC0	R/W*1	H'0000_0000	H'4D0	32, 16, 8
DMA Interrupt Vector 1 Registers	PCI_DMAINTVEC1	R/W*1	H'0000_0000	H'4D4	32, 16, 8
Reserved	—	—	—	H'4D8 to 5FC	—
Message Interruption2 H'600 to H'60C					
MSI receive Enable 0 Registers	PCI_MSIRE0	R/W*1	H'0000_0000	H'600	32, 16, 8
MSI receive Message Data 0 Registers	PCI_MSIRMD0	R/W*1	H'0000_0000	H'604	32, 16, 8
MSI receive Mask 0 Registers	PCI_MSIRM0	R/W	H'FFFF_FFFF	H'608	32, 16, 8
MSI receive Status 0 Registers	PCI_MSIRS0	R/W1C	H'0000_0000	H'60C	32, 16, 8
Reserved	—	—	—	H'610 to 7FC	—
DMAC Registers H'800 to H'FFC					
Common Control H'800 to H'8FC					
DMA Control Registers	PCI_DMACTRL	R/W*1	H'0000_0000	H'800	32, 16, 8
Reserved	—	—	—	H'804	—
DMA Interrupt Enable Registers	PCI_DMAINTE	R/W	H'0000_0000	H'808	32, 16, 8
DMA Interrupt Status Registers	PCI_DMAINTS	R/W1C	H'0000_0000	H'80C	32, 16, 8
Reserved	—	—	—	H'810 to 8FC	—
Channel Control H'900 to H'91C*2					
DMA Channel Control Registers	PCI_DMACHCTL	R/W*1	H'0000_0000	H'900	32, 16, 8
Reserved	—	—	—	H'904	—
Descriptor Start Address (Lower) Registers	PCI_DESSAL	R/W*1	H'0000_0000	H'908	32, 16, 8
Descriptor Start Address (Upper) Registers	PCI_DESSAU	R/W	H'0000_0000	H'90C	32, 16, 8
QUE Entry Registers	PCI_QUEE	R/W*1	H'0000_0000	H'910	32, 16, 8
Reserved	—	—	—	H'914 to 91C	—

Table 6.6-5 AXI Bridge Registers (3/6)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
DMA Setting H'920 to H'94C*2					
DMA Descriptor Control (Descriptor H'00)	PCI_DMADPCTL	R	H'0000_0000	H'920	32, 16, 8
DMA Transaction Control (Descriptor H'04)	PCI_DMATRCTL	R/W*1	H'0000_0000	H'924	32, 16, 8
DMA Size (Descriptor H'08)	PCI_DMASIZE	R/W*1	H'0000_0000	H'928	32, 16, 8
Reserved	—	—	—	H'92C	—
DMA Source Lower Address (Descriptor H'10)	PCI_DMAPCIEUA	R/W*1	H'0000_0000	H'930	32, 16, 8
DMA Source Upper Address (Descriptor H'14)	PCI_DMATCTL	R/W	H'0000_0000	H'934	32, 16, 8
DMA Destination Lower Address (Descriptor H'18)	PCI_DMADLA	R/W*1	H'0000_0000	H'938	32, 16, 8
DMA Destination Upper Address (Descriptor H'1C)	PCI_DMADUA	R/W	H'0000_0000	H'93C	32, 16, 8
DMA Descriptor Lower Link Pointer (Descriptor H'20)	PCI_DMADLLP	R	H'0000_0000	H'940	32, 16, 8
DMA Descriptor Upper Link Pointer (Descriptor H'24)	PCI_DMADULP	R	H'0000_0000	H'944	32, 16, 8
Reserved	—	—	—	H'948 to 94C	—
DMA Status H'950 to H'97C*2					
DMA Rest Size Registers	PCI_DMARESTSIZ	R	H'0000_0000	H'950	32, 16, 8
Reserved	—	—	—	H'954 to 95C	—
AXI Request Address (Lower) Registers	PCI_AXIREQAL	R	H'0000_0000	H'960	32, 16, 8
AXI Request Address (Upper) Registers	PCI_AXIREQAU	R	H'0000_0000	H'964	32, 16, 8
PCIe Request Address (Lower) Registers	PCI_PCIREQAL	R	H'0000_0000	H'968	32, 16, 8
PCIe Request Address (Upper) Registers	PCI_PCIREQAU	R	H'0000_0000	H'96C	32, 16, 8
QUE Status Registers	PCI_QUESTA	R	H'0000_0000	H'970	32, 16, 8
Reserved	—	—	—	H'974	—

PCIe Window Base 7 (Upper) Registers	PCI_PWBASE7U	R/W	H'0000_0000	H'11E4	32, 16, 8
PCIe Window Mask 7 (Lower) Registers	PCI_PWMASK7L	R/W*1	H'0000_0FFF	H'11E8	32, 16, 8
PCIe Window Mask 7 (Upper) Registers	PCI_PWMASK7U	R/W*1	H'0000_0000	H'11EC	32, 16, 8
PCIe Destination 7 (Lower) Registers	PCI_PDEST7L	R/W*1	H'0000_0000	H'11F0	32, 16, 8

Table 6.6-5 AXI Bridge Registers (6/6)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
PCIe Destination 7 (Upper) Registers	PCI_PDEST7U	R/W	H'0000_0000	H'11F4	32, 16, 8
Reserved	—	—	—	H'11F8 to 1FFC	—

Note: Reserved: Reserved registers. The results of access to these registers and operation of the core through such access are not guaranteed.

Note 1. Depending on the field, Read Only bit exists.

Note 2. The addresses listed in the above table are those for channel 0. These addresses should be read as the addresses for the other DMAC channels according to the table below.

Channel Offset Address	
offset + H'000	Channel 0
offset + H'080	Channel 1
offset + H'100	Channel 2
offset + H'180	Channel 3
offset + H'200	Channel 4
offset + H'280	Channel 5
offset + H'300	Channel 6
offset + H'380	Channel 7

[Example]

Channel 0: DMA Descriptor Control Register (offset: H'920 = H'920 + H'000)
Channel 1: DMA Descriptor Control Register (offset: H'9A0 = H'920 + H'080)
Channel 2: DMA Descriptor Control Register (offset: H'A20 = H'920 + H'100)
Channel 3: DMA Descriptor Control Register (offset: H'AA0 = H'920 + H'180)
Channel 4: DMA Descriptor Control Register (offset: H'B20 = H'920 + H'200)
Channel 5: DMA Descriptor Control Register (offset: H'BA0 = H'920 + H'280)
Channel 6: DMA Descriptor Control Register (offset: H'C20 = H'920 + H'300)
Channel 7: DMA Descriptor Control Register (offset: H'CA0 = H'920 + H'380)

6.6.2.2.2 PCI Express Configuration Registers (Type1)

Table 6.6-6 PCI Express Configuration Registers (1/2)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
Common Configuration Space					
Vendor and Device ID	PCI_CFG_VID	HwInit	H'0033_1912	H'6000	32, 16, 8
Command and Status	PCI_CFG_COM_STA	R/W*2	H'0010_0000	H'6004	32, 16, 8
Revision ID and Class Code	PCI_CFG_RID_CC	HwInit	H'0604_0000	H'6008	32, 16, 8
Cache Line and Header Type	PCI_CFG_CL_HT	R/W*1	H'0001_0000	H'600C	32, 16, 8
Configuration Space					
Base Address Register 0	PCI_CFG_BAR0	R/W*3	H'0000_0004	H'6010	32, 16, 8
Base Address Register 1	PCI_CFG_BAR1	R/W	H'0000_0000	H'6014	32, 16, 8
Bus Number Register	PCI_CFG_BNR	R/W*1	H'0000_0000	H'6018	32, 16, 8
I/O Base/Limit and Secondary Status	PCI_CFG_IOBL_SS	R/W*2	H'0000_0000	H'601C	32, 16, 8
Memory Base/Limit Register	PCI_CFG_MEMBL	R/W*1	H'FFF0_FFF0	H'6020	32, 16, 8
Prefetchable Memory Base/Limit Register	PCI_CFG_PMBL	R/W*1	H'0001_0001	H'6024	32, 16, 8
Prefetchable Base Upper 32bits Register	PCI_CFG_PBUP32	R/W	H'0000_0000	H'6028	32, 16, 8
Prefetchable Limit Upper 32bits Register	PCI_CFG_PLUP32	R/W	H'0000_0000	H'602C	32, 16, 8
I/O Base/Limit Upper 16-Bit Register	PCI_CFG_IOBLUP16	R/W	H'0000_0000	H'6030	32, 16, 8
Capability Pointer	PCI_CFG_CP	HwInit*1	H'0000_0040	H'6034	32, 16, 8
Reserved	—	—	—	H'6038	—
Bridge Control and Interrupt	PCI_CFG_BC_INT	R/W*3	H'0000_0000	H'603C	32, 16, 8
PCI Power Management Capability Structure					
PM Capabilities	PCI_CFG_PMC	HwInit*1	H'4803_6001	H'6040	32, 16, 8

L1 PM Substates Control 1 Register	PCI_CFG_L1PMSCTRL1	R/W*1	H'0000_0000	H'6168	32, 16, 8
L1 PM Substates Control 2 Register	PCI_CFG_L1PMSCTRL2	R/W*1	H'0000_0028	H'616C	32, 16, 8
Reserved	—	—	—	H'6170 to H'6FFC	—

Note 1. Depending on the field, Read Only bit exists.

Note 2. Depending on the field, R, R/W1C bit exists.

Note 3. Depending on the field, R, HwInit bit exists.

Note 4. Depending on the field, R, R/W1C, HwInit bit exists.

Note 5. Depending on the field, R/W1C bit exists.

Note 6. Recommended to write All “1b” at initial setting.

Note 7. Depending on the field, RS (Sticky - Read - Only) bit exists.

Note 8. Depending on the field, R/WS (Sticky - Read - Write) bit exists.

Note 9. “Specific Registers” refers to registers specific to this LSI.

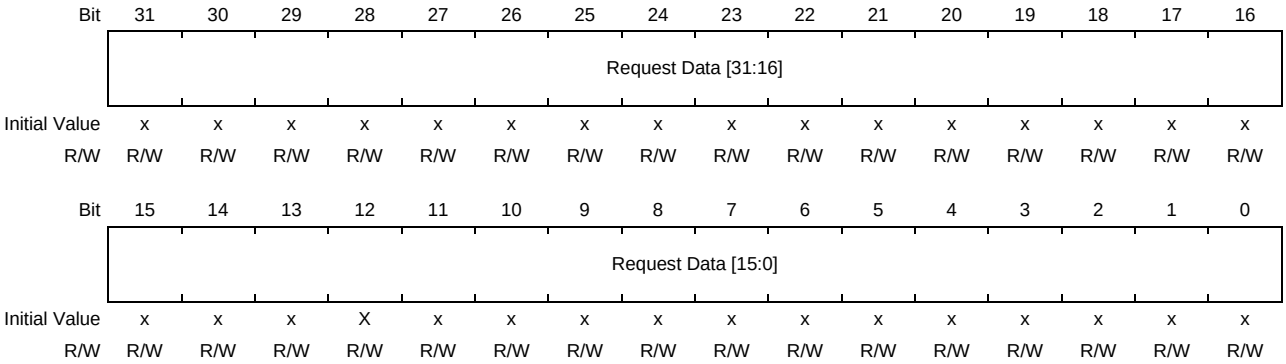
6.6.2.2.3 PHY Setting Registers

The following is a list of physical layer control registers.

When these registers are accessed for writing, PIPE_PHY_REG_EN (permission register (offset: 300h) bit[1]) must be set to 1b before a write access is made. In addition, rewrite the registers while the PCIe logic and PHY resets (other than ARESETn, RST_CFG_B, and RST_LOAD_B) are asserted.

Table 6.6-7 PHY Setting Registers

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size (bits)
XCFGD Setting Register n (n = 0 to 38)	PCI_PHY_XCFGDn	R/W	H'xxxx_xxxx	H'2000 + (H'10 × n)	32
Reserved	—	—	—	H'2270 to H'23FF	—
XCFGA CMN Setting Register n (n = 0 to 15)	PCI_PHY_XCFGA_CMNn	R/W	H'xxxx_xxxx	H'2400 + (H'10 × n)	32
XCFGA RX Setting Register n (n = 0 to 12)	PCI_PHY_XCFGA_RXn	R/W	H'xxxx_xxxx	H'2500 + (H'10 × n)	32
XCFGA TX Setting Register	PCI_PHY_XCFGA_TX	R/W	H'xxxx_xxxx	H'25D0	32
Reserved	—	—	—	H'25E0 to H'2A1F	—
XCFG Control Register	PCI_PHY_XCFG_CONT	R/W	H'0000_0000	H'2A20	32
Reserved	—	—	—	H'2A30 to H'5FFF	—



6.6.3 Register Description

6.6.3.1 AXI Bridge Register

The function of each register is described below. Register can only be accessed on the AXI bus.

6.6.3.1.1 Request Data Registers (Offset: H'80/ H'84/ H'88)

This register issues various Requests to PCIe.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Data	All x	R/W	Set Write Data when issuing a Request.

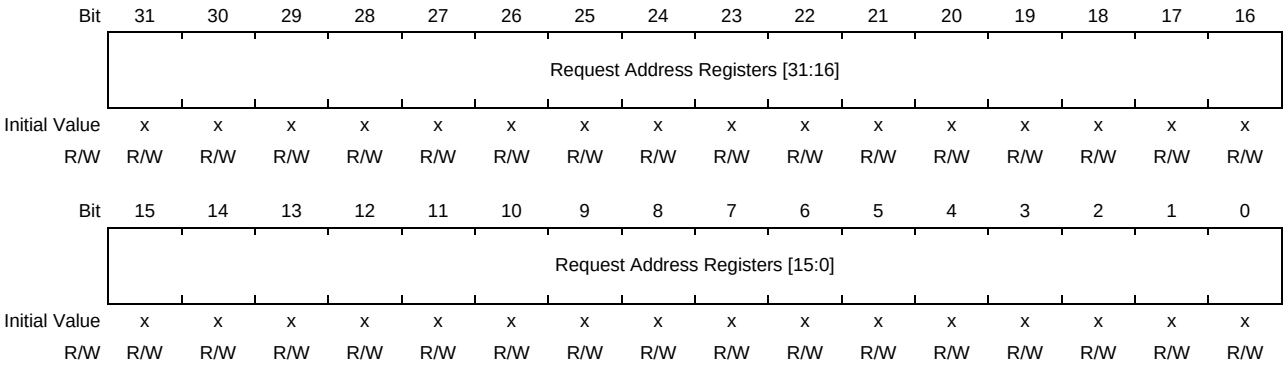
Table 6.6-8 Request Data Register 0, 1, 2

	Request Data Register 0 (Offset: H'80)	Request Data Register 1 (Offset: H'84)	Request Data Register 2 (Offset: H'88)
Zero-Length Read Request	Invalid	Invalid	Invalid
Configuration Write Type 0/1	Invalid	Invalid	Write Data
Configuration Read Type 0/1	Invalid	Invalid	Invalid
Message Request	3rd Header	4th Header	Invalid
Message Request with data payload	3rd Header	4th Header	Message Data

Note: The bits should be set to 0 for the requests indicated as "Invalid".

6.6.3.1.2 Request Receive Data Registers (Offset: H'8C)

This register is set to read data when Completion is received after a Read Request is issued.



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Request Receive Data [31:16]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Request Receive Data [15:0]															
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Receive Data	All x	R	Read data at Completion reception after Read Request issuance is set. However, it is invalid for Zero-Length Read and various write requests.

6.6.3.1.3 Request Address Registers 1 (Offset: H'90)

This register issues a Request to PCIe.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Address Registers	All x	R/W	Set Address when issuing a Request.

Table 6.6-9 Bit 31 - Bit 16 of Request Address Registers 1

Request Address Registers 1	[31:27]	[26:24]	[23:19]	[18:16]
Zero-Length Read Request	Address			
Configuration Read Type 0/1	Bus Number		Device Number	Function Number
Configuration Write Type 0/1	Bus Number		Device Number	Function Number
Message Request	Reserved	Routing Type	Reserved	Reserved
Message Request with data payload	Reserved	Routing Type	Reserved	Reserved

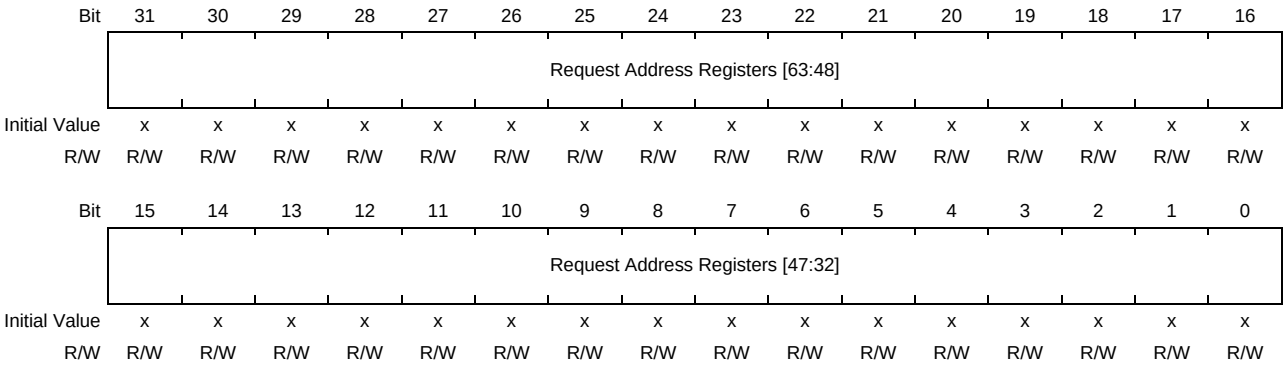


Table 6.6-10 Bit 15 - Bit 0 of Request Address Registers 1

Request Address Registers 1	[15:12]	[11:8]	[7:2]	[1:0]
Zero-Length Read Request	Address			Reserved
Configuration Read Type 0/1	Reserved	Ext. Reg. Number	Register Number	Reserved
Configuration Write Type 0/1	Reserved	Ext. Reg. Number	Register Number	Reserved
Message Request	Reserved	Reserved	Message Code	
Message Request with data payload	Reserved	Reserved	Message Code	

Note: The bits should be set to 0 for the requests indicated as "Reserved".

6.6.3.1.4 Request Address Registers 2 (Offset: H'94)

This register issues various Requests to PCIe.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Request Address Registers	All x	R/W	Set Address when issuing a Request.

Table 6.6-11 Request Address Registers 2

Request Address Registers 2	[31:0]
Zero-Length Read Request	Address
Configuration Read Type 0/1	Invalid
Configuration Write Type 0/1	Invalid
Message Request	Invalid
Message Request with data payload	invalid

Note: The bits should be set to 0 for the requests indicated as "Invalid".

6.6.3.1.5 Request Byte Enable Registers (Offset: H'98)

This register specifies First Byte (1st DW Byte) Enable in the TLP Header when issuing a Request to PCIe.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	Request Byte Enable			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	Request Byte Enable	1111b	R/W	If necessary, specify Byte Enable when issuing a Cfg Request. Normally, use 1111b. 0: Byte Enable invalid 1: Byte Enable valid

Table 6.6-12 Bit 3 - Bit 0 of Request Byte Enable Registers

Request Byte Enable Registers	[3:0]
Zero-Length Read Request	0000b
Configuration Read Type 0/1	Optional (Usually 1111b)
Configuration Write Type 0/1	Optional (Usually 1111b)
Message Request	Invalid (1111b)
Message Request with data payload	Invalid (1111b)

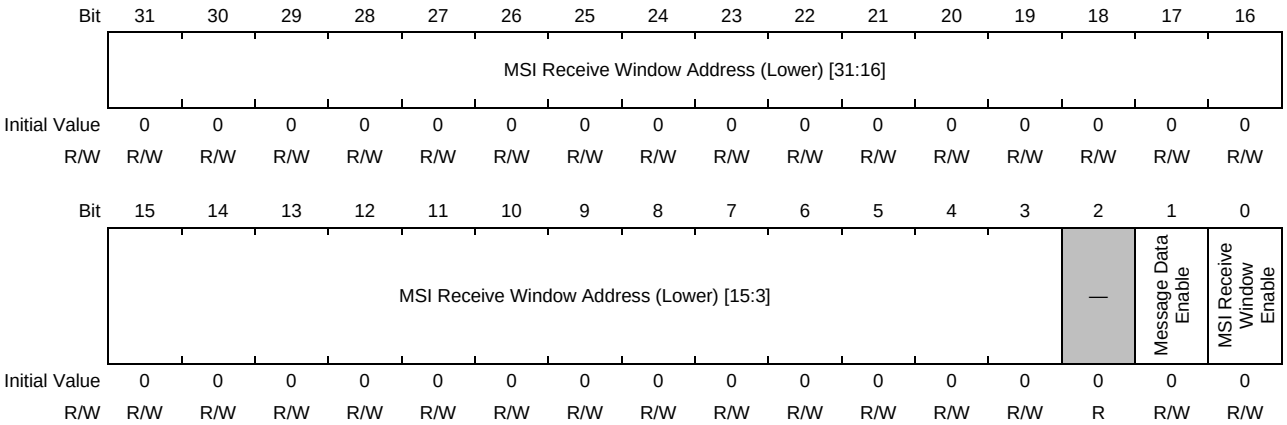
6.6.3.1.6 Request Issue Registers (Offset: H'9C)

This register issues a Request to PCIe.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	Request Rejection	MOR CD PERR	MOR CH PERR	MOR EP ERR	MOR_STATUS		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	FUNC			TR Type				—	—	—	—	—	—	—	Request Issue
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	Request Rejection	0b	R	PCI Express indicates that a stop or hibernation was detected on the sending (TX side) and processing was killed. 0: Normal state (Issue Request) 1: Forced termination (Rejection)
21	MOR CD PERR	0b	R	1 is set when a data error occurs in Completion TLP for a Non-Posted Request issued in this register. Usually do not use it. It is not updated during Posted Requests.
20	MOR CH PERR	0b	R	This is set if a header error occurs in the Completion TLP for a Non-Posted Request issued in this register. Usually do not use it. It is not updated during Posted Requests.
19	MOR EP ERR	0b	R	1 is set when the Poisoned Completion TLP for the Non-Posted Request issued in this register is received. Usually do not use it. It is not updated during Posted Requests.
18 to 16	MOR_STATUS	000b	R	Holds the MOR Status of the Completion TLP for Non-Posted Requests issued in this register. It is not updated during Posted Requests. 000b: Successful Completion (SC) 001b: Unsupported Request (UR) 010b: Configuration Request Retry Status (CRS) (Not Support) 011b: Completion Timeout 100b: Completer Abort (CA) 101b: Unexpected Completion and mismatched type (LockCompletion respond to non-Lock Request) 110b: Reserved 111b: Overrun Completion length
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 12	FUNC	000b	R/W	Set the Function of Request.
11 to 8	TR Type	0000b	R/W	Set the Type of Request.
7 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

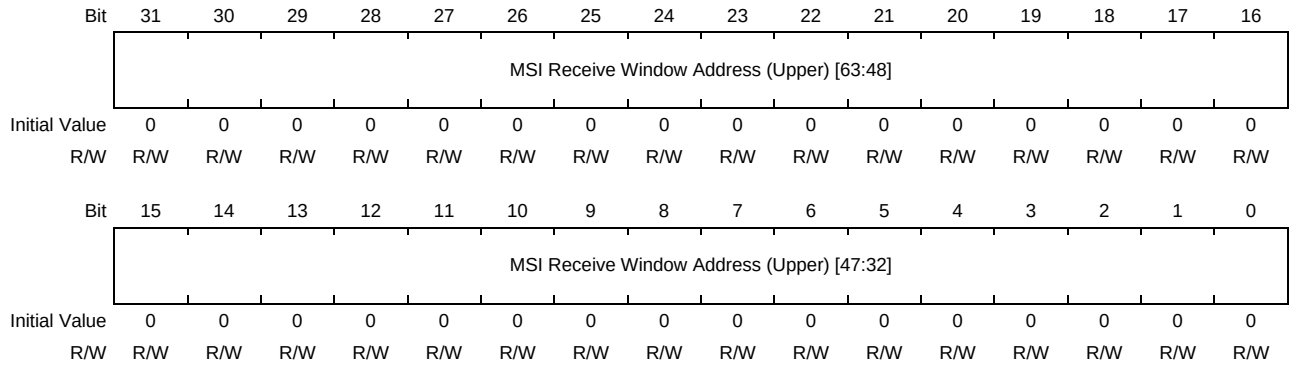


Bit	Bit Name	Initial Value	R/W	Description
0	Request Issue	0b	R/W	[Write] 1: Request 0: No Operation [Read] 1: Processing Request (Indicates that the issued Request is being processed.) 0: Request can be issued and accepted (This indicates that the issued Request has been processed.)

Table 6.6-13 TR Type of Request Byte Enable Registers

Request Byte Enable Registers	TR Type [11:8]	Posted/Non-Posted	Root Complex
Zero-Length Read Request	0000b (H'0)	Non-Posted	Issuable
Configuration Read Type 0	0100b (H'4)	Non-Posted	Issuable
Configuration Write Type 0	0101b (H'5)	Non-Posted	Issuable
Configuration Read Type 1	0110b (H'6)	Non-Posted	Issuable
Configuration Write Type 1	0111b (H'7)	Non-Posted	Issuable
Message Request	1000b (H'8)	Posted	Issuable
Message Request with data payload	1001b (H'9)	Posted	Issuable
—	Others	—	Issuing prohibited

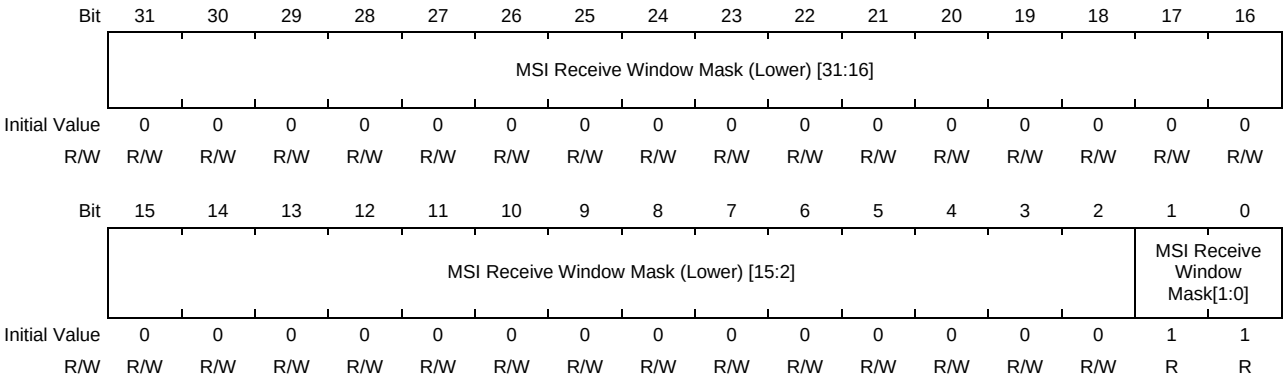
6.6.3.1.7 MSI Receive Window Address (Lower) Registers (Offset: H'100)



This register sets the start address in the Memory space of the receiving MSI.

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	MSI Receive Window Address (Lower) [31:3]	All 0	R/W	Set the MSI receiving window's Start Address [31:3]. However, they must be aligned to the size set by the MSI Receive Window Mask. Even if an unaligned Address is set, the Address Bit set with the MSI Receive Window Mask will be 0. *Note*: To change this register, make sure that MSI Receive Window Enable is set to 0b.
2	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	Message Data Enable	0b	R/W	Controls whether Message Data is used in MSI reception decisions. 0: Unused (conventional mode) 1: Used (multiple interrupts) The MSI reception judgment result selected in this register is reflected in the INTMSI_RC terminal.
0	MSI Receive Window Enable	0b	R/W	Enable setting for the MSI Receive Window. 0: Window is disabled 1: Window is enabled

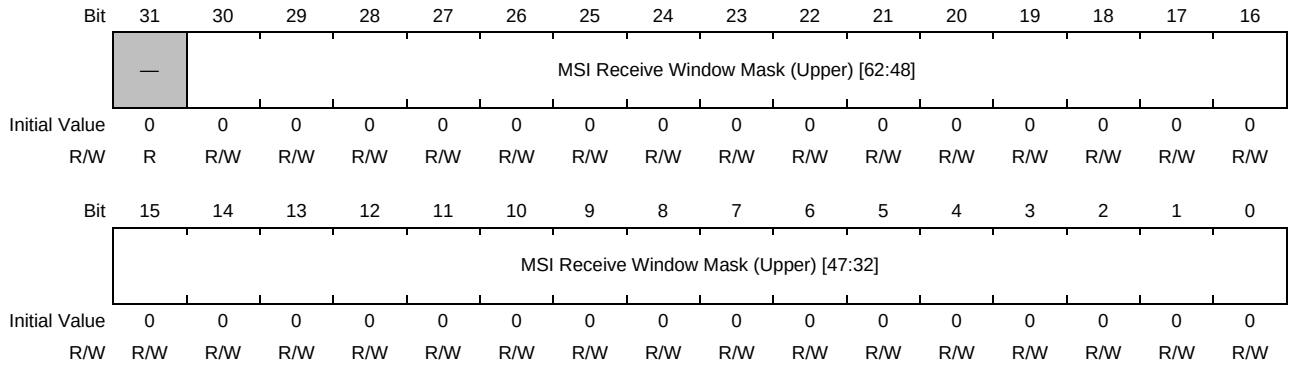
6.6.3.1.8 MSI Receive Window Address (Upper) Registers (Offset: H'104)



This register sets the start address in the Memory space of the receiving MSI.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSI Receive Window Address (Upper) [63:32]	All 0	R/W	Set the MSI receiving window's Start Address [31:3]. However, they must be aligned to the size set by the MSI Receive Window Mask. Even if an unaligned Address is set, the Address Bit set with the MSI Receive Window Mask will be 0. *Note*: To change this register, make sure that MSI Receive Window Enable is set to 0b.

6.6.3.1.9 MSI Receive Window Mask Registers (Lower) (Offset: H'108)



This register shows the size of the area from the address set by the MSI Receive Window Address.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	MSI Receive Window Mask (Lower) [31:2]	All 0	R/W	Set the lower bit of the reserved area to "1". (Min4byte, Max4Gbyte free space) The following is a sample configuration. H'0000_0000: 4 bytes free space H'0000_0001: 8 bytes free space H'0000_007F: 512 bytes free space *Note*: To change this register, make sure that MSI Receive Window Enable is set to 0b.
1 ,0	MSI Receive Window Mask [1:0]	11b	R	11b fixed. *Note*: MSI Receive Window Mask [1:0] should always be set to Mask.

6.6.3.1.10 MSI Receive Window Mask Registers (Upper) (Offset: H'10C)

This register shows the size of the area from the address set by the MSI Receive Window Address.

Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	0b fixed. *Note*: MSI Receive Window Mask of this register [63] is fixed at 0
30 to 0	MSI Receive Window Mask (Upper) [62:32]	All 0	R/W	(For setting up more than 4 Gbytes space) Set the MSI Receive Window Mask to [62:32]

6.6.3.1.11 PCI INTx Receive Interrupt Enable Registers (Offset: H'110)

31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	MSI Receive Interrupt Enable	0b	R/W	This register permit INTMSI_RC with MSI reception. 0: Do not allow 1: Allow
3	INTD Receive Interrupt Enable	0b	R/W	This register permit INTD_RC. 0: Do not allow 1: Allow
2	INTC Receive Interrupt Enable	0b	R/W	This register permit INTC_RC. 0: Do not allow 1: Allow
1	INTB Receive Interrupt Enable	0b	R/W	This register permit INTB_RC. 0: Do not allow 1: Allow
0	INTA Receive Interrupt Enable	0b	R/W	This register permit INTA_RC. 0: Do not allow 1: Allow

6.6.3.1.12 PCI INTx Receive Interrupt Status Registers (Offset: H'114)

In case of Assert_INTx is received from PCIe to Msg_Req, set the corresponding interrupt bit in this register and assert interrupt INTx_RC. Also, in case of Deassert_INTx is received to Meg Req, clear the corresponding interrupt register (bit) and de-assert INTx_RC. This register can do RW1C by S/W, but PCIe does not recommend clearing this interrupt bit by S/W itself during normal operation for interrupts on the bus. In case of each factor is detected on this field of register, it is always set regardless of the PCI_INTx_Receive_Interrupt_Enable register for RC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	Message Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a Message/ 0: Assert disallowed 1: Assert allowed
23 to 20	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	PM_Active_State_Nak Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a PM_Active_State_Nak. 0: Disable 1: Enable
18	PM_PME Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a PM_PME.
17	PME_Turn_Off Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a PME_Turn_Off. 0: Disable 1: Enable
16	PME_TO_Ack Receive Interrupt Enable	0b	R/W	Enabling the MSG_INT Assert by Receiving a PME_TO_Ack.
15 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.6.3.1.14 Message Receive Interrupt Status Registers (Offset: H'124)

This register is a status register indicating Message Request reception other than INTx, Error related. It is reflected in MSG_INT. Only the Message Code is used to determine the type of message, the validity of the Routing and the validity of the choice of Msg/MsgD are not verified, and the corresponding message is considered to have been received.

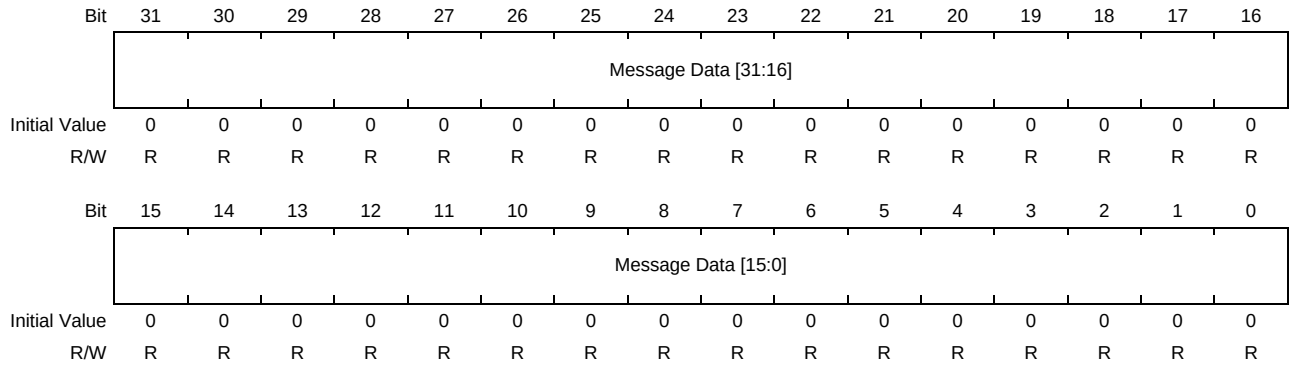
Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	Message Receive Interrupt	0b	R/W1C	Set for receiving Message (Independent of Message type)
23 to 20	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	PM_Active_State_Nak Receive Interrupt	0b	R/W1C	Invalid due to RC
18	PM_PME Receive Interrupt	0b	R/W1C	Set when PM_PME Message is received.
17	PME_Turn_Off Receive Interrupt	0b	R/W1C	Invalid due to RC
16	PME_TO_Ack Receive Interrupt	0b	R/W1C	Set when PM_TO_Ack Message is received.
15 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.6.3.1.15 Message Code Registers (Offset: H'130)

Stores the Code, Routing of the last received Message.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Code								Routing			—	—	—	—	Message Payload
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 8	Message Code	All 0	R	Stores the Code of the last Message received.
7 to 5	Routing	000b	R	Stores the Routing of the last Message received.
4 to1	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Message Payload	0b	R	Stores whether there is a data payload for the last Message received. 0: Msg (Without Payload) 1: MsgD (with Payload)

NOTE

This register is not written when Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received.

6.6.3.1.16 Message Data Registers (Offset: H'134)

Stores the Data of the last received Message.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Data	All 0	R	Stores the first DW Data of the last received Message. It is only updated when MsgD (with Data) is received, and the previous value is retained when Msg (without Data) is received.

NOTE

This register is not written when Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received.

6.6.3.1.17 Message Header 3rdDW Registers (Offset: H'138)

Stores the Header (3rdDW) of the last received Message.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Header 3rdDW [31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Header 3rdDW [15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Header 3rdDW	All 0	R	Stores the Header (3rdDW) of the last received Message.

NOTE

This register is not written when Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received.

6.6.3.1.18 Message Header 4thDW Registers (Offset: H'13C)

Stores the Header (4thDW) of the last received Message.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Message Header 4thDW [31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Message Header 4thDW [15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Message Header 4thDW	All 0	R	Stores the Header (4thDW) of the last received Message.

NOTE

This register is not written when Power Management Message (PME_TO_Ack Message, PME_Turn_Off Message, PM_PME Message, PM_Active_State_Nak Message) is received.

6.6.3.1.19 Interrupt Table Registers (Offset: H'140)

This register is the Index of the interrupt factor.

Interrupt signal (Active: High) status can be monitored by category in a list.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9	PCIE_EVT_INT	0b	R	Event Interrupt signal Monitor･Register
8	MSG_INT	0b	R	Message Interrupt signal Monito･Register
7 to 5	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	INTMSI_RC	0b	R	INT_MSI receive interrupt signal Monitor Register
3	INTD_RC	0b	R	INTD_RC receive interrupt signal Monitor Register
2	INTC_RC	0b	R	INTC_RC receive interrupt signal Monitor Register
1	INTB_RC	0b	R	INTB_RC receive interrupt signal Monitor Register
0	INTA_RC	0b	R	INTA_RC receive interrupt signal Monitor Register

NOTE

For details on the register, refer to the description of the terminal of the same name.

6.6.3.1.20 PCIe Event Interrupt Enable 0 Registers (Offset: H'200)

This register is for interrupt permission due to various event factors in PCI Express. Write permission to PCIe Event Interrupt Status 0 Register (Offset: H'204). For more information about the factors, see the Status Register.

Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30	UI_LINK_WIDTH_CHANGE_DONE	0b	R/W1C	Indicates Up/Down Configure operation complete.
29	UI_LINK_SPEED_CHANGE_DONE	0b	R/W1C	Indicates Speed Change operation complete.
28	Request Done	0b	R/W1C	In response to the request issued in Request Issue Registers (Offset: 9Ch): Non-Posted: Indicates completion received. Posted: Indicates that the request has been issued.
27, 26	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
24	CA	0b	R/W1C	Indicates that the opposing device responded with a CA (Completer Abort).
23, 22	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 14	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	RX_DLLP_PM_ENTER_L23	0b	R/W1C	Indicates transition to L2/L3 State in Power Management control.

Bit	Bit Name	Initial Value	R/W	Description
11	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10	ASPM L1 Rejected	0b	R/W1C	Indicates that the ASPM L1 transition was rejected.
9	DL_UpDown	0b	R/W1C	Set to 1b when the state changes from DL_Down to DL_Up or from DL_Up to DL_Down.. Check the DL_Down/DL_Up status with the PCIe Core Status 1 Registers (Offset: H'408).
8	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.6.3.1.22 PCIe Event Interrupt Enable 1 Registers (Offset: H'208)

This register is the Parity Error/ECC Error interrupt grant register. When each bit is set to allow, each corresponding status bit value in the PCIe Event Interrupt Status 1 Register (Offset: 20 Ch) takes effect.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

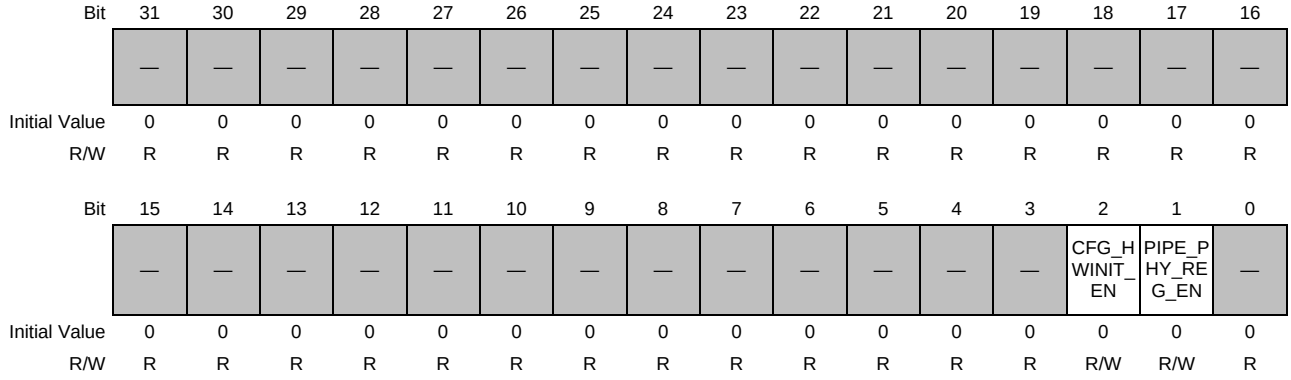
R/W	R	R	R	R	R/W1C	R/W1C	R/W1C	R/W1C	R	R	R	R	R	R	R/W1C	R/W1C



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	Write SLVERR INT	All 0	R/W1C	An AXI Slave Port has detected an unrecoverable error. (The response to the Transaction is SLVERR.) Bit 11: Burst length error In case of the burst length of data received by SAWLEN and the data channel does not match. Bit 10: ID Mismatch In case of the value of the SWID received in the SAWID and data channel is different. Bit 9: Burst type Invalid In case of SAWBURST is b 11 (undefined). In case of SAWBURST is b 10 (wrapping) and burst length is other than 2, 4, 8 or 16. Bit 8: Data size Invalid In case of SAWSIZE is between b 100 and b 111 (over AXI Bus width/not supported). <Each bit means> 0: Error Not Found 1: Error detection
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	Read SLVERR INT	00b	R/W1C	An AXI Slave Port has detected an unrecoverable error. (The response to the Transaction is SLVERR.) Bit 1: Burst type Invalid In case of SARBURST is b11(Undefined) In case of SARBURST is b 10 (wrapping) and burst length is other than 2, 4, 8 or 16. Bit 0: Burst type Invalid In case of SARSIZE is (over AXI Bus width/not supported). <Each bit means> 0: Error Not Found 1: Error detection

6.6.3.1.28 AXI Slave Error Interrupt Status 3 Registers (Offset: H'230)

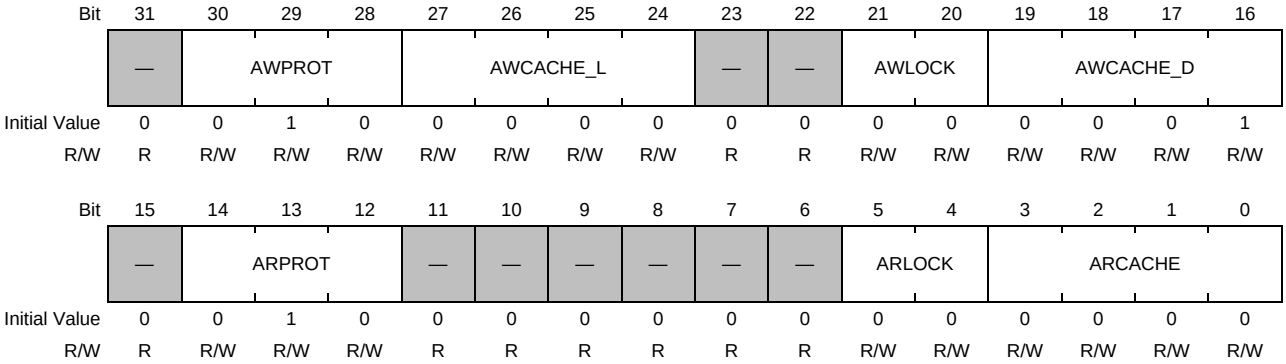
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ERR ID	All 0	R	Stores the ID of the first AXI Slave Error Interrupt Status 1 register error (Offset H'224). Only the first error detected is saved, and a new error ID can be saved when bits 11:8 and 1:0 of the AXI Slave Error Interrupt Status 1 register are all cleared.

6.6.3.1.29 Permission Registers (Offset: H'300)

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	CFG_HWINIT_EN	0b	R/W	Enable HwInit attribute registers to be rewritten from AXI. 0b: Disable 1b: Enable
1	PIPE_PHY_REG_EN	0b	R/W	Access permission signal for Physical Layer Control/Status Registers. 0b: Disable register access in PIPE PHY space. 1b: Enable register access in PIPE PHY space.
0	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.6.3.1.30 Reset Registers (Offset: H'310)

This register resets the PCIe core. The write value is saved when accessed from the AXI, but a low-level pulse is generated when the PCIe writes 0b. However, when the AXI has already written 0b, the signal remains at the low level. Writing 1b from the PCIe will be ignored.



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
16	force to D0	0	R/W	After sending PME_TO_Ack, force PM Control to transition to D0 State. Auto-cleared when PM Control transitions to D0. This bit is normally prohibited as it can create inconsistencies with the power state of the entire system. 0b: No operation 1b: Transition to D0
15 to 12	—	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
11 to 8	—	All 0	R/W	Reserved These bits are read as 0b. The write value should always be 0b.
7	RST_PREG_B	—	R/W	Not used in this macro. The setting value does not affect macro behavior. 0b: Reset 1b: Normal operation
6	RST_OUT_B	—	R/W	RST_OUT_B output 0b: Reset 1b: Normal operation
5	RST_PS_B	—	R/W	Reset to the PCI Express core part (PCLK domain) inside the macro 0b: Reset 1b: Normal operation
4	RST_LOAD_B	—	R/W	Reset to Configuration Register Reset to bits not initialized by RST_CFG_B. 0b: Reset 1b: Normal operation
3	RST_CFG_B	—	R/W	Reset to Configuration Register 0b: Reset 1b: Normal operation
2	RST_RSM_B	—	R/W	POWERGOOD reset of AUX Power (AUX not supported) Reset to Sticky register. 0b: Reset 1b: Normal operation
1	RST_GP_B	—	R/W	Reset to the PCI Express core part (ACLK domain) inside the macro 0b: Reset 1b: Normal operation

Bit	Bit Name	Initial Value	R/W	Description
0	RST_B	—	R/W	Reset to PCI Express core part inside macro 0b: Reset 1b: Normal operation

6.6.3.1.31 Mode Set 0 Registers (Offset: H'314)

Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 28	AWPROT	010b	R/W	Set the protection type from PCIe to AXI transactions. These bits indicate whether the protection level of the transaction is normal, privileged, or secure, and whether the transaction is for data access or instruction access. [2] 1b: Instruction Access 0b: Data Access [1] 1b: Non-secure access 0b: Secure access [0] 1b: Privileged Access 0b: Normal Access
27 to 24	AWCACHE_L	All 0	R/W	Indicate the value of MAWCACHE [3: 0] to be issued to AXI. This setting is output when issuing an AXI request that contains the last byte. *Note*: The recommended value is 0000b. [3] 1b: Write-allocate 0b: No write-allocate [2] 1b: Read-allocate 0b: No read-allocate [1] 1b: Cacheable 0b: Non-cacheable [0] 1b: Bufferable 0b: Non-bufferable
23, 22	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21, 20	AWLOCK	00b	R/W	Lock type in PCIe to AXI transactions. This signal provides information about the atomic nature of the transfer. 00b: Normal access 01b: Exclusive access 10b: Lock access 11b: Reserved
19 to 16	AWCACHE_D	0001b	R/W	Indicates the value of MAWCACHE [3: 0] to be issued to AXI. This setting is output when an AXI request other than the AWCACHE_L output condition is issued. [3] 1b: Write-allocate 0b: No write-allocate [2] 1b: Read-allocate 0b: No read-allocate [1] 1b: Cacheable 0b: Non-cacheable [0] 1b: Bufferable 0b: Non-bufferable
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	ARPROT	010b	R/W	Sets the protection type from PCIe to AXI transactions. This bit indicates whether the protection level of the transaction is normal, privileged, or secure, and whether the transaction is for data access or instruction access. [2] 1b: Instruction Access 0b: Data Access [1] 1b: Non-secure access 0b: Secure access [0] 1b: Privileged Access 0b: Normal Access
11 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5, 4	ARLOCK	00b	R/W	Lock type in PCIe to AXI transactions. This bit provides information about the atomic nature of the transfer. 00b: Normal access 01b: Exclusive access 10b: Lock access 11b: Reserved
3 to 0	ARCACHE	All 0	R/W	Cache type in PCIe to AXI transactions. This bit indicates whether the transaction is “buffered”, “cacheable”, “write-through”, “write-back”, or “assign” as an attribute.

6.6.3.1.32 Mode Set 1 Registers (Offset: H'318)

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 0	ASPM L1 Idle Time	All 0	R/W	Sets the idle period for AXI transactions that the macro checks during the ASPM L1 transition. One condition of the ASPM L1 transition is that the idle period is confirmed by adding H'FF to the lower 8 bits to the 8 bits set by this bit for several cycles. H'00: 256 [ACLK] H'01: 512 [ACLK] ⋮ H'FF: 65536 [ACLK]

6.6.3.1.34 PCIe Core Mode Set 1 Registers (Offset: H'400)

This register is used to set the operating mode of the PCI Express core.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ASPM_L1_INTERVAL_TIME

R/W	R	R	R	R/W	R	R/W	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29, 28	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
27 to 16	ASPM_L1_INTERVAL_TIME	H'7D0	R/W	Setting the interval for ASPM L1 requests. The PCIe Base Spec specifies that ASPM L1 transition requests must not be received consecutively within 10 µs, and this field is used to set a timer value to guard against them. Set the ACLK period x set value to 10 µs or more. Setting of this product (Default): In case of ACLK = 200 MHz (5ns): D'2000(d) = H'7D0 = 0111_1101_0000b
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14, 13	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	MODE_LINK_UPCONFIGURE_CAPABILITY_DISABLED	0b	R/W	Setting the Link Upconfigure Capability bit in the Training Sequence Ordered-set (TS-OS) 0: Link Upconfigure Capability bit = 1b set 1: Link Upconfigure Capability bit = 0b setting (Gen1 × 1) LinkUp may not occur when connecting to Gen1 PCIe devices unless this bit is 0b. In that case, use F/W to change it to 0b.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	MODE_TXSWING	0b	R/W	Amplitude control of SerDes serial output 0: Full Swing Mode (Default) 1: Half Swing Mode
9 to 4	—	H'0F	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	MODE_PORT	1b	R/W	Register for Device Type setting on our company. Changes from the initial values can cause malfunction. Please be careful.

Bit	Bit Name	Initial Value	R/W	Description
0	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.6.3.1.35 PCIe Core Control 1 Registers (Offset: H'404)

This register is a control register for Power Management control and LTSSM (Link Training Sequence State Machine) state transitions in the PCI Express core.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	BLB_RELAX_ORDERING_EN	0b	R/W	Controlling the RO bit in send requests 0: RO bit of Request TLP sent is always 0b (Default) 1: TLP can be sent with RO bit of Request TLP to be sent set to 1b.
27 to 25	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	UI_ENTER_L1S	0b	R/W	L1 SubState transition permission setting 0: L1 SubState not transitionable (Default) 1: L1 SubState transition allowed
21	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	RETURN_TO_L0	0b	R/W	Control of L1, L2 to L0 states in RC mode (Not normally used) 0: Normal operation (Default) 1: Start the return operation to the L0 state when in the L1 and L2 states in the RC mode *Note*: It is automatically cleared after checking PMU_LINKSTATE [0] = 1.
19	UI_RC_REJECT_ASPML1	0b	R/W	ASPM L1 transition rejection control 0: Accepts ASPM L1 transition requests from opposing EP devices (Default) 1: Reject ASPM L1 transition requests from opposing EP devices
18	Auto PM_Active_State_Nak	0b	R/W	PM_Active_State_Nak Message Send Mode for ASPM L1 Rejection Set 1b, if the RC wants to reject ASPM L1. When PM_Active_State_Nak is automatically sent, this Bit is automatically cleared. *Note*: Auto send only once.

Bit	Bit Name	Initial Value	R/W	Description
17	UI_ENTER_L2	0b	R/W	L2 transition control in RC mode Set to 1b when shifting to L2 in RC mode. The PCIe core must enter a reset state under the control of the Reset register during the L2 state transition. When returning, this bit must be cleared to 0b after canceling the reset.
16	UI_ENTER_TXL0S	0b	R/W	TxL0s transition control 0: Do not perform ASPM L0s transition (Default) 1: Perform ASPM L0s transition when internal conditions are satisfied
15 to 13	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11	UI_ENTER_TXMODE_SRIS	0b	R/W	Setting of Clock Tolerance Compensation 0: SRNS (Default) 1: SRIS (Not support)
10 to 8	—	000b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	—	H'0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.6.3.1.36 PCIe Core Status 1 Registers (Offset: H'408)

This register is the Power Management status register in the PCI Express core.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	—	H'0	R	Reserved When read, the initial value is read. The written value will be ignored.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22 to 20	—	000b	R	Reserved When read, the initial value is read. The written value will be ignored.
19, 18	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	bme_down	x	R	The PCIe core transmitter is in an unusable state.
16	—	0b	R	Reserved When read, the initial value is read. The written value will be ignored.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 8	LTSSM_STATE	All x	R	Shows the state of the Link Training & Status State Machine in the PCIe Core Link. The high-order 5 bits (14:10) indicate the following conditions: 000xxb: Detect 001xxb: Polling 010xxb: Config 01100b: L0 01101b: L1 0111xb: L2 100xxb: Recovery 101xxb: Disable 110xxb: Loopback
7 to 4	PMU_LINKSTATE	All x	R	L-state monitor in power management control 0100b: L1 state 1000b: L2 state

Bit	Bit Name	Initial Value	R/W	Description
3	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	x	R	Reserved When read, the initial value is read. The written value will be ignored.
1	STATE_VC0_NEGOTIATION_PENDING	x	R	Flow Control Initialization Action Monitor If this bit is 1b, the transaction must not be initiated from the AXI side. Check the status of this bit as 0b and DL_Down Status (bit [0]) as 0b. 0: Indicates that Flow Control has been initialized 1: Indicates that Flow Control has not been initialized
0	DL_Down status	x	R	Indicates whether PCIe Core is in DL_Down or DL_Up state 0: DL_Up Status 1: DL_Down Status

6.6.3.1.37 PCIe Core Control 2 Registers (Offset: H'410)

This register is for Link Speed/Width Change control in the PCI Express core.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	UI_LINK_WIDTH_CHANGE_ENABLE	All 0	R/W	Link Width settings to be changed Set the Lane to 1b that should be activated when asserting UI_LINK_WIDTH_CHANGE_REQ to issue a Link Width change request. The low-order bit (bit [24]) drives Lane 0, and the high-order bit (bit [31]) drives Lane 7.
23, 22	MODE_NODE_EMPHASIS	00b	R/W	No de-emphasis mode setting terminal for Gen 1/Gen 2 operation [0] Gen1 operating 0: Normal operating mode (Default) 1: No de-emphasis mode [1] Gen2 operating 0: Normal operating mode (Default) 1: No de-emphasis mode
21 to 17	—	All 1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
16	UI_LINK_WIDTH_CHANGE_REQ	0b	R/W	Link Width change request control Setting this bit to 1b issues a request to change the link width to the configuration set in the bit [31:24] UI_LINK_WIDTHCHANGE_ENABLE field. Asserting while in the L0 state moves from the recovered state to the configured state and negotiates with the other device. PCIe Core Status 2 Register (Offset: H'414) bit [29] Set it to 0b after seeing UI_LINK_WIDTH_CHANGE_DONE asserted.
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9, 8	UI_LINK_SPEED_CHANGE	00b	R/W	Link Speed Settings Set the Link Speed to be changed. 00b: 2.5 GT/s 01b: 5.0 GT/s 10b: 8.0 GT/s (not allowed) 11b: 16.0 GT/s (not allowed)
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	UI_LINK_CHANGE_AUTONOMOUS	0b	R/W	Setting a reason for changing Link Width/Speed 0: reliability reason (Changes for reliability. Direction of band reduction) 1: autonomous reason

Bit	Bit Name	Initial Value	R/W	Description
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UI_LINK_SPEED_CHANGE_REQ	0b	R/W	Setting a reason for changing Link Speed Setting this bit to 1b issues a request to change the Link Speed to the Speed set in the bit [8] UI_LINK_SPEED_CHANGE field. Asserting while in the L0 state moves to the recovery state and negotiates with the other device. PCIe Core Status 2 Register (Offset: H'414) bit [28] Set it to 0b after seeing UI_LINK_SPEED_CHANGE_DONE asserted.

6.6.3.1.38 PCIe Core Status 2 Registers (Offset: H'414)

This register is the Link Speed/Width Change status register in the PCI Express core.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	UI_LINK_WIDTH_CHANGE_DONE	UI_LINK_SPEED_CHANGE_DONE	—	—	—	STATE_UPCONFIGURE_CAPABLE	—	STATE_NEGOTIATED_LANE_END			—	STATE_NEGOTIATED_LANE_START

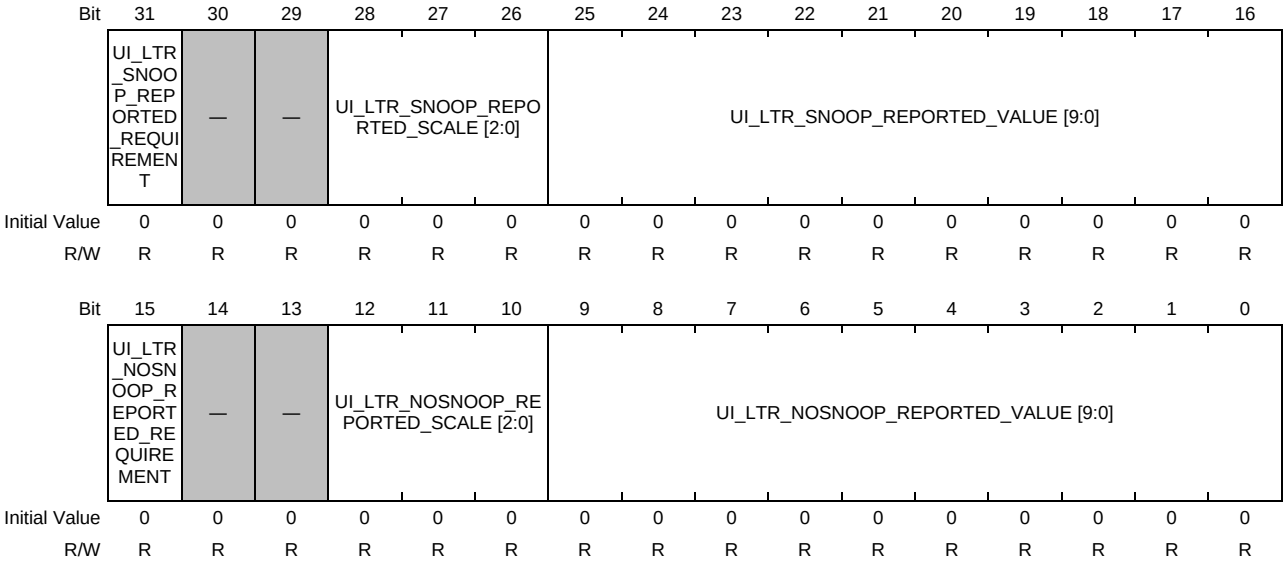
Initial Value	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	UI_LINK_WIDTH_CHANGE_DONE	x	R	Link Width Change operation completed display PCIe Core Status 2 Register (Offset: H'410) bit[16] The setting of UI_LINK_WIDTH_CHANGE_REQ notifies (1b) that the Width Change has been completed. The setting of UI_LINK_WIDTH_CHANGE_REQ to 0b sets it to 0b.
28	UI_LINK_SPEED_CHANGE_DONE	x	R	Link Width Change operation completed display PCIe Core Status 2 Register (Offset: H'410) bit[0] The setting of UI_ LINK_WIDTH_CHANGE_REQ notifies (1b) that the Width Change has been completed. The setting of UI_LINK_WIDTH_CHANGE_REQ to 0b sets it to 0b.
27 to 25	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	STATE_UPCONFIGURE_CAPABLE	x	R	Upconfigure Capable bit display for opposing devices Indicates whether the opposing device can change the direction of widening the Link Width. If this bit is 0b, changing the Link Width will not restore the original Link Width.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22 to 20	STATE_NEGOTIATED_LANE_END	All x	R	n Displays the location of Lane Number (n − 1) (n = 2 means Lane 1) after Link Negotiation with an oncoming device during lane operation. Used to check the state of the current behavior Lane before changing Link Width. 000b: Lane0 is Lane Number (n − 1) 001b: Lane1 is Lane Number (n − 1) Others: Reserved
19	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18 to 16	STATE_NEGOTIATED_LANE_START	All x	R	n When the lane is operating, the position of Lane Number 0 after Link Negotiation with the opposing device is displayed. Used to check the state of the current behavior Lane before changing Link Width. 000b: Lane0 is Lane Number 0 001b: Lane1 is Lane Number 0 Others: Reserved

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	STATE_RECEIVER_DETECTED	All x	R	Display connection status with other devices The Receiver Detection results are displayed. [0]: Opposing device detected on Lane 0 [1]: Opposing device detected on Lane 1 (for x2 only) [2] to [7]: Reserved
7 to 0	STATE_DATA_RATE_IDENTIFIER_RECEIVED	All x	R	Viewing Link Speeds Supported by Opposing Devices Displays the TS-OS Data Rate Identifier feed received from the other device. Bit 0: Reserved Bit 1: 2.5 GT/s Data Rate Supported. Must be set to 1b. Bit 2: 5.0 GT/s Data Rate Supported. Must be set to 1b if Bit 3 is 1b. Bit 3-7: Reserved

6.6.3.1.39 PCIe Core Status 5 Registers (Offset: H'42C)

This register is a status register in the PCI Express core.



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

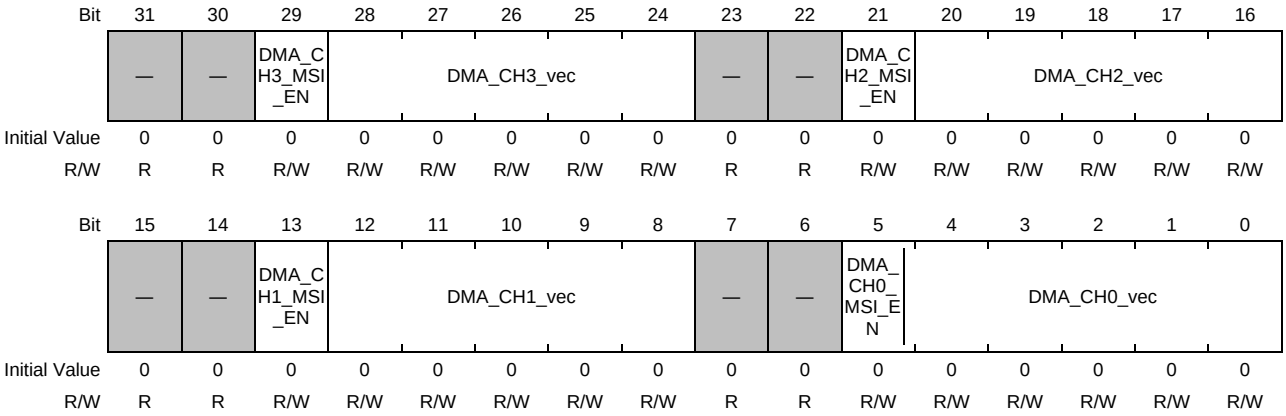
Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved
9, 8	—	xx		When read, the initial value is read. The written value will be ignored.
7 to 1	—	All 0		
0	ORT_TRANSACTION_PENDING	0b	R	Indicates the presence or absence of an Outstanding Request (All Completions corresponding to Non-Posted Requests sent from the AXI side have not been received.). Check this bit to make sure that there is no Outstanding Request before making/granting transition requests to TxL0s/L1/L2. 0: No Outstanding Request 1: With an Outstanding Request

6.6.3.1.40 LTR Reported value Registers (Offset: H'470)

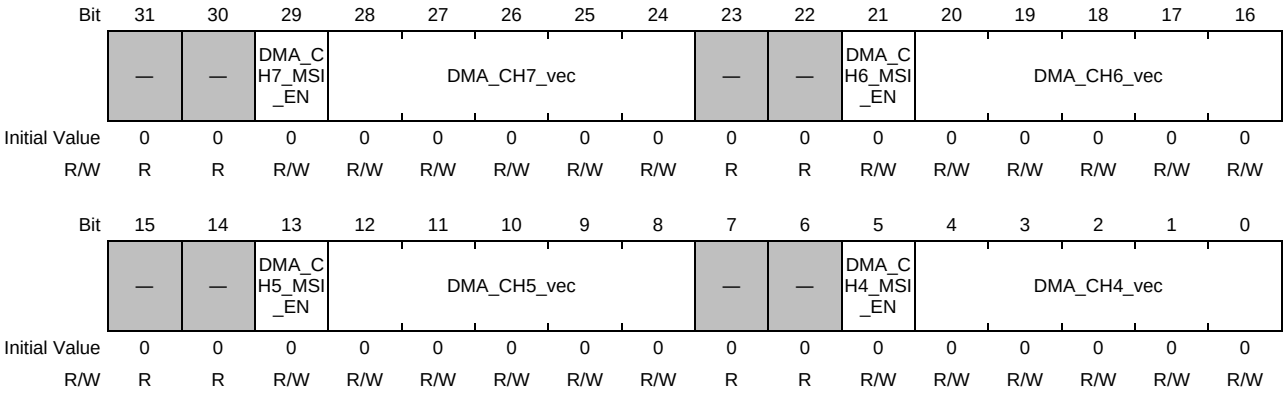


EP only, RC reserved.

Bit	Bit Name	Initial Value	R/W	Description
31	UI_LTR_SNOOP_REPORTED_REQUIREMENT	0b	R	Snoop Latency Requirement field value for issued LTR Msg
30 to 29	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 26	UI_LTR_SNOOP_REPORTED_SCALE [2:0]	000b	R	Snoop Latency Scale field value for issued LTR Msg
25 to 16	UI_LTR_SNOOP_REPORTED_VALUE [9:0]	All 0	R	Snoop Latency Value field value for issued LTR Msg
15	UI_LTR_NOSNOOP_REPORTED_REQUIREMENT	0b	R	NoSnoop Latency Requirement field value for issued LTR Msg
14 to 13	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 10	UI_LTR_NOSNOOP_REPORTED_SCALE [2:0]	000b	R	NoSnoop Latency Scale field value for issued LTR Msg
9 to 0	UI_LTR_NOSNOOP_REPORTED_VALUE [9:0]	All 0	R	NoSnoop Latency Value field value for issued LTR Msg

6.6.3.1.41 DMA Interrupt Vector 0 Registers (Offset: H'4D0)

Interrupt vector specification function when notifying (MSI) an interrupt from the AXI to the PCIe direction during DMAC transfer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	DMA_CH3_MSI_EN	0b	R/W	DMA Ch3 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
28 to 24	DMA_CH3_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch3
23 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	DMA_CH2_MSI_EN	0b	R/W	DMA Ch2 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
20 to 16	DMA_CH2_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch2
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	DMA_CH1_MSI_EN	0b	R/W	DMA Ch1 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
12 to 8	DMA_CH1_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch1
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	DMA_CH0_MSI_EN	0b	R/W	DMA Ch0 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
4 to 0	DMA_CH0_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch0

Note: DMA_CHx_vec should be fixed at H'00 for RC functions.

6.6.3.1.42 DMA Interrupt Vector 1 Registers (Offset: H'4D4)

Interrupt vector specification function when notifying (MSI) an interrupt from the AXI to the PCIe direction during DMAC transfer.

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	DMA_CH7_MSI_EN	0b	R/W	DMA Ch7 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
28 to 24	DMA_CH7_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch7
23 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	DMA_CH6_MSI_EN	0b	R/W	DMA Ch6 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
20 to 16	DMA_CH6_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch6
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	DMA_CH5_MSI_EN	0b	R/W	DMA Ch5 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
12 to 8	DMA_CH5_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch5
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	DMA_CH4_MSI_EN	0b	R/W	DMA Ch4 MSI Enable 0: Do not use MSI (DMA interrupt notification via DMA_INT terminal) 1: Use MSI For RC function, set it to 0b fixed because MSI transmission is prohibited.
4 to 0	DMA_CH4_vec	All 0	R/W	Vector specification of MSI interrupts sent by DMAC Ch4

Note: DMA_CHx_vec should be fixed at H'00 for RC functions.

6.6.3.1.43 MSI Receive Enable 0 Registers (Offset: H'600)

Registers to enable control of a group of one-set MSI receiving (Message Data Judgment) registers:

- MSI reception enabled 0 register (offset H'600)
- MSI received message data 0 register (offset H'604)
- MSI receive mask 0 register (offset H'608)
- MSI reception status 0 register (offset H'60C)

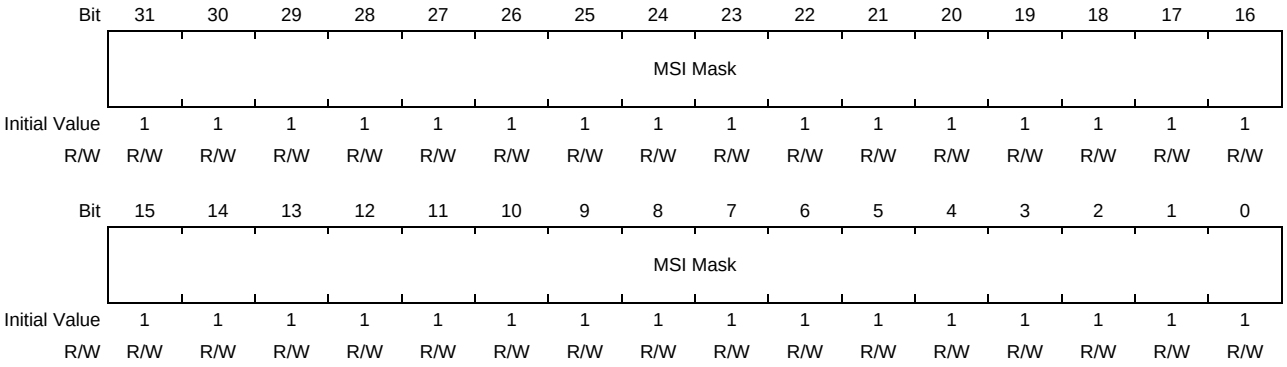
0	Enable	0b	R/W	Enable/disable the MSI Receive (Message Data Judgment) register group consisting of 1 set of + 16 bytes registers from this register's Offset. 0: Disabled 1: Valid

6.6.3.1.44 MSI Receive Message Data 0 Registers (Offset: H'604)



Message Data setting register for MSI reception judgment of the register group to be enabled in the MSI Receive Enable n register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	Message Data	All 0	R/W	Setting Message Data for MSI reception judgment
4 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.6.3.1.45 MSI Receive Mask 0 Registers (Offset: H'608)

In the MSI Receive Enable n register, the Mask control register for interrupts by the MSI receive status of the register group to enable.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSI Mask	All 1	R/W	Set the interrupt mask with each bit of MSI Status. 0: Allow interrupt 1: Interrupt Mask

6.6.3.1.46 MSI Receive Status 0 Registers (Offset: H'60C)

A register indicating the MSI receive status of the group of registers to be enabled in the MSI Receive Enable n register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSI Status															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSI Status															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSI Status	All 0	R/W1C	MSI receive status. When Message Data [31:5] and MSI receive Data [31:5] match, the bit corresponding to Data [4:0] is set. (When Data [4:0] = H'00, MSI Status n [0] is set. When Data [4:0] = H'01, MSI Status n [1] is set.)

6.6.3.1.47 DMA Control Registers (Offset: H’800)

As a function of DMAC, this is a setting related to the upper limit of the Read Request Size that can be issued to PCIe Core. Use with the default setting (128 bytes). Common settings for DMA Channel

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	CH7_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
30	CH7_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
29	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
28	CH7_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
27	CH6_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
26	CH6_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
25	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
24	CH6_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
23	CH5_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
22	CH5_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
21	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	CH5_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
19	CH4_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
18	CH4_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
17	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
16	CH4_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
15	CH3_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
14	CH3_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
13	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	CH3_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
11	CH2_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
10	CH2_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
9	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
8	CH2_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
7	CH1_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
6	CH1_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
5	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
4	CH1_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1
3	CH0_ERR	0b	R/W1C	Set when an Error occurs during a DMA transfer.
2	CH0_QUE_EMP	0b	R/W1C	It is set when the QUE is empty by pulling the list from the descriptor queue (moving it to the execution descriptor list).
1	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	CH0_END	0b	R/W1C	Set when DMAC completes successfully. Successful completion refers to the following conditions: • Transfer finished as indicated by DMA_SIZE • End of descriptor list with EI field equal to 1

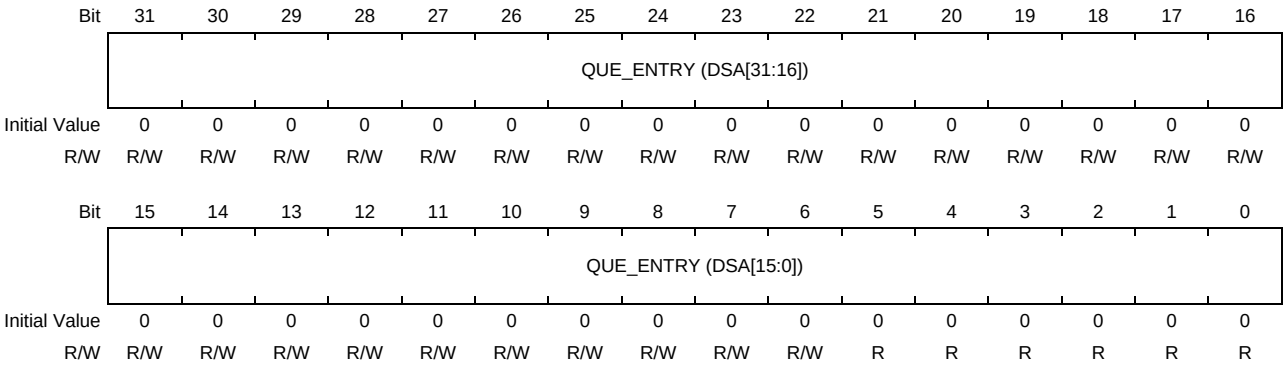
6.6.3.1.50 DMA Channel Control Registers (Offset: H'900/+Channel Offset)

This register is used to set the control method for each DMA Channel.

Please set register/descriptor method exclusively.

- Setting QUE_EN = 1b and QUE_CLR = 1b is prohibited during register-type DMA transfer (RDMA_EN = 1b).
- Setting RDMA_EN = 1b is prohibited during descriptor-type DMA transfer (QUE_EN = 1b).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R



Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	QUE_CLR	—	—	—	—	—	—	QUE_EN	RDMA_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	QUE_CLR	0b	R/W	QUE Clear Write 1 to clear QUE. All descriptor lists (waiting and running lists) registered in QUE are cleared. Do not clear during DMA execution. The lead value is always 0. It is prohibited to 1write at the same time as Set of QUE_EN.
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	QUE_EN	0b	R/W	QUE Enable Set to 1 to enable the descriptor list registered in the descriptor queue and start DMA transfer (descriptor method). When the DMA stops (normal or abnormal), it is automatically cleared to 0.
0	RDMA_EN	0b	R/W	Register-based DMA transfer Enable Set to 1 to start a DMA transfer (register method) and perform the transfer set by DMA_SIZE. It is automatically cleared to 0 when the DMA transfer is complete, or an error is detected, and the DMA is terminated.

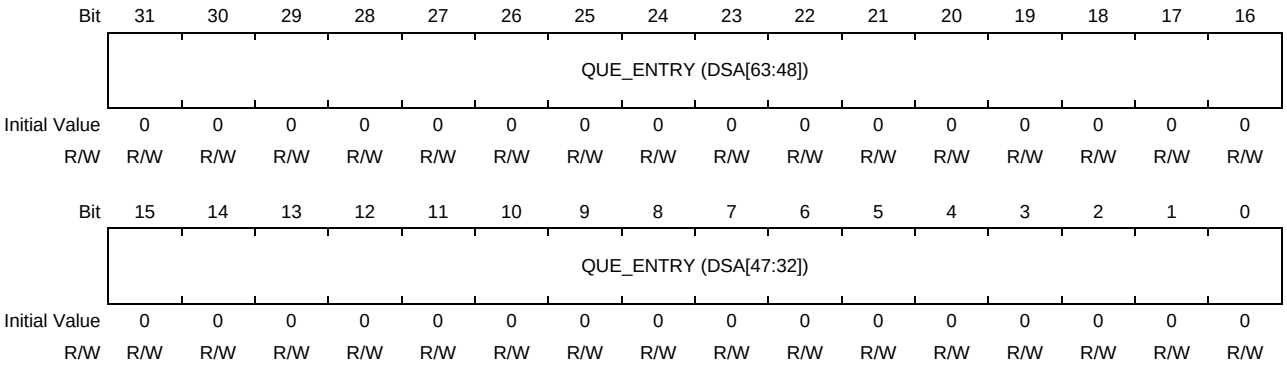
6.6.3.1.51 Descriptor Start Address (Lower) Registers (Offset: H'908/+Channel Offset)

This registry is a register for descriptor queue list settings.

This setting is registered as the lower 32 bits of the DSA (DMA Start Address) of the queue list.

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	QUE_ENTRY (DSA[31:6])	All 0	R/W	Descriptor list queue register. This area becomes the DSA. Sets the low 32 bits of the address where the first descriptor is stored.
5 to 0	QUE_ENTRY (DSA[5:0])	All 0	R	When the Data bus width is 128 bits, 16 bytes alignment: the lower 6 bits are fixed at 0.

NOTE



At the time of a lead, the following content will be the lead value depending on the DMA situation.

- DMA transfer in progress: running descriptor list
- DMA stopped (when QUE_EN auto-clear): Last run list

6.6.3.1.52 Descriptor Start Address (Upper) Registers (Offset: H'90C/+Channel Offset)

This registry is a register for descriptor queue list settings.

This setting is registered as the upper 32 bits of the DSA (DMA Start Address) of the queue list.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	QUE_ENTRY (DSA[63:32])	All 0	R/W	Descriptor list queue register. This area becomes the DSA. Sets the up 32 bits of the address where the first descriptor is stored.

NOTE

At the time of a lead, the following content will be the lead value depending on the DMA situation.

- DMA transfer in progress: running descriptor list
- DMA stopped (when QUE_EN auto-clear): Last run list

6.6.3.1.53 Que Entry Registers (Offset: H'910/+Channel Offset)

This register is for setting the descriptor queue list.

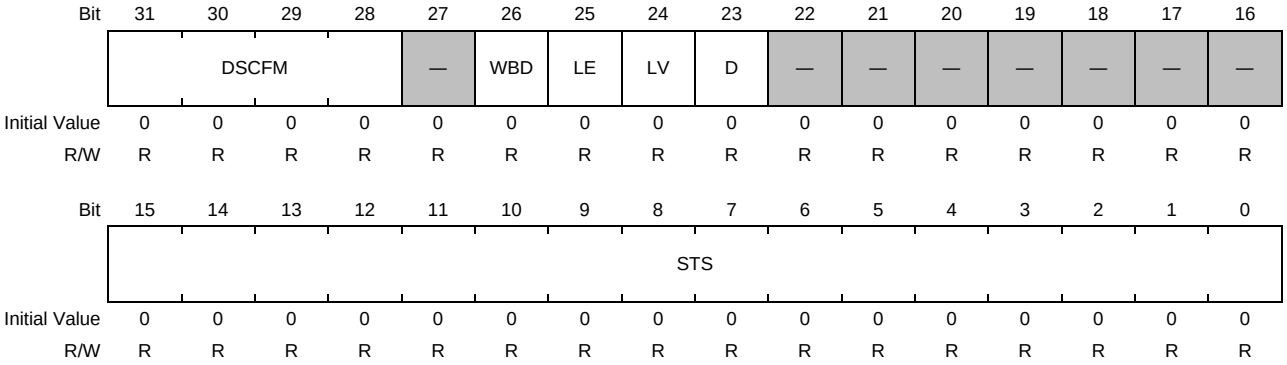
This setting is registered as EI (End Interrupt), LS (List Stop) and LABEL in the queue list.

Writing to 31:24 puts it in the queue.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	QUE_Registration						QUE_ENTRY (EI)	QUE_ENTRY (LS)	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	QUE_ENTRY (LABEL [15:0])															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	QUE_Registration	All 0	R/W	Write to 31:24 to queue. The read value is always 0.
25	QUE_ENTRY(EI)	0b	R/W	It indicates whether to signal an interrupt (Interrupt Status CHx_END) when the descriptor list is processing. 0: Do not signal interrupts 1: Notify interrupt
24	QUE_ENTRY(LS)	0b	R/W	It indicates whether to stop DMA upon completion of descriptor list processing. 0: Do not stop 1: Stop
23 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	QUE_ENTRY (LABEL [15:0])	All 0	R/W	In the sense of a list label, there are no rules for how to set it up. Feel free to set values.

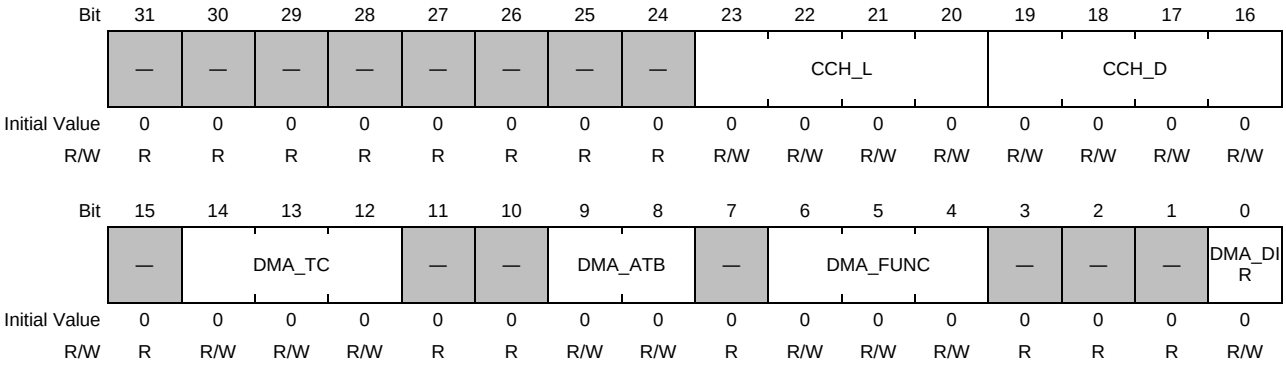


NOTE

At the time of a lead, the following content will be the lead value depending on the DMA situation.

- DMA transfer in progress: running descriptor list
- DMA stopped (when QUE_EN auto-clear): Last run list

6.6.3.1.54 DMA Descriptor Control (Descriptor H'00) Registers (Offset: H'920/+Channel Offset)



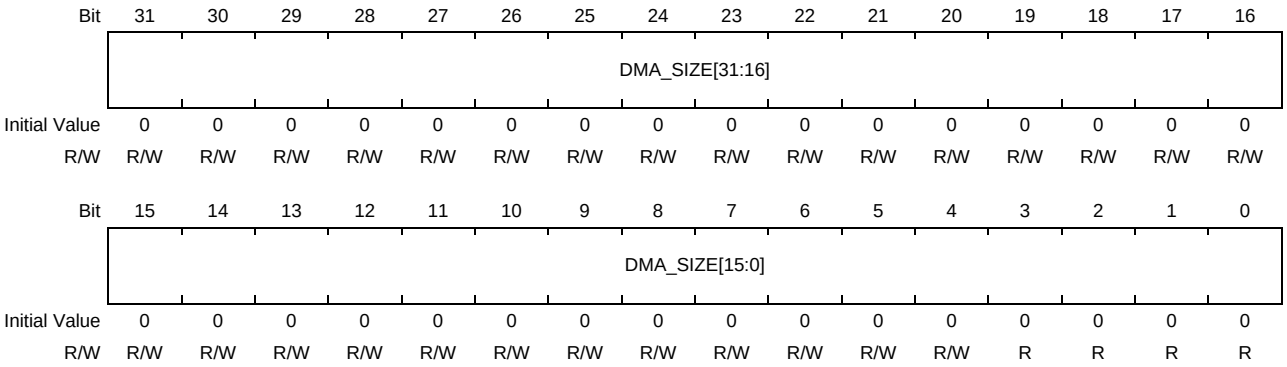
This register shows the field value of Offset H'00 in the descriptor table. Valid only when the descriptor method DMA is selected (read values have no meaning when using the register method).

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DSCFM	H'0	R	It indicates the value of the DSCFM field in the running descriptor table.
27	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	WBD	0b	R	It indicates the value of the WBD field in the running descriptor table.
25	LE	0b	R	It indicates the value of the LE field in the running descriptor table.
24	LV	0b	R	It indicates the value of the LV field in the running descriptor table.
23	D	0b	R	It indicates the value of the D field in the running descriptor table.
22 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	STS	All 0	R	It indicates the value of the STS field in the running descriptor table.

6.6.3.1.55 DMA Transaction Control (Descriptor H'04) Registers (Offset: H'924/+Channel Offset))

This register is used to set transfer control to the AXI and PCIe sides when performing DMA transfers.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 20	CCH_L	All 0	R/W	It indicates the value of A * CACHE [3:0] to be issued to AXI. CCH_L is printed when issuing an AXI request with the last byte in the transfer indicated by SIZE. The recommended value is 0000b. Bit [3] 1b: Write-allocate 0b: No write-allocate Bit [2] 1b: Read-allocate 0b: No read-allocate Bit [1] 1b: Cacheable 0b: Non-cacheable Bit [0] 1b: Bufferable 0b: Non-bufferable
19 to 16	CCH_D	All 0	R/W	It indicates the value of A * CACHE [3:0] to be issued to AXI. CCH_D is output when an AXI request other than the output condition of CCH_L is issued. The recommended value is 0001b when DIR = 0 (PCIe → AXI) and 0000b when DIR = 1 (AXI → PCIe). Bit [3] 1b: Write-allocate 0b: No write-allocate Bit [2] 1b: Read-allocate 0b: No read-allocate Bit [1] 1b: Cacheable 0b: Non-cacheable Bit [0] 1b: Bufferable 0b: Non-bufferable
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 12	DMA_TC	000b	R/W	The traffic class to publish to PCIe. Specifies the traffic class value for requests issued to PCIe. *Note*: This IP does not support Virtual Channel, so use it fixed at 000b.
11, 10	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9, 8	DMA_ATB	00b	R/W	Attribute to publish to PCIe. Bit [1]: Relaxed Ordering (unsupported features: 0b fixed) Bit [0]: No Snoop (0b recommended)
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	DMA_FUNC	000b	R/W	Specifies the function number of the request to be issued to PCIe.
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.



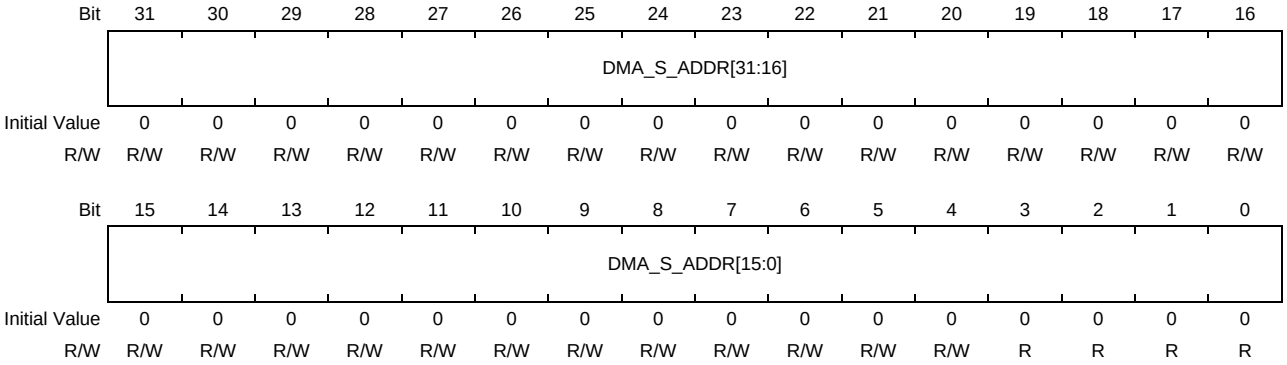
Bit	Bit Name	Initial Value	R/W	Description
0	DMA_DIR	0b	R/W	Sets the DMA transfer direction. 0: PCIe → AXI 1: AXI → PCIe

NOTE

During descriptor method DMA execution, write is prohibited and the read value indicates the value of the CCH_L, CCH_D, TC, ATB, DIR fields in the running descriptor table.

6.6.3.1.56 DMA Size (Descriptor H’08) Registers (Offset: H’928/+Channel Offset)

This register sets the number of DMA transfer bytes. It is reflected in the field OffsetH’08 in the descriptor table.



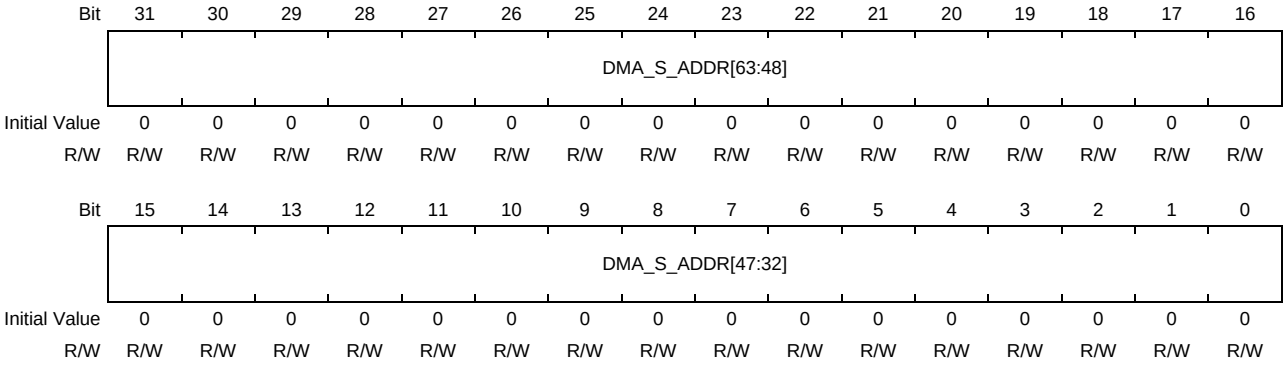
Bit	Bit Name	Initial Value	R/W	Description
31 to 4	DMA_SIZE [31:4]	All 0	R/W	Sets the number of DMA transfer bytes.
3 to 0	DMA_SIZE [3:0]	0000b	R	Since the setting for 16-byte alignment, the lower 4 bits are fixed to 0000b.

NOTE

During descriptor method DMA execution, write is prohibited and the read value is the value of the SIZE field in the running descriptor table.
The number of Bytes transferred when H’0000_0000 is set is H’1_0000_0000.

6.6.3.1.57 DMA Source Lower Address (Descriptor H'10) Registers (Offset: H'930/+Channel Offset)

This register sets the low-order 32 bits of the start address of the transfer source for DMA transfers. It is reflected in the Offset H'10 field of the descriptor table.



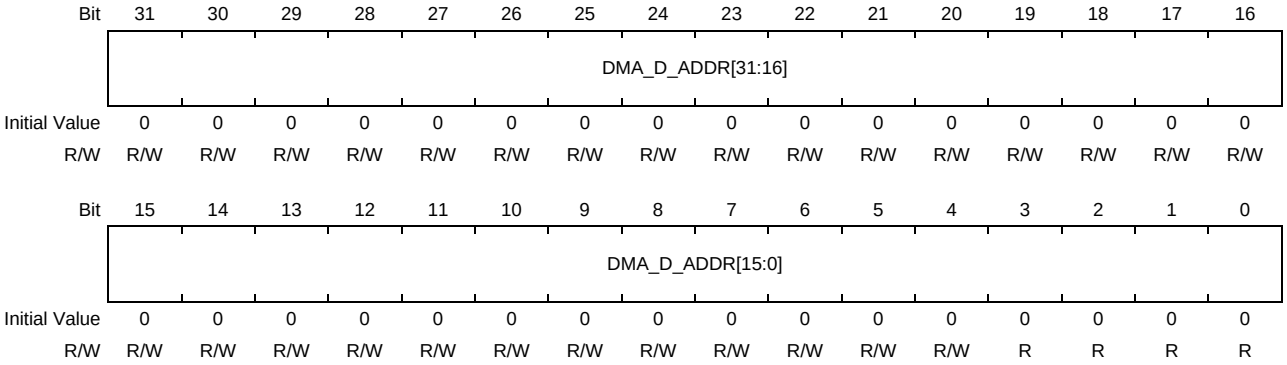
Bit	Bit Name	Initial Value	R/W	Description
31 to 4	DMA_S_ADDR [31:4]	All 0	R/W	Sets the low 32 bits of the source start address for DMA transfers.
3 to 0	DMA_S_ADDR [3:0]	0000b	R	Since the setting for 16-byte alignment, the lower 4 bits are fixed to 0000b.

NOTE

When Source Address indicates the PCIe space (DIR = 0), it is combined with the DMA PCIe Upper Address (Descriptor H'10) to form the PCIe request address. During descriptor method DMA execution, write is prohibited and the read value indicates the value of the SA field in the running descriptor table.

6.6.3.1.58 DMA Source Upper Address (Descriptor H’14) Registers (Offset: H’934/+Channel Offset)

This register sets the up-order 32 bits of the start address of the transfer source for DMA transfers. It is reflected in the Offset H’14 field of the descriptor table.



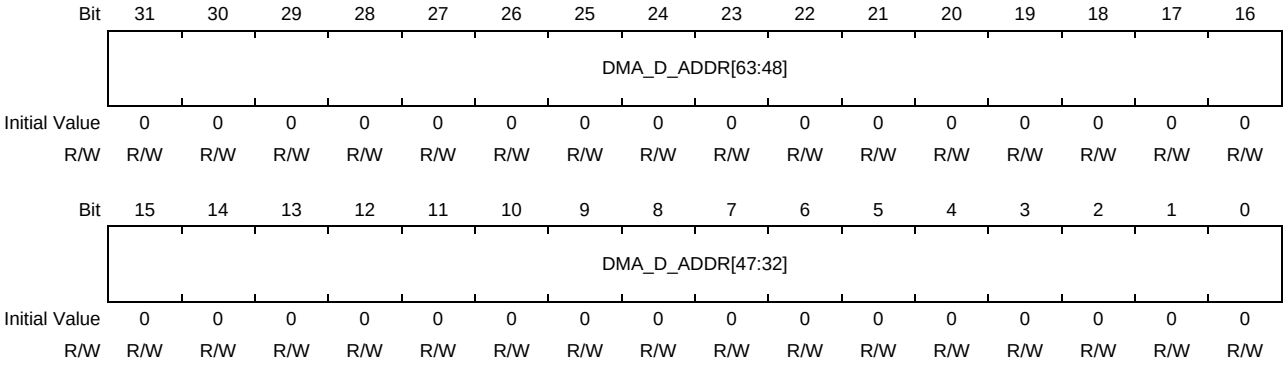
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_S_ADDR	All 0	R/W	Sets the up 32 bits of the source start address for DMA transfers.

NOTE

When Source Address indicates the PCIe space (DIR = 0), it is combined with the DMA PCIe Upper Address (Descriptor H’10) to form the PCIe request address. During descriptor method DMA execution, write is prohibited and the read value indicates the value of the SA field in the running descriptor table.

6.6.3.1.59 DMA Destination Lower Address (Descriptor H'18) Registers (Offset: H'938/+Channel Offset)

This register sets the low-order 32 bits of the start address of the transfer source for DMA transfers. It is reflected in the Offset H'18 field of the descriptor table.



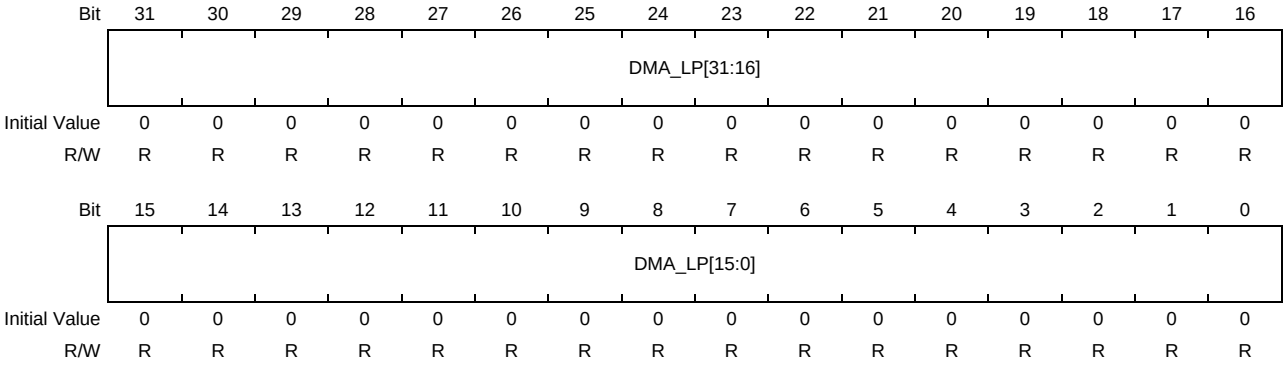
Bit	Bit Name	Initial Value	R/W	Description
31 to 4	DMA_D_ADDR [31:4]	All 0	R/W	Sets the low 32 bits of the source start address for DMA transfers.
3 to 0	DMA_D_ADDR [3:0]	0000b	R	Since the setting for 16-byte alignment, the lower 4 bits are fixed to 0000b.

NOTE

When Destination Address indicates the PCIe space (DIR = 1), it is combined with the DMA PCIe Upper Address (Descriptor H'10) to form the PCIe request address. During descriptor method DMA execution, write is prohibited and the read value indicates the value of the DA field in the running descriptor table.

6.6.3.1.60 DMA Destination Upper Address (Descriptor H'1C) Registers (Offset: H'93C/+Channel Offset)

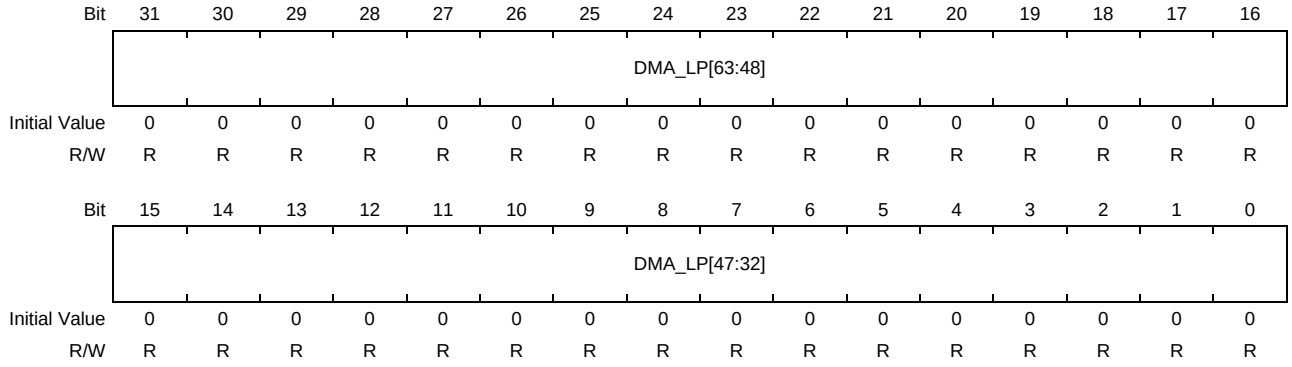
This register sets the up-order 32 bits of the start address of the transfer source for DMA transfers. It is reflected in the Offset H'32 field of the descriptor table.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_D_ADDR	All 0	R/W	Sets the up 32 bits of the source start address for DMA transfers.

Note: When Destination Address indicates PCIe space (DIR = 1), it becomes PCIe request address together with DMA PCIe Upper Address (Descriptor H'10). When executing descriptor method DMA, writing is prohibited, and the read value indicates the value of the DA field of the descriptor table being executed.

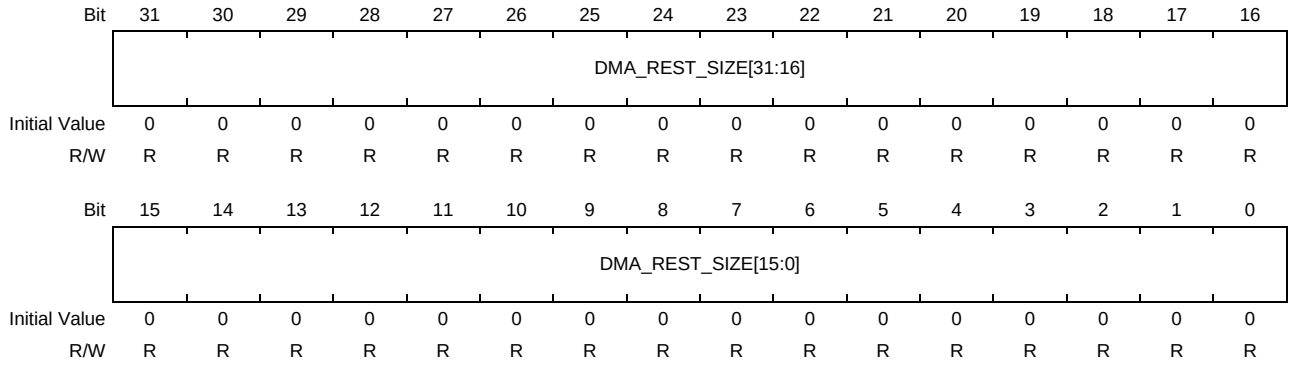
6.6.3.1.61 DMA Descriptor Lower Link Pointer (Descriptor H'20) Registers (Offset: H'940/+Channel Offset)



This register shows the Offset H'20 field value in the descriptor table. Valid only when descriptor method DMA is selected (read value has no meaning when using register method)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_LP	All 0	R	It indicates the value of the LP field in the running descriptor table.

6.6.3.1.62 DMA Descriptor Upper Link Pointer (Descriptor H'24) Registers (Offset: H'944/+Channel Offset)



This register shows the Offset H'24 field value in the descriptor table. Valid only when descriptor method DMA is selected (read value has no meaning when using register method)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_LP	All 0	R	Indicates the value of the LP field in the running descriptor table.

6.6.3.1.63 DMA Rest Size Registers (Offset: H'950/+Channel Offset)

This register shows the number of Bytes for which DMA transfers have not been completed.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DMA_REST_SIZE	All 0	R	It shows the number of Bytes for which DMA transfers have not been completed. (Register/descriptor method common)

6.6.3.1.64 AXI Request Address (Lower) Registers (Offset: H'960/+Channel Offset)

This register displays the low 32 bits of the address of a transfer that is running an AXI transfer or has just completed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AXI_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AXI_REQ_ADDR	All 0	R	It shows the low 32 bits of the address of a transfer that is running an AXI transfer or has just completed. (Register/descriptor method common)

6.6.3.1.65 AXI Request Address (Upper) Registers (Offset: H'964/+Channel Offset)

This register displays the up 32 bits of the address of a transfer that is running an AXI transfer or has just completed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AXI_REQ_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AXI_REQ_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AXI_REQ_ADDR	All 0	R	It shows the up 32 bits of the address of a transfer that is running an AXI transfer or has just completed. (Register/descriptor method common)

6.6.3.1.66 PCIe Request Address (Lower) Registers (Offset: H'968/+Channel Offset)

This register displays the low 32 bits of the address of a transfer that is running an PCIe transfer or has just completed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCIE_REQ_ADDR[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCIE_REQ_ADDR[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCIE_REQ_ADDR	All 0	R	It shows the low 32 bits of the address of a transfer that is running an PCIe transfer or has just completed. (Register/descriptor method common)

6.6.3.1.67 PCIe Request Address (Upper) Registers (Offset: H'96C/+Channel Offset)

This register displays the up 32 bits of the address of a transfer that is running an PCIe transfer or has just completed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCIE_REQ_ADDR[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCIE_REQ_ADDR[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PCIE_REQ_ADDR	All 0	R	It shows the up 32 bits of the address of a transfer that is running an PCIe transfer or has just completed. (Register/descriptor method common)

6.6.3.1.68 QUE Status Registers (Offset: H'970/+Channel Offset)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

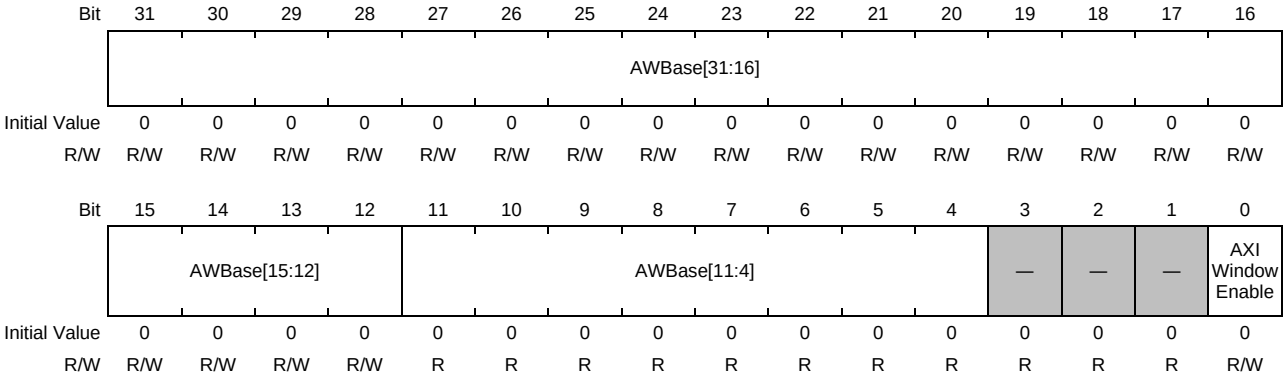
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GO_LIST	LIST_NUM			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GO_LIST	0b	R	It shows with or without a running descriptor list. 0: None 1: Yes
3 to 0	LIST_NUM	H'0	R	It shows the number of descriptor lists stacked on the QUE (not including the currently running list). When this register indicates H'8, new registrations to the QUE (write access to the QUE Entry) are disabled (discarded).

6.6.3.1.69 DMAC Error Status Registers (Offset: H'978/+Channel Offset)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BME_DOWN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	MOR_CD_PERR	MOR_CH_PERR	MOR_EP_ERR	MOR_STATUS			—	—	—	—	—	—	AXI_RESP	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

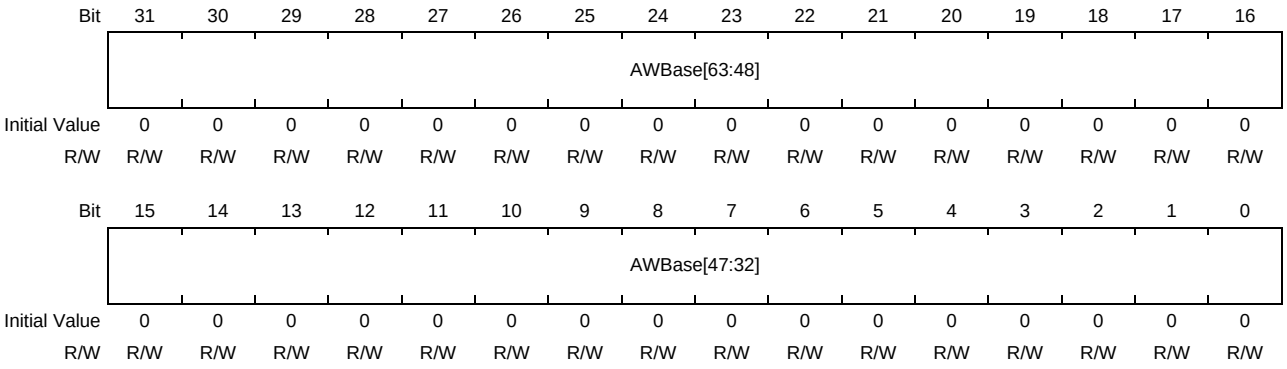


Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	BME_DOWN	0b	R	This bit is set, when a stop signal from the PCIe core by CHx_ERR error detection. Holds this bit until CHx_ERR error is cleared.
15, 14	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	MOR_CD_PERR	0b	R	This bit is set, detecting MOR_CD_PERR error by CHx_ERR error detection. Holds this bit until CHx_ERR error is cleared.
12	MOR_CH_PERR	0b	R	This bit is set, detecting MOR_CH_PERR error by CHx_ERR error detection. Holds this bit until CHx_ERR error is cleared.
11	MOR_EP_ERR	0b	R	This bit is set, detecting Poisoned Completion status by CHx_ERR error detection. Holds this bit until CHx_ERR error is cleared.
10 to 8	MOR_STATUS	All 0	R	These bits set below value, detecting MOR_STATUS is not 000b (Success) by CHx_ERR error detection. Holds these bits until CHx_ERR error is cleared. 000b: Initial value 001b: Unsuspended Request 010b: CRS 011b: Completion Timeout 100b: Completer Abort 101b: Unexpected Completion 110b: Reserved 111b: Mismatched Length (Length Overrun)
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	AXI_RESP	00b	R	These bits represent the slave response status, in AXI Master transaction. These bits are updated, in causing CHx_ERR error. Holds these bits until CHx_ERR error is cleared. 00b: Initial value 01b: Unsuspended Request 10b: SLVERR 11b: DECERR

Note: CHx_ERR (x = 7 to 0).

6.6.3.1.70 AXI Window Base (Lower) Registers (H'1000 + Offset: H'00/H'20/H'40/…/H'E0)

This register is Window setting register for Lower address translation when accessing AXI from PCIe.

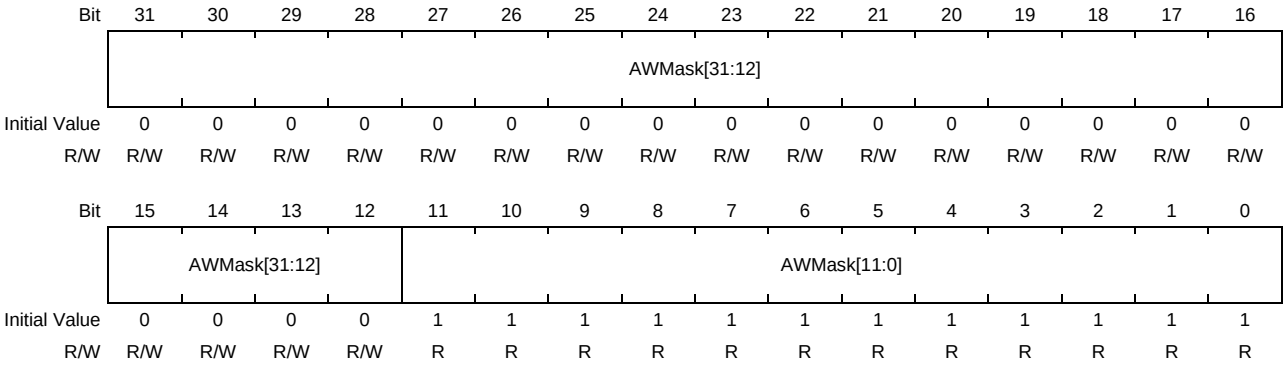


Sets the base point for PCIe side addresses. The configurable area is a 4K boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	AWBase	All 0	R/W	Window setting register for address translation when accessing AXI from PCIe. The configurable area is a 4K boundary.
11 to 4	AWBase	All 0	R	H'00 fixed
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	AXI Window Enable	0b	R/W	Enable setting for the AXI Window. 0: Window disabled 1: Window enabled

6.6.3.1.71 AXI Window Base (Upper) Registers (H'1000 + Offset: H'04/H'24/H'44/…/H'E4)

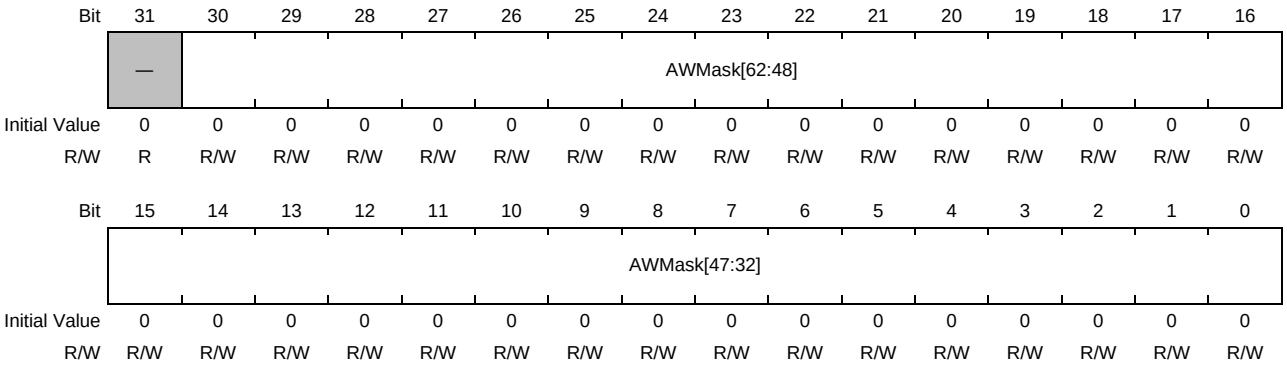
This register is Window setting register for Upper address translation when accessing AXI from PCIe.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	AWBase	All 0	R/W	Window setting register for address translation when accessing AXI from PCIe.

6.6.3.1.72 AXI Window Mask (Lower) Registers (H'1000 + Offset: H'08/H'28/H'48/…/H'E8)

This register is Window setting register for Lower address translation when accessing AXI from PCIe.

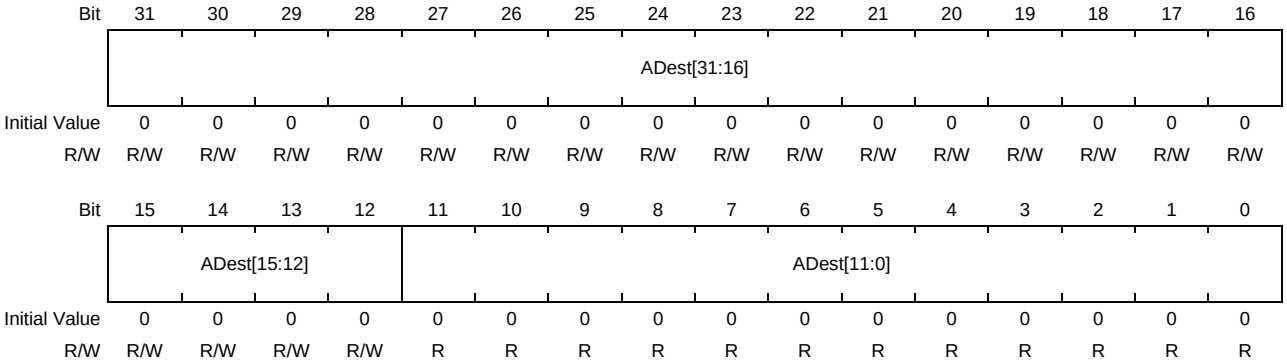


Set the Window from the address set in the AWBase register to the area of the set number of bits. The configurable area is $4K \times 2^N$ bytes.

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	AWMask	All 0	R/W	Set the Window from the address set in the AWBase register to the area of the set number of bits. The setting is set from the low order bit to 1. Therefore, the configurable area is $4K \times 2^N$ bytes.
11 to 0	AWMask	All 1	R	H'FFF fixed

6.6.3.1.73 AXI Window Mask (Upper) Registers (H'1000 + Offset: H'0C/H'2C/H'4C/…/H'EC)

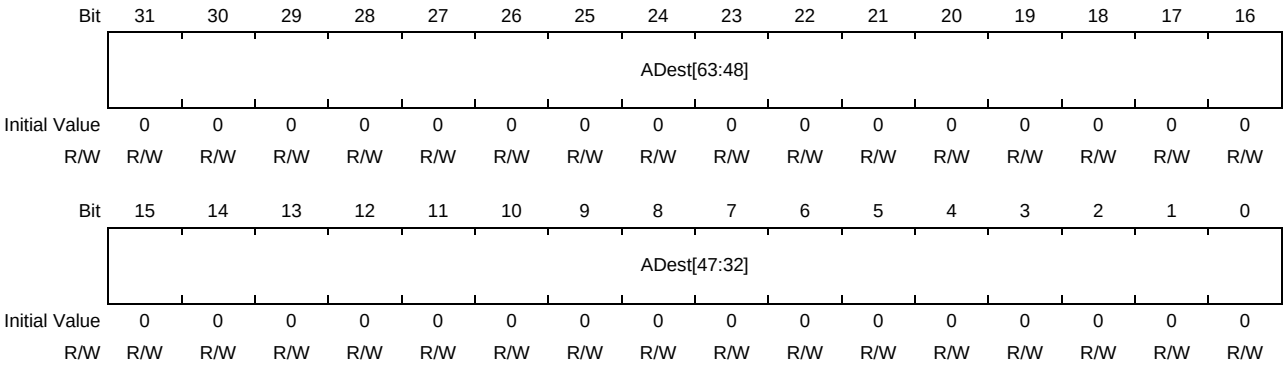
This register is Window setting register for Upper address translation when accessing AXI from PCIe.



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 0	AWMask	All 0	R/W	Set the Window from the address set in the AWBase register to the area of the set number of bits. The setting is set from the low order bit to 1.

6.6.3.1.74 AXI Destination (Lower) Registers (H'1000 + Offset: H'10/H'30/H'50/H'70/…/H'F0)

This register is Window setting register for Lower address translation when accessing AXI from PCIe.

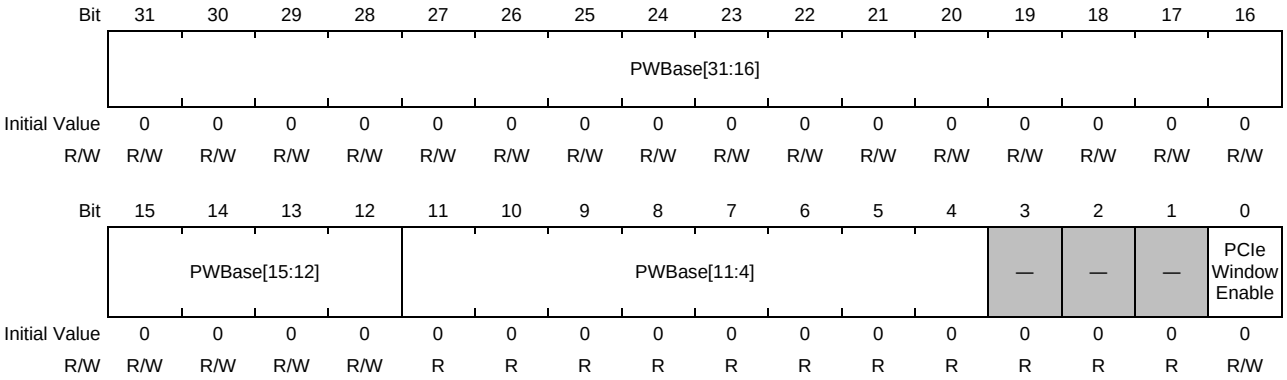


From the AXI side, set the Window point in the address space. The configurable area is a 4K boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	ADest	All 0	R/W	Sets the window base point in the address space from the AXI side. The configurable area is a 4K boundary.
11 to 0	ADest	All 0	R	H'000 fixed

6.6.3.1.75 AXI Destination (Upper) Registers (H'1000 + Offset: H'14/H'34/H'54/H'74/…/H'F4)

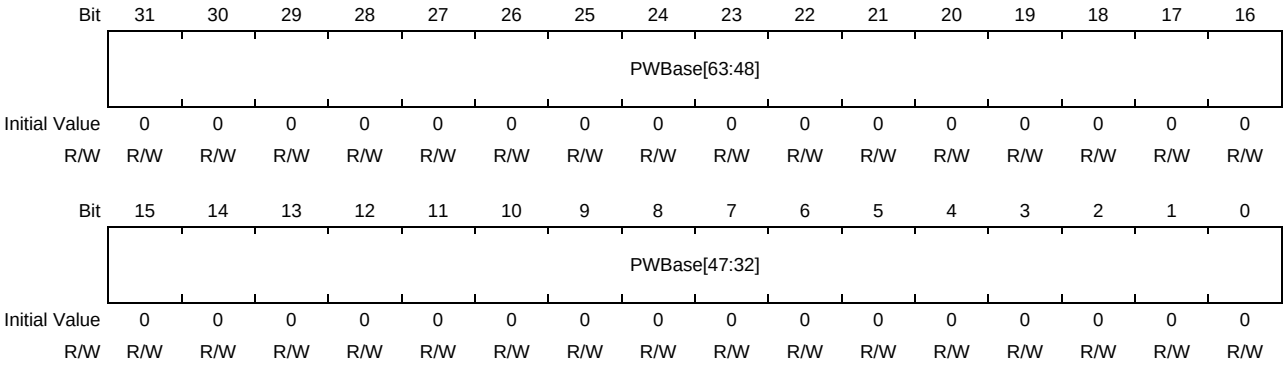
This register is Window setting register for Upper address translation when accessing AXI from PCIe.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADest	All 0	R/W	Sets the window base point in the address space from the AXI side.

6.6.3.1.76 PCIe Window Base (Lower) Registers (H'1000 + Offset: H'100/H'120/H'140/…/H'1E0)

This register is Window setting register for Lower address translation when accessing PCIe from AXI.

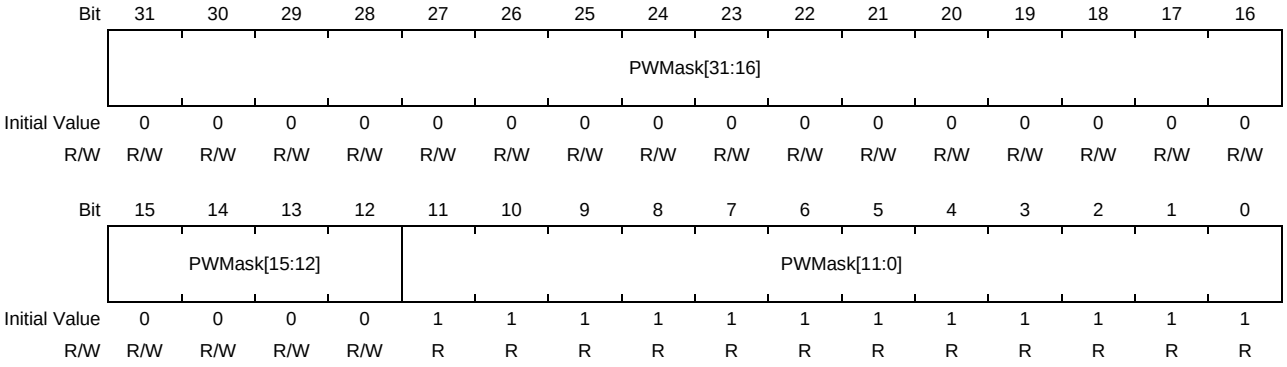


Sets the base point for AXI side addresses. The configurable area is a 4K boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PWBase	All 0	R/W	Sets the base point for AXI side addresses. The configurable area is a 4K boundary.
11 to 4	PWBase	All 0	R	H'00 fixed
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	PCIe Window Enable	0b	R/W	PCIe Window Enable setting. 0: Window disabled 1: Window enabled

6.6.3.1.77 PCIe Window Base (Upper) Registers (H'1000 + Offset: H'104/H'124/H'144/…/H'1E4)

This register is Window setting register for Upper address translation when accessing PCIe from AXI.

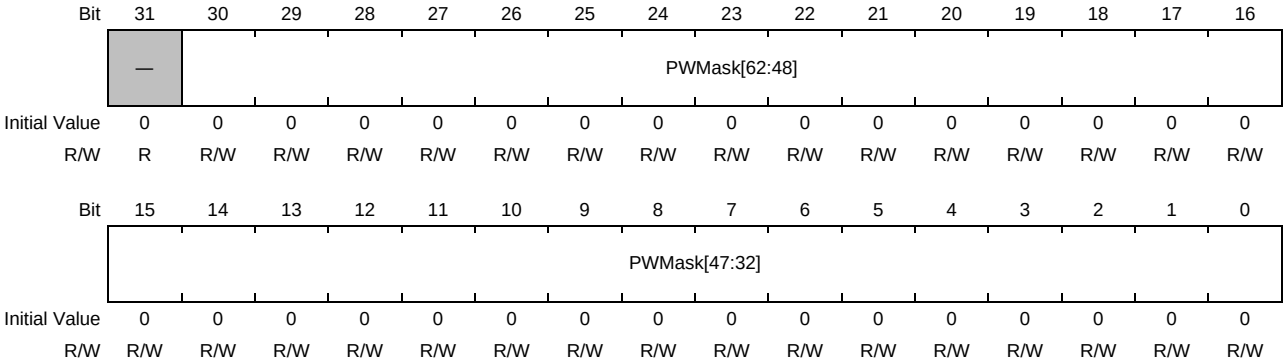


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PWBase	All 0	R/W	Sets the base point for AXI side addresses. The configurable area is a 4K boundary.

6.6.3.1.78 PCIe Window Mask (Lower) Registers (H'1000 + Offset: H'108/H'128/H'148/…/H'1E8)

This register is Window setting register for Lower address translation when accessing PCIe from AXI.

Set the Window from the address set in the PWBase register to the area of the set number of bits.



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	PWMask	All 0	R/W	Set the Window from the address set in the PWBase register to the area of the set number of bits. The setting is set from the low order bit to 1.
11 to 0	PWMask	All 1	R	H'FFF fixed

6.6.3.1.79 PCIe Window Mask (Upper) Registers (H'1000 + Offset: H'10C/H'12C/H'14C/…/H'1EC)

This register is Window setting register for Upper address translation when accessing PCIe from AXI.

Set the Window from the address set in the PWBase register to the area of the set number of bits.

Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 0	PWMask	All 0	R/W	Set the Window from the address set in the PWBase register to the area of the set number of bits. The setting is set from the low order bit to 1.

6.6.3.1.80 PCIe Destination (Lower) Registers (H'1000 + Offset: H'110/H'130/H'150/H'170/…/H'1F0)

This register is Window setting register for Lower address translation when accessing PCIe from AXI.

Set the Window point in the PCIe side address space. The configurable area is a 4K boundary.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

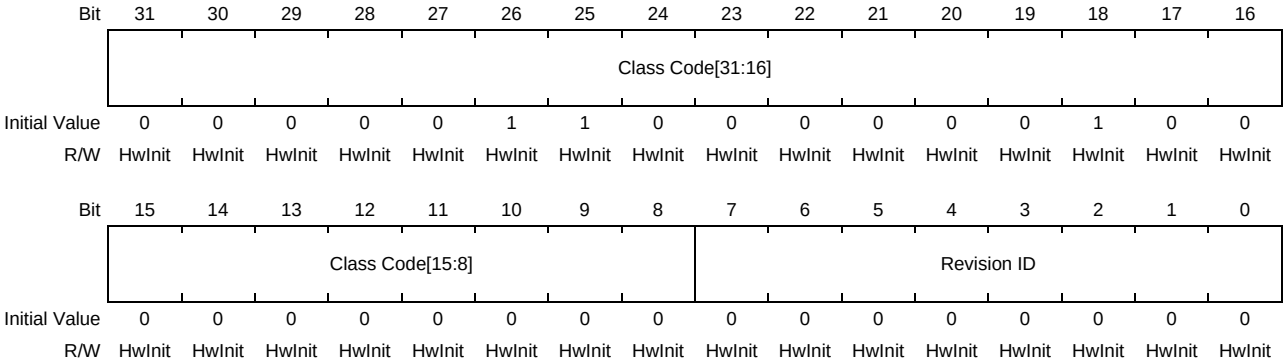
6.6.3.2 PCI Express Configuration Registers (Type1)

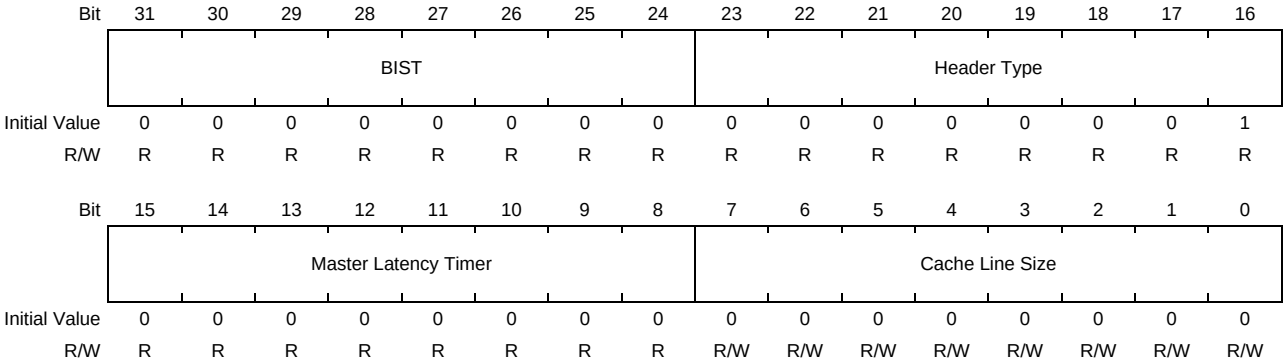
6.6.3.2.1 Vendor and Device ID (Offset: H'6000)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 16	Device ID	H'0033	HwInit	RST_LOAD_B	Indicates the manufacturer of the device. Set a fixed value.
15 to 0	Vendor ID	H'1912	HwInit	RST_LOAD_B	Used to identify the device manufactured by the manufacturer specified by Vendor ID. Set a fixed value.



6.6.3.2.2 Command and Status (Offset: H'6004)

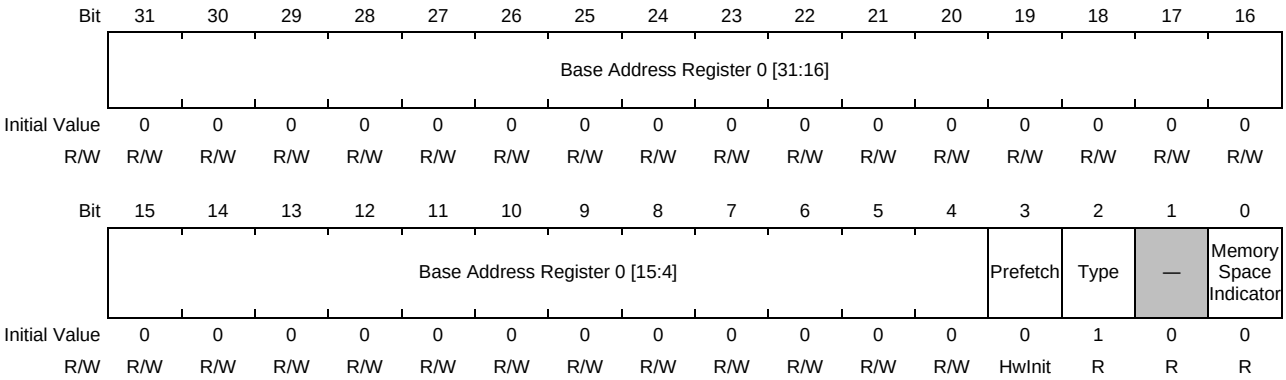
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	Detected Parity Error	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
30	Signaled System Error	0b	R/W1C	RST_CFG_B	The SERR Enable bit is set to 1b when this macro sends an ERR_FATAL or ERR_NONFATAL Message.
29	Received Master Abort	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
28	Received Target Abort	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
27	Signaled Target Abort	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
26, 25	DEVSEL Timing	00b	R	—	Reserved Does not apply to PCI Express.
24	Master Data Parity Error	0b	R	—	Not applicable for Root Complex devices. 0b fixed.
23 to 21	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	Capabilities List	1b	R	RST_CFG_B	All PCI Express devices must implement PCI Express Capability, so this bit is fixed at 1b.
19	Interrupt Status	0b	R	RST_CFG_B	Indicates the interrupt status of the device.
18, 17	—	00b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	Immediate Readiness	0b	R	—	Fixed to 0b.
15 to 11	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	Interrupt Disable	0b	R/W	RST_CFG_B	Suppresses the sending of Assert_INTx Messages. Not used for Root Complex devices.
9	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
8	SERR# Enable	0b	R/W	RST_CFG_B	When set to 1b, this bit notifies the Advanced Error Reporting registers of Non-Fatal Errors and Fatal Errors that occur within the Root Complex. *Note*: Even if this bit is not set, the Advanced Error Reporting registers are notified of an error when a bit related to Error Reporting in the Device Control register of PCI Express Capability is set to “1”.
7	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	Parity Error Response	0b	R/W	RST_CFG_B	Controls the behavior when a Poisoned TLP is sent or received. *Note*: The Detected Parity Error field in the Status register, the Device Status register in the PCI Express Capability, and the Uncorrectable Error in the Advanced Error Reporting Capability Error Logging to the Status register is performed regardless of the setting of this bit.
5 to 3	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	Bus Master Enable	0b	R/W	RST_CFG_B	Controls whether the device acts as a bus master.
1	Memory Space Enable	0b	R/W	RST_CFG_B	Controls whether to respond to accesses to memory space.
0	I/O Space Enable	0b	R	—	Does not respond to I/O space accesses. 0b fixed

6.6.3.2.3 Revision ID and Class Code (Offset: H'6008)

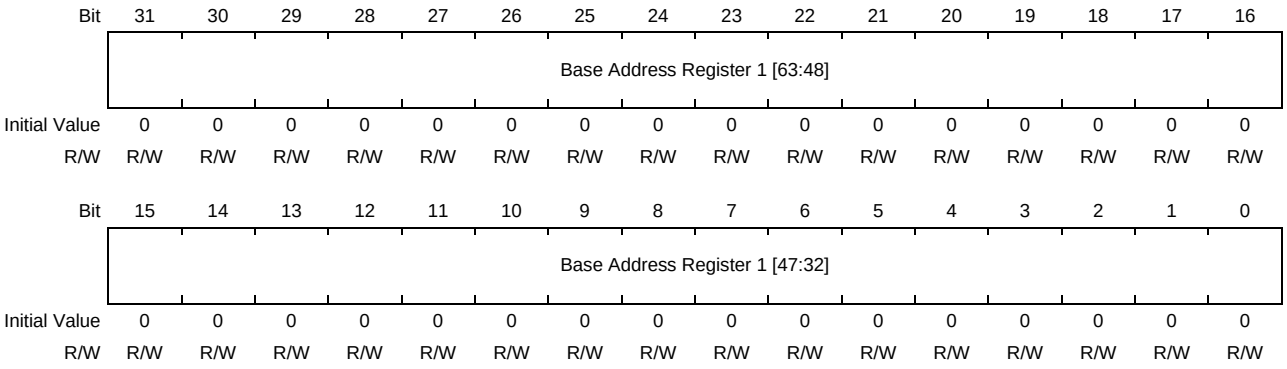
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 8	Class Code	H'06_040 0	HwInit	RST_LOAD_B	Information indicating the type and function of the device, the definition of the value is divided into the following two bytes by the PCI SIG: Bit [31:24]: Base class (H'06) Bit [23:16]: Sub-class (H'04) Bit [15:8]: Programming interface (H'00) Set a fixed value. The initial value is parameter settable.
7 to 0	Revision ID	All 0	HwInit	RST_LOAD_B	An 8-bit ID used to represent the revision of a particular device identified by its Vendor ID and Device ID. Set a fixed value. The initial value is parameter settable.



6.6.3.2.4 Cache Line and Header Type (Offset: H'600C)

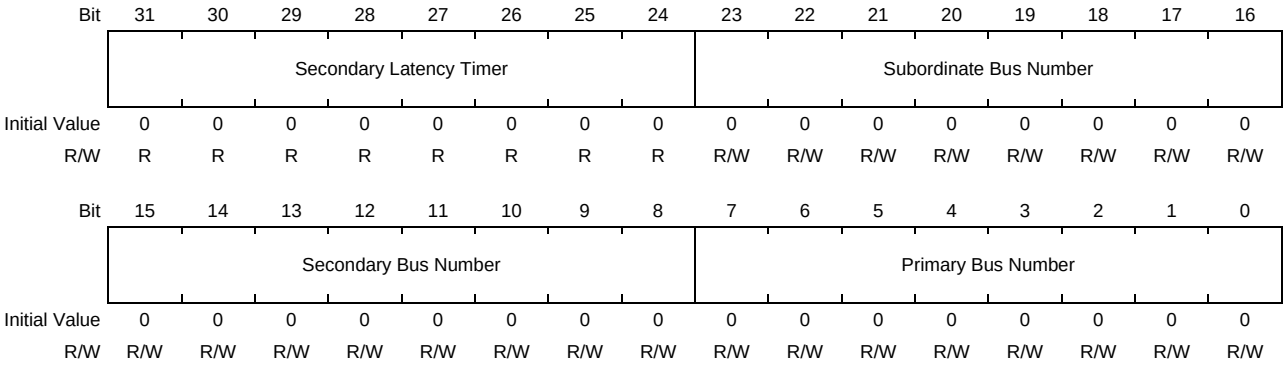
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	BIST	H'00	R	—	It does not support the BIST register function, so it is fixed at H'00.
23 to 16	Header Type	H'01	R	—	Root Complex: H'01 fixed.
15 to 8	Master Latency Timer	H'00	R	—	Master delay timer register not used in PCI Express, so it is fixed at H'00.
7 to 0	Cache Line Size	H'00	R/W	RST_CFG_B	Implemented as a read-write field for legacy compatibility, but the value set has no effect on this device.

6.6.3.2.5 Base Address Register 0 (Offset: H'6010)



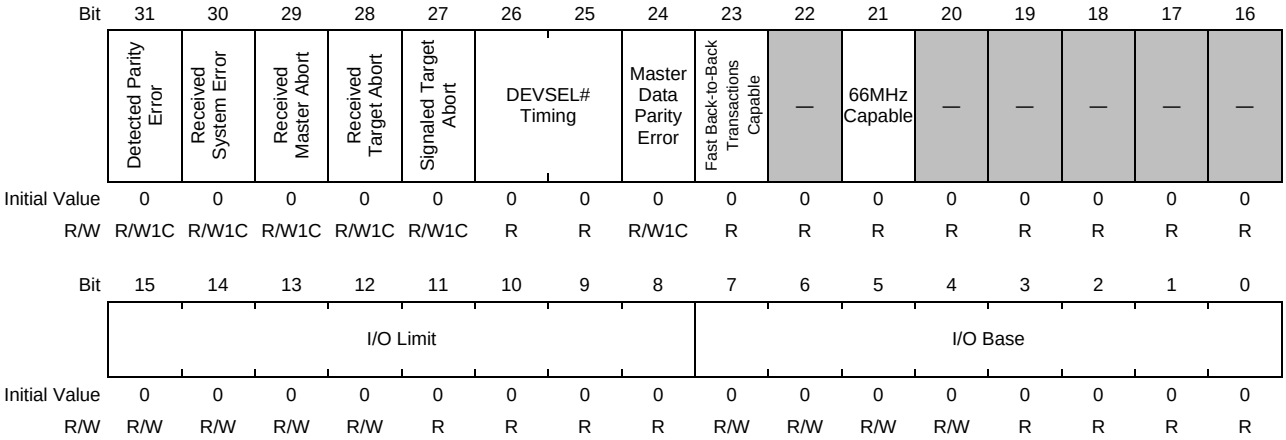
The combination with Base Address Register 1 (BAR1) constitutes a 64 bits Memory Space.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 4	Base Address Register 0	All 0	R/W	RST_CFG_B	It indicates the base address. Depending on the size of the address block required, some low-order bits of this field should be implemented as 0b fixed Read Only bits. In this macro, the Read Only bit can be set in the Base Address 0 Mask register (Offset: H'0A0).
3	Prefetch	0b	HwInit	RST_LOAD_B	The Prefetchable Memory Base and Prefetchable Memory Limit registers must indicate that 64-bit addresses are supported, as defined in PCI-to-PCI Bridge Architecture Specification. 0: Disable 1: Enable
2	Type	1b	R	—	The 64-bit addresses are supported, as defined in PCI-to-PCI Bridge Architecture Specification. 0b: 32bit address 1b: 64bit address 1b: Fixed to use 64bit Address
1	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Memory Space Indicator	0b	R	—	0b fixed to indicate memory space.



6.6.3.2.6 Base Address Register 1 (Offset: H'6014)

The combination with Base Address Register 0 (BAR0) constitutes a 64 bits Memory Space.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Base Address Register 1	All 0	R/W	RST_CFG_B	Base Address Register 1 (64bit Upper Address) It indicates the high-order 32 bits of the base address.

6.6.3.2.7 Bus Number Register (Offset: H'6018)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	Secondary Latency Timer	H'00	R	—	PCI Express does not use H'00 fixed
23 to 16	Subordinate Bus Number	H'00	R/W	RST_CFG_B	Set the Subordinate Bus Number. Default: H'00
15 to 8	Secondary Bus Number	H'00	R/W	RST_CFG_B	Set the Subordinate Bus Number. Default: H'00
7 to 0	Primary Bus Number	H'00	R/W	RST_CFG_B	Set the Primary Bus Number. Default: H'00

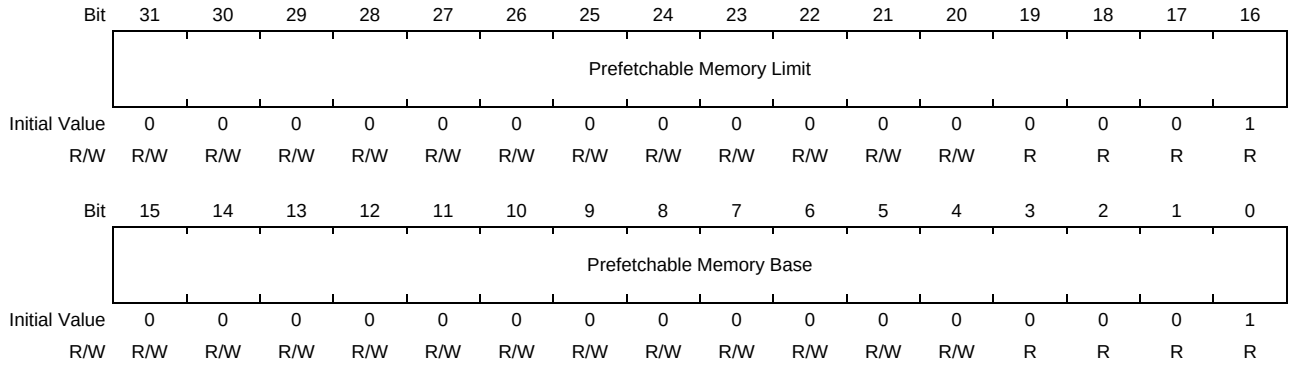
6.6.3.2.8 I/O Base/Limit and Secondary Status (Offset: H'601C)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	Detected Parity Error	0b	R/W1C	RST_CFG_B	It is set to 1b when a Poisoned TLP is received, regardless of the setting of the Parity Error Response Enable bit in the Bridge Control and Interrupt Register (Offset: H'03C).
30	Received System Error	0b	R/W1C	RST_CFG_B	It is set to 1b when ERR_FATAL or ERR_NONFATAL Message is received.
29	Received Master Abort	0b	R/W1C	RST_CFG_B	The Completion Status field is set to 1b when Completion of an Unsupported Request is received.
28	Received Target Abort	0b	R/W1C	RST_CFG_B	The Completion Status field is set to 1b when Completion of Completer Abort is received.
27	Signaled Target Abort	0b	R/W1C	RST_CFG_B	The Completion Status field is set to 1b when a Completion of Completer Abort (Posted or Non-Posted Request) is sent.
26, 25	DEVSEL# Timing	00b	R	—	PCI Express does not use it, so it is fixed at 00b.
24	Master Data Parity Error	0b	R/W1C	RST_CFG_B	The Parity Error Response bit is set to 1b and is set to 1b when the following two conditions occur: 1) The Requester (BME) received Completion TLP of Poisoned. 2) The Requester (BME) sent the Write Request TLP of Poisoned. If the Parity Error Response bit is 0b, this bit is not set to 1b.
23	Fast Back-to-Back Transactions Capable	0b	R	—	PCI Express does not use it 0b fixed
22	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	66MHz Capable	0b	R	—	PCI Express does not use it 0b fixed
20 to 16	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 12	I/O Limit	All 0	R/W	—	This field is not used. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11 to 8		All 0	R	—	This field is not used. When read, the initial value is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
7 to 4	I/O Base	All 0	R/W	—	This field is not used. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3 to 0		All 0	R	—	This field is not used. When read, the initial value is read. The written value will be ignored.

6.6.3.2.9 Memory Base/Limit Register (Offset: H'6020)

Although this register exists in the Base Spec Type 1, they are intended exclusively for Bridge (switch) use. Therefore, when used in a Root Complex, this register is not utilized.

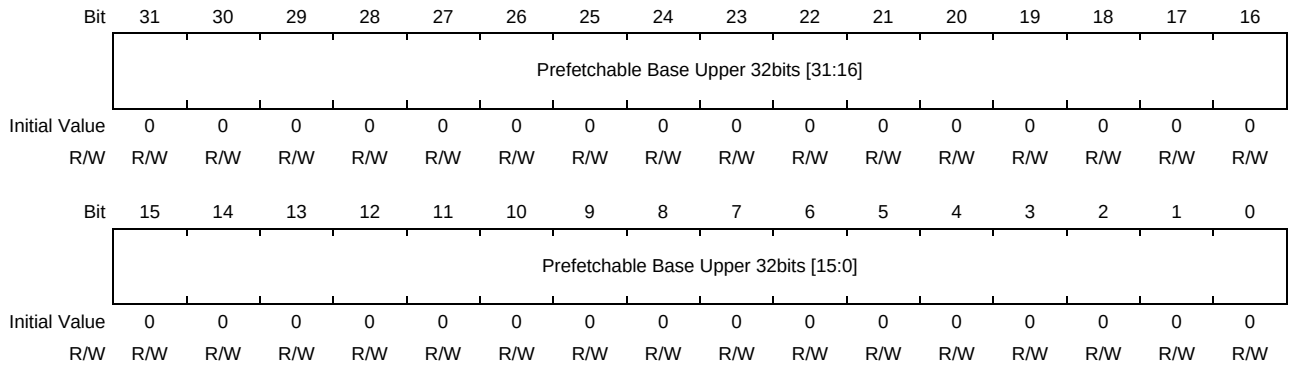


Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Memory Limit															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Memory Base															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 20	Memory Limit	H'FFF0	R/W	RST_CFG_B	Not used in this product. Do not change from the initial value.
19 to 16			R		
15 to 4	Memory Base	H'FFF0	R/W	RST_CFG_B	Not used in this product. Do not change from the initial value.
3 to 0			R		

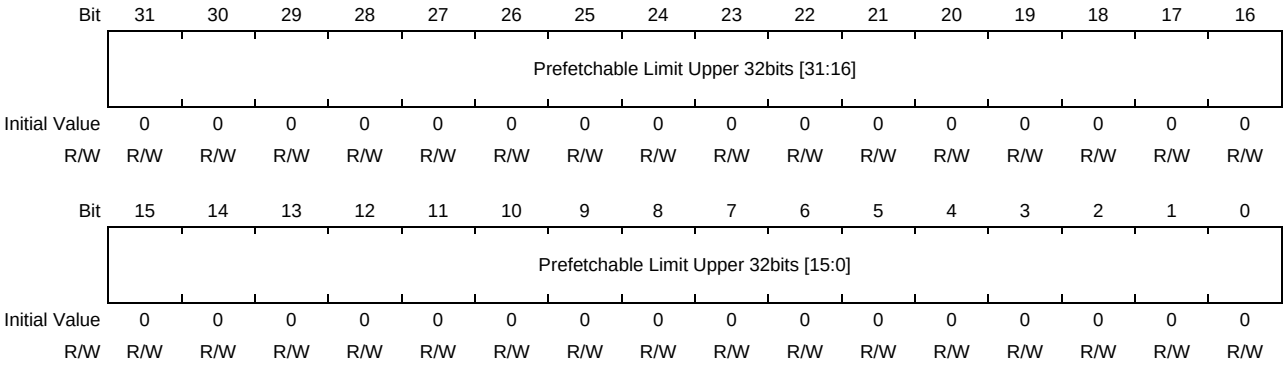
6.6.3.2.10 Prefetchable Memory Base/ Limit Register (Offset: H'6024)



Although this register exists in the Base Spec Type 1, they are intended exclusively for Bridge (switch) use. Therefore, when used in a Root Complex, this register is not utilized.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 20	Prefetchable Memory Limit	H'0001	R/W	RST_CFG_B	Not used in this product. Do not change from the initial value.
19 to 16			R		
15 to 4	Prefetchable Memory Base	H'0001	R/W	RST_CFG_B	Not used in this product. Do not change from the initial value.
3 to 0			R		

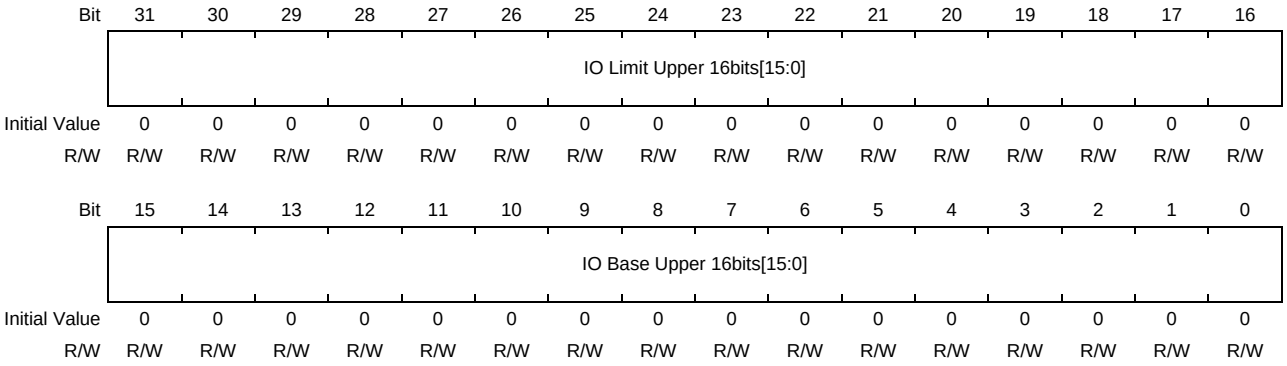
6.6.3.2.11 Prefetchable Base Upper 32Bits Registers (Offset: H'6028)



Although this register exists in the Base Spec Type 1, they are intended exclusively for Bridge (switch) use. Therefore, when used in a Root Complex, this register is not utilized.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Prefetchable Base Upper 32bits	All 0	R/W	RST_CFG_B	Not used in this product. Do not change from the initial value.

6.6.3.2.12 Prefetchable Limit Upper 32Bits (Offset: H'602C)



Although this register exists in the Base Spec Type 1, they are intended exclusively for Bridge (switch) use. Therefore, when used in a Root Complex, this register is not utilized.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Prefetchable Limit Upper 32bits	All 0	R/W	RST_CFG_B	Not used in this product. Do not change from the initial value.

6.6.3.2.13 I/O Base/Limit Upper 16-Bit Register (Offset: H'6030)

This register forms a 64-bit memory space in combination with Base Address Register 0 (BAR0).

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 16	IO Limit Upper 16bits[15:0]	0h	R/W	RST_CFG_B	This is an unused field in this macro.
15 to 0	IO Base Upper 16bits[15:0]	0h	R/W	RST_CFG_B	This is an unused field in this macro.

6.6.3.2.14 Capability Pointer (Offset: H'6034)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
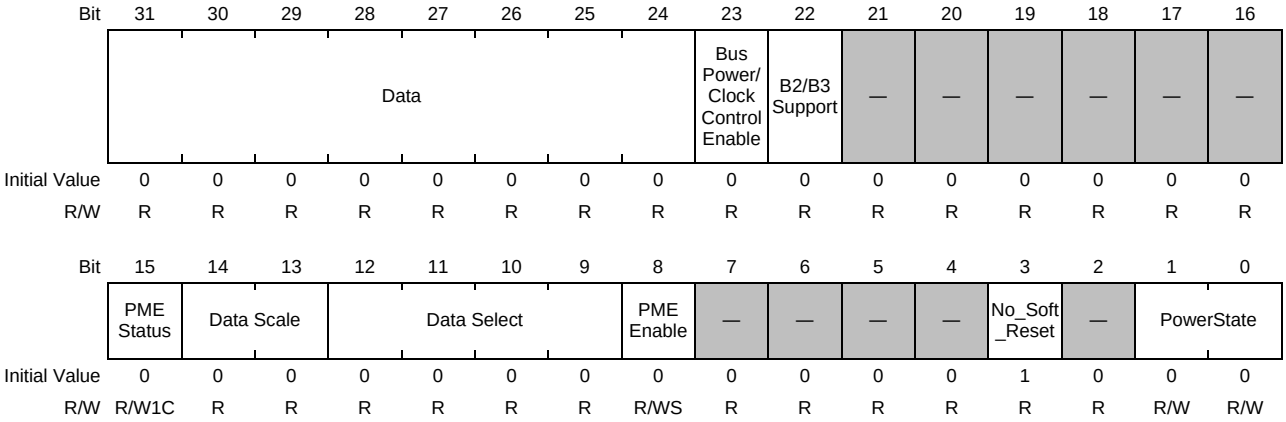
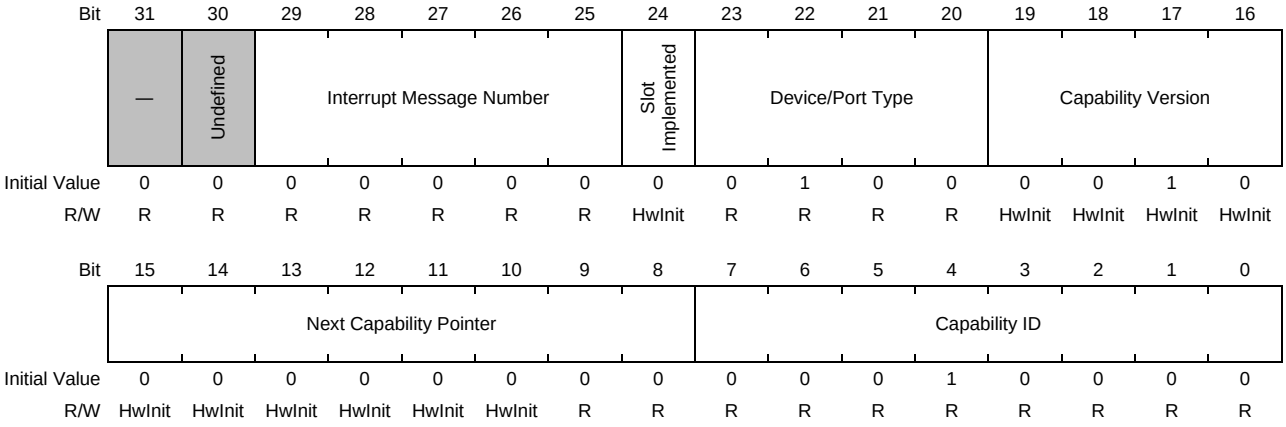
31 to 28	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	Discard Timer SERR Enable	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
26	Discard Timer Status	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
25	Secondary Discard Timer	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
24	Primary Discard Timer	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
23	Fast Back-to-Back Enable	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
22	Secondary Bus Reset	0b	R/W	RST_CFG_B	Transition to Hot Reset state with 1b write
21	Master Abort Mode	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed
20	VGA 16-bit Decode	0b	R/W	RST_CFG_B	Initial value 0b It is not used in this macro.
19	VGA Enable	0b	R/W	RST_CFG_B	Initial value 0b It is not used in this macro.
18	ISA Enable	0b	R/W	RST_CFG_B	Initial value 0b It is not used in this macro.
17	SERR# Enable	0b	R/W	RST_CFG_B	1b Write enables INT_SERR * interrupt terminal notification
16	Parity Error Response Enable	0b	R/W	RST_CFG_B	1b Set the Master Data Parity Error bit in the Secondary Status register when Poisoned TLP is received by writing.
15 to 8	Interrupt Pin	H'00	HwInit	RST_LOAD_B	The Interrupt Pin register is a read-only register that identifies the legacy interrupt Message(s) the Function uses H'00 fixed.
7 to 0	Interrupt Line	H'00	R/W	RST_CFG_B	The Interrupt Line register communicates interrupt line routing information. H'00 fixed.



6.6.3.2.16 PM Capabilities (Offset: H'6040)

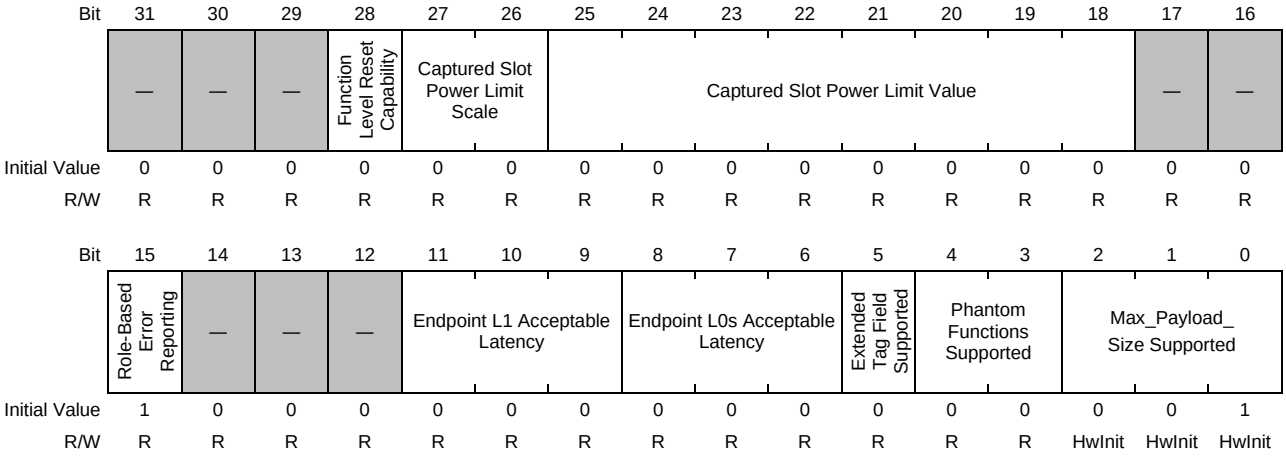
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 27	PME Support	01001b	HwInit	RST_LOAD_B	Indicates with or without PME support of each Device State. xxxx1: Supports D0 xxx1x: Supports D1 xx1xx: Supports D2 x1xxx: Supports D3hot 1xxxx: Supports D3cold (Not supported)
26	D2 Support	0b	HwInit	RST_LOAD_B	Indicates with or without D2 Power Management State support. 0: Not Support 1: Support
25	D1 Support	0b	HwInit	RST_LOAD_B	Indicates with or without D1 Power Management State support. 0: Not Support 1: Support
24 to 22	AUX_Current	000b	HwInit	RST_LOAD_B	Indicates 3.3 Vaux auxiliary current (Maximum current value, supplied by the auxiliary power supply). 111b: 375 mA 110b: 320 mA 101b: 250 mA 100b: 220mA 011b: 160 mA 010b: 100 mA 001b: 55 mA 000b: 0 (self-powered) (Read value returns 000b. AUX not supported)
21	DSI	0b	HwInit	RST_LOAD_B	Indicates with or without to use DSI (Device Specific Initialization). 0: Not Support 1: Support
20	Immediate_Readiness_on_Return_to_D0	0b	R	—	This Function is guaranteed to be ready to successfully complete valid accesses immediately after being set to D0. 0b fixed
19	PME Clock	0b	R	—	Reserved: Does not apply to PCI Express. 0b fixed.
18 to 16	Version	011b	HwInit	RST_LOAD_B	PCI Power Management Interface Specification Rev.1.2 011b fixed

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
15 to 10	Next Capability Pointer	H'60	R	RST_LOAD_B	Indicates the PCI Express Capability starting address. This field provides an offset into the Function's Configuration Space pointing to the location of next item in the capabilities list. If there are no additional items in the capabilities list, this field is set to H'00.
9, 8				—	
7 to 0	Capability ID	H'01	R	—	Indicates PCI Power Management Capability. H'01 fixed



6.6.3.2.17 PM Status/Control (Offset: H'6044)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	Data	H'00	R	—	Does not support. Fixed H'00.
23	Bus Power/Clock Control Enable	0b	R	—	Does not support. Fixed 0b.
22	B2/B3 Support	0b	R	—	Does not support. Fixed 0b.
21 to 16	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15	PME Status	0b	R/W1C	—	Indicates that a PME assert factor is occurring. When this bit is 1b, indicates that there is a PME assert factor.
14,13	Data Scale	00b	R	—	Does not support. Fixed 00b.
12 to 9	Data Select	H'0	R	—	Does not support. Fixed H'0.
8	PME Enable	0b	R/WS	RST_RSM_B	Controls the assertion of the PME. When this bit is 1b, PME assertions are enabled. Assert PME if PME_Status is set. PCI Express performs Link wake-up processing and then PME assert processing by sending a PM_PME Message. *Note*: According to the value of PM Capabilities register PME Support [4] (PME Support in D3cold), the specifications are as follows. – PME Support [4] =1b Reset: RST_RSM_B PME – Support [4] = 0b Reset: RST_CFG_B
7 to 4	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	No_Soft_Reset	1b	R	—	Indicates that no internal reset occurs inside the device during the power state transition from D3hot to D0.
2	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
1 to 0	PowerState	00b	R/W	RST_CFG_B	Set the PCI Device State. 00b: D0 (Default) 01b: D1 (Setting prohibited) 10b: D2 (Setting prohibited) 11b: D3hot

6.6.3.2.18 PCI Express Capability (Offset: H'6060)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 25	Interrupt Message Number	All 0	R	—	This field indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability structure. 00000b: fixed
24	Slot Implemented	0b	HwInit	RST_LOAD_B	Setting 1b to this bit, indicates that the PCI Express Link (Down Port) is connected to the Slot.
23 to 20	Device/Port Type	0100b	R	—	Indicates the PCI Express Root Complex device. 0000b: PCI Express Endpoint device 0001b: Legacy PCI Express Endpoint device 0100b: Root Port of PCI Express Root Complex (Default) 0101b: Upstream Port of PCI Express Switch 0110b: Downstream Port of PCI Express Switch 0111b: PCI Express-to-PCI/PCI-X Bridge 1000b: PCI/PCI-X-to-PCI Express Bridge 1001b: Root Complex Integrated Endpoint Device 1010b: Root Complex Event Collector All other encodings are reserved.
19 to 16	Capability Version	0010b	HwInit	—	Indicates the version of the PCI Express Capability Structure. 0010b: fixed
15 to 10	Next Capability Pointer	H'00	HwInit	RST_LOAD_B	Indicates that this Capability List is a final List (H'00 fixed) The lower two bits [9: 8] are Reserved and fixed at 00b.
9, 8			R	—	
7 to 0	Capability ID	H'10	R	—	Indicates the PCI Express Capability. H'10: fixed.

6.6.3.2.19 Device Capabilities (Offset: H'6064)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 29	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	Function Level Reset Capability	0b	R	—	It does not apply to Root Complex devices. 0b fixed.
27, 26	Captured Slot Power Limit Scale	00b	R	—	It does not apply to Root Complex devices. 00b fixed.
25 to 18	Captured Slot Power Limit Value	All 0	R	—	It does not apply to Root Complex devices. H'00 fixed.
17, 16	—	00b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15	Role-Based Error Reporting	1b	R	—	1b set if implementing the Error Reporting feature (compliant with the PCI Express Base Spec 1.1 or later). 1b fixed in this core.
14 to 12	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 9	Endpoint L1 Acceptable Latency	000b	R	—	It does not apply to Root Complex devices. 000b fixed.
8 to 6	Endpoint L0s Acceptable Latency	000b	R	—	It does not apply to Root Complex devices. 000b fixed.
5	Extended Tag Field Supported	0b	R	—	Extended Tag support. 0b: 5-bit Tag field supported 1b: 8-bit Tag field supported 0b fixed in this core.
4, 3	Phantom Functions Supported	00b	R	—	Phantom Function is not supported. 00b fixed.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
2 to 0	Max_Payload_Size Supported	001b	HwInit	RST_LOAD_B	This field indicates the maximum payload size that the Function can support for TLPs. 000b: 128 bytes max payload size 001b: 256 bytes max payload size (Default) 010b: 512 bytes max payload size 011b: 1024 bytes max payload size 100b: 2048 bytes max payload size 101b: 4096 bytes max payload size 110b: Reserved 111b: Reserved

6.6.3.2.20 Device Control/Status (Offset: H'6068)

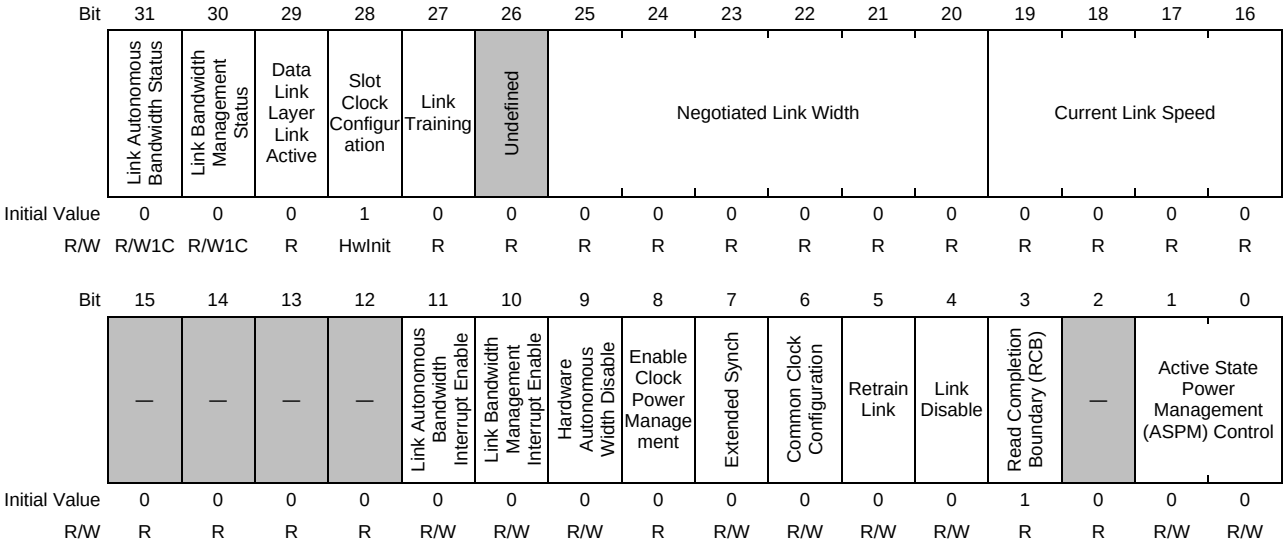
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 23	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	Emergency Power Reduction Detected	0b	R	—	Not supported 0b fixed.
21	Transaction Pending	0b	R	—	It does not apply to Root Complex devices. 0b fixed.
20	AUX Power Detected	0b	R	—	Indicates AUX Power is detected. Not supported 0b fixed
19	Unsupported Request Detected	0b	R/W1C	RST_CFG_B	Indicates that an Unsupported Request Error was detected. 1b has detected an error.
18	Fatal Error Detected	0b	R/W1C	RST_CFG_B	Indicates that a Fatal Error has been detected. 1b has detected an error.
17	Non-Fatal Error Detected	0b	R/W1C	RST_CFG_B	Indicates that a Non-Fatal error has been detected. 1b has detected an error.
16	Correctable Error Detected	0b	R/W1C	RST_CFG_B	Indicates that a Correctable Error has been detected. 1b has detected an error.
15	Initiate Function Level Reset	0b	R	—	A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b.
14 to 12	Max_Read_Request_Size	010b	R/W	RST_CFG_B	Set Max_Read_request_Size. 000b: 128 bytes max read request size 001b: 256 bytes max read request size 010b: 512 bytes max read request size (Default) 011b: 1024 bytes max read request size 100b: 2048 bytes max read request size 101b: 4096 bytes max read request size 110b: Reserved 111b: Reserved

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
11	Enable No Snoop	0b	R	—	This macro does not use No Snoop Attribute as a Requester.
10	Auxiliary (AUX) Power PM Enable	0b	R/W	RST_RSM_B	Set to with or without use Auxiliary (AUX) power. Not supported 0b fixed. 0: Not support (Default) 1: Support If this bit is set to 1b (Enable), AUX_Current (Power Management Capabilities register) must be set.
9	Phantom Functions Enable	0b	R	—	Phantom Function is not supported. 0b fixed.
8	Extended Tag Field Enable	0b	R/W	RST_CFG_B	Extended Tag is not supported. It uses only 5 Bit-Tag.
7 to 5	Max_Payload _Size	000b	R/W	RST_CFG_B	Set Max_Payload_Size. 000b: 128 bytes max payload size (Default) 001b: 256 bytes max payload size 010b: 512 bytes max payload size 011b: 1024 bytes max payload size 100b: 2048 bytes max payload size 101b: 4096 bytes max payload size 110b: Reserved 111b: Reserved
4	Enable Relaxed Ordering	1b	R/W	RST_CFG_B	Set to with or without Relaxed Ordering use as a Requester. 0: Not support 1: Support
3	Unsupported Request Reporting Enable	0b	R/W	RST_CFG_B	ERR_NONFATAL with Unsupported Request detection or control the generation of the ERR_FATAL Message. Message generation is enabled on 1b.
2	Fatal Error Reporting Enable	0b	R/W	RST_CFG_B	Controls the generation of the ERR_FATAL Message. Message generation is enabled on 1b.
1	Non-Fatal Error Reporting Enable	0b	R/W	RST_CFG_B	Controls the generation of the ERR_NONFATAL Message. Message generation is enabled on 1b.
0	Correctable Error Reporting Enable	0b	R/W	RST_CFG_B	Controls the generation of the ERR_COR Message. Message generation is enabled on 1b.

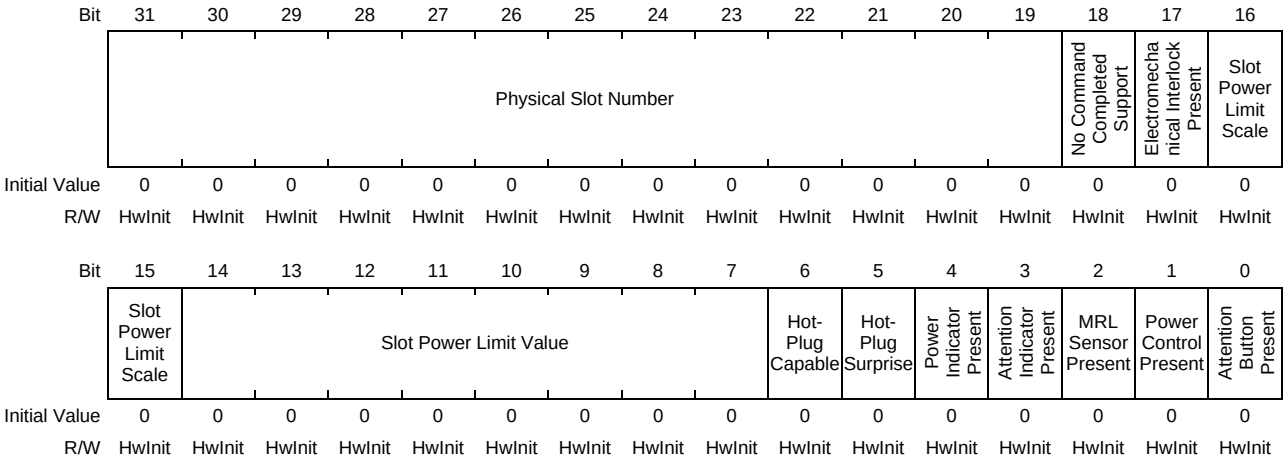


6.6.3.2.21 Link Capabilities (Offset: H'606C)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	Port Number	All 0	HwInit	—	Indicate PCI Express Link Port number.
23	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	ASPM Optionality Compliance	1b	HwInit	RST_LOAD_B	This bit must be set to 1b in all Functions. Components implemented against certain earlier versions of this specification will have this bit set to 0b. 1b fixed.
21	Link Bandwidth Notification Capability	1b	HwInit	RST_LOAD_B	Indicates support for Link Bandwidth Notification status and Interrupt features.
20	Data Link Layer Link Active Reporting Capable	1b	HwInit	RST_LOAD_B	Indicates support for the DL_Active state reporting feature in the Data Link Control and Management State Machine.
19	Surprise Down Error Reporting Capable	0b	HwInit	RST_LOAD_B	0b fixed. It does not support detection and reporting of Surprise Down error.
18	Clock Power Management	0b	R	—	It does not apply to Root Complex devices. 0b fixed.
17 to 15	L1 Exit Latency	110b	HwInit	RST_LOAD_B	This field indicates the L1 exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from ASPM L1 to L0. If ASPM L1 is not supported, the value is undefined. 000b: Less than 1µs 001b: 1 µs to less than 2 µs 010b: 2 µs to less than 4 µs 011b: 4 µs to less than 8 µs 100b: 8 µs to less than 16 µs 101b: 16 µs to less than 32 µs (Default) 110b: 32 µs to 64 µs 111b: More than 64 µs

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
14 to 12	L0s Exit Latency	100b	HwInit	RST_LOAD_B	This field indicates the L0s exit latency for the given PCI Express Link. The value reported indicates the length of time this Port requires to complete transition from L0s to L0. 000b: Less than 64 ns 001b: 64 ns to less than 128 ns 010b: 128 ns to less than 256 ns 011b: 256 ns to less than 512 ns 100b: 512 ns to less than 1 µs (Default) 101b: 1 µs to less than 2 µs 110b: 2 µs-4 µs 111b: More than 4 µs
11, 10	Active State Power Management (ASPM) Support	11b	HwInit	RST_LOAD_B	This field indicates the level of ASPM supported on the given PCI Express Link. 00b: No ASPM support 01b: L0s Entry Supported 10b: L1 Entry Supported 11b: L0s and L1 Entry Supported (Default)
9 to 4	Maximum Link Width	000001b	HwInit	RST_LOAD_B	This field indicates the maximum Link width Lanes, implemented by the component. This value is permitted to exceed the number of Lanes routed to the slot (Downstream Port), adapter connector (Upstream Port), or in the case of component-to-component connections, the actual wired connection width. 000000b: Reserved 000001b: x1 (Default) 000010b: x2 (Set prohibited) 000100b: x4 (Set prohibited) 001000b: x8 (Set prohibited) 001100b: x12 (Set prohibited) 010000b: x16 (Set prohibited) 100000b: x32 (Set prohibited)
3 to 0	Supported Link Speed	0010b	HwInit	RST_LOAD_B	This field indicates the maximum Link speed of the associated Port. 0001b: 2.5 GT/s Link speed supported 0010b: 5.0 GT/s and 2.5 GT/s Link speeds supported (Default) 0011b: 8.0 GT/s Link speed supported (Set prohibited) 0100b: 16.0 GT/s Link speed supported (Set prohibited) All other encodings are reserved.

6.6.3.2.22 Link Control/Status (Offset: H'6070)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	Link Autonomous Bandwidth Status	0b	R/W1C	RST_CFG_B	This bit is output when Link Autonomous Bandwidth Interrupt Enable is asserted.
30	Link Bandwidth Management Status	0b	R/W1C	RST_CFG_B	This bit is output when Link Bandwidth Management Interrupt Enable is asserted.
29	Data Link Layer Link Active	0b	R	—	1b indicates that the Data Link Layer is in the Link Active state.
28	Slot Clock Configuration	1b	HwInit	RST_LOAD_B	It indicates that it uses a common reference clock with EP. 0b: Do not use Connector Reference Clock 1b: Use Connector Reference Clock (Default)
27	Link Training	0b	R	—	1b indicates that the Physical layer LTSSM is in the Configuration state or Recovery state. This bit is cleared when exiting the Configuration/Recovery state.
26	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 20	Negotiated Link Width	All 0	R	—	Indicates the link width established because of negotiation. 000001b: x1 000010b: x2 000100b: x4 001000b: x8 001100b: x12 010000b: x16 100000b: x32 The other encoding is Reserved.
19 to 16	Current Link Speed	All 0	R	—	This field indicates the negotiated Link speed of the given PCI Express Link. 0001b: 2.5 GT/s PCI Express Link 0010b: 5.0 GT/s PCI Express Link 0011b: 8.0 GT/s PCI Express Link 0100b: 16.0 GT/s PCI Express Link 0000b during reset period

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
15 to 12	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	Link Autonomous Bandwidth Interrupt Enable	0b	R/W	RST_CFG_B	Controls interrupt generation via the Link Autonomous Bandwidth Management Status bit (bit 31). 0b: Interrupt Disable (Default) 1b: Interrupt Enable
10	Link Bandwidth Management Interrupt Enable	0b	R/W	RST_CFG_B	Controls interrupt generation via the Link Bandwidth Status bit (bit 30). 0b: Interrupt Disable (Default) 1b: Interrupt Enable
9	Hardware Autonomous Width Disable	0b	R/W	RST_CFG_B	Set the Link Width Change feature to Disable. 0b: Link Width Change Enable (Default) 1b: Link Width Change Disable
8	Enable Clock Power Management	0b	R	RST_CFG_B	It does not apply to Root Complex devices. 0b fixed
7	Extended Synch	0b	R/W	RST_CFG_B	If set to 1 b, 4096 FTS Ordered-sets are transmitted when transitioning from L0s to L0. It also sends 1024 TS1 Ordered-sets at the beginning of the Recovery state during the transition from L1 to L0. The default value is 0b.
6	Common Clock Configuration	0b	R/W	RST_CFG_B	Sets whether the Common Reference Clock is used. 0b: Supplied by Non-Common Reference Clock (Default) 1b: Supplied by Common Reference Clock
5	Retrain Link	0b	R/W	RST_CFG_B	Setting it to 1b will transition LTSSM into the Recovery state and start Link Retraining. Readout is always 0b.
4	Link Disable	0b	R/W	RST_CFG_B	Setting it to 1b to transition LTSSM to the disabled state.
3	Read Completion Boundary (RCB)	1b	R	—	Read Completion Boundary (RCB) – Indicates the RCB value for the Root Port. 0: 64 bytes 1: 128 bytes (Default)
2	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	Active State Power Management (ASPM) Control	00b	R/W	RST_CFG_B	Sets the permission level for Active State Power Management. 00b: Disabled (Default) 01b: L0s Entry Supported 10b: Reserved 11b: L0s and L1 Entry Supported

6.6.3.2.23 Slot Capabilities (Offset: H'6074)

PCI Express Capability Structure: Configuration Space Bit [24]: If Slot Implemented is 0 b, then this register is all '0' because it does not implement Slot.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 19	Physical Slot Number	All 0	HwInit	RST_LOAD_B	Indicates Slot Number connected to Port.
18	No Command Completed Support	0b	HwInit	RST_LOAD_B	If the issued command is completed by the Hot-Plug Controller, it indicates that the Slot does not make a software notification.
17	Electromechanical Interlock Present	0b	HwInit	RST_LOAD_B	Indicates that Electromechanical Interlock is implemented.
16, 15	Slot Power Limit Scale	00b	HwInit	RST_LOAD_B	Set the Scale for the Slot Power Limit Value. This register is effective when the Slot Implemented bit (Express Capability Register (offset: H'060), bit 24) is set.00b = 1.0x 01b: 0.1x 10b: 0.01x 11b: 0.001x
14 to 7	Slot Power Limit Value	All 0	HwInit	RST_LOAD_B	In combination with the Slot Power Limit Scale Register value, sets the upper power limit in the Slot. This register is effective when the Slot Implemented bit (Express Capability Register (offset: H'060), bit 24) is set. H'F0: 250 W Slot Power Limit H'F1: 275 W Slot Power Limit H'F2: 300 W Slot Power Limit H'F3 to H'FF: Reserved
6	Hot-Plug Capable	0b	HwInit	RST_LOAD_B	Indicates that the Slot can support Hot-plug operation.
5	Hot-Plug Surprise	0b	HwInit	RST_LOAD_B	Indicates that an adapter in a Slot may be removed without notice.
4	Power Indicator Present	0b	HwInit	RST_LOAD_B	Indicates that the Power Indicator is electrically controlled by a Slot (enclosure).
3	Attention Indicator Present	0b	HwInit	RST_LOAD_B	Indicates that the Attention Indicator is electrically controlled by a Slot (enclosure).
2	MRL Sensor Present	0b	HwInit	RST_LOAD_B	Indicates that MRL Sensor is implemented.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
1	Power Control Present	0b	HwInit	RST_LOAD_B	Indicates that a software programmable Power Controller is implemented.
0	Attention Button Present	0b	HwInit	RST_LOAD_B	Indicates that the Attention Button is electrically controlled by a Slot (enclosure).

6.6.3.2.24 Slot Control/Status (Offset: H'6078)

PCI Express Capability Structure: Configuration Space Bit [24]: If Slot Implemented is 0 b, it means that it has not implemented Slot, so all registers except bit [22]: Presence Detect State are all '0'.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	Data Link Layer State Changed	Electromechanical Interlock Status	Presence Detect State	MRL Sensor State	Command Completed	Presence Detect Changed	MRL Sensor Changed	Power Fault Detected	Attention Button Pressed
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W1C	R	R	R	R/W1C	R/W1C	R/W1C	R/W1C	R/W1C

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	Data Link Layer State Changed Enable	Electromechanical Interlock Control	Power Controller Control	Power Indicator Control		Attention Indicator Control		Hot-Plug Interrupt Enable	Command Completed Interrupt Enable	Presence Detect Changed Enable	MRL Sensor Changed Enable	Power Fault Detected Enable	Attention Button Pressed Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 25	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	Data Link Layer State Changed	0b	R/W1C	RST_CFG_B	This bit is Set when the value reported in the Data Link Layer Link Active bit of the Link Status Register is changed. Not used in this macro. 0b fixed.
23	Electromechanical Interlock Status	0b	R	—	If an Electromechanical Interlock is implemented, this bit indicates the status of the Electromechanical Interlock. Not used in this macro. 0b fixed.
22	Presence Detect State	1b	R	—	This bit indicates the presence of an adapter in the slot. When the In-Band PD Disable bit is Clear, this is reflected by the logical "OR" of the Physical Layer in-band presence detect mechanism and, if present, any out-of-band presence detect mechanism defined for the slot's corresponding form factor. The Slot Implemented bit in the PCI Express Capabilities register is 0 and then this bit is 1b fixed.
21	MRL Sensor State	0b	R	—	This bit reports the status of the MRL sensor if implemented. Not used in this macro. 0b fixed.
20	Command Completed	0b	R/W1C	RST_CFG_B	If Command Completed notification is supported (if the No Command Completed Support bit in the Slot Capabilities Register is 0b), this bit is Set when a hot-plug command has completed and the Hot-Plug Controller is ready to accept a subsequent command. Not used in this macro. 0b fixed.
19	Presence Detect Changed	0b	R/W1C	RST_CFG_B	This bit is Set when the value reported in the Presence Detect State bit is changed. Not used in this macro. 0b fixed.
18	MRL Sensor Changed	0b	R/W1C	RST_CFG_B	If an MRL sensor is implemented, this bit is Set when a MRL Sensor State change is detected. If an MRL sensor is not implemented, this bit must not be Set. Not used in this macro. 0b fixed.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
17	Power Fault Detected	0b	R/W1C	RST_CFG_B	If a Power Controller that supports power fault detection is implemented, this bit is Set when the Power Controller detects a power fault at this slot. Not used in this macro. 0b fixed.
16	Attention Button Pressed	0b	R/W1C	RST_CFG_B	If an Attention Button is implemented, this bit is Set when the attention button is pressed. Not used in this macro. 0b fixed.
15 to 13	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	Data Link Layer State Changed Enable	0b	R/W	RST_CFG_B	If the Data Link Layer Link Active Reporting Capable is 1b, this bit enables software notification when Data Link Layer Link Active bit is changed. Not used in this macro. Please use 0b fixed.
11	Electromechanical Interlock Control	0b	R/W	RST_CFG_B	If an Electromechanical Interlock is implemented, a write of 1b to this bit causes the state of the interlock to toggle. A write of 0b to this bit has no effect. A read of this bit always returns a 0b. Not used in this macro. Please use 0b fixed.
10	Power Controller Control	0b	R/W	RST_CFG_B	If a Power Controller is implemented, this bit when written sets the power state of the slot per the defined encodings. Not used in this macro. Please use 0b fixed.
9, 8	Power Indicator Control	00b	R/W	RST_CFG_B	If a Power Indicator is implemented, writes to this field set the Power Indicator to the written state Not used in this macro. Please use 00b fixed.
7, 6	Attention Indicator Control	00b	R/W	RST_CFG_B	If an Attention Indicator is implemented, writes to this field set the Attention Indicator to the written state. Not used in this macro. Please use 0b fixed.
5	Hot-Plug Interrupt Enable	0b	R/W	RST_CFG_B	When Set, this bit enables generation of an interrupt on enabled hot-plug events. Not used in this macro. Please use 0b fixed.
4	Command Completed Interrupt Enable	0b	R/W	RST_CFG_B	If Command Completed notification is supported when Set, this bit enables software notification when a hot-plug command is completed by the Hot-Plug Controller. Not used in this macro. Please use 0b fixed.
3	Presence Detect Changed Enable	0b	R/W	RST_CFG_B	When Set, this bit enables software notification on a presence detect changed event. Not used in this macro. Please use 0b fixed.
2	MRL Sensor Changed Enable	0b	R/W	RST_CFG_B	When Set, this bit enables software notification on a MRL sensor changed event. Not used in this macro. Please use 0b fixed.
1	Power Fault Detected Enable	0b	R/W	RST_CFG_B	When Set, this bit enables software notification on a power fault event. Not used in this macro. Please use 0b fixed.
0	Attention Button Pressed Enable	0b	R/W	RST_CFG_B	When Set to 1b, this bit enables software notification on an attention button pressed event. Not used in this macro. Please use 0b fixed.

6.6.3.2.25 Root Control/Capabilities (Offset: H'607C)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CRS Software Visibility

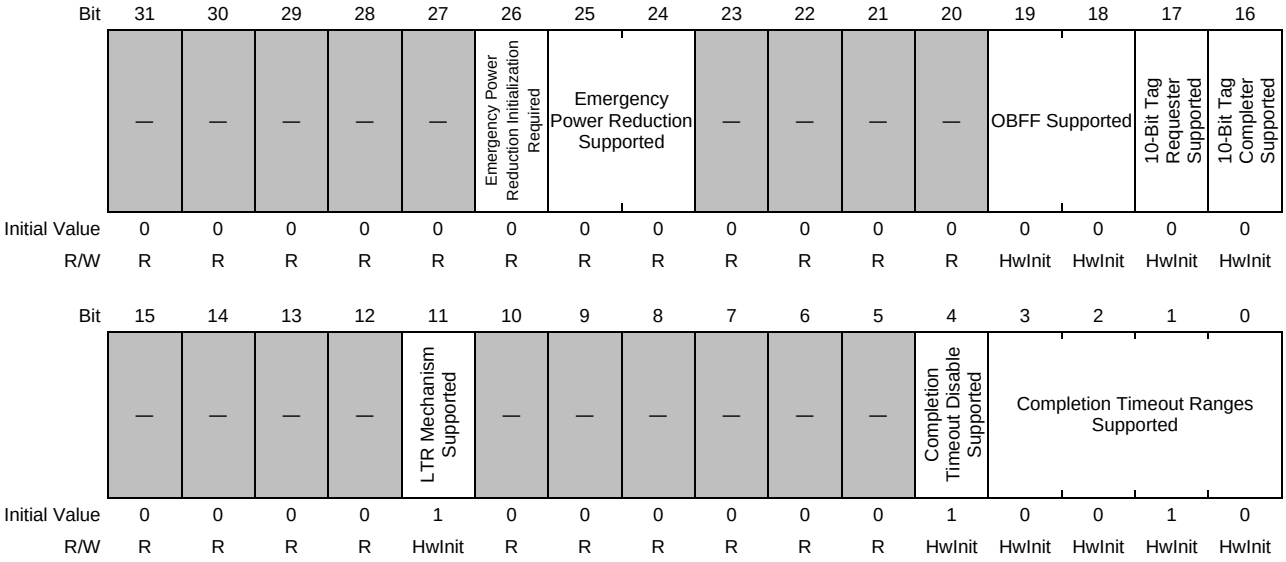
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 17	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CRS Software Visibility	0b	R	—	Indicates whether the Root Port can notify the software of the CRS status. Not used in this macro. Please use 0b fixed.
15 to 5	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CRS Software Visibility Enable	0b	R/W	RST_CFG_B	When implemented, allows the Root Port to inform the software of the CRS status. Not used in this macro. Please use 0b fixed.
3	PME Interrupt Enable	0b	R/W	RST_CFG_B	When a PME Message is received, it can be combined with a set of PME status bits to generate a PME interrupt. If the PME status is already up and this bit is enabled later, an interrupt will also occur.
2	System Error on Fatal Error Enable	0b	R/W	RST_CFG_B	This bit allows a system error to be generated when ERR_FATAL occurs in any of the hierarchies below the root port.
1	System Error on Non-Fatal Error Enable	0b	R/W	RST_CFG_B	This bit allows a system error to be generated when NON_ERR_FATAL occurs in any of the hierarchies below the root port.
0	System Error on Correctable Error Enable	0b	R/W	RST_CFG_B	This bit allows a system error to be generated when ERR_ERR_COR occurs in any of the hierarchies below the root port.



6.6.3.2.26 Root Status (Offset: H'6080)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 18	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	PME Pending	0b	R	RST_CFG_B	This bit indicates a status where the PME Status bit is 1 and further PME is pending. When the software clears the PME status bit, the pending PME is resent in hardware by resetting the PME status bit and properly updating the Requester ID field and PME status. The PME pending bit is cleared in hardware when there are no more PME's pending.
16	PME Status	0b	R/W1C	RST_CFG_B	This bit indicates that a PME was received by the requester indicated by the PME Requester ID field. Subsequent PMEs are held until this bit is cleared by the software.
15 to 0	PME Requester ID	All 0	R	RST_CFG_B	This field shows the PCI Requester ID of the most recent PME requester. This field is valid only when the PME status bit is 1.

6.6.3.2.27 Device Capabilities 2 (Offset: H'6084)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 27	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	Emergency Power Reduction Initialization Required	0b	R	RST_LOAD_B	Emergency Power Reduction Initialization Required Not supported 0b fixed
25, 24	Emergency Power Reduction Supported	00b	R	RST_LOAD_B	Emergency bower Reduction Supported Not supported 00b fixed
23 to 20	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19, 18	OBFF Supported	00b	HwInit	RST_LOAD_B	This field indicates if OBFF is supported and, if so, what signaling mechanism is used. 00b (Not Supported). 00b: OBFF Not Supported (Default) 01b: OBFF supported using Message signaling only 10b: OBFF supported using WAKE# signaling only 11b: OBFF supported using WAKE# and Message signaling
17	10-Bit Tag Requester Supported	0b	HwInit	RST_LOAD_B	10-Bit Tag (Requester) supported. 0b fixed. 0b: Not supported (Default) 1b: Supported
16	10-Bit Tag Completer Supported	0b	HwInit	RST_LOAD_B	10-Bit Tag (Completer) supported. 0b fixed. 0b: Not supported (Default) 1b: Supported
15 to 12	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	LTR Mechanism Supported	1b	HwInit	RST_LOAD_B	Set with or without to support Latency Tolerance Reporting (LTR). 0b: Not Supported 1b: Supported (Default)
10 to 5	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
4	Completion Timeout Disable Supported	1b	HwInit	RST_LOAD_B	Set with or without to support Completion Timeout Disable. 0b: Not Supported 1b: Supported (Default)
3 to 0	Completion Timeout Ranges Supported	0010b	HwInit	RST_LOAD_B	Set Completion Timeout Range. Range A: 50 µs to 10 ms Range B: 10 ms to 250 ms Range C: 250 ms to 4 s Range D: 4 s to 64 s The four patterns described above are determined, and settings can be made in the following combinations. 0000b: Program settings not supported 0001b: Range A 0010b: Range B 0011b: Ranges A and B 0110b: Ranges B and C 0111b: Ranges A, B, and C 1110b: Ranges B, C and D 1111b: Ranges A, B, C, and D The other encoding is Reserved. *Note*: The initial value in the UM description is “0010b”, but please change the initial value according to the installed system/device performance or specify the initial value as a product requirement.

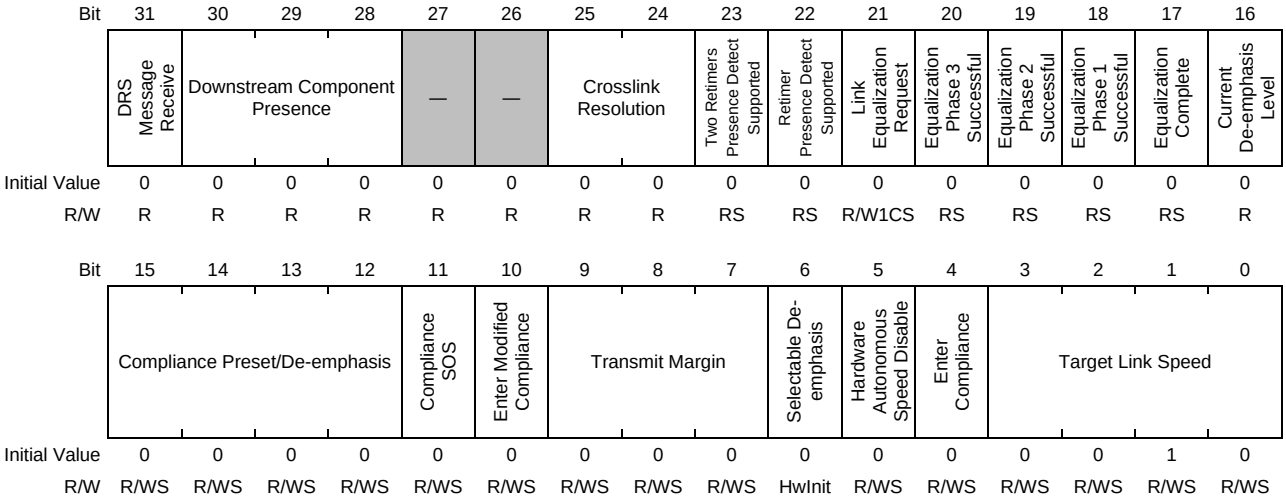
R/W	R	R/W	R/W	R/W	R	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

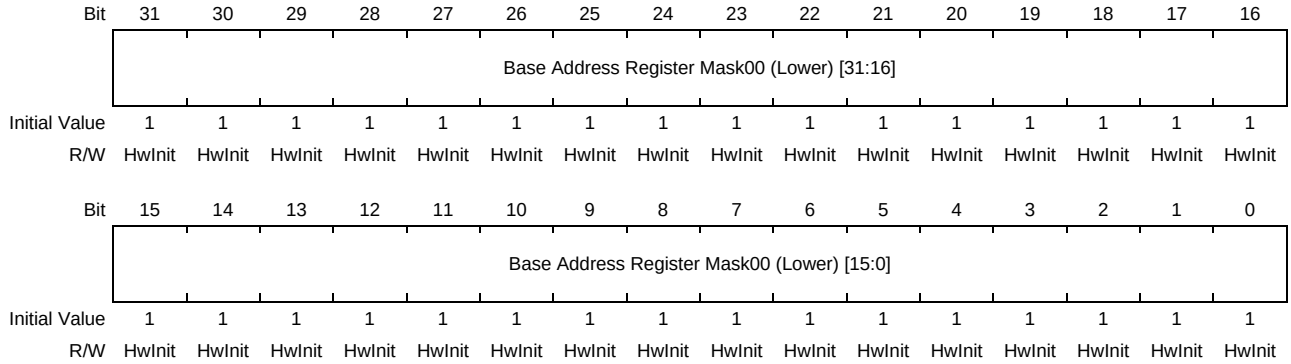
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 15	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14, 13	OBFF Enable	00b	R/W	RST_CFG_B	This field enables the OBFF mechanism and selects the signaling method. CHANGE prohibited 00b (Disabled) 01b Enabled using Message signaling [Variation A] 10b Enabled using Message signaling [Variation B] 11b Enabled using WAKE# signaling *Note*: OBFF Supported = 00b equals Reserved.
12	10-Bit Tag Requester Enable	0b	R/W	RST_CFG_B	10-Bit Tag (Requester) enabled. 0b fixed. 0b: Disabled (Default) 1b: Valid
11	Emergency Power Reduction Request	0b	R	—	Emergency Power Reduction Request. 0b fixed due to unsupported
10	LTR Mechanism Enable	0b	R/W	RST_CFG_B	If this bit is set, the LTR function is enabled.
9 to 5	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	Completion Timeout Disable	0b	R/W	RST_CFG_B	If this bit is set, the Completion Timeout Disable function is enabled.



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
3 to 0	Completion Timeout Value	H'0	R/W	RST_CFG_B	Set Completion Timeout Range. 0000b: 10 ms to 50 ms (Default) 0001b: 50 µs to 100 µs 0010b: 1 ms to 10 ms 0101b: 16 ms to 55 ms 0110b: 65 ms to 210 ms 1001b: 260 ms to 900 ms 1010b: 1 s to 3.5 s 1101b: 4 s to 13 s 1110b: 17 s to 64 s Others: reserved (set prohibited) *Note*: The default, 0000b, sets Base Spec to a time longer than the default 50usec lower limit. This considers the 10 msec lower bound recommended for Base Spec.

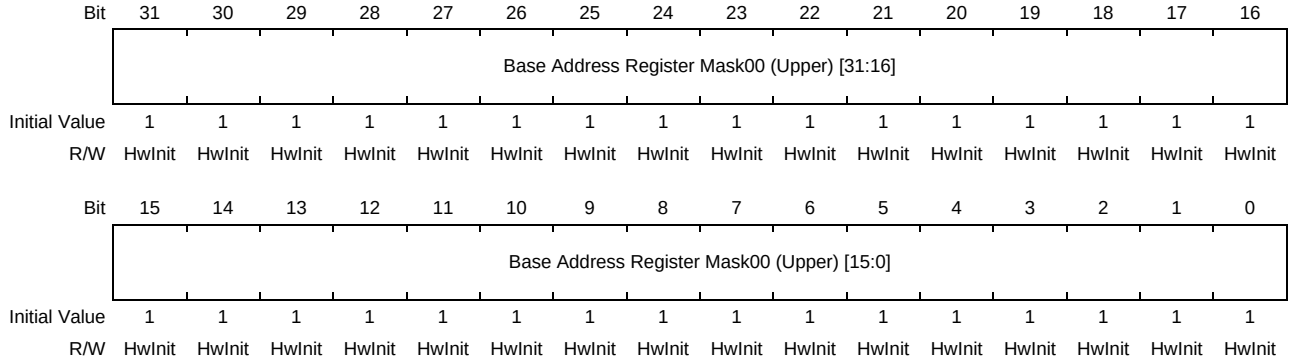
6.6.3.2.29 Link Capabilities 2 (Offset: H'608C)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	DRS Supported	0b	R	—	When Set, indicates support for the optional Device Readiness Status (DRS) capability. This function is not supported by this product. 0b fixed
30 to 25	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	Two Retimers Presence Detect Supported	0b	HWinit	RST_LOAD_B	When set to 1b, this bit indicates that the associated Port supports detection and reporting of two Retimers presence. This function is not supported by this product. 0b fixed
23	Retimer Presence Detect Supported	0b	HWInit	RST_LOAD_B	When set to 1b, this bit indicates that the associated Port supports detection and reporting of Retimer presence. This function is not supported by this product. 0b fixed
22 to 16	Lower SKP OS Reception Supported Speeds Vector	All 0	HWinit	RST_LOAD_B	If this field is non-zero, it indicates that the Port, when operating at the indicated speeds supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. This function is not supported by this product. 7'h00 fixed
15 to 9	Lower SKP OS Generation Supported Speeds Vector	All 0	HWinit	RST_LOAD_B	If this field is non-zero, it indicates that the Port, when operating at the indicated speeds supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. This function is not supported by this product. 7'h00 fixed
8	Crosslink supported	0b	R	—	When set to 1b, this bit indicates that the associated Port supports crosslinks. This function is not supported by this product. 0b fixed
7 to 1	Supported Link Speeds Vector	0000011b	HwInit	RST_LOAD_B	Indicate Support Link Speed. This field indicates the supported Link speed(s) of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit 0: 2.5 GT/s Bit 1: 5.0 GT/s Bit 2: 8.0 GT/s (set prohibited) Bit 3: 16.0 GT/s (set prohibited) Bits 6 to 4: Reserved
0	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.



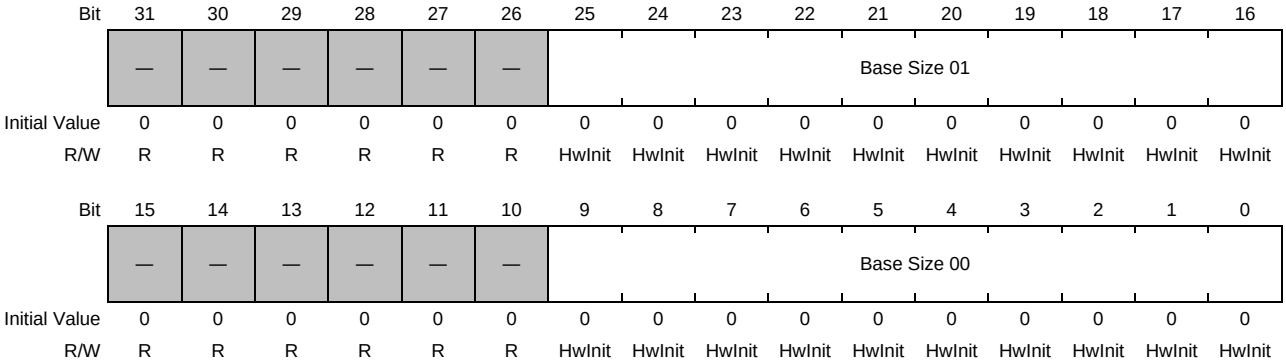
6.6.3.2.30 Link Control 2/Status 2 (Offset: H'6090)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31	DRS Message Received	0b	R	—	This bit must be Set whenever the Port receives a DRS Message. This function is not supported by this product. 0b fixed
30 to 28	Downstream Component Presence	000b	R	—	This field indicates the presence and DRS status for the Downstream Component, if any, connected to the Link. This function is not supported by this product. 000b fixed
27, 26	—	00b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25, 24	Crosslink Resolution	00b	R	—	This field indicates the state of the Crosslink negotiation. This function is not supported by this product. 00b fixed
23	Two Retimers Presence Detect Supported	0b	RS	—	When set to 1b, this bit indicates that two Retimers were present during the most recent Link negotiation. This function is not supported by this product. 0b fixed
22	Retimer Presence Detect Supported	0b	RS	—	When set to 1b, this bit indicates that a Retimer was present during the most recent Link negotiation. This function is not supported by this product. 0b fixed
21	Link Equalization Request	0b	R/W1CS	RST_RSM_B	This bit is Set by hardware to request the Link equalization process to be performed on the Link. This function is not supported by this product. 0b fixed
20	Equalization Phase 3 Successful	0b	RS	—	When set to 1b, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed. This function is not supported by this product. 0b fixed
19	Equalization Phase 2 Successful	0b	RS	—	When set to 1b, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed. This function is not supported by this product. 0b fixed
18	Equalization Phase 1 Successful	0b	RS	—	When set to 1b, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed. This function is not supported by this product. 0b fixed
17	Equalization Complete	0b	RS	—	When set to 1b, this bit indicates that the Transmitter Equalization procedure has completed. This function is not supported by this product. 0b fixed



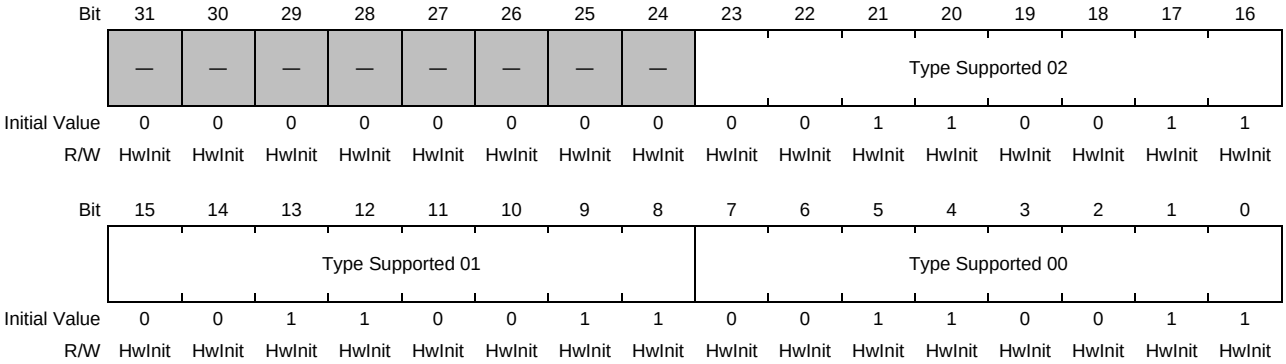
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
16	Current De-emphasis Level	0b	R	—	Status register showing De-emphasis Level during Gen2 operation. 0: −6 dB (Default) 1: −3.5 dB *Note*: The initial value of this bit is 0b at reset and after Gen2-Linkup. However, Gen1-Linkup indicates 1b, but this bit has no meaning in Gen1, so ignore it.
15 to 12	Compliance Preset/De-emphasis	0000b	R/WS	RST_RSM_B	Polling. Set the De-emphasis Level in the Compliance State. 0000b: −6 dB (Default) 0001b: −3.5 dB
11	Compliance SOS	0b	R/WS	RST_RSM_B	If this bit set to 1b, the SKP Ordered-set is inserted periodically during Compliance pattern transmission.
10	Enter Modified Compliance	0b	R/WS	RST_RSM_B	Set bit for Modified Compliance pattern transmission. 0: Compliance Pattern (Default) 1: Modified Compliance Pattern
9 to 7	Transmit Margin	000b	R/WS	RST_RSM_B	Adjust the voltage level of the Transmitter. 000b: Normal operating range 001b to 111b: See *Base Spec Section 8.3.4*.
6	Selectable De-emphasis	0b	HwInit	—	This register is for De-emphasis setting during RC Gen 2 operation. 0: −6 dB 1: −3.5 dB
5	Hardware Autonomous Speed Disable	0b	R/WS	RST_RSM_B	Controls the Link Speed Change function. 0: Support of Link Speed Change (Enable) 1: not Support of Link Speed Change (Disable)
4	Enter Compliance	0b	R/WS	RST_RSM_B	By setting it to 1b, Allows a transition to Compliance mode. At this time, the Link Speed will be the value set in the Target Link Speed field.
3 to 0	Target Link Speed	0010b	R/WS	RST_RSM_B	Set Link Speed value to notify opposing devices during training. 0001b: 2.5 GT/s Target Link Speed 0010b: 5.0 GT/s Target Link Speed (Default) 0011b: 8.0 GT/s Target Link Speed (set prohibited) 0100b: 16.0 GT/s Target Link Speed (set prohibited) All other encodings are reserved.

6.6.3.2.31 Base Address Register Mask00(Lower) (Offset: H'60A0)



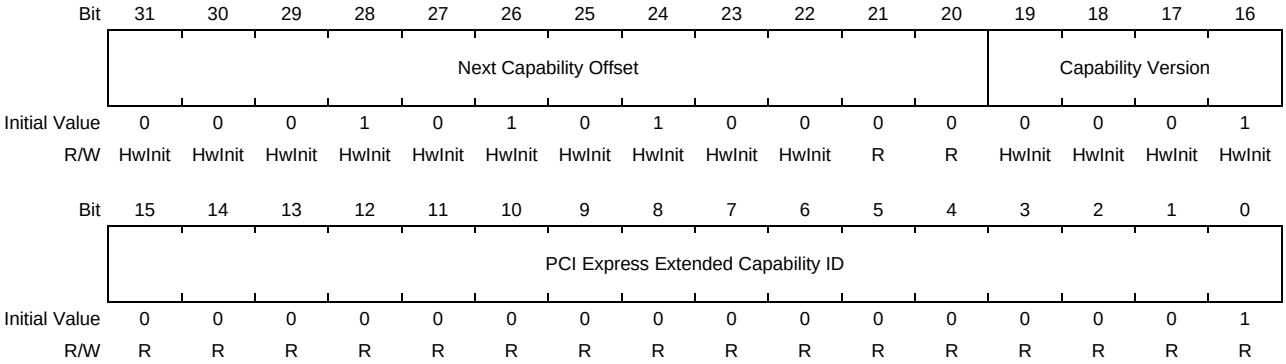
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Base Address Register Mask00 (Lower)	All 1	HwInit	RST_LOAD_B	This register is a mask register for Base Address Register 0 (BAR 0).

6.6.3.2.32 Base Address Register Mask00(Upper) (Offset: H'60A4)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	Base Address Register Mask00 (Upper)	All 1	HwInit	RST_LOAD_B	This register is a mask register for Base Address Register 1 (BAR1).

6.6.3.2.33 Base Size 00/01 (Offset: H’60C8)



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 26	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 16	Base Size 01	All 0	HwInit	RST_LOAD_B	(H’000 fixed) Not used.
15 to 10	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 0	Base Size 00	All 0	HwInit	RST_LOAD_B	Sets the size of the TLP (DW Size) by unit of DW that will be accepted in BAR0/1 area which set in the Base Address Register and Base Address Mask Register. Detects a Completer Abort Error (CA) when a TLP with a packet length greater than the size set here is received (even if it is smaller than the Max Payload Size). Note that the default value is H’000, which disables this feature.

6.6.3.2.34 Type Supported 00/01/02 (Offset: H'60D8)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	—	H'00	HwInit	RST_LOAD_B	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 16	Type Supported 02	H'33	HwInit	RST_LOAD_B	*Note*: Do not use.
15 to 8	Type Supported 01	H'33	HwInit	RST_LOAD_B	*Note*: Do not use.
7 to 0	Type Supported 00	H'33	HwInit	RST_LOAD_B	Set the Transaction Type that can be supported by BAR0/1 area. See the below for the meaning of each bit. Bit 0: Memory read 32 bits Bit 1: Memory read 64 bits Bit 2: Memory read lock 32 bits Bit 3: Memory read lock 64 bits Bit 4: Memory write 32 bits Bit 5: Memory write 64 bits Bit 6: IO Read Bit 7: IO Write

6.6.3.2.35 Advanced Error Reporting Capability (Offset: H’6100)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 22	Next Capability Offset	H’150	HwInit	RST_LOAD_B	Indicates the starting address of the Device Serial Number Capability.
21, 20			R	—	
19 to 16	Capability Version	0001b	HwInit	RST_LOAD_B	Indicates the Capability Structure version. Default: 0001b
15 to 0	PCI Express Extended Capability ID	H’0001	R	—	Indicates the Advanced Error Reporting Capability. Default: H’0001

6.6.3.2.36 Uncorrectable Error Status Register (Offset: H'6104)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	ACS Violation Status	Unsupported Request Error Status	ECRC Error Status (Optional)	Malformed TLP Status	Receiver Overflow Status (Optional)	Unexpected Completion Status

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 22	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	ACS Violation Status	0b	R	—	ACS is not supported 0b fixed
20	Unsupported Request Error Status	0b	R/W1CS	—	Indicate an unsupported TLP was received. 0: No error detected 1: Error detected
19	ECRC Error Status (Optional)	0b	R/W1CS	—	ECRC Error was received. 0: No error detected 1: Error detected
18	Malformed TLP Status	0b	R/W1CS	—	Indicate Malformed TLP received. 0: No error detected 1: Error detected
17	Receiver Overflow Status (Optional)	0b	R/W1CS	—	Indicates A receipt of a TLP larger in size than the free credits in the receive buffer. 0: No error detected 1: Error detected
16	Unexpected Completion Status	0b	R/W1CS	—	Indicates that Completion was received, but there is no record of a corresponding Non-Posted Request issue (Transaction Descriptor did not match). 0: No error detected 1: Error detected
15	Completer Abort Status (Optional)	0b	R/W1CS	—	Indicates that Completion has been returned with a Completion Status of Completer Abort (CA) after receiving a Non-Posted Request. 0: No error detected 1: Error detected
14	Completion Timeout Status	0b	R/W1CS	—	Indicates that after sending a Non-Posted Request, the corresponding Completion was not received within the specified time. 0: No error detected 1: Error detected

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
13	Flow Control Protocol Error Status (Optional)	0b	R	—	Not Implemented (0b fixed)
12	Poisoned TLP Received Status	0b	R/W1CS	—	Indicates that TLP of Poisoned TLP (with payload and EP field of header is 1b) has been received. 0: No error detected 1: Error detected
11 to 6	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	Surprise Down Error Status (Optional)	0b	R	—	Not Implemented (0b fixed)
4	Data Link Protocol Error Status	0b	R/W1CS	—	Indicates that Sequence Number error has been detected in the Data Link Layer. 0: No error detected 1: Error detected
3 to 1	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.6.3.2.37 Uncorrectable Error Mask Register (Offset: H'6108)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 22	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	ACS Violation Mask	0b	R	—	ACS is not supported 0b fixed
20	Unsupported Request Error Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Unsupported Request Error is detected. 0b: No mask 1b: Masks recording of the header in the Header Log register and updating of the first error pointer.
19	ECRC Error Mask (Optional)	0b	R/WS	RST_RSM_B	Mask error notifications when the ECRC Error is detected. 0b: No mask 1b: Masks recording of the header in the Header Log register and updating of the first error pointer.
18	Malformed TLP Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Malformed TLP Error is detected. 0b: No mask 1b: Masks recording of the header in the Header Log register and updating of the first error pointer.
17	Receiver Overflow Mask (Optional)	0b	R/WS	RST_RSM_B	Mask error notifications when the Receiver Overflow Error is detected. 0b: No mask 1b: Masks updating of the first error pointer.
16	Unexpected Completion Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Unexpected Completion Error is detected. 0b: No mask 1b: Masks recording of the header in the Header Log register and updating of the first error pointer.
15	Completer Abort Mask (Optional)	0b	R/WS	RST_RSM_B	Mask error notifications when the Completer Abort Error is detected. 0b: No mask 1b: Masks recording of the header in the Header Log register and updating of the first error pointer.
14	Completion Timeout Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Completion Timeout Error is detected. 0b: No mask 1b: Masks updating of the first error pointer.

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
13	Flow Control Protocol Error Mask (Optional)	0b	R	—	Not Implemented (0b fixed)
12	Poisoned TLP Received Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Poisoned TLP Error is detected. 0b: No mask 1b: Masks recording of the header in the Header Log register and updating of the first error pointer.
11 to 6	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	Surprise Down Error Mask (Optional)	0b	R	—	Not Implemented (0b fixed)
4	Data Link Protocol Error Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Data Link Protocol Error is detected. 0b: No mask 1b: Masks updating of the first error pointer.
3 to 1	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.6.3.2.38 Uncorrectable Error Severity Register (Offset: H'610C)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 23	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	—	1b	R	RST_LOAD_B	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21	ACS Violation Severity	0b	R	—	ACS is not supported. 0b fixed
20	Unsupported Request Error Severity	0b	R/WS	RST_RSM_B	Set the Error Severity when the Unsupported Request Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
19	ECRC Error Severity (Optional)	0b	R/WS	RST_RSM_B	Set the Error Severity when the ECRC Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
18	Malformed TLP Severity	1b	R/WS	RST_RSM_B	Set the Error Severity when the Malformed TLP Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
17	Receiver Overflow Severity (Optional)	1b	R/WS	RST_RSM_B	Set the Error Severity when the Receiver Overflow Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
16	Unexpected Completion Severity	0b	R/WS	RST_RSM_B	Set the Error Severity when the Unexpected Completion Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
15	Completer Abort Severity (Optional)	0b	R/WS	RST_RSM_B	Set the Error Severity when the Completer Abort Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
14	Completion Timeout Severity	0b	R/WS	RST_RSM_B	Set the Error Severity when the Completion Timeout Error is detected. 0b: Non-Fatal Error 1b: Fatal Error

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
13	Flow Control Protocol Error Severity (Optional)	1b	R	—	Not Implemented (1b fixed)
12	Poisoned TLP Received Severity	0b	R/WS	RST_RSM_B	Set the Error Severity when the Poisoned TLP Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
11 to 6	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	Surprise Down Error Severity (Optional)	1b	R	—	Not Implemented (1b fixed)
4	Data Link Protocol Error Severity	1b	R/WS	RST_RSM_B	Set the Error Severity when the Data Link Protocol Error is detected. 0b: Non-Fatal Error 1b: Fatal Error
3 to 1	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Undefined	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.6.3.2.39 Correctable Error Status Register (Offset: H'6110)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 14	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	Advisory Non-Fatal Error Mask	1b	R/WS	RST_RSM_B	Mask error notifications when the Advisory Non-Fatal Error is detected. 0b: No mask 1b: Masks advisory non-fatal error handling. (mask updating of the first error pointer and logging of the header)
12	Replay Timer Timeout Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Replay Timer Timeout Error is detected. 0b: No mask 1b: Mask Replay Timer Timeout Error Handling
11 to 9	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	REPLAY_NUM Rollover Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the REPLAY_NUM Roll Over Error is detected. 0b: No mask 1b: Mask REPLAY_NUM Roll Over Error Handling
7	Bad DLLP Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Bad DLLP Error is detected. 0b: No mask 1b: Mask Bad DLLP Error Handling
6	Bad TLP Mask	0b	R/WS	RST_RSM_B	Mask error notifications when the Bad TLP Error is detected. 0b: No mask 1b: Mask Bad TLP Error Handling
5 to 1	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	Receiver Error Mask (optional)	0b	R/WS	RST_RSM_B	Masks error notification when Receiver Error is detected. 0b: No mask 1b: Mask Receive Error Handling

6.6.3.2.41 Advanced Error Capabilities and Control Register (Offset: H'6118)

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 3	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	Fatal Error Reporting Enable	All 0	R/W	RST_CFG_B	This bit allows an interrupt to be generated when ERR_FATAL occurs in any of the hierarchies below the root port.
1	Non-Fatal Error Reporting Enable	All 0	R/W	RST_CFG_B	This bit allows an interrupt to be generated when NON_ERR_FATAL occurs in any of the hierarchies below the root port.
0	Correctable Error Reporting Enable	All 0	R/W	RST_CFG_B	This bit allows an interrupt to be generated when ERR_COR occurs in any of the hierarchies below the root port.

6.6.3.2.47 Root Error Status (Offset: H'6130)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 27	Advanced Error Interrupt Message Number	All 0	R	—	Not Implemented (H'00 fixed)
26 to 7	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	Fatal Error Message Received	0b	R/W1C	RST_RSM_B	Set when one or more ERR_FATALs are received.
5	Non-Fatal Error Message Received	0b	R/W1C	RST_RSM_B	Set when one or more ERR_NON_FATALs are received.
4	First Uncorrectable Fatal	0b	R/W1C	RST_RSM_B	Set when an uncorrectable error is first received, and the error is ERR_FATAL.
3	Multiple ERR_FATAL/ NONFATAL Received	0b	R/W1C	RST_RSM_B	Indicates that more ERR_FATAL or ERR_NON_FATAL has been received with the ERR_FATAL/NONFATAL Received bit already set.
2	ERR_FATAL/ NONFATAL Received	0b	R/W1C	RST_RSM_B	Indicates that ERR_FATAL or ERR_NON_FATAL has been received with the ERR_FATAL/NONFATAL Received bit cleared.
1	Multiple ERR_COR Received	0b	R/W1C	RST_RSM_B	Indicates that more ERR_COR has been received with the ERR_COR Received bit already set.
0	ERR_COR Received	0b	R/W1C	RST_RSM_B	Indicates that ERR_COR has been received with the ERR_COR Received bit cleared.

6.6.3.2.48 Error source Identification Register (Offset: H'6134)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ERR_FATAL/NONFATAL Source Identification															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERR_COR Source Identification															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 16	ERR_FATAL/ NONFATAL Source Identification	All 0	R	RST_RSM_B	When ERR_FATAL or ERR_NONFATAL is received without the ERR_FATAL/NONFATAL Received bit of the Root Error Status register being set, capture the requestor ID for that error.
15 to 0	ERR_COR Source Identification	All 0	R	RST_RSM_B	When ERR_COR is received without the ERR_COR Received bit in the Root Error Status register being set, the requestor ID for that error is captured.

6.6.3.2.49 Device Serial Number Extended Capability (Offset: H'6150)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Next Capability Offset												Capability Version

	PCI Express Extended Capability ID															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

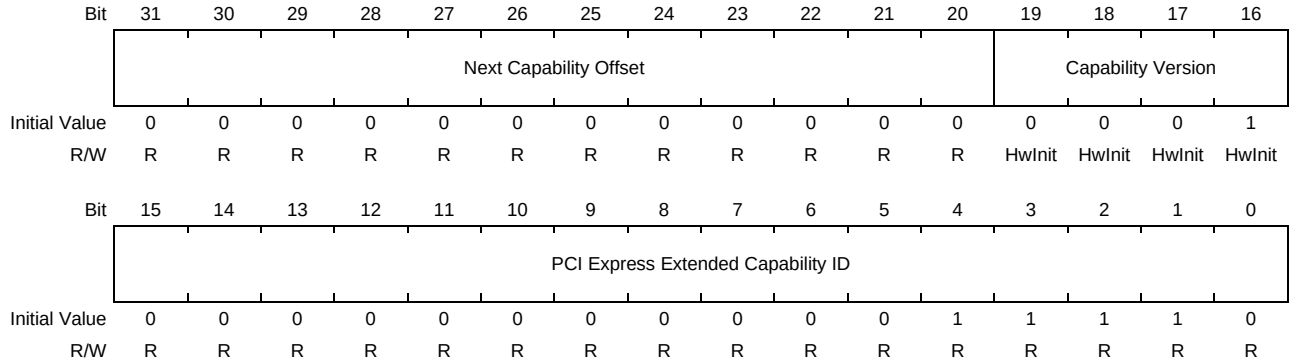
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 22	Next Capability Offset	H'160	R	RST_LOAD_B	Indicates the starting address of the L1 PM Substates Extended Capability Header. H'160 fixed.
21, 20				—	
19 to 16	Capability Version	H'1	HwInit	RST_LOAD_B	Indicates the Capability Structure version.
15 to 0	PCI Express Extended Capability ID	H'0003	R	—	Indicates the Device Serial Number Extended Capability.

6.6.3.2.50 Serial Number Register (Lower DW) (Offset: H'6154)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCI Express Device Serial Number (Lower DW)															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCI Express Device Serial Number (Lower DW)															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit

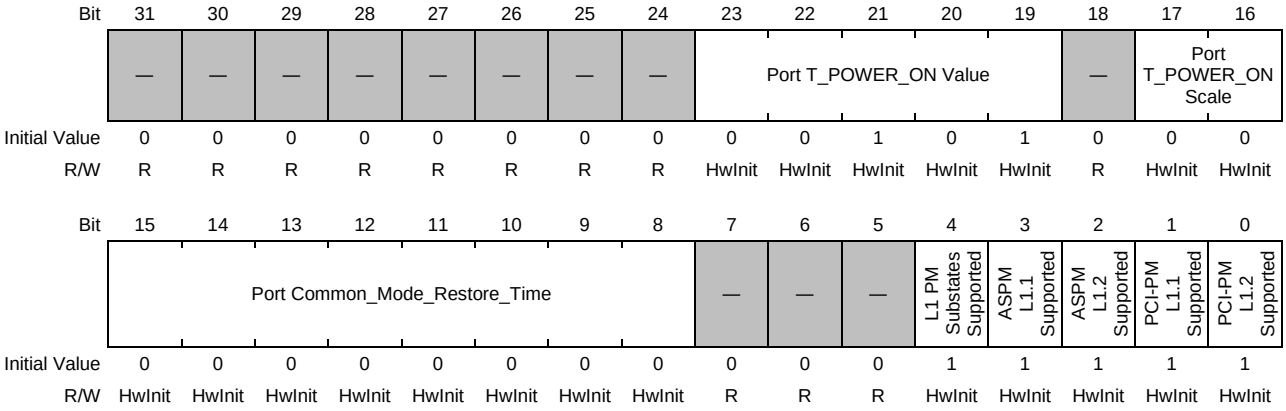
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	PCI Express Device Serial Number (Lower DW)	All 0	HwInit	RST_LOAD_B	Lower 32 bits of the IEEE standard's 64-bit unique ID (EUI-64). EUI-64 consists of a 24-bit company ID and 40-bit vendor-defined extensions. If a unique ID is used, write it from the UDL side during the timing indicated by the "Load period into the Configuration Register" in the **Figure 6.6-2 Reset Sequence for Power-On Reset**.



6.6.3.2.51 Serial Number Register (Upper DW) (Offset: H'6158)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PCI Express Device Serial Number (Upper DW)															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit

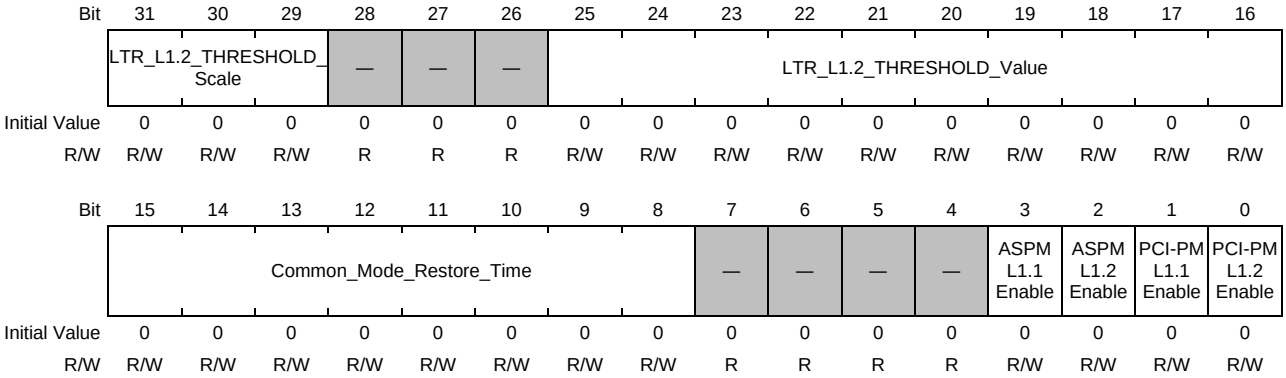
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCI Express Device Serial Number (Upper DW)															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit	HwInit



Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 0	PCI Express Device Serial Number (Upper DW)	All 0	HwInit	RST_LOAD_B	Lower 32 bits of the IEEE standard's 64-bit unique ID (EUI-64). EUI-64 consists of a 24-bit company ID and 40-bit vendor-defined extensions. If a unique ID is used, write it from the UDL side during the timing indicated by the "Load period into the Configuration Register" in the **Figure 6.6-2 Reset Sequence for Power-On Reset**.

6.6.3.2.52 L1 PM Substates Extended Capability Header (Offset: H'6160)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 20	Next Capability Offset	H'000	R	—	Indicates that this Capability List is the final List.
19 to 16	Capability Version	H'1	HwInit	RST_LOAD_B	Indicates the Capability Structure version.
15 to 0	PCI Express Extended Capability ID	H'001E	R	—	Indicate L1 PM Substates Extended Capability Header.



6.6.3.2.53 L1 PM Substates Capabilities Register (Offset: H'6164)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 24	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 19	Port T_POWER_ON Value	H'05	HwInit	RST_LOAD_B	Along with the Port T_POWER_ON Scale field in the L1 PM Substates Capabilities register sets the time (in µs) that this Port requires the port on the opposite side of Link to wait in L1.2. Exit after sampling CLKREQ# asserted before actively driving the interface. The value of Port T_POWER_ON is calculated by multiplying the value in this field by the scale value in the Port T_POWER_ON Scale field in the L1 PM Substates Capabilities register. Default value is 00101b Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP.
18	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17, 16	Port T_POWER_ON Scale	00b	HwInit	RST_LOAD_B	Specifies the scale used for the Port T_POWER_ON Value field in the L1 PM Substates Capabilities register. Range of Values 00b: 2 µs 01b: 10 µs 10b: 100 µs 11b: Reserved Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP.
15 to 8	Port Common_Mode_Restore_Time	All 0	HwInit	RST_LOAD_B	Time (in µs) required for this Port to re-establish common mode as described in table (reference "PCI Express Base Specification 4.0" Table.5-11 L1.2 Timing Parameters "TCOMMONMODE"). Required for all Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP.
7 to 5	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	L1 PM Substates Supported	1b	HwInit	RST_LOAD_B	L1 PM Substates support
3	ASPM L1.1 Supported	1b	HwInit	RST_LOAD_B	ASPM L1.1 support

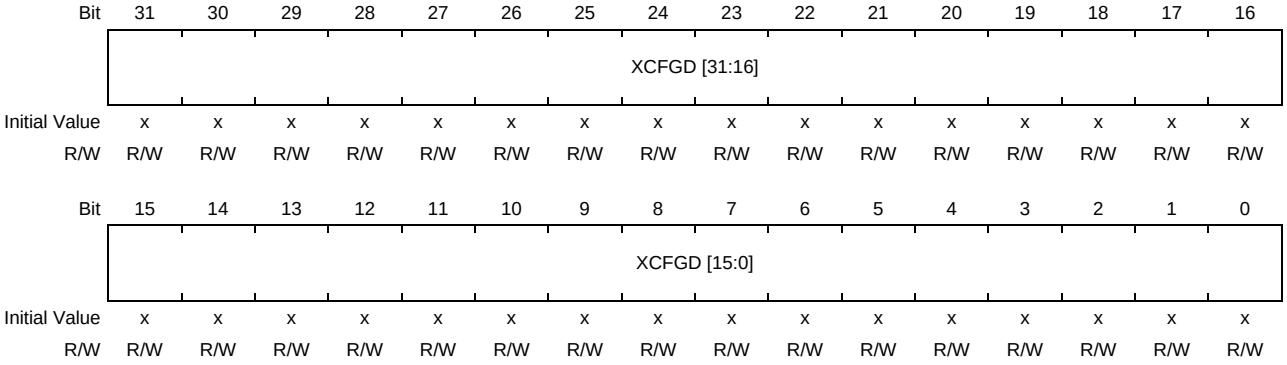
Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
2	ASPM L1.2 Supported	1b	HwInit	RST_LOAD_B	ASPM L1.2 support
1	PCI-PM L1.1 Supported	1b	HwInit	RST_LOAD_B	PCI-PM L1.1 support
0	PCI-PM L1.2 Supported	1b	HwInit	RST_LOAD_B	PCI-PM L1.2 support

6.6.3.2.54 L1 PM Substates Control 1 Register (Offset: H'6168)

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 29	LTR_L1.2_THRESHOLD_Scale	000b	R/W	RST_CFG_B	This field provides a scale for the value contained within the LTR_L1.2_THRESHOLD_Value. Encoding is the same as the LatencyScale fields in the LTR Message. The default value for this field is 000b. Hardware operation is undefined if software writes a Not-Permitted value to this field. This field must only be modified when the ASPM L1.2 Enable bit is Clear. The Port behavior is undefined if this field is modified when the ASPM L1.2 Enable bit is Set. Required for all Ports for which the ASPM L1.2 Supported bit is Set, otherwise this field is of type RsvdP.
28 to 26	—	000b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 16	LTR_L1.2_THRESHOLD_Value	All 0	R/W	RST_CFG_B	Along with the LTR_L1.2_THRESHOLD_Scale, this field indicates the LTR threshold used to determine if entry into L1 results in L1.1 (if enabled) or L1.2 (if enabled). The default value for this field is 00_0000_0000b. This field must only be modified when the ASPM L1.2 Enable bit is Clear. The Port behavior is undefined if this field is modified when the ASPM L1.2 Enable bit is Set. Required for all Ports for which the ASPM L1.2 Supported bit is Set, otherwise this field is of type RsvdP.
15 to 8	Common_Mode_Restore_Time	H'00	R/W	RST_CFG_B	Sets value of TCOMMONMODE (in µs), which must be used by the Downstream Port for timing the re-establishment of common mode, as described in . This field must only be modified when the ASPM L1.2 Enable and PCI-PM L1.2 Enable bits are both Clear. The Port behavior is undefined if this field is modified when either the ASPM L1.2 Enable and/or PCI-PM L1.2 Enable bit(s) are Set. Required for Downstream Ports for which either the PCI-PM L1.2 Supported bit is Set, ASPM L1.2 Supported bit is Set, or both are Set, otherwise this field is of type RsvdP. This field is of type RsvdP for Upstream Ports.
7 to 4	—	H'0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	ASPM L1.1 Enable	0b	R/W	RST_CFG_B	ASPM L1.1 support
2	ASPM L1.2 Enable	0b	R/W	RST_CFG_B	ASPM L1.2 support
1	PCI-PM L1.1 Enable	0b	R/W	RST_CFG_B	PCI-PM L1.1 support

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
0	PCI-PM L1.2 Enable	0b	R/W	RST_CFG_B	PCI-PM L1.2 support

6.6.3.2.55 L1 PM Substates Control 2 Register (Offset: H'616C)



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

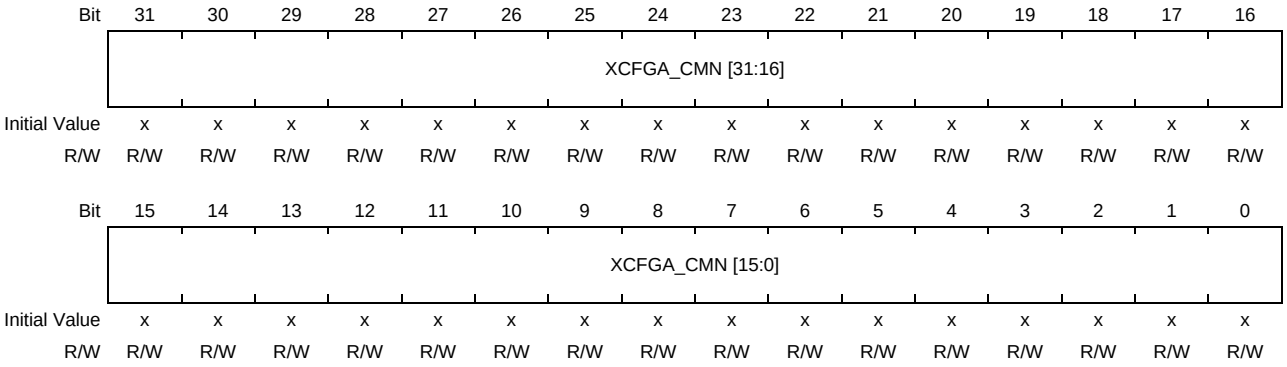
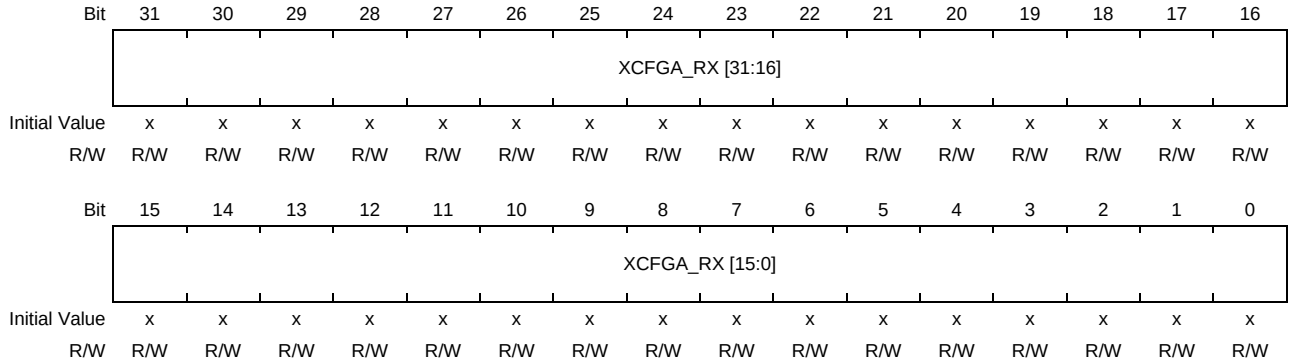
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Valid Reset	Description
31 to 8	—	All 0	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 3	T_POWER_ON Value	H'05	R/W	RST_CFG_B	Along with the T_POWER_ON Scale sets the minimum amount of time (in µs) that the Port must wait in L1.2. Exit after sampling CLKREQ# asserted before actively driving the interface. T_POWER_ON is calculated by multiplying the value in this field by the value in the T_POWER_ON Scale field. This field must only be modified when the ASPM L1.2 Enable and PCI-PM L1.2 Enable bits are both Clear. The Port behavior is undefined if this field is modified when either the ASPM L1.2 Enable and/or PCI-PM L1.2 Enable bit(s) are Set. Default value is 0_0101b Required for all Ports that support L1.2, otherwise this field is of type RsvdP
2	—	0b	R	—	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	T_POWER_ON Scale	00b	R/W	RST_CFG_B	Specifies the scale used for T_POWER_ON Value. Range of Values 00b: 2 µs 01b: 10 µs 10b: 100 µs 11b: Reserved Required for all Ports that support L1.2, otherwise this field is of type RsvdP. This field must only be modified when the ASPM L1.2 Enable and PCI-PM L1.2 Enable bits are both Clear. The Port behavior is undefined if this field is modified when either the ASPM L1.2 Enable and/or PCI-PM L1.2 Enable bit(s) are Set. Default value is 00b



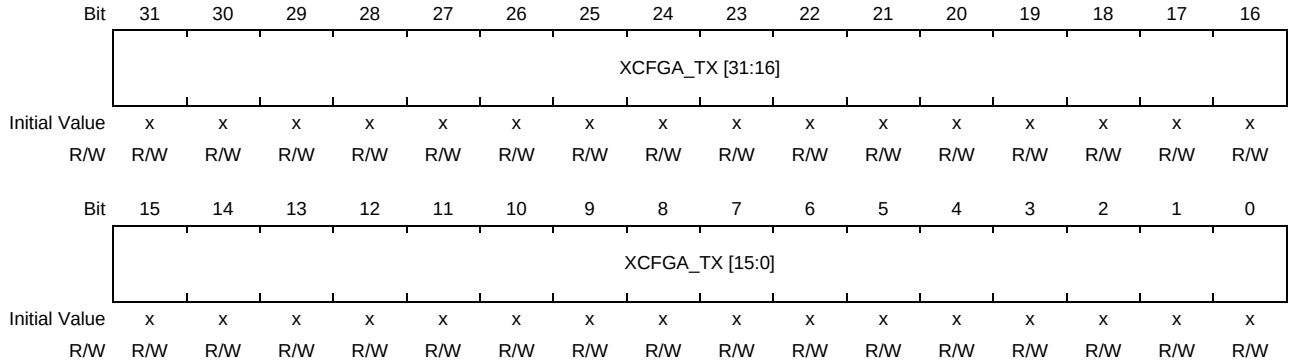
6.6.3.3 PHY Setting Registers

6.6.3.3.1 XCFGD Setting Register n (n = 0 to 38) (Offset: H'2000 + H'10 × n)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGD	All x	R/W	Set the XCFGD setting value of PHY.

6.6.3.3.2 XCFGA CMN Setting Register n (n = 0 to 15) (Offset: H'2400 + H'10 × n)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGA_CMN	All x	R/W	Set the XCFGA_CMN setting value of PHY.

6.6.3.3.3 XCFGA RX Setting Register n (n = 0 to 12) (Offset: H'2500 + H'10 × n)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGA_RX	All x	R/W	Set the XCFGA_RX setting value of PHY.

6.6.3.3.4 XCFGA TX Setting Register (Offset: H'25D0)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	XCFGA_TX	All x	R/W	Set the XCFGA_TX setting value of PHY.

6.6.3.3.5 XCFG Control Register (Offset: H'2A20)

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	PHYREG_SEL	0b	R/W	Select PHY setting value 0b: Core pin value 1b: PHY setting registers (PCI_PHY_XCFG* registers) value Before setting 1 to PHYREG_SEL bit, PCI_PHY_XCFG* registers should be set.

6.6.4 Function Description

6.6.4.1 PCIe Core Functionality

This module is configured based on the Base Spec 4.0. For the detailed specification, refer to the Base Spec 4.0

6.6.4.2 Issuing of PCIe Request and Register Access (From AXI)

The following gives functional description on access to the PCI Express core by the AXI bus.

6.6.4.2.1 PCIe Requests which can be Issued (Supported Commands for TX)

Requests to be issued via PCIe windows

MRd: Memory Read Request

MWr: Memory Write Request

Requests to be issued by the registers

MRd: Zero-Length Memory Read Request

CfgRd0: Configuration Read Type 0

CfgWr0: Configuration Write Type 0

CfgRd1: Configuration Read Type 1

CfgWr1: Configuration Write Type 1

Msg: Message Request

MsgD: Message Request with data payload

Unsupported requests (issuance prohibited)

IORd: I/O Read Request

IOWr: I/O Write Request

MRdLk: Memory Read Request-Locked

CplDLk: Completion for Locked Memory Read

6.6.4.2.2 Register access

- Internal register read/write
- Configuration register read/write

The following restrictions apply to access to the configuration registers.

- Byte-lane transfer is only acceptable if the transfer consists of consecutive valid bytes.
- If the valid bytes are not consecutive, only values which are no greater than 32 bits (1 dword) and do not span the dword alignment are acceptable.
  [Example] A value which can represent a dword TLP for PCIe

6.6.4.2.3 Issuing Memory Requests

Access from the AXI side is converted into a PCIe request and then issued. Up to eight windows can be allocated. Note that only incremental bursts and fixed bursts (of 1 beat) are acceptable. Wrapping bursts and fixed bursts (of 2 or more beats) are prohibited. If these prohibited bursts are received, the module operates as follows.

- Although the response will in general be “OKAY” (except in cases that involved a protocol error of the AXI), this is beyond the scope of guaranteed operation.
- Unexpected requests may be issued to the PCIe bus.
- Unexpected registers may be modified.

To maintain the order between memory writing and memory reading, only issue next transactions after the reception of responses to writing. Buffering is not available in the issuing of memory write requests. (Refer to the description of AWCACHE* of Mode Set 0 Register (offset: H’314).)

Note that when accessing outside the set Window area, it responds “OKAY”, but it is discarded inside this module.

(1) Memory Write Transaction from the AXI

A write transaction from the AXI via a window is converted into a MWr command and then issued.

- Number of write transactions which can be accepted at a time: 1
- Write data are held in an internal buffer.
- The order between memory write transactions is preserved (with the exception of transactions for messages and configuration).
- The order of memory write and other transactions is not preserved (a preceding memory read may be overtaken).
- To preserve the order between memory writing and memory reading or of Msg and MsgD, make sure that a next transaction is only issued after a response is returned. Buffering is not available in the issuing of memory write requests.
- Writing does not proceed if the PCI power state is not D0.
- Transactions where all bits of WSTRB are 0 during a burst return an “OKAY” response, but the written data are not reflected.

(2) Memory Read Transaction from the AXI

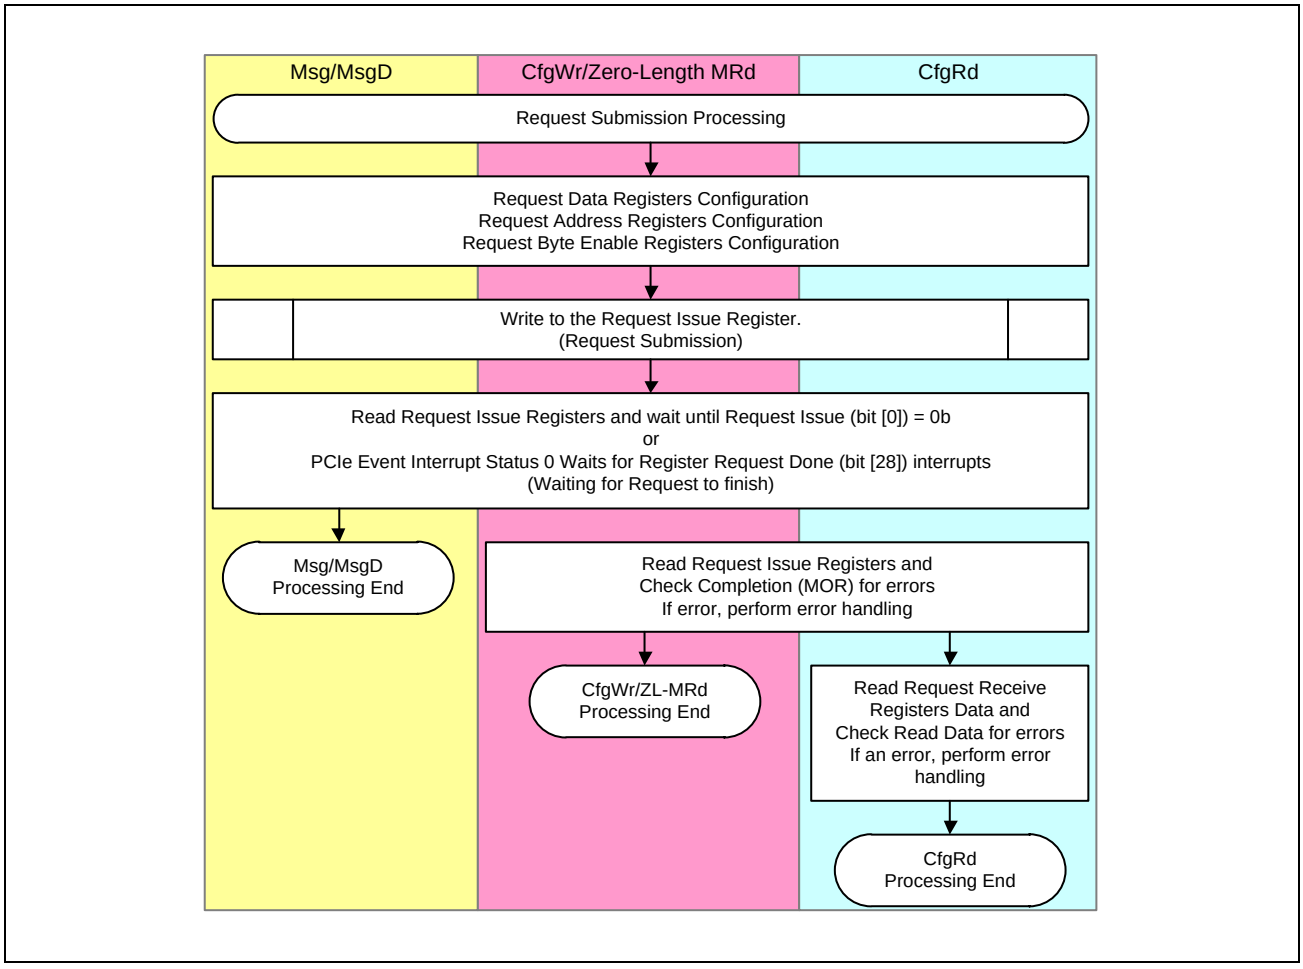
A read transaction from the AXI via a window is converted into an MRd command and then issued.

- Number of read transactions which can be accepted at a time: 1 to 8.
- Read data are held in an internal buffer to preserve the order of transactions with the same ID.
- To preserve the order of memory read transactions from the same master ID, the system can also wait until the indicator of completion of a preceding read transaction is returned. The method of waiting is selectable as either of the above by the setting of an internal register as listed in the table below.

PCIe Request Order*1	Method of Waiting	Performance	Severity of Order
0 (Default)	Make Read Data wait in internal buffer	✓	—
1	Waiting to issue a Read Request	—	✓

Note 1. The order can be set by using the PCIe Request Order bit (bit [0]) of Mode Set 1 Register (offset: H'318).

- The order of memory read transactions from a different master ID is not preserved.
- The order of memory read and other transactions is not preserved.
- To preserve the order between memory reading and memory writing, make sure that a next transaction is only issued after a response is returned. Buffering is not available in the issuing of memory write requests.
- MRdLk requests are not supported and therefore cannot be issued.
- Reading does not proceed if the PCI power state is not D0.



6.6.4.2.4 Issuing Special Requests

The following requests can be issued by controlling the internal registers.

- Configuration Read Type0/1
- Configuration Write Type0/1
- Zero-Length Memory Read Request
- Message Request
- Message Request with data payload

The internal registers are only writable from the AXI side. Attempted writing from the PCIe side is ignored and the write operation returns an “OKAY” response, but the written data are not reflected.

The figure below shows the flow of issuing requests by the registers.

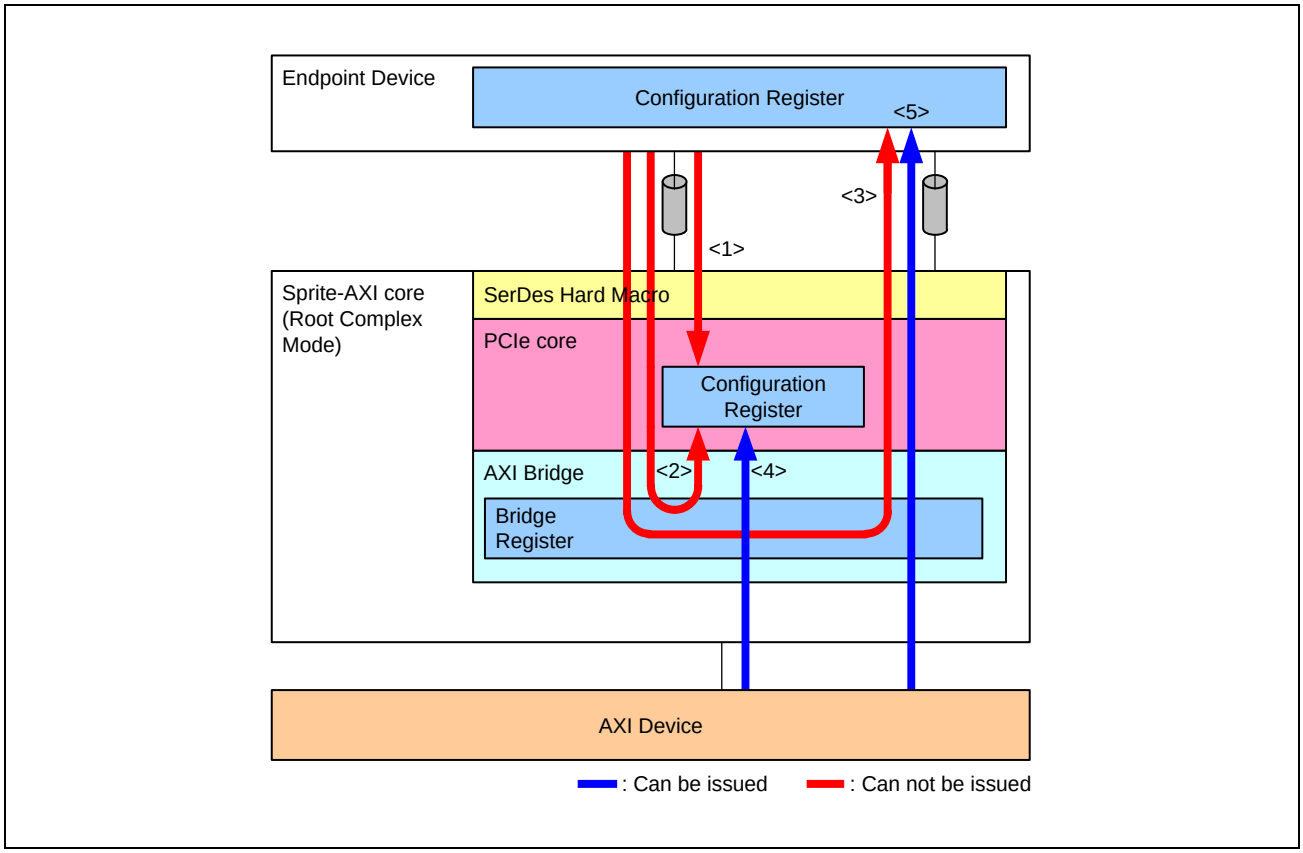
(1) Issuing a Configuration Request

AXI Slave I/F accesses internal registers, sets destination in Request Address Registers 1 (Offset: H’90), then sets Request Issue (bit [0]) in Request Issue Registers (Offset: H’9C), and automatically issues a Configuration Request.

(a) Flow of issuing Configuration Requests

An example of the flow for issuing a Configuration Requests is described below.

1. Set a destination in Request Address Registers 1 (Offset: H’90)



Bits [31: 24]:	Bus Number [7:0]	Set 0 to 255
Bits [23:19]:	Device Number [4:0]	Set 0 to 31
Bits [18:16]:	Function Number [2:0]	Set 0 to 7
Bits [15:12]:	Reserved	Set 0000b (Fixed value)
Bits [11:8]:	Extend Register Number [3:0]	
Bits [7:2]:	Register Number [7:0]	
Bits [1:0]:	Reserved	Set 00b (Fixed value)

2. Set to Byte Enable in Request Byte Enable Registers (Offset: H’98).
   Set Enable/Disable corresponding to each Byte position if Read/Write is desired for each Byte (Default: 1111b)
3. For CfgWr, set Write Data in Request Data Registers (Offset: H’80/H’84/H’88). (Not needed for CfgRd)
4. A Configuration Request is automatically issued by setting the Request Issue (bit [0]) in the Request Issue Registers (Offset: H’9C) to 1b. (Set CfgWr/CfgRd in TR type (bit [11:8]) of Request Issue Registers (Offset: H’9C).)
5. Wait for the Request to finish by reading the Request Issue Registers (Offset: H’9C) and waiting for the Request Done (bit [28]) interrupt of wait (Polling) or PCIe Event Interrupt Status 0 Registers (Offset: H’204) until the Request Issue (bit [0]) reaches 0b.
6. For CfgRd, the CplD from the opposing Endpoint device is stored in Request Receive Data Registers (Offset: H’8C). It is possible to check this register by reading it.

(b) Configuration Request Issue Patterns

The following table shows whether the Configuration Request can be issued in Root complex mode.

No.	Request Direction	Access
1	EP to PCIe Core	Can not be issued
2	EP to Register → PCIe Core	Can not be issued
3	EP to Register → EP	Can not be issued
4	AXI to PCIe Core	Can be issued
5	AXI to Register → EP	Can be issued

(2) Issuing Message Requests

A message request is automatically issued by setting the Request Issue bit (bit [0]) of the Request Issue Register after access to an internal register through the AXI slave interface and setting a destination in Request Address Register 1.

(a) Flow of Issuing Message Requests

An example of the flow of issuing message requests is described below.

1. Set a destination in Request Address Register 1.

Bits [31:27]:	Reserved	Set 0_0000b (Fixed value)
Bits [26:24]:	Routing Type	Specify the message routing
Bits [23:8]:	Reserved	Set H'0000 (Fixed value)
Bits [7:0]:	Message Code	Specify the message code

2. Set the 3rd header in Request Data Register 1 as required.
3. Set the 4th header in Request Data Register 2 as required.
4. For MsgD, set write data in Request Data Register 3 (not required in the case of Msg)
5. Message requests are automatically issued by setting the Request Issue bit (bit [0]) of the Request Issue Register to 1b (the TR type bits (bits [11:8]) of the Request Issue Register are used to set Msg/MsgD).
6. Read the Request Issue Register and wait (polling) or wait for an interrupt of Request Done (bit [28]) of PCIe Event Interrupt Status 0 Register until the Request Issue bit (bit [0]) is set to 0b, wait for the request to end.

(b) Notes when Issuing Message Requests

Points to note when issuing message requests are described below.

- INTx and error type messages are automatically issued. They do not require issuing as message requests by the user (prohibited).
- Set message headers appropriately.
- A value to be set in a message header must be 0 except when sending a vendor defined message.

(3) Issuing Zero-Length Read

A zero-length read request is automatically issued by setting a destination in Request Address Register 1 after access to an internal register through the AXI slave interface and setting the Request Issue bit (bit [0]) of the Request Issue Register.

(a) Flow of Issuing Zero-Length Read Requests

An example of the flow of issuing zero-length read requests is described below.

1. Set a destination in Request Address Register 1.

Bits [31:2]:	Address	Set the address
Bits [1:0]:	Reserved	Set 00b (Fixed value)

2. Set a destination in Request Address Register 1.

Bits [64:32]:	Address	Set the address

3. Set Byte Enable (0000b) in Request Byte Enable Register.
4. Zero-length read requests are automatically issued by setting the Request Issue bit (bit[0]) of the Request Issue Register to 1b (the TR type bits (bits [11:8]) of the Request Issue Register are used to set zero-length read).
5. Read the Request Issue Register and wait (polling) or wait for an interrupt of Request Done (bit [28]) of PCIe Event Interrupt Status 0 Register until the Request Issue bit (bit [0]) is set to 0b, wait for the request to end.

An example of using this request is to issue a zero-length read request to the same address where the write request was issued for a Posted Request that did not receive a response, such as a memory write, and use the response as a completion notification for the write request.

6.6.4.3 Issuing of AXI Transaction and Register Access (From PCIe)

The following gives functional description on access to the AXI bus by the PCI Express core.

6.6.4.3.1 PCIe Requests which can be Received (Supported Commands for RX)

MRd: Memory Read Request

MWr: Memory Write Request

CfgRd0: Configuration Read Type 0

CfgWr0: Configuration Write Type 0

Msg: Message Request

MsgD: Message Request with data payload

Cpl: Completion

CplD: Completion with Data

The following requests are not supported.

MRdLk: Memory Read Request-Locked

IORd: I/O Read Request

IOWr: I/O Write Request

CplLK: Completion for Locked Memory Read without Data

CplDLk: Completion for Locked Memory Read

CfgRd1: Configuration Read Type 1

CfgWr1: Configuration Write Type 1

AtomicOP is not supported.

6.6.4.3.2 Issuing AXI Transaction

Access from the PCIe side is converted into an AXI transaction and then issued. Up to eight windows can be allocated.

To avoid a read-after-write (RAW) hazard, only issue a next memory write request following reception of the completion TLP for the previous one.

Table 6.6-14 AXI transaction from PCIe Request

PCIe Request Order	Burst Type	Bath Size	Split
MWr/MRd	Increment	64/128	Yes
		32	No
IOWr/IORd	Unsupported request		
MRdLk	Unsupported request		

(1) Memory Write Transaction from the PCIe

- Allowable number of write requests to be issued: Variable (the value is set by the AXI Max Issue Write bits (bits [15:12]) of Mode Set 1 Register).
- Write data are not held in an internal buffer (buffering within the PCIe core).
- The order between memory write transactions is preserved.
- The order of memory writing and memory reading is not preserved.
- To preserve the order between memory writing and memory reading, make sure that a next request is only issued after a completion TLP is returned.
- AWCACHE and AWPROT can be set by using Mode Set 0 Register.
- In cases of contention between DMA transfer (from PCIe to AXI) and memory write transaction, requests are accepted in turn in round-robin fashion.

(2) Memory Read Transaction from the PCIe

- Allowable number of read requests to be issued: Variable (the value is set by the AXI Max Issue Read bits (bits[11:8]) of Mode Set 1 Register).
- Since the PCI specification requires dword-aligned memory addresses in transfer, invalid byte lanes may be read. If an AXI slave as a read destination has a register or FIFO buffer which has been cleared by being read, the transaction may be non-compliant.
- Read Data are held in an internal buffer.
- The order between memory read operations is preserved.
- A preceding memory write is not overtaken.
  Read Data are held in an internal buffer until a preceding memory write is completed.
- When a zero-length read request is received, an “OKAY” response is returned, but the written data are not reflected and a completion TLP is transmitted after waiting for the completion of the preceding memory write.
  Read Data are held in an internal buffer until a preceding memory write is completed.
- ARCACHE can be set by using Mode Set 0 Register.
- In cases of contention between DMA transfer (from AXI to PCIe) and memory read transaction, requests are accepted in turn in round-robin fashion.

6.6.4.3.3 Narrow Transfer

Narrow transfer to be initiated by the AXI transfer only supports the following AXI transactions.

- MAxBURST = INCR
- MAxSIZE = H'0 to H'2 (8 bits / 16 bits / 32 bits)
- MAxLEN = H'0 (1 beat)

The following restrictions apply to TLPs from the PCIe module in narrow transfer.

- The length is 1 dword.
- The First Byte Enable bit only supports the following.
  - MAxSIZE = H'0 (8 bits): 1000b / 0100b / 0010b / 0001b
  - MAxSIZE = H'1 (16 bits): 1100b / 0011b
  - MAxSIZE = H'2 (32 bits): 1111b

6.6.4.4 DMA Functions

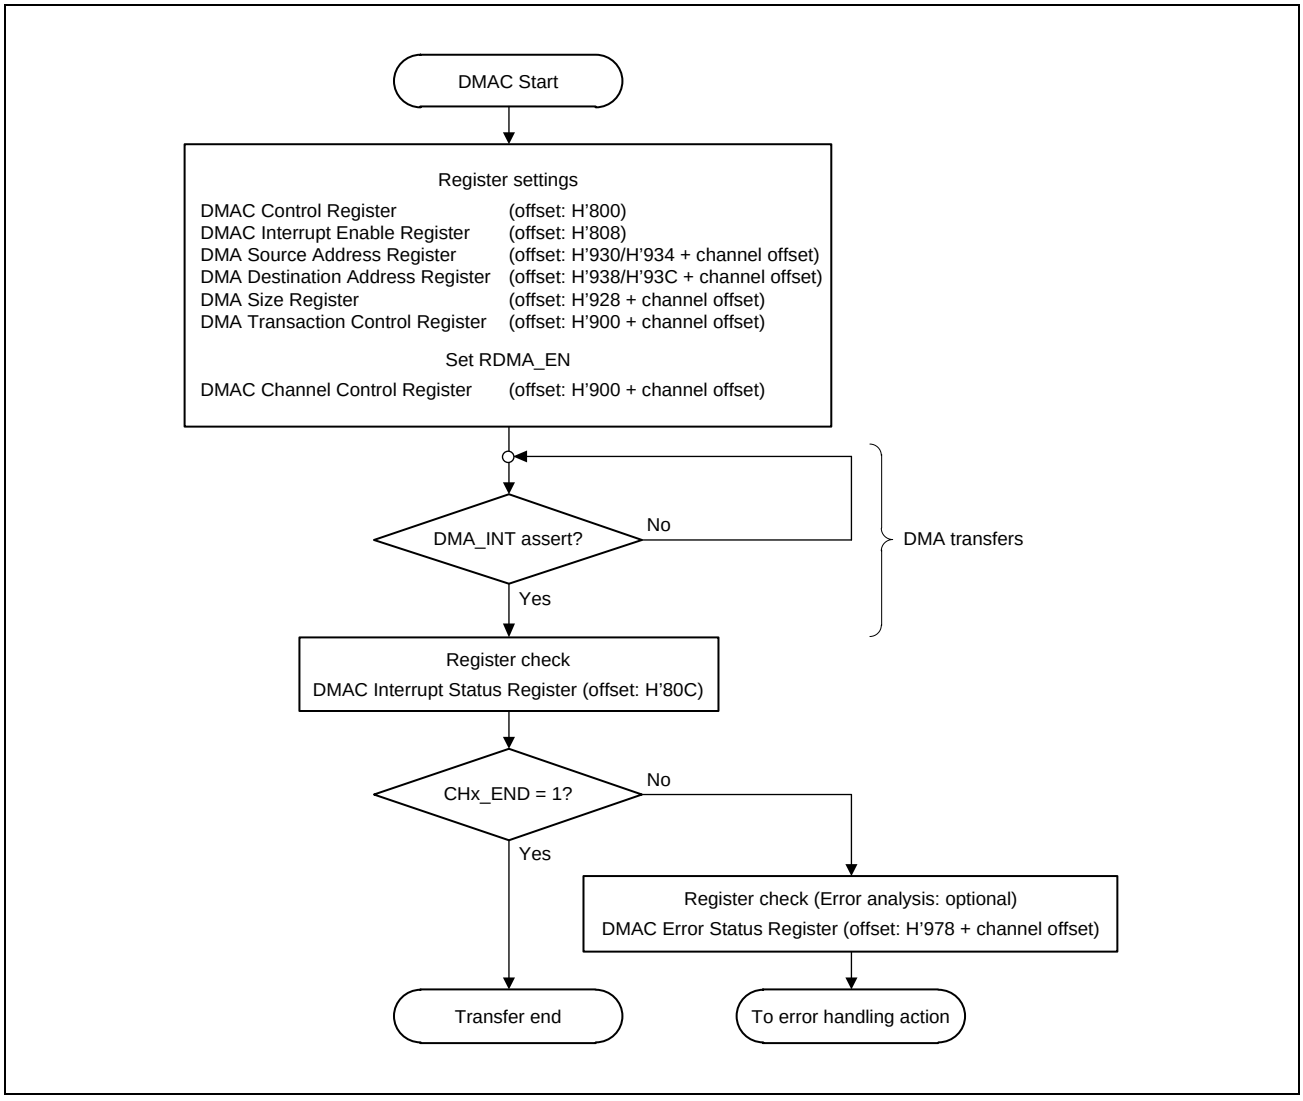
This section explains functions of the DMAC within the module. Control by registers and by descriptors are both supported as methods of DMA control. The method of control is independently selected per channel.

6.6.4.4.1 Register-Type Transfer

DMA transfer from AXI to PCIe or vice versa is handled by software making register settings. The table below lists the DMAC registers for execution of register-type DMA transfer.

Table 6.6-15 Registers Related to Register-Type DMA Transfer

Common Control	
H'800	DMAC Control
H'808	DMAC Interrupt Enable
H'80C	DMAC Interrupt Status
Channel Control	
H'900 + channel offset	DMA Channel Control
DMA Setting	
H'924 + channel offset	DMA Transaction Control (Descriptor H'04)
H'928 + channel offset	DMA Size (Descriptor H'08)
H'930 + channel offset	DMA Source Lower Address (Descriptor H'10)
H'934 + channel offset	DMA Source Upper Address (Descriptor H'14)
H'938 + channel offset	DMA Destination Lower Address (Descriptor H'18)
H'93C + channel offset	DMA Destination Upper Address (Descriptor H'1C)
DMA Status	
H'950 + channel offset	DMA Reset Size
H'960 + channel offset	AXI Request Address (Lower)
H'964 + channel offset	AXI Request Address (Upper)
H'968 + channel offset	PCIe Request Address (Lower)
H'96C + channel offset	PCIe Request Address (Upper)
H'978 + channel offset	DMAC Error Status



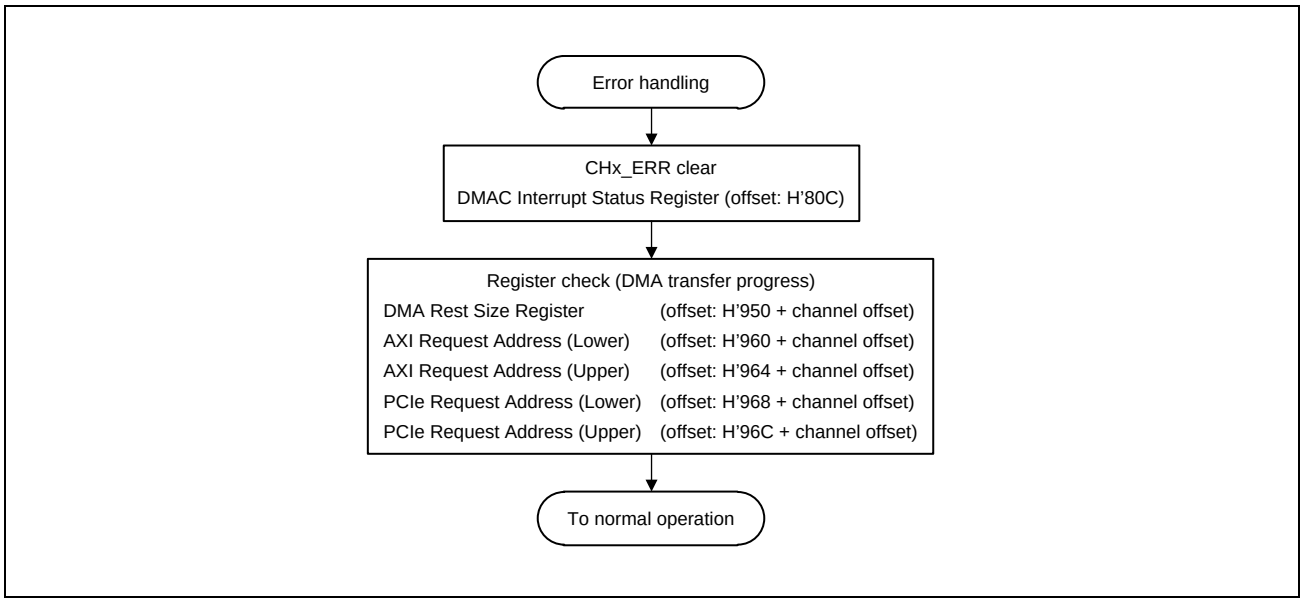
Note: During Register-type DMA, the maximum number of bytes transferred at one time is 4 Gbytes.

(1) Flow of Operations

The following describes the procedures for settings to activate and stop the DMAC in the case of register-type transfer.

(a) Activation and Normal Operation

Before activating the DMAC, set the PCIe and AXI windows. After that, set the registers of the DMAC to start the DMAC.



(b) Error Processing

If an error is detected in the AXI bus or a PCIe link while DMA transfer is in progress, the DMA_INT interrupt signal is asserted.

Check the channel where the error was found (CHx_ERR = 1b) by using the DMAC Interrupt Status Register (offset: H’80C) and also the type of error by using the DMAC Error Status Register (offset: H’978 + channel offset) as required.

Clear the CHx_ERR bit that is currently set in the DMAC interrupt status register (offset: H’80C) by writing 0b to it and check the address to which transfer was most recently completed before it was stopped and the remaining number of bytes for transfer by reading the DMA Status registers (offset: H’950 + channel offset to H’96C + channel offset) for the given channel.

6.6.4.4.2 Descriptor-Type Transfer

Consecutive DMA transfer is achieved by sequentially reading descriptors which indicate parameters of DMA transfer. Descriptors are allocated to the AXI memory space, and the descriptor lists indicate the addresses where the descriptors start. This DMAC has a queue for storing multiple descriptors lists and these descriptor lists are written by software. The first list loaded in the queue is executed after being moved to become the descriptor list for execution following the detection of the condition for starting DMA transfer (the DMAC retains up to nine lists, including the one currently being executed).

Descriptors can have a chained configuration; execution of a descriptor list ends on detection of the last descriptor, and if the queue has a next list, execution of the next descriptor follows.

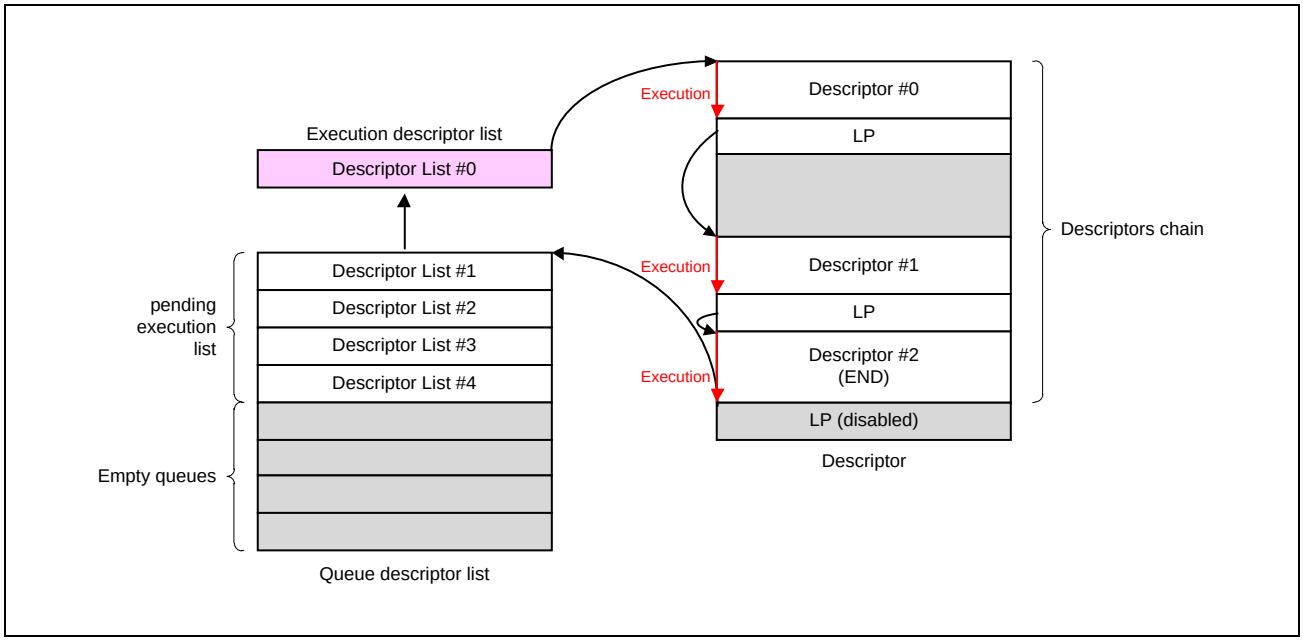


Figure 6.6-3 Descriptor Chain

The table below lists the DMAC registers for execution of descriptor-type DMA transfer.

Table 6.6-16 Registers Related to Descriptor-Type DMA Transfer

Common Control	
H'800	DMAC Control
H'808	DMAC Interrupt Enable
H'80C	DMAC Interrupt Status
Channel Control	
H'900 + channel offset	DMA Channel Control
H'908 + channel offset	Descriptor Start Address (Lower)
H'90C + channel offset	Descriptor Start Address (Upper)
H'910 + channel offset	QUE Entry
DMA Setting	
H'920 + channel offset	DMA Descriptor Control (Descriptor H'00)
H'924 + channel offset	DMA Transaction Control (Descriptor H'04)
H'928 + channel offset	DMA Size (Descriptor H'08)
H'930 + channel offset	DMA Source Lower Address (Descriptor H'10)
H'934 + channel offset	DMA Source Upper Address (Descriptor H'14)
H'938 + channel offset	DMA Destination Lower Address (Descriptor H'18)
H'93C + channel offset	DMA Destination Upper Address (Descriptor H'1C)
H'940 + channel offset	DMA Descriptor Lower Link Pointer (Descriptor H'20)
H'944 + channel offset	DMA Descriptor Upper Link Pointer (Descriptor H'24)
DMA Status	
H'950 + channel offset	DMA Rest Size
H'960 + channel offset	AXI Request Address (Lower)
H'964 + channel offset	AXI Request Address (Upper)
H'968 + channel offset	PCIe Request Address (Lower)
H'96C + channel offset	PCIe Request Address (Upper)
H'970 + channel offset	QUE Status
H'978 + channel offset	DMAC Error Status

(1) Descriptor List Queues

The DMAC has queues for storing descriptor lists for each of the channels. The number of FIFO queue stages is eight, so it can hold up to eight descriptor list entries (not including the one currently being executed).

Software places descriptor list entries in the queue. The descriptor lists to be entered are set by the combination of the QUE_ENTRY (upper) register and the QUE_ENTRY (lower) register in 64-bit (or 8-byte) units.

Since the target registers are also accessible in 8-bit units, making the settings in byte units through multiple accesses is also possible. A descriptor list entry is placed in the queue at the time when the QUE_ENTRY (upper) bits [31:24] are written. When making the settings and entering lists in the queue, take care with the order of register access (values written to the QUE_ENTRY (upper) bits [31:26] will not affect the register values and settings because they are read-only bits).

When the DMAC detects the presence of a list which has been entered in the queue, the first list entry is moved to become the pointer to the next descriptor for execution and DMA transfer starts.

(2) Descriptor List Format

The table below is the format of a descriptor list.

Table 6.6-17 Descriptor List Format

Offset	Byte 3			Byte 2	Byte 1	Byte 0
H'00	DSA[31:0] (Descriptor Start Address)					
H'04	DSA[63:32] (Descriptor Start Address)					
H'08	Reserved	EI	LS	Reserved	LABEL [15:0]	

Field Name	Description
DSA[63:0]	Descriptor start address for DAM. Sets the address where the first descriptor is stored. 16-byte alignment and 1 descriptor (H'00 to H'24) beyond the 4K boundary is prohibited. Set the lower 6 bits [5:0] to be 00_0000b.
EI	End Interrupt bit. This bit indicates whether an interrupt (Interrupt Status CHx_END of the DMAC Interrupt Status Register (offset: H'80C)) is or is not conveyed when processing of this descriptor list is completed. 1b: The interrupt is conveyed. 0b: The interrupt is not conveyed.
LS	List Stop bit. This bit indicates whether DMA transfer is or is not to be stopped on completion of processing for this descriptor list entry. 1b: Stopped 0b: Not stopped On completion of the list in which the setting of this bit is 1b, the QUE_EN bit of the DMA control register is cleared.
LABEL[15:0]	This field represents the label of the list. There are no special rules for the setting procedures. The value can be set as desired.

Operations by the settings of the EI and LS bits following the completion of the descriptor list are as follows.

Table 6.6-18 Details of the EI/LS Bits

EI	LS	
0	0	No interrupt. DMA transfer is not stopped. If the queue has a next list, execution of the next descriptor follows.
0	1	No interrupt. DMA transfer is stopped (QUE_EN is cleared).
1	0	Interrupt (DMAC Interrupt Status Register (Offset: H'80C), Interrupt Status CHx_END) is present. DMA transfer is not stopped. If the queue has a next list, execution of the next descriptor follows.
1	1	Interrupt (DMAC Interrupt Status Register (Offset: H'80C), Interrupt Status CHx_END) is present. DMA transfer is stopped (QUE_EN is cleared).

(3) Descriptor Format

The table below is the format of descriptors.

When reading descriptors, this module reads data up to Offset H'00 to H'2C, but data up to Offset H'28 to H'2C is not used in the macro.

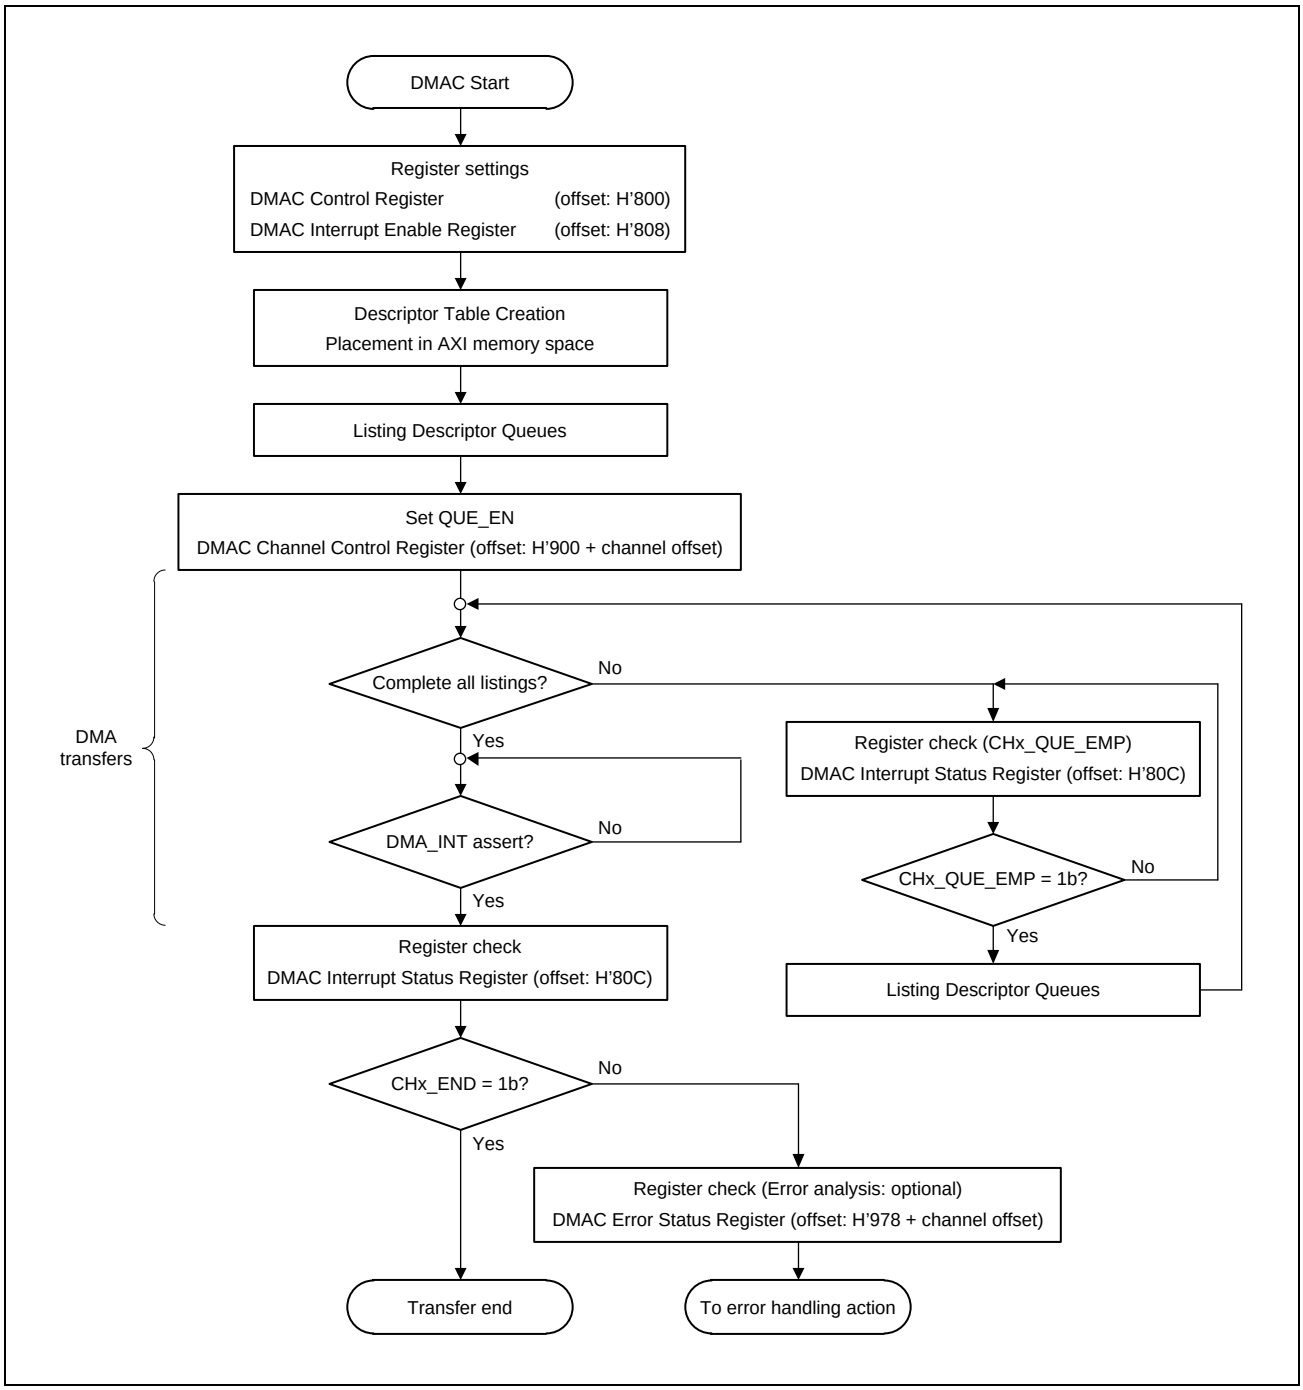
Table 6.6-19 Descriptor List Format

Offset	Byte 3								Byte 2								Byte 1								Byte 0							
H'00	DSCFM = 0001b			—	WBD	LE	LV		D	—	—	—	—	—	—	—	STS (not used)															
H'04	—	—	—	—	—	—	—	—	CCH_L								CCH_D								—	TC			—	—	ATB		—	DMA_FUNC							DIR
H'08	SIZE [31:0]																															
H'0C	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
H'10	SA[31:0]																															
H'14	SA[63:32]																															
H'18	DA[31:0]																															
H'1C	DA[63:32]																															
H'20	LP[31:0]																															
H'24	LP[63:32]																															

Field Name	Description
DSCFM[3:0]	Descriptor Format, which specifies the format of the descriptor. This DMAC only supports 0001b. Do not set any other values.
WBD	Write Back Disable bit Indicates whether the DMAC writes 0b back to the LV bit when DMA transfer specified by a single descriptor is completed. 1b: The LV bit is not written back. 0b: The LV bit is written back.
LE	List End bit Indicates the end of the current descriptor chain. 1b: The current descriptor is the last of the chain. 0b: The current descriptor is not the last of the chain.
LV	Link Valid bit Indicates that the descriptor is valid. When DMA transfer is completed, the DMAC writes 0b back to this bit. When DMA transfer ends due to an error, write-back does not proceed. 1b: The descriptor is valid (DMA transfer specified by the descriptor is not completed). 0b: The descriptor is not valid (DMA transfer specified by the descriptor is completed).
D	Descriptor error bit Indicates a descriptor access error. If LV = 0 when the descriptor is read, the DMAC writes 1b back to the LV bit. When a descriptor error occurs, if the setting of the LE bit is 0 (indicating that the current descriptor is not the last of the chain), the DMAC continues transfer in accord with the descriptor the LP bits indicate. 1b: A descriptor access error occurred. 0b: No error
STS[15:0]	This field has no effect when DSCFM = 0001b. The DMAC does not use this field.

Field Name	Description
CCH_L[3:0]	This field indicates the value of A*CACHE [3:0] to be issued through the AXI. The value of CCH_L [3:0] is output when an AXI request including the last byte is issued in transfer specified in the SIZE bits. Bit [3]: Write allocation Bit [2]: Read allocation Bit [1]: Cache enabled Bit [0]: Buffer enabled The recommend value is 0000b regardless of whether DIR is 0 or 1.
CCH_D[3:0]	This field indicates the value of A*CACHE [3:0] to be issued through the AXI. The value of CCH_D[3:0] is output when an AXI request other than the condition for the output of CCH_L[3:0] is issued. Bit [3]: Write allocation Bit [2]: Read allocation Bit [1]: Cache enabled Bit [0]: Buffer enabled The recommended value is 0001b when DIR = 0b (PCIe to AXI) and 0000b when DIR = 1b (AXI to PCIe).
TC[2:0]	This field specifies the value of the traffic class of the request to be issued through the PCIe interface. The value must be fixed to 000b.
ATB[1:0]	This field indicates the value of the attribute to be issued through the PCIe interface. Bit [1]: Relaxed ordering Bit [0]: No-snoop If neither relaxed ordering nor no-snoop is used, this field should be set to 00b (recommended).
DMA_FUNC[2:0]	This field specifies the function number of the request to be issued through the PCIe interface.
DIR	This bit indicates the direction of data transfer. 1b: AXI to PCIe 0b: PCIe to AXI
SIZE[31:0]	This field indicates the number of bytes for transfer. Since the setting is 16-byte alignment, do not set anything other than 0000b for the lower 4 bits ([3:0]).
SA[63:0]	The Source Address field indicates the address of the source data for transfer. Since the setting is 16-byte alignment, do not set anything other than 0000b for the lower 4 bits ([3:0]).
DA[63:0]	The Destination Address field indicates the destination address. Since the setting is 16-byte alignment, do not set anything other than 0000b for the lower 4 bits ([3:0]).
LP[63:0]	This field indicates the address where a next descriptor is stored. Since 16-byte alignment and 1 descriptor (H'00 to H'24) beyond the 4K boundary is prohibited, set the lower 6 bits ([5:0]) to be 00_0000b.

The conditions where the descriptor is written back after the descriptor is read, the timings, and the corresponding bits are listed below.



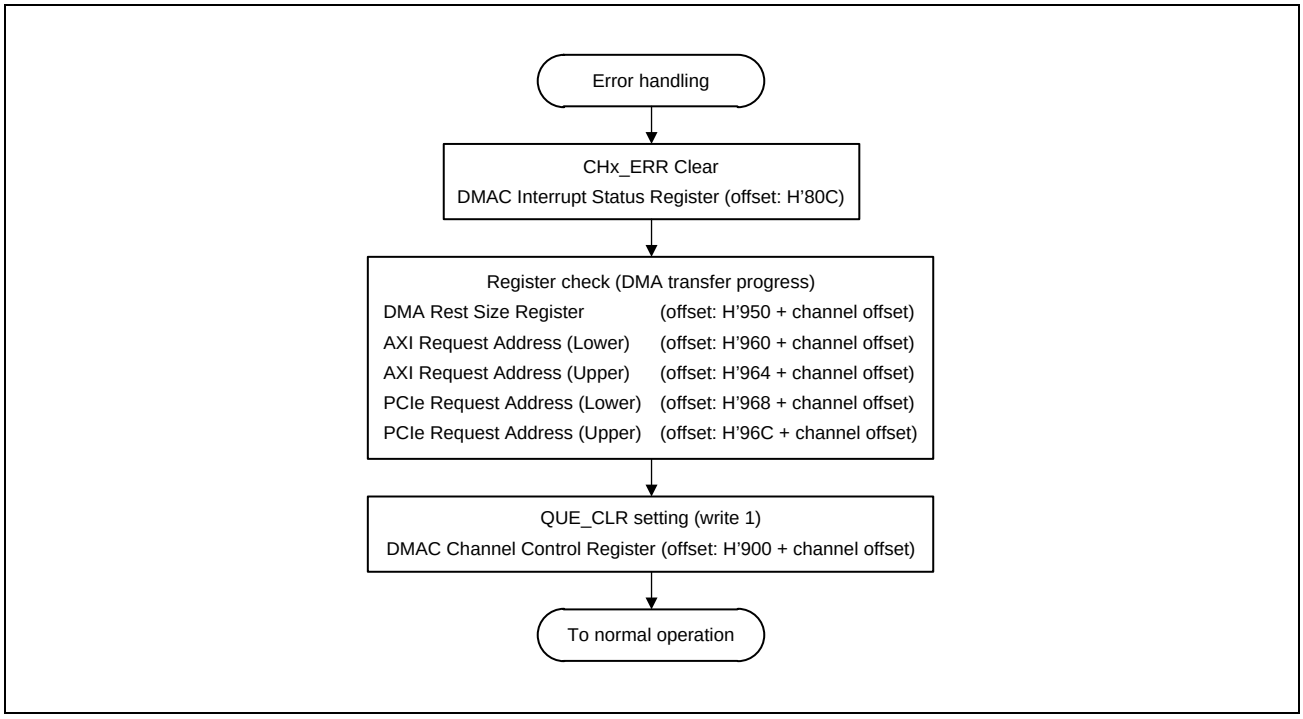
Condition	Timing	Corresponding Bit and Value
WBD = 0 && LV = 1	After DMA transfer specified by the descriptor is completed	LV = 0
WBD = (1 or 0) && LV = 0	After the descriptor is read (DMA transfer does not proceed)	D = 1
WBD = 1 && LV = 1	Write-back does not proceed.	—

(4) Flow of Operations

The following describes the procedures for settings to activate and stop the DMAC in the case of descriptor-type transfer.

(a) Activation and Normal Operation

Before activating the DMAC, set the PCIe and AXI windows. After that, set the registers of the DMAC to start the DMAC.



(b) Error Processing

If an error is detected in the AXI bus or a PCIe link while DMA transfer is in progress, the DMA_INT interrupt signal is asserted. Check the channel where the error was found (CHx_ERR = 1b) by using the DMAC interrupt status register and also the type of error by using the DMAC error status register (offset: H'978 + channel offset) as required.

Clear the CHx_ERR bit that is currently set in the DMAC interrupt status register (offset: H'80C) to 0b by writing to it. The address to which transfer was most recently completed before it was stopped and the remaining number of bytes for transfer can be checked by reading the DMA status registers (offset: H'950 + channel offset to H'96C + channel offset) for the given channel.

Based on that information, setting the registers as described in **6.6.4.4.2(4) (a) Activation and Normal Operation** and create a descriptor table again. At this time, write 1b to the QUE_CLR bit (bit [8]) of the DMAC channel control register (offset: H'900 + channel offset). Writing 1b to it leads to clearing of the queue. The descriptor lists registered in the queue (those waiting for execution and the one currently being executed) are all cleared.

6.6.4.4.3 Method of Transfer

This section describes the issuing of requests to the AXI or PCIe and data transfer in the case of DMA transfer. In either direction of transfer (from AXI to PCIe or vice versa), a request is issued to the reading side. After confirming the completion of preparation (reception) of the data to be read, a request is issued to the writing side for data transfer.

(1) DMA Transfer from PCIe to AXI

An MRd is issued to the PCIe module and an AXI write request is transferred following the reception of CplD from the PCIe. MRd requests corresponding to the number of outstanding transfers can be issued regardless of the reception of CplD. The received CplD (read data) is stored in the data buffer (RAM) once and then transferred by the DMAC to the AXI.

(2) DMA Transfer from AXI to PCIe

After the DMAC is activated, a read request (address channel) is issued to the AXI. The reception of data for reading from the given AXI slave starts and an MWr is issued to the PCIe. Data are repeatedly transferred until the completion of DMA data transfer corresponding to the amount of data set in the DMA Size bits.

6.6.4.4.4 Inter-Channel Arbitration

The DMAC arbitrates the following three types of requests between channels.

1) PCIe Read Request
2) AXI Read Request
3) AXI Write Request

PCIe write requests do not require arbitration because data read over the AXI are returned one by one.

In the case of arbitration on the AXI side, not only requests for DMA data, but also reading and writing of descriptor data are subject to arbitration (each channel has a single source of requests for arbitration since a channel will not output a descriptor and request for data at the same time).

(1) Method of Arbitration

An MRd is issued to the PCIe module and an AXI write request is transferred following the reception of CplD from the PCIe. MRd requests corresponding to the number of outstanding transfers (eight) can be issued regardless of the reception of CplD. The received CplD (read data) is stored in the data buffer (RAM) once and then transferred by the DMAC to the AXI.

Arbitration for each type of request 1) to 3) above proceeds in round-robin fashion. A channel for which execution has just been completed is given the lowest priority and each channel which had a lower priority than that channel is raised by one rank in the order of priority.

The initial order of priority is ch0 > ch1 > ch2 > ch3 > ch4 > ch5 > ch6 > ch7.

The order of priority is changed every time a single request is completed.

There are two types of request for the AXI, requests for DMA data and requests for descriptors, but they are not distinguished for purposes of arbitration.

6.6.4.4.5 DMA Completed Interrupt

The DMAC has interrupt functions. It supports two types of interrupt source: one set is for normal operation and the other is for errors. For details, see **6.6.4.6.4 DMA Interrupt**.

6.6.4.5 Reception of PCIe Commands

6.6.4.5.1 Reception of MSIs (Root Complex)

When an MSI is received (see Judgment conditions), it is forwarded to AXI as a Write Transaction and at the same time, it is reflected in the MSI reception status (see Status). MSI receive Asserts the interrupt signal (INTMSI_RC) when the interrupt generation condition (see Interrupt conditions) is satisfied. S/W identifies MSI by interrupt factor. When Message Data Enable = 0, it is possible to determine the factors by reading the data in memory.

Related Registers

- MSI Receive Window Address (Lower) Registers (Offset: H’100) Message Data Enable
- PCI INTx Receive Interrupt Enable Registers (Offset: H’110) MSI Receive Interrupt Enable
- PCI INTx Receive Interrupt Status Registers (Offset: H’114) MSI Receive Interrupt Status
- MSI Receive Mast n Registers (Offset: H’6x8) MSI Mask
- MSI receive Status n Registers (Offset: H’6xC) MSI Status

Judgment conditions

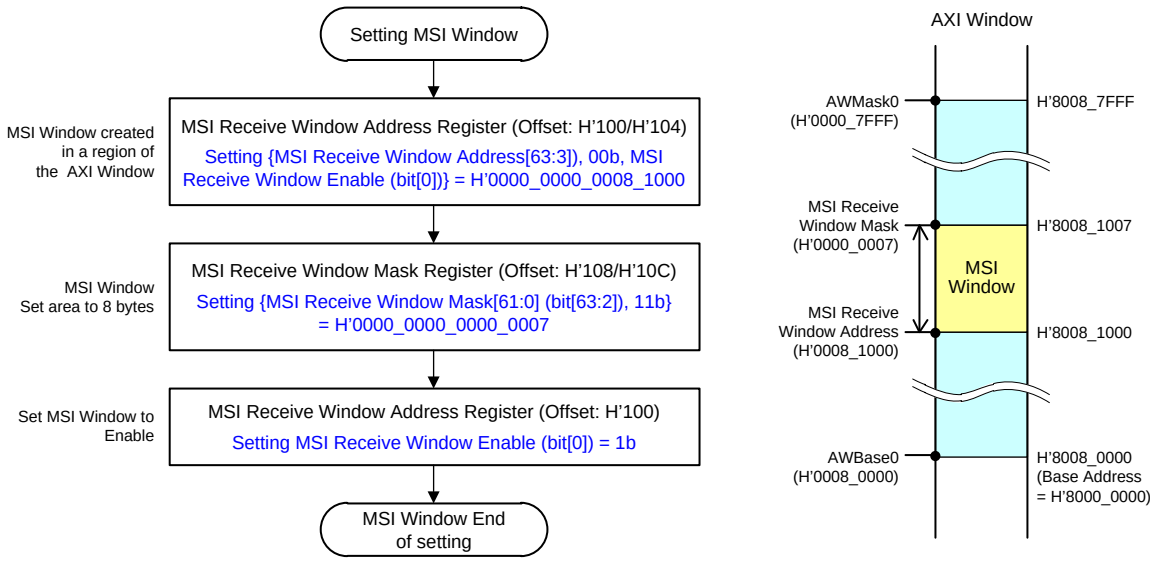
When all of the following conditions are satisfied, a request is judged to be an MSI.

- The request is a memory write request.
- The request is entered for any area within an AXI window.
- The address of an MWr from the PCIe interface must be within the area set by the MSI Reception Window Address register and the MSI Reception Window Mask register. If a memory read request is received in the MSI reception area, the request is not judged to be an MSI so an interrupt is not generated.
- The length of memory write requests is 1 dword.
- When Message Data matches (only when Message Data Enable is 1)

Status

- When Message Data Enable is 0, MSI Receive Interrupt Status (bit[4]) is set.
- When Message Data Enable is 1, the corresponding vector bit of MSI Status is set.

Interrupt conditions



- When Message Data Enable is 0, when MSI Receive Interrupt Enable (bit[4]) is set
- When Message Data Enable is 1, when the corresponding vector bit of MSI Mask is 0.

Notes on the MSI (When Message Data Enable is 0)

- When a response to the MSI write transaction is returned, this module judges execution of the MSI to have been completed and asserts an interrupt signal. Depending on the system, however, the MSI memory write transaction may not be completed due to the latency over the AXI to the actual memory even if the interrupt signal is asserted.
  To avoid this problem, buffering of AXI write transactions must be disabled (MAWCACHE[0] = 0b) at the time an MSI is issued.
  For MAWCACHE[3:1], the setting of AWCACHE_L (bits [27:24]) of Mode Set 0 Register is used.
- If an MSI is received, the MSI write transaction is executed when MAWID[3:0] = 0001b. This is required for the module to recognize the reception of the response to the MSI and for assertion of INTMSI_RC.

6.6.4.5.2 Setting the MSI Window

To enable MSI interrupts, the MSI window must be set. **Figure 6.6-4 Settings for the MSI Window** shows example settings. The MSI window can be allocated within any AXI window.

Note: The values assigned in the figure (values in blue) are examples

Figure 6.6-4 Settings for the MSI Window

6.6.4.5.3 Reception of an Interrupt in Response to a Message Request (Root Complex)

When Assert_INTx is received in response to an Msg request from the PCIe interface, the corresponding interrupt bit (bits [3] to [0]) is set in the PCI INTx Receive Interrupt Status Register (offset: H'114) and an interrupt (INTx_RC) is asserted. When Deassert_INTx is received in response to a message request, the corresponding interrupt register (bit) is cleared and INTx_RC is de-asserted. The PCI INTx Receive Interrupt Status Register (offset: H'114) can be cleared by writing to it (RW1C) by software. In the PCIe, however, we do not recommend using software to clear an interrupt bit which has been set in response to an Msg in normal operation.

6.6.4.5.4 Reception of Message Requests

When a message is received through the PCIe interface, the relevant information is stored in the following registers.

Table 6.6-20 Message Related Registers

	Related Register
Message Code/Routing	Message Code Registers (Offset: H'130)
Message Data	Message Data Registers (Offset: H'134)
Message 3rd Header	Message Header 3rdDW Registers (Offset: H'138)
Message 4th Header	Message Header 4thDW Registers (Offset: H'13C)

The corresponding bit in the Message Receive Interrupt Status Register is set at the same time as the reception of the following messages, and this is indicated by an interrupt.

Received Message		Corresponding Bit in Message Receive Interrupt Status Register
Type of Message	Message Code	
PM_Active_State_Nak	0001_0100	Bit [19]
PM_PME	0001_1000	Bit [18]
PME_Turn_Off	0001_1001	Bit [17]
PME_TO_Ack	0001_1011	Bit [16]

In the reception of PM messages other than the above, the relevant information is not written to the registers listed in **Table 6.6-20 Message Related Registers**.

- Unsupported messages:
  - Unlock
  - Vendor Defined Type 0
  - Vendor Defined Type 1

6.6.4.6 Interrupt

This module prepares the output of interrupt signals in the ways stated below. The states of all interrupt signals are indicated at a glance in the Interrupt Table Register.

6.6.4.6.1 Error and Event Interrupt Notification

Table 6.6-21 Error/Event Interrupt Outputs

Signal Name	Active	Attribute	Description
DMA_INT	High	Level	DMA-related events
PCIE_EVT_INT	High	Level	PCIe related events
MSG_INT	High	Level	Reception of messages
AXI_ERR_INT	High	Level	AXI-related errors

Interrupt Output Related Status Registers

DMA_INT: DMAC Interrupt Status Registers (Offset: H’80C)
DMAC Error Status Registers (Offset: H’978/+Channel Offset)

PCIE_EVT_INT: PCIe Event Interrupt Status 0 Registers (Offset: H’204)
PCIe Event Interrupt Status 1 Registers (Offset: H’20C)
PCIe Event Interrupt Status 2 Registers (Offset: H’244)

MSG_INT: Message Receive Interrupt Status Registers (Offset: H’124)

AXI_ERR_INT: AXI Master Error Interrupt Status Registers (Offset: H:214)
AXI Slave Error Interrupt Status 1 Registers (Offset: H’224)

6.6.4.6.2 INTx/MSI Interrupt Notification (Root Complex)

Table 6.6-22 INTx/MSI Interrupt Outputs

Signal Name	Active	Attribute	Description
INTA_RC	High	Level	Set in response to the reception of an assert INTA message and cleared in response to the reception of a deassert INTA message.
INTB_RC	High	Level	Set in response to the reception of an assert INTB message and cleared in response to the reception of a deassert INTB message.
INTC_RC	High	Level	Set in response to the reception of an assert INTC message and cleared in response to the reception of a deassert INTC message.
INTD_RC	High	Level	Set in response to the reception of an assert INTD message and cleared in response to the reception of a deassert INTD message.
INTMSI_RC	High	Level	Set when a memory write request comes from the PCIe to the area set in the MSI reception window.
INT_LINK_BANDWIDTH	High	Level	Set when the link width has been changed.
INT_PM_PME	High	Level	Set in response to the reception of PME event notification (PM_PME message).
INT_SERR_COR/ INT_SERR_NONFATAL/ INT_SERR_FATAL	High	Level	Set in response to the reception of a correctable error message, non-fatal error message, or fatal error message.

6.6.4.6.3 Root Complex Interrupt Notification

This module has the following interrupt sources.

- INT_LINK_BAND_WIDTH
- INT_PM_PME
- INT_SERR
- INT_SERR_COR
- INT_SERR_FATAL
- INT_SERR_NONFATAL

(1) Interrupt due to the Change to the Link Bandwidth (INT_LINK_BAND_WIDTH)

This interrupt source is conveyed in response to the change to the bandwidth in link negotiation of PCI Express.

This interrupt source is only enabled when the Link Bandwidth Notification Capability bit (bit 21) of the Link Capabilities register (offset: H’60C) is set to 1b. This interrupt signal can also be disabled by setting the Link Bandwidth Notification Capability bit to 0b even in operation as the root complex.

If the Link Bandwidth Notification Capability bit (bit 21) is set to 1b, the Link Bandwidth Management Status bit (bit 30) and the Link Autonomous Bandwidth Status bit (bit 31) in the Link Status register (offset H’70) serve as a source of the interrupt. These bits are set to 1b when the bandwidth is changed.

Whether to enable this interrupt source corresponds to the respective states of the Link Bandwidth Management Interrupt Enable bit (bit 10) and the Link Autonomous Bandwidth Interrupt Enable (bit 11) of the Link Control register (offset: H’70).

The following is the Related Registers.

Offset	Bit	Description
PCI Express Capability Structure: Link Control / Status		
H’06C	21	Link Bandwidth Notification Capability
H’070	10	Link Bandwidth Management Interrupt Enable
	11	Link Autonomous Bandwidth Interrupt Enable
	30	Link Bandwidth Management Status
	31	Link Autonomous Bandwidth Status

(2) PM-PME Reception Interrupt (INT_PM_PME)

This interrupt source is conveyed when the notification of a PME event (PM_PME message) is received from the other party device.

This interrupt source is only conveyed when the PME Interrupt Enable bit (bit 3) of the Root Control/Capabilities Register (offset: H’7C) is set to 1b. This interrupt source is not conveyed when the PME Interrupt Enable bit (bit 3) is set to 0b.

Note that the reception state of the received PM_PME message and the ID information, etc. are stored in the Root Status Register (offset: H’80) regardless of the setting of the PME Interrupt Enable bit mentioned above.

Offset	Bit	Description
PCI Express Capability Structure: Root Control Capabilities		
H’07C	3	PME Interrupt Enable
PCI Express Capability Structure: Root Status		
H’080	15:0	PME Requester ID
	16	PME Status
	17	PME Pending

(3) System Error Interrupt (INT_SERR_xxx)

This interrupt is conveyed when a correctable error message, non-fatal error message, or fatal error message is received.

- INT_SERR: The system error notification mentioned in the Base Spec. is obtained as the logical OR of the following three signals.
- INT_SERR_COR: System Error on Correctable Error
- INT_SERR_FATAL: System Error on Fatal Error
- INT_SERR_NONFATAL: System Error on Non-Fatal Error

(a) Correctable Error Interrupt (INT_SERR_COR)

To proceed with interrupt control due to a correctable error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	H'03C	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	H'068	0	Correctable Error Reporting Enable
3	Advanced Error Reporting (AER) Capability: Root Error Command		
	H'12C	0	Correctable Error Reporting Enable

Interrupt Source

(1) ERR_COR Message Reception

If an ERR_COR message is received from the other-party device (endpoint), the INT_SERR_COR interrupt will be asserted. The following status register will be set at the same time.

Offset	Bit	Description
Advanced Error Reporting (AER) Capability: Root Error Status		
H'130	0	ERR_COR Received

Note: If the Enable bits in no. 1, 2, and 3 are not set, the interrupt source will not be generated.
If the Enable bits in no. 1 and 2 are not set, writing will be masked.

(2) Correctable Error Detection

Any of the following correctable errors being detected within the unit will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Correctable Error Status		
8B10B Decode Error 8B10B RD Error 1	H'110	0	Receiver Error Status
Bad TLP		6	Bad TLP Status
Bad DLLP		7	Bad DLLP Status
REPLAY_NUM Roll over		8	REPLAY_NUM Rollover Status
Replay Timer Timeout		12	Replay Timer Timeout Status
Advisory Non-Fatal Error		13	Advisory Non-Fatal Error Status

Note: If the Mask bit (Correctable Error Mask Register: Offset H'114) corresponding to each bit is set (masked), the corresponding error will not be detected, and the interrupt source will not be generated.

At the same time, the INT_SERR_COR interrupt will be generated, and the following status registers will be set to 1b.

Offset	Bit	Description
PCI Express Capability Structure: Device Status		
H'068	16	Correctable Error Detect
Advanced Error Reporting (AER) Capability : Root Error Status		
H'130	0	ERR_COR Received

Note: If the Enable bit in no. 2 is not set, the interrupt source will not be generated.
If the Enable bit in no. 2 is not set, writing to the Root Error Status Register will be masked.
If the Correctable Error Reporting Enable bit listed in no. 3 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_COR will not be asserted even if writing to the Root Error Register has proceeded.

(b) Fatal Error Interrupt (INT_SERR_FATAL)

To proceed with interrupt control due to a fatal error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	H'03C	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	H'068	2	Fatal Error Reporting Enable
3	Common Configuration Space: Command and Status		
	H'004	8	SERR# Enable
4	Advanced Error Reporting (AER) Capability: Root Error Command		
	H'12C	2	Fatal Error Reporting Enable

Interrupt Source

(1) ERR_FATAL Message Reception

If an ERR_FATAL message is received from the other-party device (endpoint), the INT_SERR_FATAL interrupt will be asserted (if the Enable bits in no.1 and 2 or no.3 and 4 are not set, the interrupt source will not be generated).

The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
Type1 Configuration Space: Secondary Status			*1
H'01C	30	Received System Error	
Common Configuration Space: Status Register			*2
H'004	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			*3
H'130	6	Fatal Error Message Received	

Note 1. Writing to this status register proceeds at the point a message is received regardless of the settings of the Enable bits.

Note 2. If the Enable bits in no. 1 and 3 are not set, writing will be masked.

Note 3. If the Enable bit in no. 1, 2, or 3 is not set, writing will be masked.

(2) Fatal Error Detection

Any of the following fatal errors being detected within the module will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Uncorrectable Error Status		
Data Link Protocol Error	H'104	4	Data Link Protocol Error Status
Poisoned TLP		12	Poisoned TLP Status
Completion Timeout		14	Completion Timeout Status
Completer Abort		15	Completer Abort Status
Unexpected Completion		16	Unexpected Completion Status
Receiver Overflow		17	Receiver Overflow Status
Malformed TLP		18	Malformed TLP Status
ECRC Error		19	ECRC Error Status
Unsupported Request		20	Unsupported Request Error Status

Note: If the Mask bit (Uncorrectable Error Mask Register: Offset H'108) corresponding to each bit is set (masked), the corresponding error will not be detected and the interrupt source will not be generated.
Also, the setting of the corresponding Severity bit (Uncorrectable Error Severity: Offset H'10C) must be 1b (Fatal).

The INT_SERR_FATAL interrupt will be generated at the same time (if the Enable bits in no. 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
PCI Express Capability Structure: Device Status			
H'068	18	Fatal Error Detect	
Common Configuration Space: Status Register			*1
H'004	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			*2
H'130	6	Fatal Error Message Received	

Note 1. If the Enable bit in no. 3 is not set, writing will be masked.

Note 2. If the Enable bit in no. 2 or 3 is not set, writing will be masked.

If the Fatal Error Reporting Enable bit listed in no. 4 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_FATAL will not be generated even if writing to the Root Error Status Register has proceeded.

(c) Non-Fatal Error Interrupt (INT_SERR_NONFATAL)

To proceed with interrupt control due to a non-fatal error, set the interrupt enable bits of the following registers to 1b.

No.	Offset	Bit	Description
1	PCI Compatible Configuration: Bridge Control and Interrupt		
	H'03C	17	SERR# Enable
2	PCI Express Capability Structure: Device Control		
	H'068	1	Non-Fatal Error Reporting Enable
3	Common Configuration Space: Command and Status		
	H'004	8	SERR# Enable
4	Advanced Error Reporting (AER) Capability: Root Error Command		
	H'12C	1	Non-Fatal Error Reporting Enable

Interrupt Source

(1) ERR_NONFATAL Message Reception

If an ERR_NONFATAL message is received from the other-party device (endpoint), the INT_SERR_NONFATAL interrupt will be generated (if the Enable bits in no.1 and 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
Type1 Configuration Space: Secondary Status			*1
H'01C	30	Received System Error	
Common Configuration Space: Status Register			*2
H'004	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			*3
H'130	5	Non-Fatal Error Message Received	

Note 1. Writing to this status register proceeds at the point a message is received regardless of the settings of the Enable bits.

Note 2. If the Enable bits in no. 1 and 3 are not set, writing will be masked.

Note 3. If the Enable bit in no. 1, 2, or 3 is not set, writing will be masked.

(2) Non-Fatal Error Detection

Any of the following non-fatal errors being detected within the module will be written to the corresponding status register.

Error	Offset	Bit	Description
	Advanced Error Reporting (AER) Capability: Uncorrectable Error Status		
Data Link Protocol Error	H'104	4	Data Link Protocol Error Status
Poisoned TLP		12	Poisoned TLP Status
Completion Timeout		14	Completion Timeout Status
Completer Abort		15	Completer Abort Status
Unexpected Completion		16	Unexpected Completion Status
Receiver Overflow		17	Receiver Overflow Status
Malformed TLP		18	Malformed TLP Status
ECRC Error		19	ECRC Error Status
Unsupported Request		20	Unsupported Request Error Status

Note: If the Mask bit (Uncorrectable Error Mask Register: Offset H'108) corresponding to each bit is set (masked), the corresponding error will not be detected, and the interrupt source will not be generated.
Also, the setting of the corresponding Severity bit (Uncorrectable Error Severity: Offset H'10C) must be 0b (Non-fatal).

The INT_SERR_NONFATAL interrupt will be generated at the same time (if the Enable bits in no. 2 or no.3 and 4 are not set, the interrupt source will not be generated). The following status registers will be set at the same time.

Offset	Bit	Description	Remarks
PCI Express Capability Structure: Device Status			
H'068	17	Non-Fatal Error Detect	
Common Configuration Space: Status Register			*1
H'004	30	Signaled System Error	
Advanced Error Reporting (AER) Capability: Root Error Status			*2
H'130	5	Non-Fatal Error Message Received	

Note 1. If the Enable bit in no. 3 is not set, writing will be masked.

Note 2. If the Enable bit in no. 2 or 3 is not set, writing will be masked.

If the Non-Fatal Error Reporting Enable bit listed in no. 4 is not set, the source due to (1) and (2) stated above will be generated and INT_SERR_NONFATAL will not be generated even if writing to the Root Error Status Register has proceeded.

6.6.4.6.4 DMA Interrupt

The DMAC has interrupt functions. It supports two types of interrupt source: one set is for normal operation and the other is for errors. Use the DMAC Interrupt Enable Register to select the interrupt sources and control masking. DMA interrupt notification includes notification by DMA_INT in the direction of the AXI bus (local bus direction) and notification by issuing an MSI to an other-party RC.

On completion of DMA transfer, either conveying a DMA_INT interrupt or transmitting an MSI to the RC, but not both, is selected per-channel by a register setting (transmitting an MSI is prohibited in RC mode).

The DMA_CH*_MSI_EN bits of the DMA Interrupt Vector 0 Register and the DMA Interrupt Vector 1 Register are used to switch the setting ("*" corresponds to the channel number of a given DMA and per-channel control is possible). If an MSI is to be issued, the value of its traffic class (TC) bits is fixed to 0. The vector value can be specified by using the DMA_CH*_vec bits of these registers.

CAUTION

Take care that the specified vector value does not impose a related restriction on the Multiple Message Enable register.

For example, if the number set for Multiple Message Enable is 4, the two lower-order bits within the value set for the Message Data are overwritten by the value specified for the DMA_CH*_vec bits, and at that time, specify the value 0b for the higher-order bits that are not overwritten by DMA_CH*_vec bits.

6.6.4.7 Power Management (Root Complex Mode)

6.6.4.7.1 PCI Power Management (PCI-PM)

An endpoint is placed in non-D0 (the D3 hot state) by changing the setting of the Power State field register of the endpoint by the root complex., which causes a transition of the link state of both RC and EP to L1.

This module does not support the AUX power supply function. D3 cold is not supported. Implementing the L2 function goes to implementation of L2/L3 ready.

(1) Flow of Transition to the L2/L3 Ready State (RC)

< For transition via PCIPM L1 >

1. A root complex (RC) issues a config write to change the D-state of an endpoint (EP) to D3 (D3 hot).
2. The RC is automatically placed in L1 by automatic response of the other-party EP.
3. The RC transmits a PME_Turn_Off Message.
4. Confirm the reception of a PME_TO_Ack Message from the EP by reading the value of the PME_TO_Ack Receive Interrupt bit (bit 16) in the Message Receive Interrupt Status Register of the RC.
5. Set PCIe Core Control 1 Register (bit [17]: UI_ENTER_L2 = 1b).
6. Confirm the transition to the L2/L3 ready state by reading the value of the LTSSM_STATE bits (bits [14:8]) in the PCIe Core Status 1 Register (5 higher-order bits [14:10] = 0111xb: L2).

< For direct transition to the L2/L3 ready state >

Steps 3 to 6 above apply.

(2) Flow of Return from the L2/L3 Ready State (RC)

< Return from the L2/L3 ready state by the RC >

1. Assert the following reset signals.
   RST_B, RST_GP_B, RST_PS_B, RST_CFG_B
2. Deassert the reset signals at a desired time and wait for return to L0 (wait for linkup).
3. Clear PCIe Core Control 1 Register (bit [17]: UI_ENTER_L2 = 0b).
4. If the link is not up, repeat steps 1 and 2.

< Return from the L2/L3 ready state by the EP >

1. Wait for the reception of a beacon by the EP. Read the LINKDN bit (H’0204, bit 9) in the PCIe Event Interrupt Status register regularly to check whether ELECTRICAL_IDLE_BROKEN has been generated.
2. Assert the following reset signals.
   RST_B, RST_GP_B, RST_PS_B, RST_CFG_B
3. Deassert the reset signals at a desired time, and wait for it to return to L0 (wait for linkup).
4. Clear PCIe Core Control 1 Register (bit [17]: UI_ENTER_L2 = 0b).
5. If the link is not up, repeat steps 2 and 3.

6.6.4.7.2 Active State Power Management (ASPM)

The ASPM L0s and L1 states can be used by the setting of the Active State PM Control bits (bits [1:0]) in the Link Control/Status Register (PCIe Configuration Register: H’6070).

ASPM L0s:

The module is automatically placed in the ASPM L0s state following setting of the Active State PM Control bits to 01b or 11b. When to initiate a transition to this state is determined by judgment of the idle state by the PCIe core.

ASPM L1:

An RC is placed in the ASPM L1 state in response a request for transition to the ASPM L1 state from an EP following setting of the Active State PM Control bit to 11b. When to initiate a transition to this state is determined by judgment of the idle state by the PCIe core.

A transition to the ASPM L1 state is enabled by setting the UI_RC_REJECT_ASPM_L1 bit (bit [19]) of the PCIe Core Control 1 Register (offset: H’404) to 0b. To reject a transition to the ASPM L1 state on the RC side, set the UI_RC_REJECT_ASPM_L1 bit to 1b.

Return to the L0 state from the L1 state:

- Resuming access from the AXI master side:

  Return to the L0 state is initiated in response to the other-party PCIe device resuming access.

- Resuming access from the AXI slave side:

  The AXI can be returned to the L0 state in response to the AXI starting access to a PCIe device. Access to an AXI configuration register also returns the AXI to the L0 state.

6.6.4.8 Error Processing

Two error reporting paradigms are defined for PCI Express: baseline error reporting capability, which is the minimal requirement, and advanced error reporting (AER) capability, which can provide greater stability, as an optional error reporting facility. This module supports both error reporting functions.

6.6.4.8.1 Error Classification

PCI Express errors are of two types, correctable and uncorrectable. Uncorrectable errors are further classified into two types, non-fatal and fatal.

Error Type	Description
Correctable Error	An error which cannot be recovered by hardware
Uncorrectable Error (Non-Fatal)	An error which causes a particular transaction in PCI Express to be unreliable (but the PCI Express link itself is functional).
Uncorrectable Error (Fatal)	An error which causes the PCI Express link itself to be unreliable

In operation as a root complex, the above types of error are indicated by the individual interrupt names.

- INT_SERR_COR
- INT_SERR_NONFATAL
- INT_SERR_FATAL

6.6.4.8.2 Error Checking Mechanism

(1) Physical Layer Error List

The following type of error is to be detected in the physical layer.

- Receiver Error

(2) Data Link Layer Error List

The following type of error is to be detected in the link layer.

- Bad TLP Error
- Bad DLLP Error
- REPLAY_NUM Rollover
- Replay Timer Timeout
- Receiver Overflow Error

(3) Transaction Layer Error List

The following type of error is to be detected in the transaction layer.

- Completion Timeout
- Completer Abort
- Unsupported Request
- Unexpected Completion
- Malformed TLP
- Poisoned TLP

NOTE

The specifications of the receiver error detection function in each LTSSM state are as listed below.

LTSSM State	Module Specifications	Base Spec Specifications
Configuration	Support	Must
Recovery	Non-Support	Option
L0	Support	Must
Disabled	Support	Option
HotReset	Support	Option

6.6.4.8.3 Error Message

The PCI Express Base Specification defines error messages as one of the mechanisms for notifying the system or another device of an error when it is detected by a PCI Express agent.

Error Message	Description
ERR_COR	Used when Correctable Error is detected
ERR_NONFATAL	Used when a non-fatal, uncorrectable error is detected ERR_FATAL
ERR_FATAL	Used when a fatal, uncorrectable error is detected

(1) Advisory Non-Fatal Error

The PCI Express Base Specification states that when a PCI Express agent as the detecting agent detects a non-fatal error, it handles the error as an advisory non-fatal error whether it does or does not support AER. In handling a non-fatal error as an advisory non-fatal error, the agent sends an ERR_COR message instead of an ERR_NONFATAL message and sends an advisory notification to the software. At this time, the advisory non-fatal error status bit of the correctable error status register is set to indicate the error state. Note that subsequent setting of the first error pointer register, logging of the header, and message transmission only proceed if the Advisory Non-Fatal Error Mask bit of the Correctable Error Mask Register is clear (no masking). They do not proceed if the bit is set.

The error cases which are handled as advisory non-fatal errors are as follows.

- Reception of unsupported Non-Posted Requests
- Reception of a Non-Posted Request with a completer abort completion response
- Reception of an unexpected completion
- Reception of a poisoned TLP (this is not handled as an advisory non-fatal error in this core)
- Detection of a completion timeout (this is not handled as an advisory non-fatal error in this core)

This module may merge multiple error messages with the same ID. This would occur when multiple errors are detected during the wait for the module to be ready for the transmission of messages after an error condition is detected. However, messages will not always be merged in such cases.

6.6.5 Operation

6.6.5.1 Setting Up

Set the internal registers of the module including the configuration registers.

This section explains the procedure for setting up until the PCI Express link is up (the module is ready for data transfer).

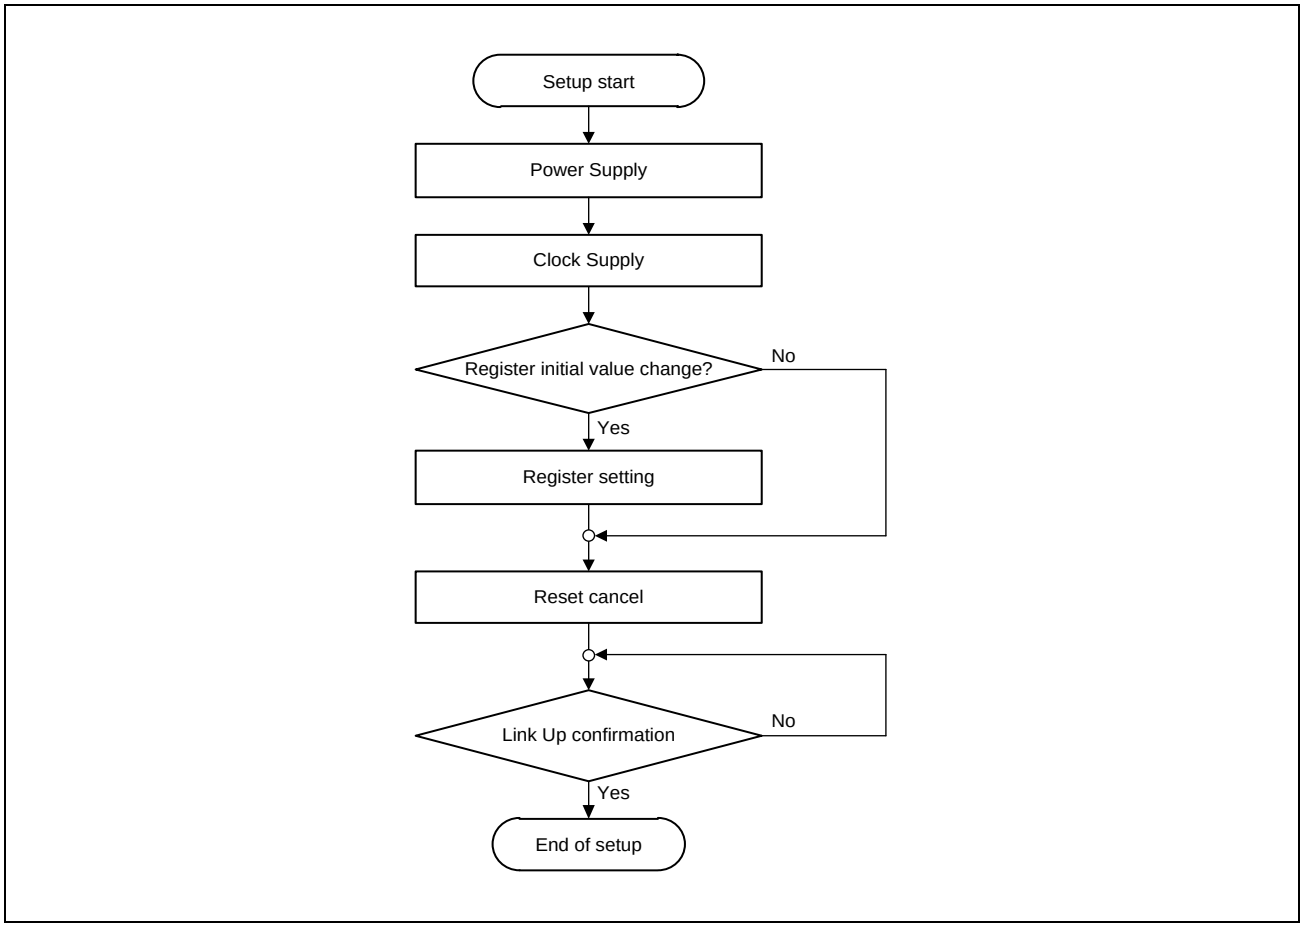


Figure 6.6-5 Setting Up

6.6.5.1.1 Changing the Initial Values of the Registers

Of the internal registers, the initial values of the configuration registers can be changed via the AXI slave interface.

AXI Bridge Registers

De-asserting ARESETn following supply of CLK allows access to these registers. In the case of resetting of the PCIe core, write to the registers while the reset signal is being asserted.

PCIe Configuration Register

De-asserting ARESETn following supply of CLK allows access to these registers. Of the reset signals of the PCIe core, those related to the configuration register must be de-asserted.

(1) Setting the Initial Values of the Registers

Set appropriate values in the registers before the start of link up, if necessary.

- Device ID
- Vendor ID
- Class Code (base class/sub-class/programming interface)
- Revision ID
- Subsystem ID
- Subsystem Vendor ID

Set the device ID and vendor ID of the manufacturing device to the vendor and device ID register.

The device ID of this LSI and the vendor ID of Renesas are shown below.

- Device ID: 003Fh
- Vendor ID: 1912h

(2) Setting the initial values of the registers

Make the following settings.

- L1 PM Substates Capabilities Register (Offset: H’6164) to H’0028_0000
  Because this is an HWINIT attribute, write access must be enabled in the Permission Registers (offset: H’300) before writing.

6.6.5.1.2 De-asserting the Reset

De-asserting of the reset of the core automatically starts operations such as receiver detection and the training sequence with the other-party device.

Check that link negotiation with the other party has been completed and the link with the module is up.

Refer to **6.6.1.4.1 Reset Sequence for Power-On Reset**.

Note that this module requires a wait of at least 5[ms] from power-on to de-assertion of the reset.

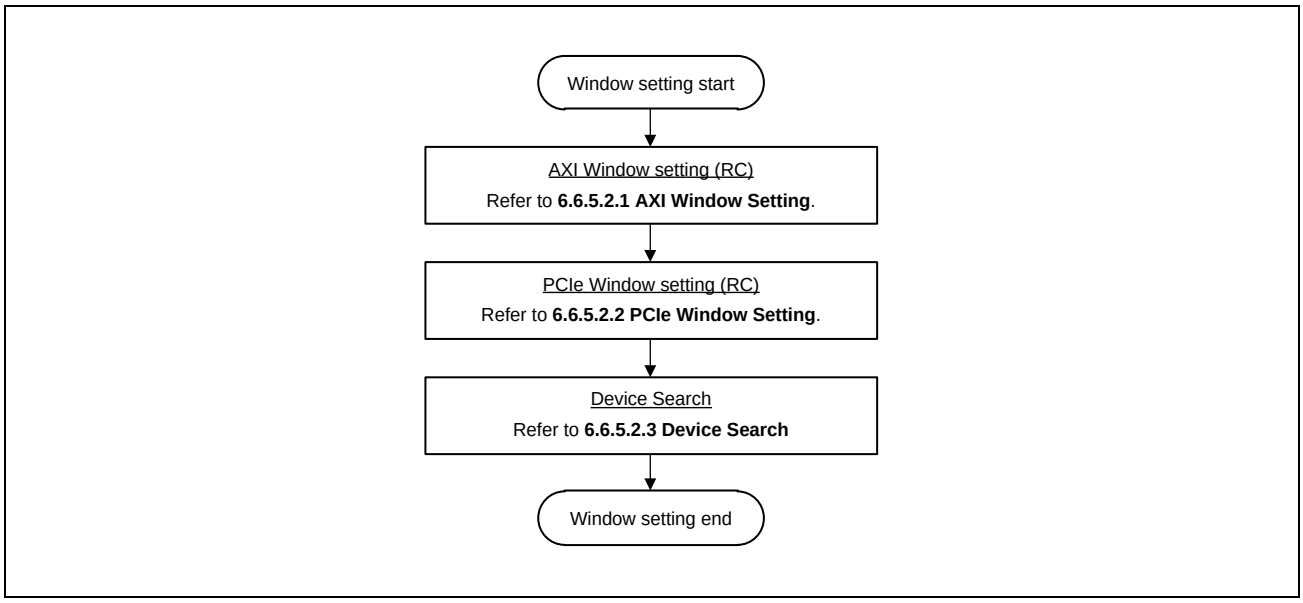
6.6.5.1.3 Checking if the Link is Up

Checking if the link is up can be done through either of the following methods. This is usually done by the root complex.

(1) Polling

Have the CPU of the chip poll the DL_Down Status bit (bit [0]) of the PCIe core Status 1 Register in AXI bridge registers until the value of the bit is 0 (indicating the DL_Up state).

(2) Interrupt



After assertion of the PCIE_EVT_INT pin of the interrupt signal, check the interrupt source by reading the DL_UpDown bit (bit [9]) in the PCIe Event Interrupt Status 0 register in AXI Bridge Registers. After that, check that the DL_Down Status bit (bit [0]) of the PCIe Core Status 1 Register is 0 (indicating the DL_Up state)

The settings above make this module ready for transfer with the other party device.

However, data transfer such as reading or writing memory is not yet possible in this state. This requires subsequent window settings.

6.6.5.2 Setting the Windows (Root Complex Mode)

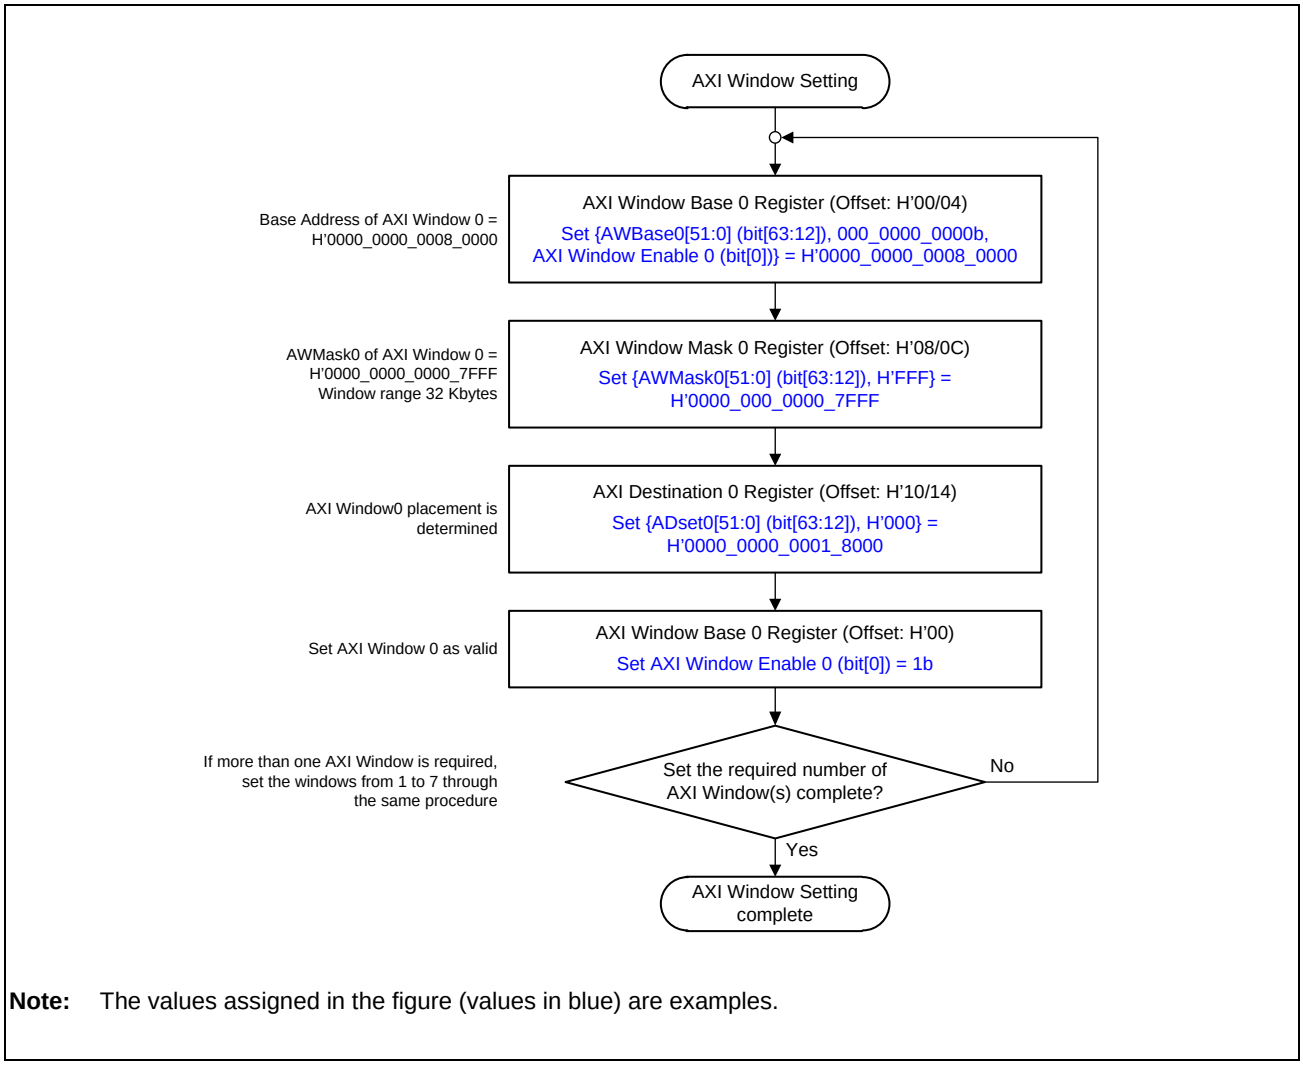
Set Window to Root Complex. All PCI Express commands are issued through this memory or register space. After configuring Window settings and Configuration Register, data such as PCIe MRd/MWr can be sent and received.

When using the window settings in the root complex configuration, the recommended settings in the BAR and BAR Mask registers are “BAR: All 0s” and “BAR Mask: All 1s”.

Table 6.6-23 Example BAR Settings (64 Bits, Function = 1)

Function	BAR (Memory Space)	AXI Window	Note
Function #0	64-bit Memory space {BAR1, BAR0}	AXI #0	
		AXI #1	
		AXI #2	
		AXI #3	
		AXI #4	
		AXI #5	
		AXI #6	
		AXI #7	

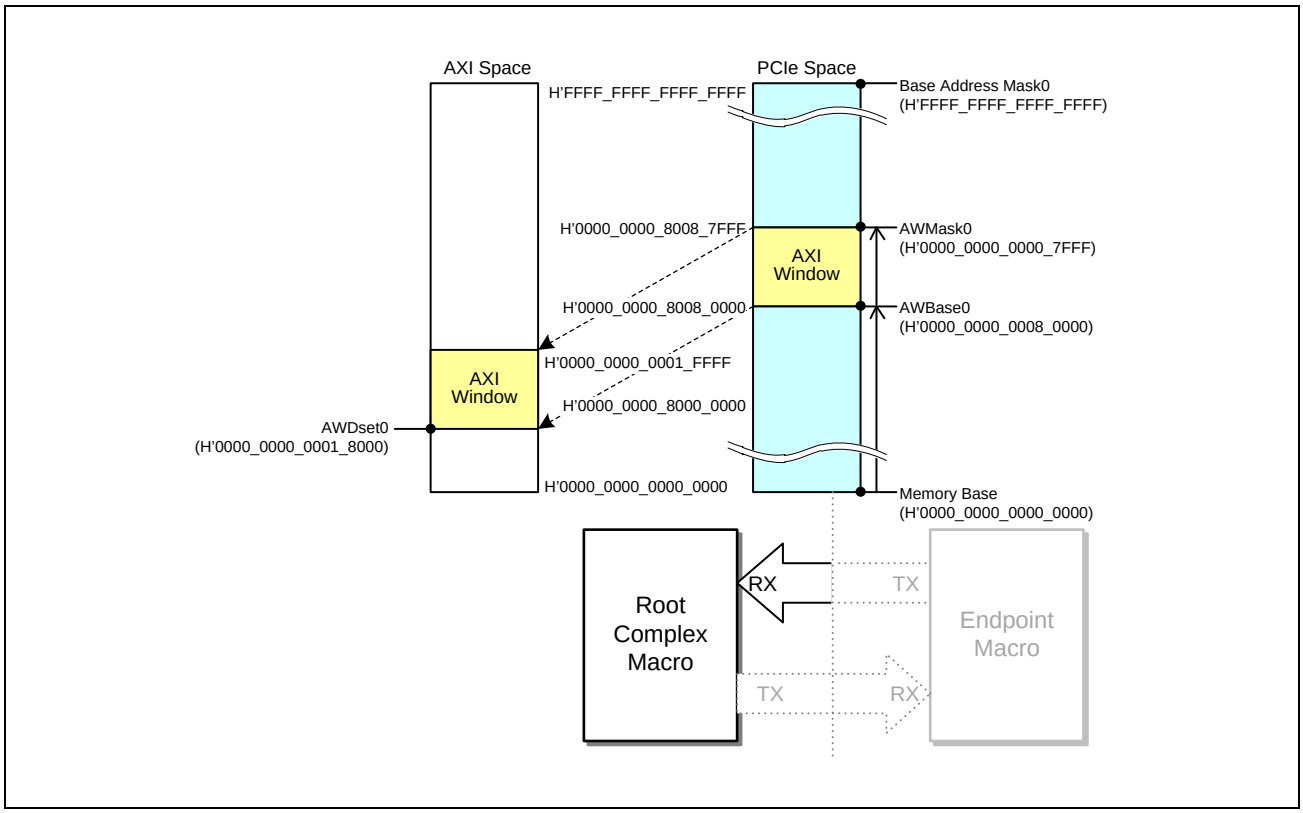
6.6.5.2.1 AXI Window Setting



AXI Window is used to transfer MWR/MRd data from PCIe (RX side) to AXI bus.

It can be set by write access to the following registers from the AXI Slave I/F.

Up to 8 windows can be set. The following registers need to be set for the required number of windows.



AXI Window Base x Lower Register	(PCI_AWBasexL)	(Offset: H'00/20/40/60/80/A0/C0/E0)
AXI Window Base x Upper Register	(PCI_AWBasexU)	(Offset: H'04/24/44/64/84/A4/C4/E4)
AXI Window Mask x Lower Register	(PCI_AWMaskxL)	(Offset: H'08/28/48/68/88/A8/C8/E8)
AXI Window Mask x Upper Register	(PCI_AWMaskxU)	(Offset: H'0C/2C/4C/6C/8C/AC/CC/EC)
AXI Destination x Lower Register	(PCI_ADestxL)	(Offset: H'10/30/50/70/90/B0/D0/F0)
AXI Destination x Upper Register	(PCI_ADestxU)	(Offset: H'14/34/54/74/94/B4/D4/F4)

(x = 0 to 7)

Note: The values assigned in the figure (values in blue) are examples.

6.6.5.2.2 PCIe Window Setting

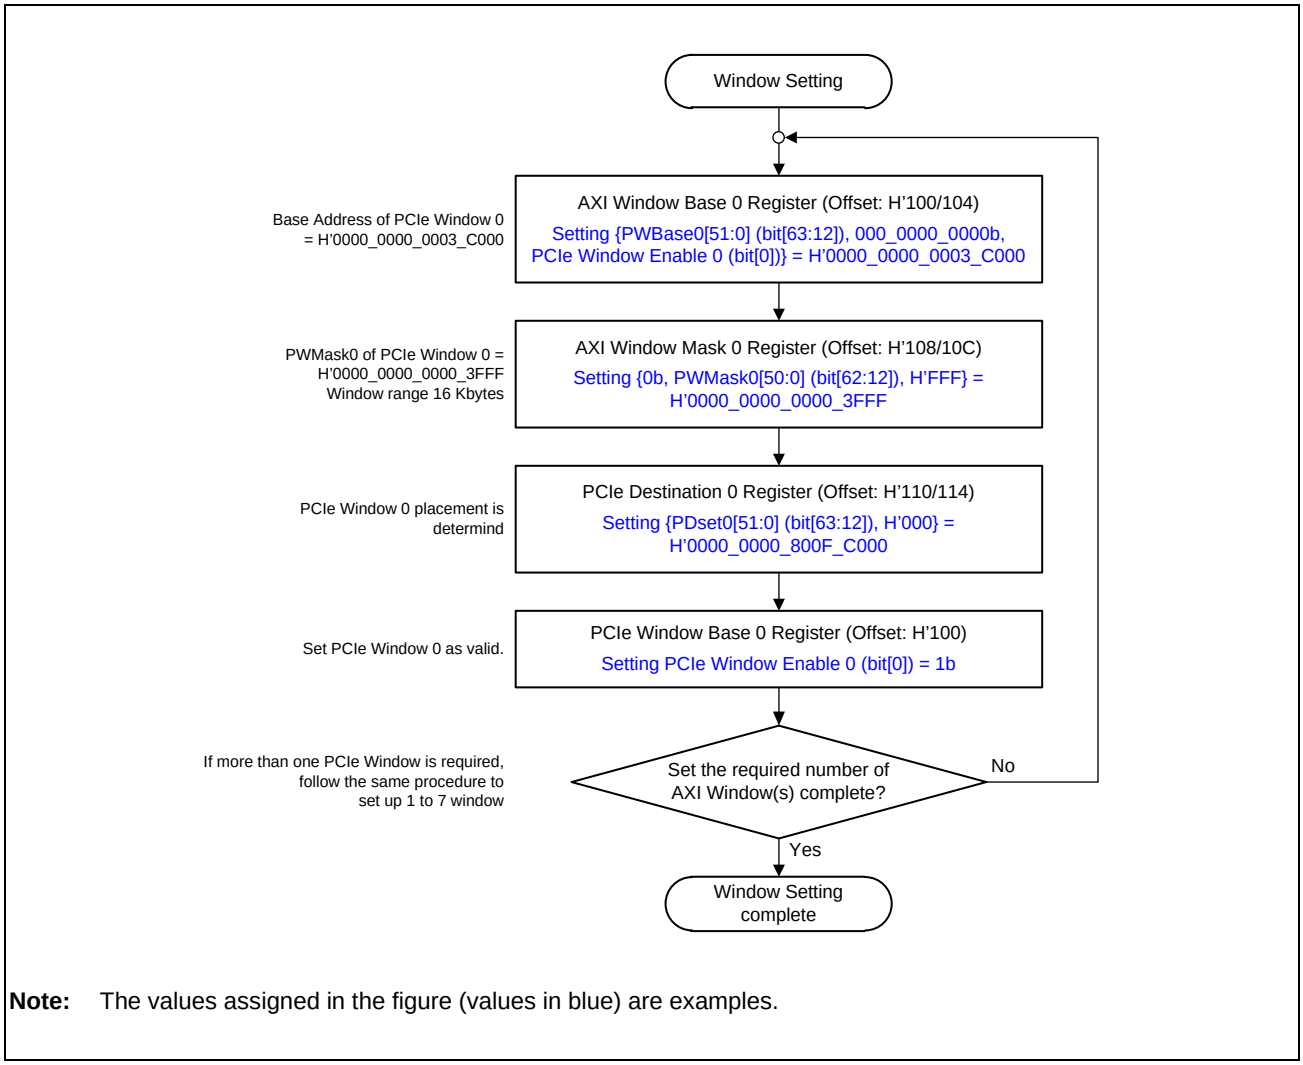
PCIe Window is used to transfer data from the AXI bus to PCIe (TX side) as MWr/MRd.

It can be set by write access to the following registers from the AXI Slave I/F.

Up to 8 windows can be set. The following register settings are required for the required number of windows.

PCIe Window Base x Lower Register (PCI_PWBasexL) (Offset: H'100/120/140/160/180/1A0/1C0/1E0)

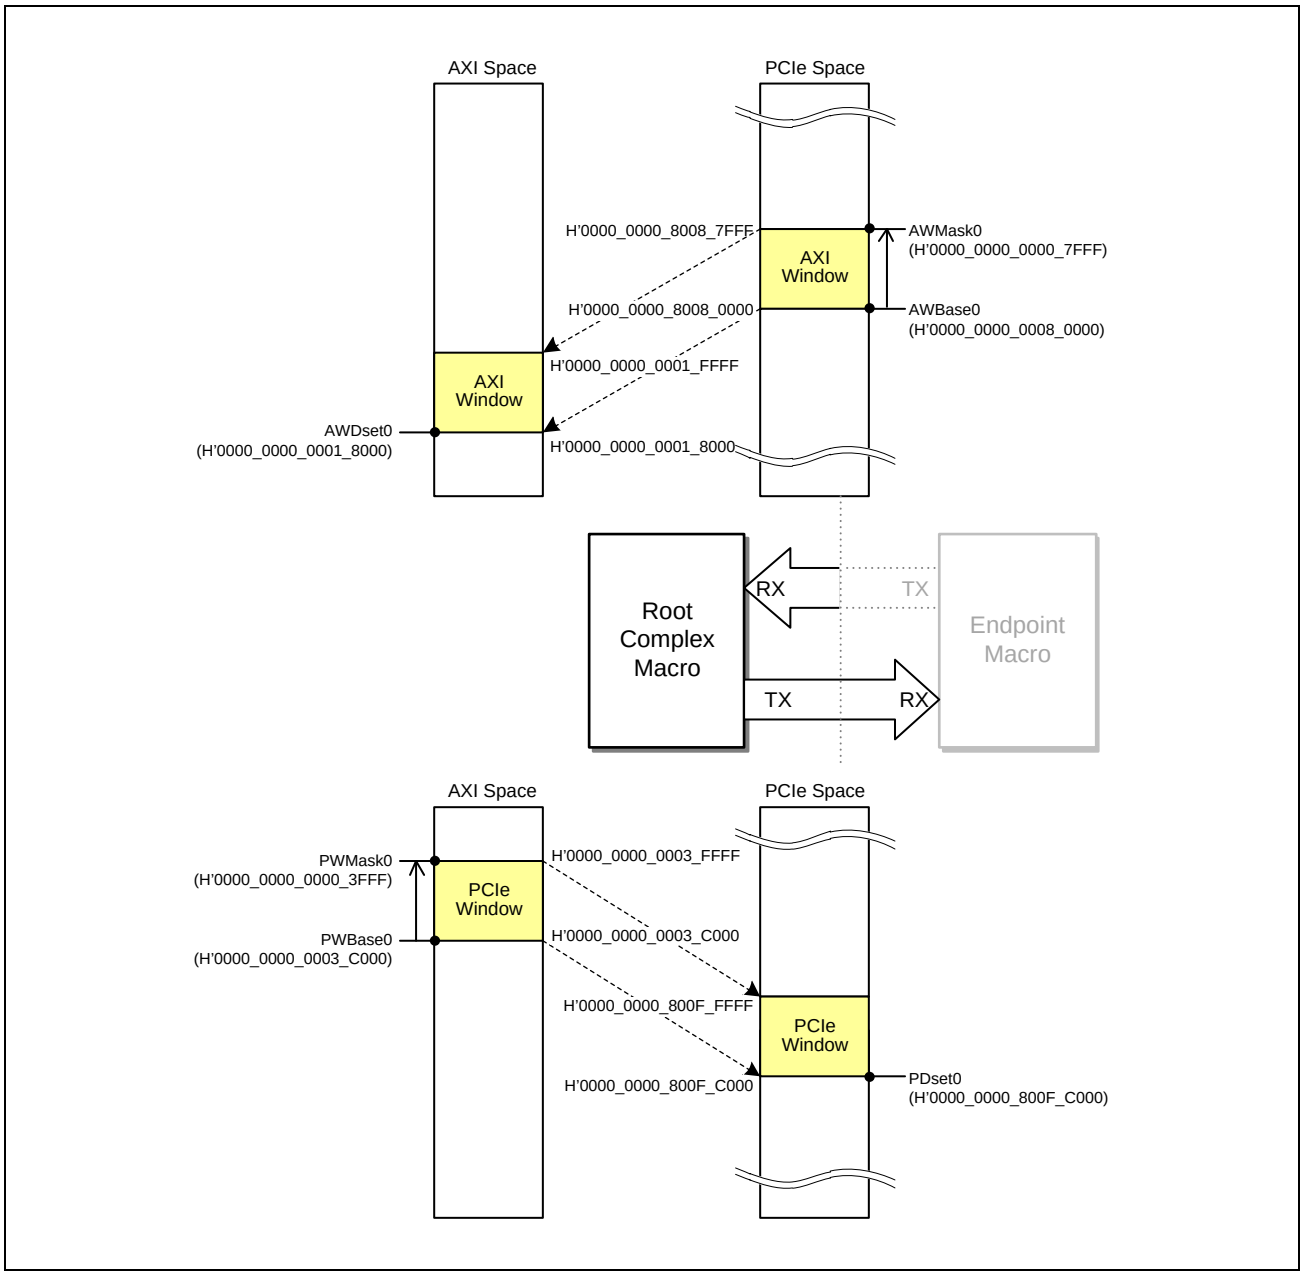
PCIe Window Base x Upper Register (PCI_PWBasexU) (Offset: H'104/124/144/164/184/1A4/1C4/1E4)



PCIe Window Mask x Lower Register (PCI_PWMaskxL) (Offset: H'108/128/148/168/188/1A8/1C8/1E8)

PCIe Window Mask x Upper Register (PCI_PWMaskxU) (Offset: H'10C/12C/14C/16C/18C/1AC/1CC/1EC)

PCIe Destination x Register (Lower) (PCI_PDestxL) (Offset: H'110/130/150/170/190/1B0/1D0/1F0)



PCIe Destination x Register (Upper) (PCI_PDestxU) (Offset: H'114/134/154/174/194/1B4/1D4/1F4)

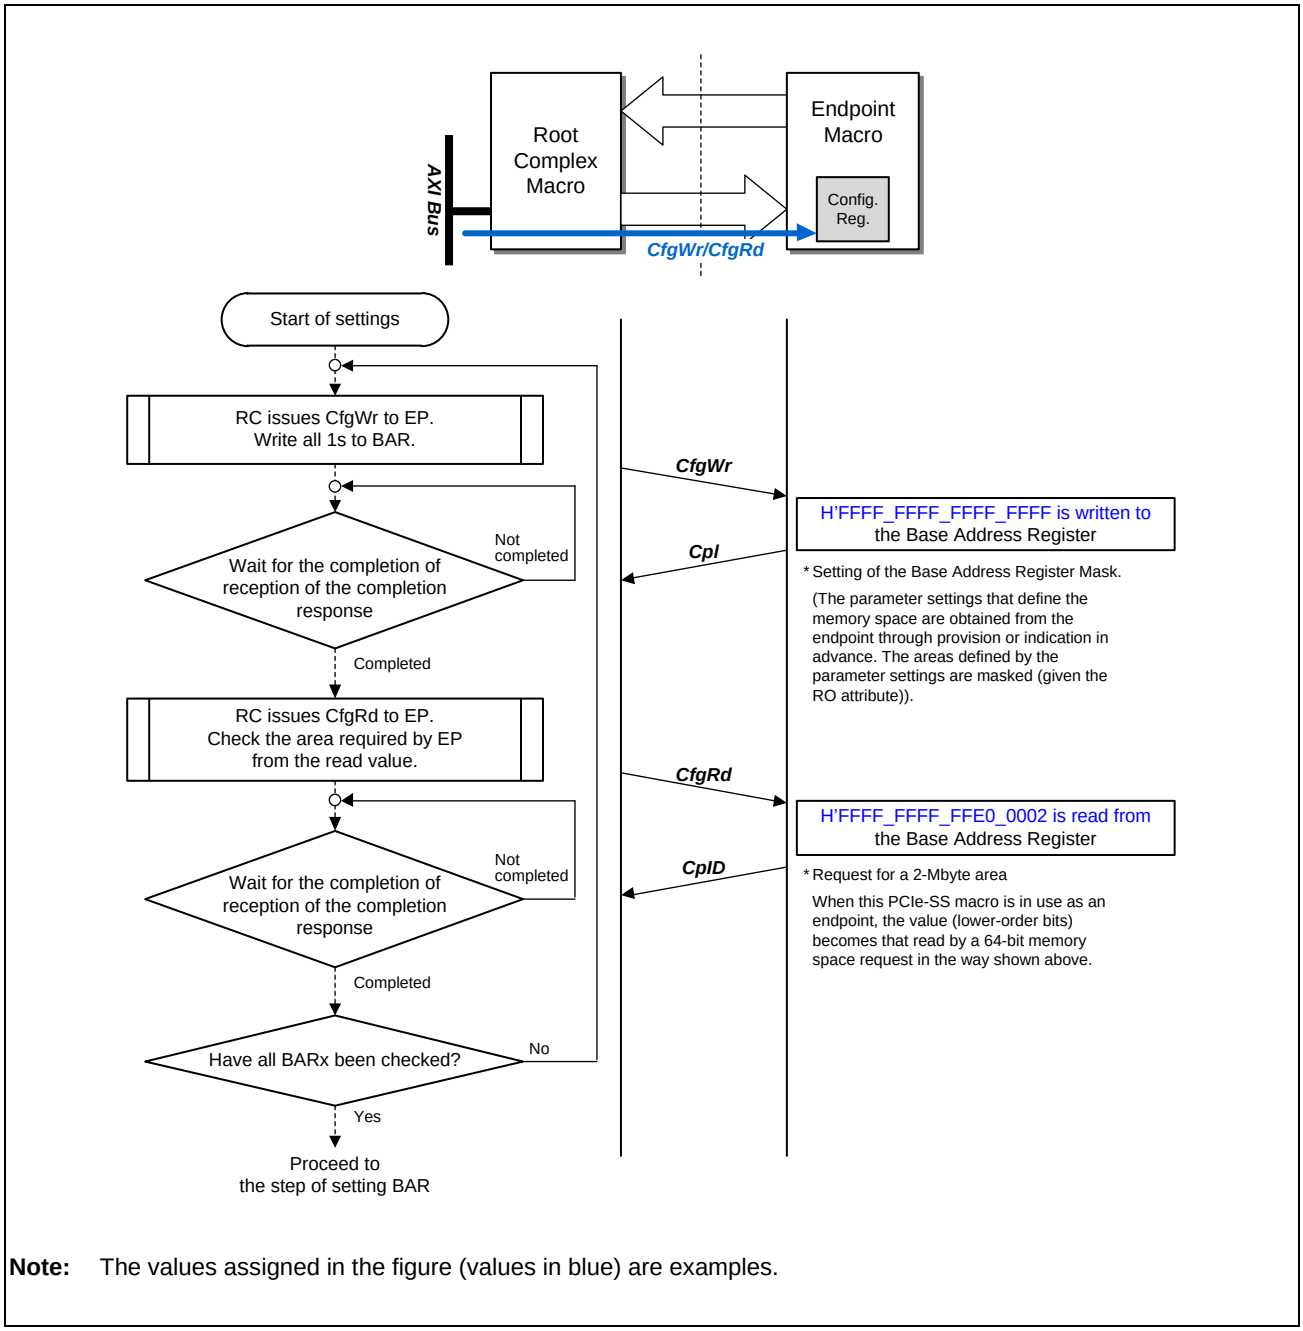
(x = 0 to 7)

Note: The values assigned in the figure (values in blue) are examples.

Figure 6.6-7 Example Settings of the PCIe Window

6.6.5.2.3 Device Search

On PC systems, the Root Complex (Host CPU) reads the Vendor ID/Device ID and Header Type in the oncoming device's Configuration Register to determine what product is connected as the oncoming device. Please check Base Spec for details.



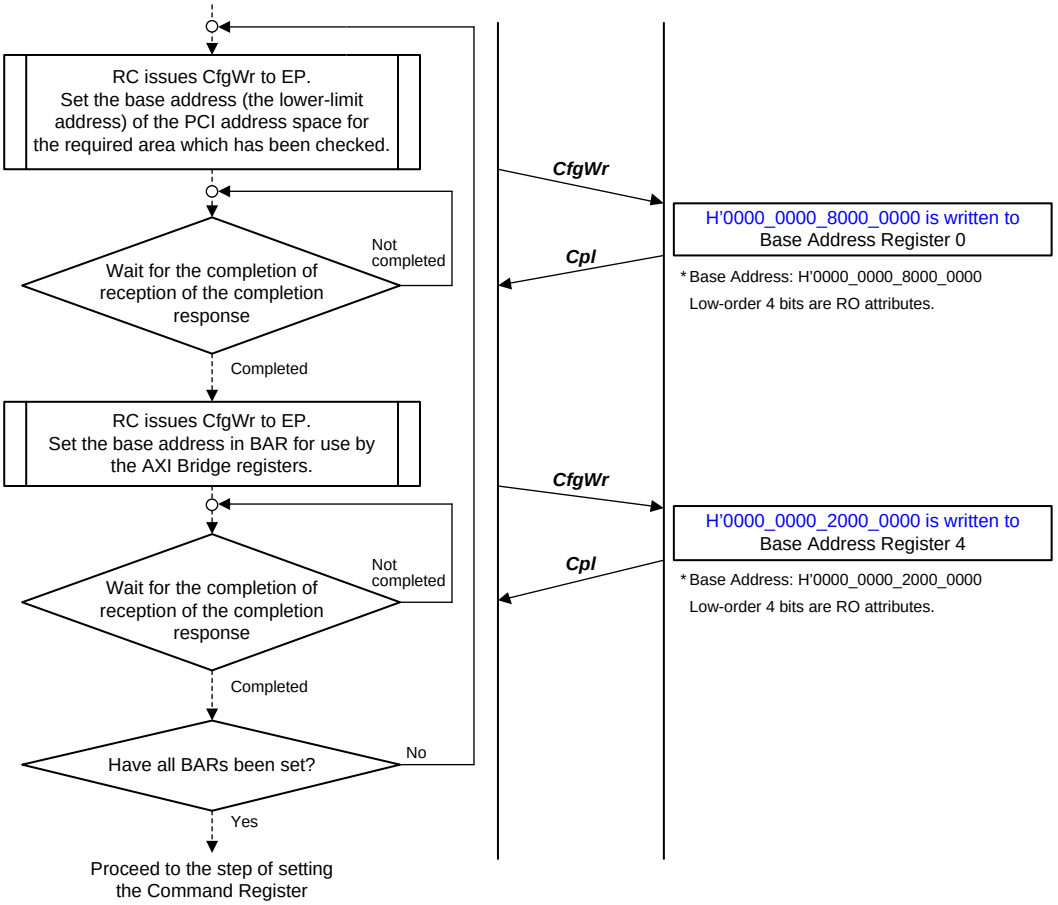
If it is clear that the oncoming device is an endpoint device, such as an embedded system, there is no need to perform a device search. However, the allocation of the bus number must be performed from the Root Complex side to the Endpoint side.

6.6.5.3 Setting the PCIe Address Space

A PC or similar system recognizes information on the areas of the memory space which are required by other-party endpoint devices by access to the configuration registers of the endpoints through software processing by the CPU on the root-complex side. In the case of embedded systems, etc., the areas required by the other-party devices will generally be known in advance, so this processing is not usually required.

The following is an example procedure for setting of the PCIe memory space for an other-party endpoint by the root complex.

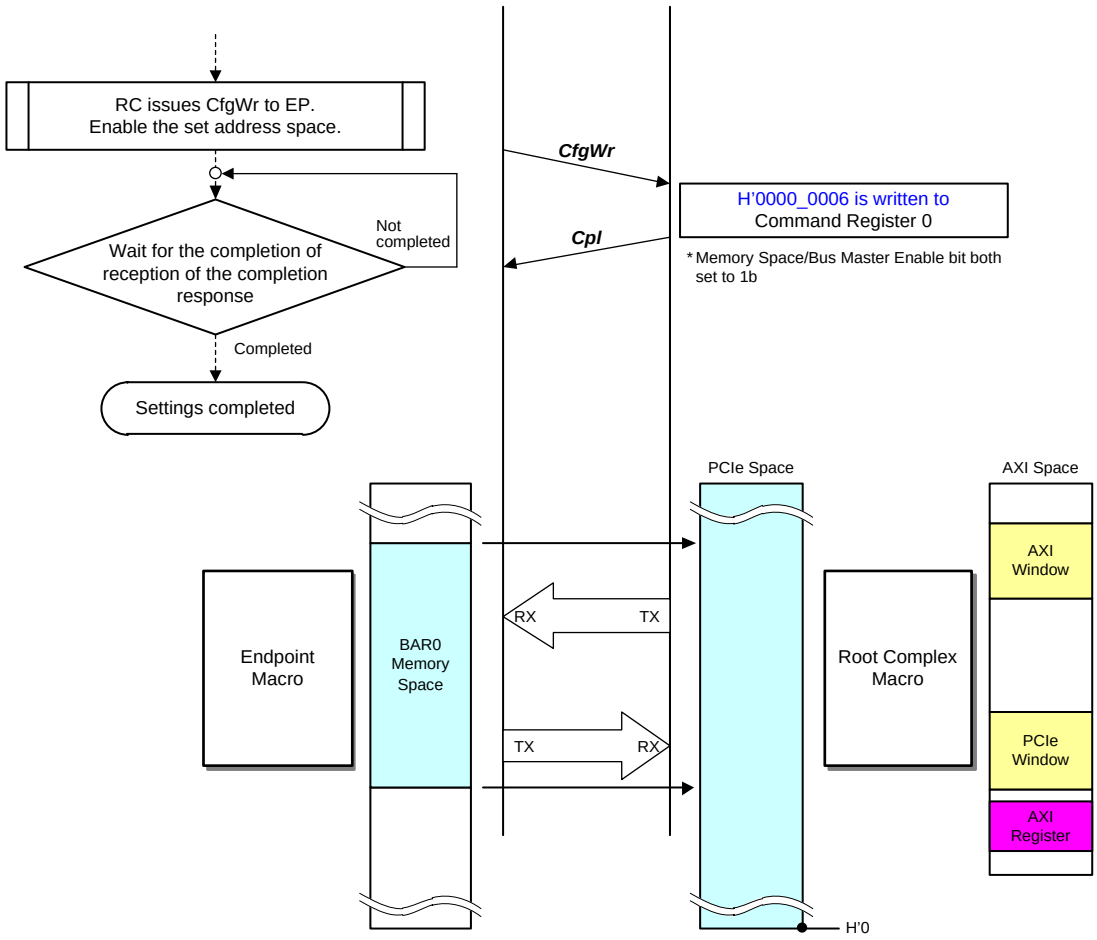
Configuration requests are made to be issued to the other-party endpoint devices by register access through the AXI slave interface.



Note: The values assigned in the figure (values in blue) are examples.

Figure 6.6-8 Example Settings for the PCIe Address Space

After issuing a configuration write request for writing all 1s (H'FFFF_FFFF), a configuration read request is issued and if the result of reading is all 0s (H'0000_0000), the given base address register (BAR) is judged to be reserved and the corresponding space is considered to be unused.



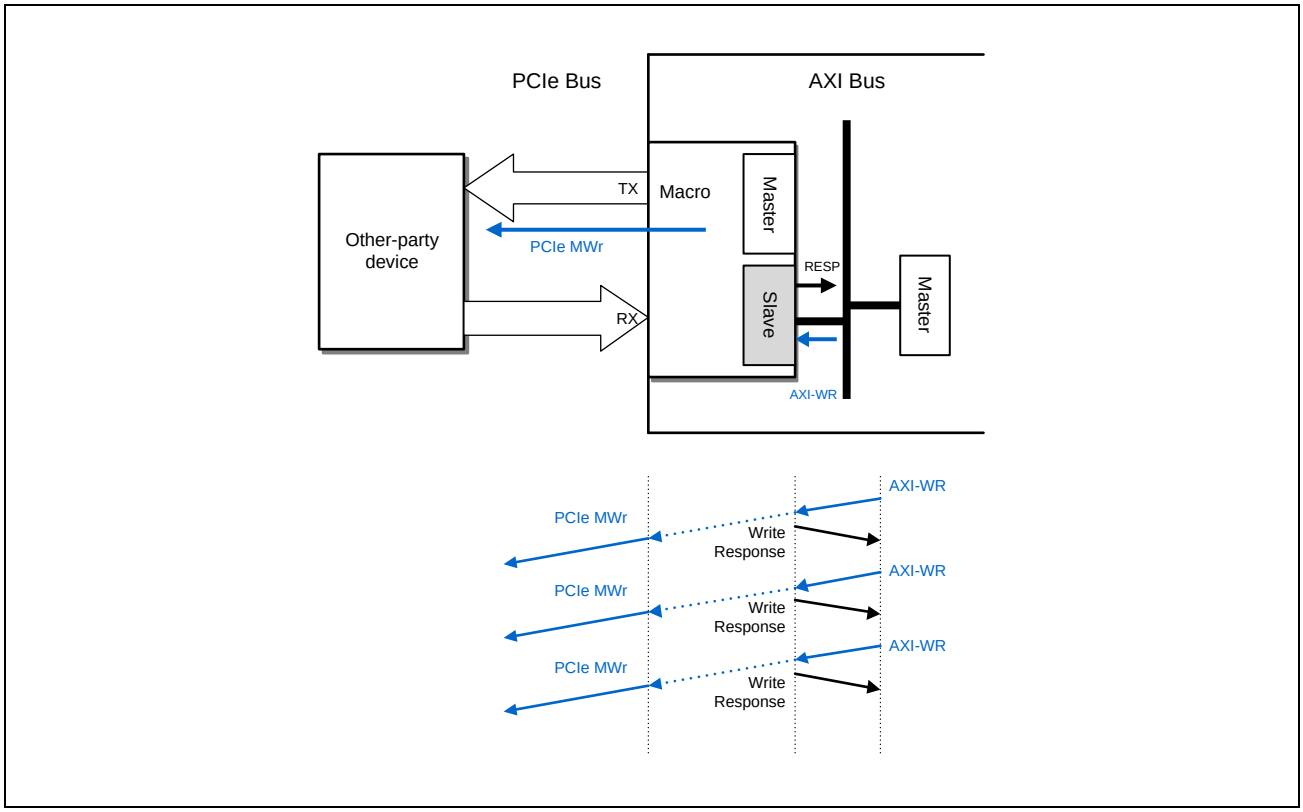
From the result of reading, software on the root complex side writes the base address (the lower-limit address) of the PCI address space to be allocated to the endpoint device by issuing a configuration write request.*[1] At this time, setting of a BAR for which the area requested by the endpoint device was found to be reserved and thus unused is not required. Also, if an address space which includes the other party has been prepared in advance, the above confirmation is not required. Set the base address directly.

Note 1. Setting a base address register to all 0s is prohibited.

Note: The values assigned in the figure (values in blue) are examples.

The completion of settings for the PCIe address space means that the root complex is ready for data transfer to the corresponding endpoint. Finally, set the Bus Master Enable bit and the Memory Space Enable bit of the given command register to enable the memory space.

Note: The values assigned in the figure (values in blue) are examples.



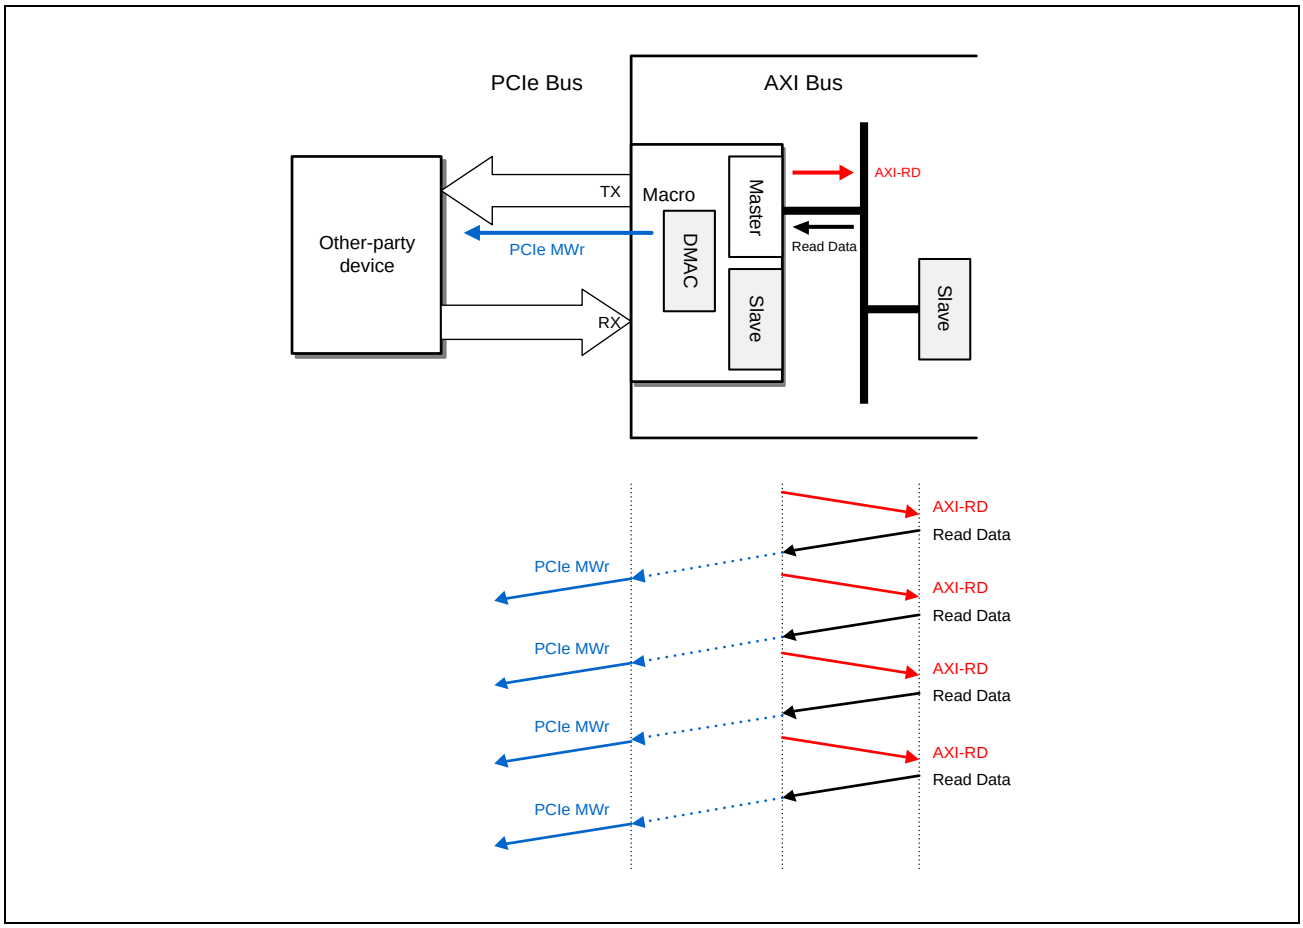
6.6.5.4 Data Transfer

This module has one port each for master and slave operation as an AXI interface. For PCIe requests which can be issued through the master and slave ports, see **6.6.4.2 Issuing of PCIe Request and Register Access (From AXI)** and **6.6.4.3 Issuing of AXI Transaction and Register Access (From PCIe)**.

The focus of this explanation is on normal memory data transfer.

6.6.5.4.1 PCIe MWr (when the AXI Slave is in Use)

A write transaction from the AXI bus (AXI-WR) via a window set as a PCIe window is converted into an MWr command (PCIe MWr) and then issued. If a PCIe MWr request is to be issued through the AXI interface slave port of the module by using a DMAC, etc. external to the module, the number of write transactions which can be accepted at a time is one, so the operation is as follows.



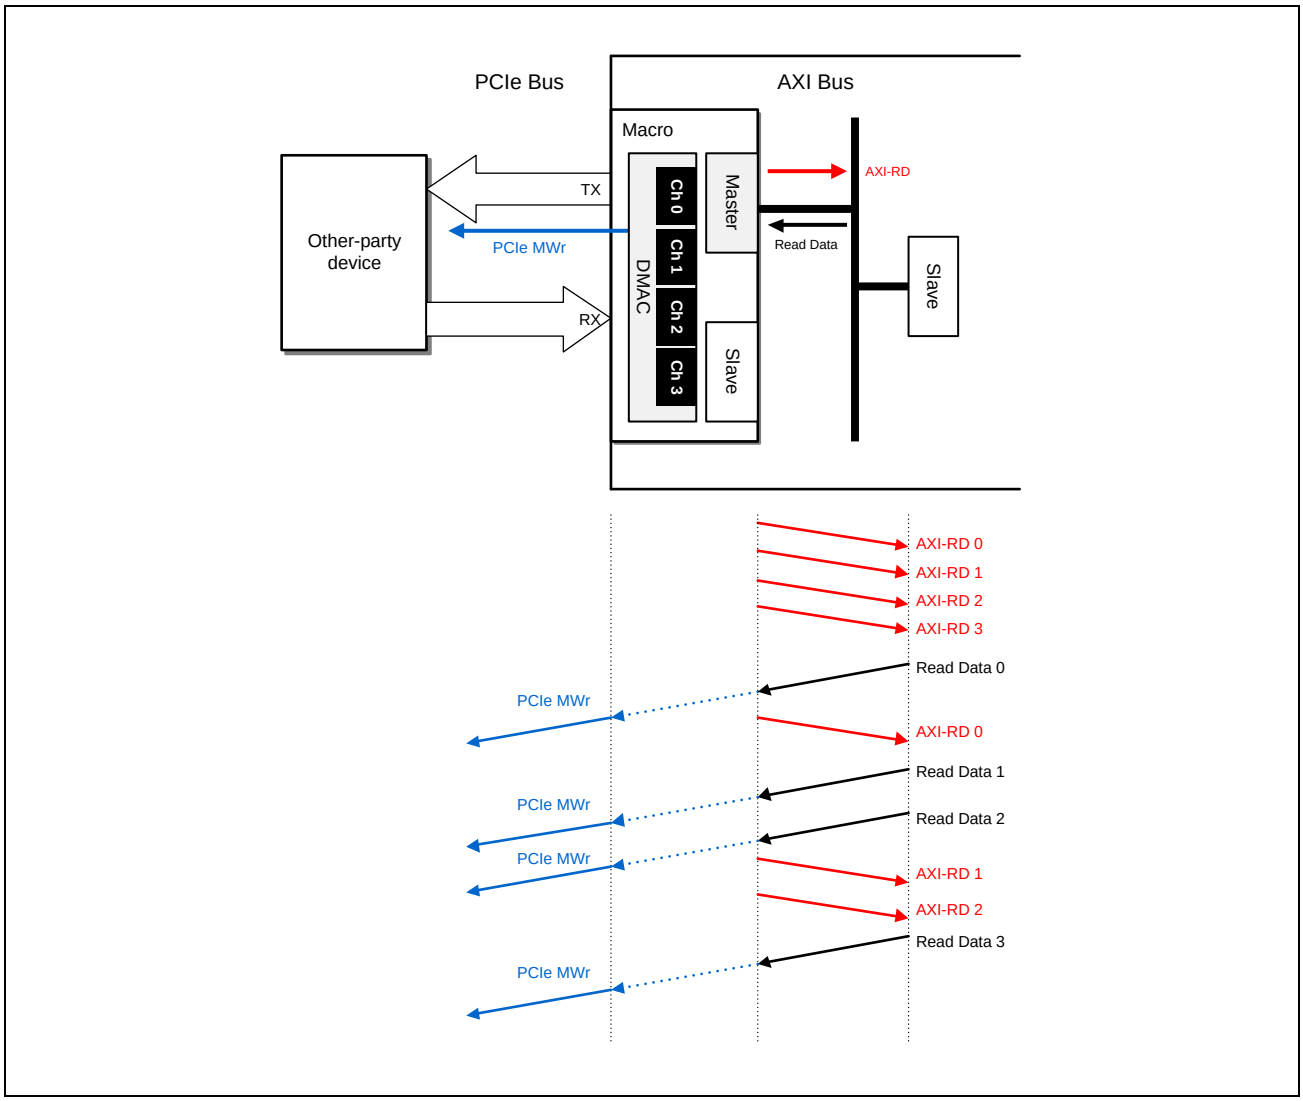
1. A write transaction from the AXI bus is issued through the AXI slave interface (write address channel, write data channel).
2. The transaction is converted into a PCIe MWr command and data are transferred to the other-party device via the PCIe bus.
3. After a wait for a response from the AXI slave interface (write response channel), a next AXI write transaction is issued.

A write response is issued after writing data to the transmission buffer (SRAM) within the module. If this transmission buffer is full, the module receives as much data as it can capture and then places the READY signal at the low level. Accordingly, the AXI bus may be placed in the hold state during transfer.

Since this depends not only on the specifications of the PCIe module (the number of lanes, rate, maximum payload size, etc.) but also on the size of the transmission buffer, the size of the reception buffer of the other-party device, and the external system configuration (the time for access to the external DRAM, etc.), care should be taken when considering the system configuration in general.

6.6.5.4.2 PCIe MWr (when the DMAC is in Use)

If a PCIe MWr request is to be issued through the AXI master port by using the DMAC within the module, the number of requests which can be read by the internal DMAC is one transaction per channel, so the operation is as follows.



1. An AXI read (AXI-RD) request is issued through the AXI master interface (read address channel).
2. After the AXI master interface (read data channel) receives read data, this is converted into a PCIe MWr command and data are transferred to the other-party device via the PCIe bus.
3. Following the completion of the reception of read data, the next AXI-RD is issued.
4. The above steps are repeated until transfer of all bytes set in the DMA Size bits is completed.

The read data channel checks that the data that have been read are valid and indicates the readiness of the data for reception. Even when the transmission buffer (SRAM) within the module is full, the module issues read requests through the read address channel. Also, it receives as much data as it can capture and places subsequent data in the non-receivable state. Accordingly, depending on the state of the transmission buffer, data may not be transferred regardless of a request having been issued, or the AXI bus may be placed in the hold state during transfer. This lengthens the period of waiting for data that have been read, leading to the deterioration of transfer performance as well as the deterioration of overall system performance.

Likewise, contention with write access by the slave interface and contention in write access between channels may decrease performance in transfer.

Since this depends not only on the specifications of the PCIe module (the number of lanes, rate, maximum payload size, etc.) but also on the size of the transmission buffer, the size of the reception buffer of the other-party device, and the external system configuration (the time for access to the external DRAM, etc.), care should be taken when considering the system configuration in general.

The following is an example where the number of requests which can be read by the AXI master interfaced through four DMAC channels is 4.

1. An AXI read (AXI-RD0: DMAC ch. 0) request is issued through the AXI master interface (read address channel).
2. Since the number of requests which can be read by the module = 4, AXI read requests are subsequently issued through DMAC ch. 1, ch. 2, and ch. 3.

   Note: No order of priority applies to the issuing of requests through these channels.
3. Following the completion of the reception of data read in response to the read request through ch. 0, ch. 0 is able to issue a next AXI-RD0.
4. The above steps are repeated until transfer of all bytes set in the DMA Size bits for each channel is completed.

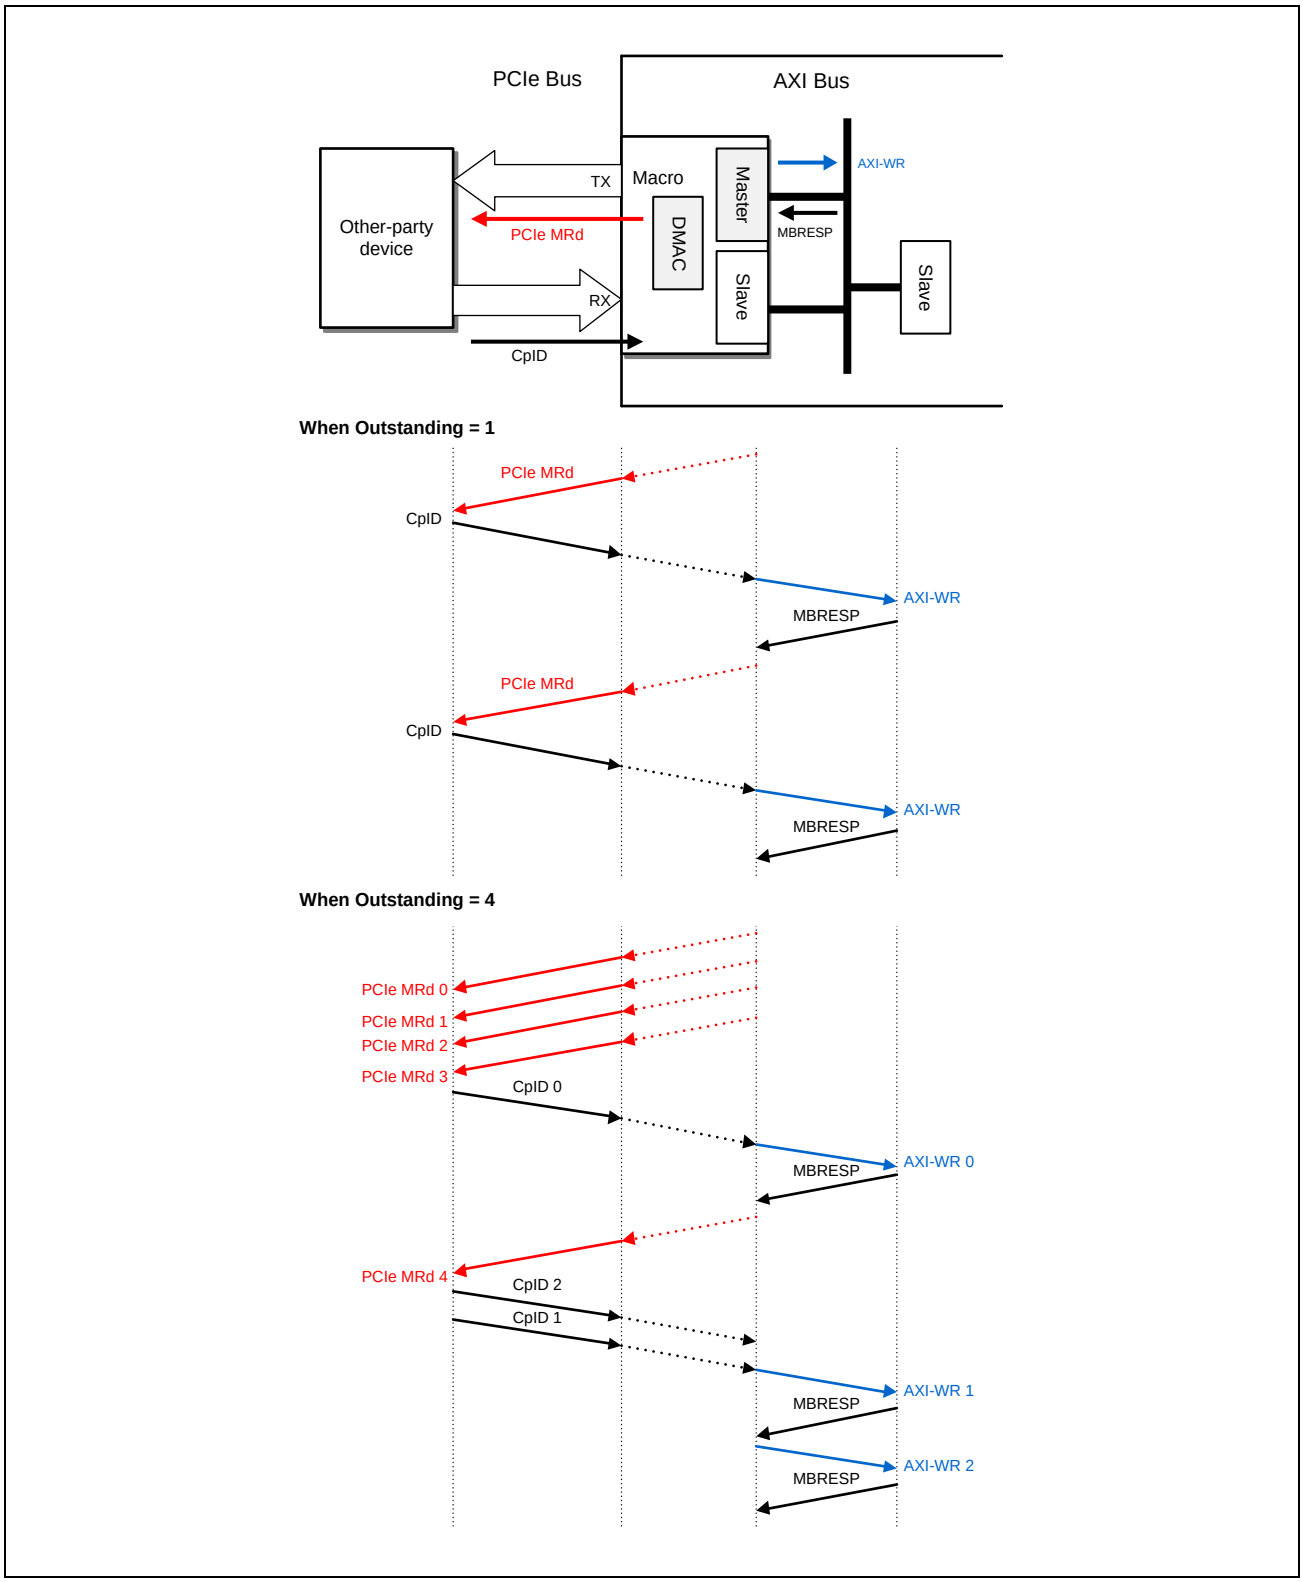
Configuring data transfer as described above allows increased performance, although such a configuration complicates software control.

6.6.5.4.3 PCIe MRd (when the AXI Slave is in Use)

In usage as an AXI slave, memory read requests (PCIe MRd) are issued to the PCIe interface, a completion (CplD) is received from the PCIe interface, and an AXI write transfer (AXI-WR) is initiated (this module supports eight outstanding transfers). Therefore, only the number of PCIe MRd requests that corresponds to this set number of outstanding transfers can be issued first, regardless of the reception of CplD. The received CplDs are stored in a data buffer (RAM) and then transferred through the AXI bus.

If a PCIe MRd is issued through the AXI interface slave port of the module, the number of read requests which can be accepted by the AXI slave at a time = 1 to 8 corresponding to the PCIe section.

When outstanding = 1



1. An AXI read transaction is issued through the AXI slave interface (read address channel).
2. A transaction is converted into a PCIe MRd command and the request for data reading is issued to the other-party device via the PCIe bus.
3. CplD is received from the other-party device and an AXI read response is issued through the AXI slave interface (read data channel).
4. Steps 1 to 3 are repeated.

When outstanding = 4

1. An AXI read transaction is issued through the AXI slave interface (read address channel).
2. A transaction is converted into a PCIe MRd command and the request for data reading is issued to the other-party device via the PCIe bus.
   Steps 1 and 2 can be repeated until up to four consecutive requests have been issued.
3. CplD is received from the other-party device and an AXI read response is issued through the AXI slave interface (read data channel).
   At this time, the PCIe module can operate with out-of-order transactions, so the order of CplDs from the other-party device may not be preserved. The module also includes a buffer to support in-order transactions with the AXI bus. If this is used and the CplD for a preceding PCIe MRd is never returned, however, the next request cannot be issued and performance deteriorates accordingly.
   After that, steps 1 to 3 are repeated.

6.6.5.4.4 PCIe MRd (when the DMAC is in Use)

If a PCIe MRd request is to be issued by using the DMAC within the module, the overall number of requests is also 1 to 8 when the DMAC is incorporated depending on the number of outstanding transfers.

1. Activate the internal DMAC through the AXI slave interface or from an other-party device.

When outstanding = 1

2. The DMAC issues a read request and this is converted to a PCIe MRd command within the module. The request for data reading is issued to the other-party device via the PCIe bus.
3. CplD is received from the other-party device and an AXI write transaction is issued through the AXI master interface (write address channel, write data channel).
4. Following the completion of the AXI write transfer, a next request is issued.
5. Steps 2 to 4 are repeated until transfer of all bytes set in the DMA Size bits is complete

When outstanding = 4

2. The DMAC issues a read request and this is converted to a PCIe MRd command within the module. The request for data reading is issued to the other-party device via the PCIe bus. Up to four consecutive requests can be issued.
3. CplD is received from the other-party device and an AXI write transaction is issued through the AXI master interface (write address channel, write data channel).
   At this time, the PCIe module can operate with out-of-order transactions, so the order of CplDs from the other-party device may not be preserved. The module also includes a buffer to support in-order transactions with the AXI bus. If this is used and the CplD for a preceding PCIe MRd is never returned, however, the next request cannot be issued and performance deteriorates accordingly.
4. Following the completion of the AXI write transfer, a next request is issued.
5. Steps 2 to 4 are repeated until transfer of all bytes set in the DMA Size bits is completed.

6.6.6 Usage Notes

6.6.6.1 Points for Caution and Prohibited Items in the Issuing of Requests

The following describes the restrictions in the issuing of various requests.

(1) Prohibition of fixed bursts of 2 or more beats

Fixed bursts for 2 or more beats are prohibited. If an attempt to use these is made, an OKAY response is returned to the AXI bus, but this may lead to issuing of the unexpected requests to the PCIe side, or unexpected register access which will change register values, and so on.

(2) Points for caution in the issuing of special requests

The requests listed below are issued by access to the internal registers. The registers are only accessible from the AXI side and writing to them while requests are being processed is prohibited. Attempted access from the PCIe side will be ignored.

[Special Requests]

- Zero-Length Memory Read Request
- Configuration Read
- Configuration Write
- Message Request
- Message Request with data payload

Remark Do not issue a special request for which issuing of the request is prohibited. Operation is not guaranteed if this is done.

6.6.6.2 Ordering Specifications of Received Non-Posted and Posted Requests

In the specifications of this module, a Non-Posted Request is not overtaken by a Posted Request on the receiving side. Requests received from another party are output to the higher-level bus in the order of reception.

6.6.6.3 Caution when Changing the Speed Spontaneously

Follow the procedure below. The following control bits are present in the PCI Core Control 2 Register and PCI Core Status 2 Register among the AXI-Bridge registers.

1. Wait until the home node is placed in the L0 state.
2. Read the value of the STATE_DATA_RATE_IDENTIFIER_RECEIVED bit to check the supported speed of the other-party node.
3. If the home node supports the speed to which the other-party node wants to change, set the UI_LINK_SPEED_CHANGE[1:0] bits and assert the UI_LINK_SPEED_CHANGE_REQ bit.
4. Wait for the UI_LINK_SPEED_CHANGE_DONE bit to be asserted (wait for the completion).

Remark UI_LINK_SPEED_CHANGE_REQ is retained until UI_LINK_SPEED_CHANGE_DONE is asserted. It should be de-asserted after checking the assertion of UI_LINK_SPEED_CHANGE_DONE.

6.6.6.4 Error Processing of Unsupported Requests

The following describes the flow of processing for error reporting and error logging.

(1) Access that straddles a 4-KB boundary

Data transfer to a memory space which straddles a 4-KB boundary cannot proceed (this is stipulated by the PCI Express Base Specification). In this module, the reception of a memory write or read request for a memory space which straddles a 4-KB boundary is handled as a malformed TLP.

(2) RCB violations

The PCI Express Base Specification states that error processing in response to violations of the read completion boundary (RCB) is optional. The PCIe module of this LSI chip does not support the detection of RCB violations at the time of the reception of completion responses.

(3) Error processing in response to byte enable fields.

The PCI Express Base Specification states that error processing in response to Byte Enable fields is optional. This module does not support the detection of errors in the form of violations of Byte Enable rules.

(4) Request that extends beyond the base address boundary

This module does not detect a request that starts within the range set in the Base Address Register but extends beyond the boundary from the base address as an error.

(5) Processing when a TLP that is ready to be transferred by the transmitter is a malformed TLP

Even if malformation of a TLP that is ready to be transferred by the transmitter is detected, due to the detection of parity errors when it is read from the FIFO buffer and so on, this unit does not suspend the transmission of such a TLP. Received malformed TLPs must be handled appropriately by other-party devices.

6.6.6.5 Processing on Reception of the Message

The following lists the messages to be detected as a silent drop or UR on reception of the given message.

Table 6.6-24 Operations on Message Reception

Received Message	Root Complex
Assert_INTx	Normal processing
Deassert_INTx	Normal processing
ERR_COR	Normal processing
ERR_NONFATAL	Normal processing
ERR_FATAL	Normal processing
UNLOCK	Silent Drop
Set_Slot_Power_Limit	Silent Drop
Vendor_Defined_Type0	UR
Vendor_Defined_Type1	Silent Drop
Ignore	Silent Drop
LTR	Normal processing
OBFF	UR
PM_PME	Normal processing
PME_TO_Ack	Normal processing
PM_Active_State_Nak	Silent Drop
PME_Turn_Off	Silent Drop
PTM_Request	UR
PTM_Response	UR
PTM_ResponseD	UR
Invalidate_Request	Silent Drop
Invalidate_Completion	Normal processing
Page_Request	UR
Page_Response	UR

Note: Silent Drop: Normal completion, data are not reflected
UR: Unsupported Request

6.6.6.6 Other Points for Caution

(1) Point for caution on register writing

In some cases of writing 2DW or more and skipping over with the use of byte enable to a register from the AXI side, writing might not proceed as expected.

Using a pin reset or register reset from the AXI side as a non-consecutive SWSTRB, restricts writing to no more than 1DW (32 bits).

(2) Point for caution on register reading

In the case of reading a register from the AXI side, values read from invalid byte lanes are from undefined outputs (meaningless garbage data).

(3) Generation of unexpected correctable errors

A correctable error may be detected at the time of EIOS reception following low power state transitions of this module such as from L0s to L1. If this happens, processing to send a message or assert an interrupt flag signal is to proceed. Take care on this point and respond appropriately so that a correctable error is not handled as a fatal error (a mask setting by a register to switch the notification of unexpected correctable errors off is recommended).

(4) Reset interval in transitions from a hot reset to detection in RC mode

In generations of PCI Express after Gen1, at the time of transitions from a hot reset to detection in accord with the operating rate, the base specification prescribes securing a 1-ms waiting interval for changes to the rate, so secure a reset interval of 1 ms.

(5) How to use the PCI_RST_OUT# terminal

By connecting this terminal to the “PERST#” input terminal on the Endpoint side of the opposite device in the Root Complex mode, initialization of the opposite device can be controlled by the Root Complex side.

(6) Retimer

One Retimer can be used.

(7) Point for caution on Window setting

Window addressing has the following precautions and limitations:

- When the BAR* register and the corresponding BAR Mask* register setting value are added, bit carry should not be allowed.
- When the AXI Window Base* register and the corresponding AXI Window Mask* register setting value are added, bit carry should not be allowed.
- When the PCIe Window Base* register and the corresponding PCIe Window Mask* register setting value are added, bit carry should not be allowed.
- When the AXI Window Mask* register and the corresponding AXI Destination* register setting value are added, bit carry should not be allowed.
- When the PCIe Window Mask* register and the corresponding PCIe Destination* register setting value are added, bit carry should not be allowed.

- The value of BAR Mask*, AXI Window Mask* and PCIe Window Mask* register should be set a power of 2 minus 1.

  Ex) H’0000_0007_FFFF_FFFF is OK. H’0000_0001_0FFF_FFFF is NG.
- Each Window should be a single memory size with a power of 2.
- The minimum space between BAR-BAR masks is 4 Kbytes.
- Make sure that each window area and AXI Bridge register area (BAR4/5) do not overlap.

SECTION 7 LOW-SPEED INTERFACE

7.1 Low-Speed Interface Overview

This section describes the Low-Speed Interface unit of this LSI. For details, refer to the sections of each unit.

■ Expanded Serial Peripheral Interface (xSPI) (See 7.2)

Supports connection of Serial flash memory. By setting the BOOT_MODE[2:0] pin, it can be specified as a boot device.

■ Serial Communications Interface (RSCI) (See 7.3)

This LSI equips 4ch of SCI. SCI can communicate with UART, Simple SPI, Simple I2C.

■ Serial Communications Interface with FIFO (SCIF) (See 7.4)

This LSI equips 6ch of SCIF. In this LSI, SCIF ch0 executes UART communication. By setting the BOOT_MODE[2:0] pin, download boot can be specified.

■ Serial Peripheral Interface (RSPI) (See 7.5)

This LSI equips 3ch of RSPI.

■ I^2C Bus Interface (RIIC) (See 7.7)

This LSI equips 4ch of RIIC.

RIIC ch0 is located in PD_AWO and can be used for PMIC control during boot.

■ I^3C Bus Interface (I3C) (See 7.8)

This LSI equips 1ch of I3C.

■ CAN-FD Interface (See 7.9)

This LSI equips 3ch of CAN-FD

■ A/D Converter (ADC0) (See 7.10)

For this unit, analog inputs of up to 8 channels are selectable.

A signal from GPT or ELC can be used as an A/D conversion start trigger.

■ Temperature Sensor Unit (TSU) (See 7.11)

This LSI equips 1ch of TSU.

■ **A/D Converter for TSU (ADC1) (See 7.12)**

This unit is used TSU.

SECTION 7 LOW-SPEED INTERFACE

7.2 Expanded Serial Peripheral Interface (xSPI)

7.2.1 Overview

This LSI has one unit of Expanded Serial Peripheral Interface (xSPI). The xSPI protocol specifies the interface for Memory Devices, which provides high data throughput, low signal count, and limited backward compatibility with legacy SPI devices. The electrical interface can deliver up to 266 MB per second raw data throughput.

Table 7.2-1 lists the xSPI specifications.

Table 7.2-1 xSPI Specifications

Item	Description
Number of channels	2 channels (ch0 and ch1 are exclusive) × 1 unit
Protocol	Compliant for the xSPI protocol
Data transmission and reception	Issue the transaction for up to 2 Slave as Master
Transfer speed	Support the transfer at xSPI200 or xSPI266
Mode	• Support Protocol modes below – 1/4/8pin with SDR/DDR (1S-1S-1S, 4S-4D-4D*1, 8D-8D-8D) – 2/4pin with SDR (1S-4S-4S, 4S-4S-4S) • Configurable address length • Configurable initial access latency cycle • Support XiP mode
xSPI function	• Support Write Data Mask • Support In-band Reset (JESD252) • Memory-mapping – Support up to 256 MBytes address space – Prefetch function for burst-read with low latency – Outstanding buffer for burst-write with high throughput • Manual command – Configurable up to 4 commands – Status Register Polling function • Output Clock port timing shift • Input Strobe port timing shift

Note 1. DDR access without XSPI_DS is not supported.

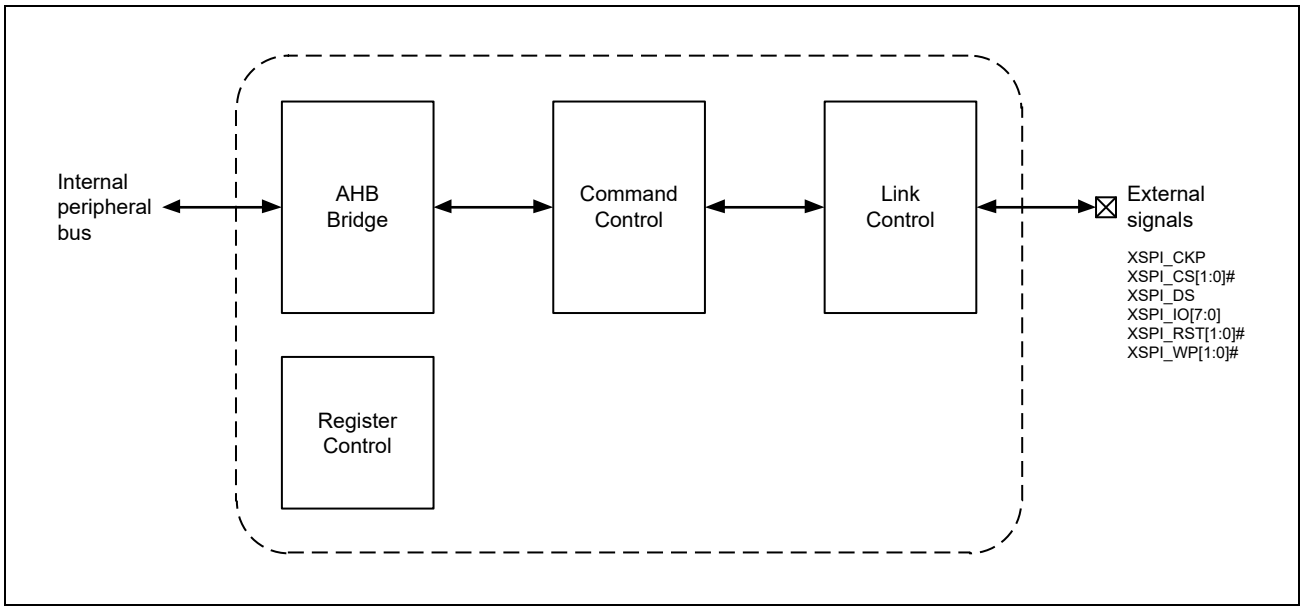


Figure 7.2-1 Block Diagram

7.2.2 Input/Output Pins

Table 7.2-2 xSPI I/O Pins

Pin Name	Input/Output	Functional Description
XSPI_CKP	Output	SPI Clock
XSPI_CS0#	Output	Chip Select for slave0
XSPI_CS1#	Output	Chip Select for slave1
XSPI_DS	I/O	Read Data Strobe / Write Data Mask
XSPI_IO0	I/O	Data 0 input/output
XSPI_IO1	I/O	Data 1 input/output
XSPI_IO2	I/O	Data 2 input/output
XSPI_IO3	I/O	Data 3 input/output
XSPI_IO4	I/O	Data 4 input/output
XSPI_IO5	I/O	Data 5 input/output
XSPI_IO6	I/O	Data 6 input/output
XSPI_IO7	I/O	Data 7 input/output
XSPI_RST0#	Output	Master reset status for slave0
XSPI_RST1#	Output	Master reset status for slave1
XSPI_WP0#	Output	Write Protect for slave0
XSPI_WP1#	Output	Write Protect for slave1

Table 7.2-3 Address Map

Channel	Internal Address	Space
xSPI	H’2000_0000 to H’27FF_FFFF	CS0
	H’2800_0000 to H’2FFF_FFFF	CS1

Note: The address space of CS0 and CS1 can be set by registers in Section SYSC. When setting the address spaces of CS0 and CS1, overlapping addresses is prohibited.

7.2.3 Register Descriptions

Table 7.2-4 shows the register configuration. The address of the xSPI register is represented by the offset address from the base address. xSPI base address is as follows:

Base address: H'0_1006_0000 (Overall Address Space)
Base address: H'4006_0000 (Cortex-M33 Address Space Secure)
Base address: H'5006_0000 (Cortex-M33 Address Space Non-Secure)

Table 7.2-4 Register Configuration (1/2)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
xSPI Wrapper Configuration Register	WRAPCFG	R/W	H'0000_0000	H'000	32
xSPI Common Configuration Register	COMCFG	R/W	H'0000_0000	H'004	32
xSPI Bridge Map Configuration Register	BMCFG	R/W	H'0000_0000	H'008	32

xSPI Command Calibration Control Register 5 CS1	CCCTL5CS1	R/W	H'0000_0000	H'164	32
xSPI Command Calibration Control Register 6 CS0	CCCTL6CS0	R/W	H'0000_0000	H'148	32
xSPI Command Calibration Control Register 6 CS1	CCCTL6CS1	R/W	H'0000_0000	H'168	32
xSPI Command Calibration Control Register 7 CS0	CCCTL7CS0	R/W	H'0000_0000	H'14C	32
xSPI Command Calibration Control Register 7 CS1	CCCTL7CS1	R/W	H'0000_0000	H'16C	32
xSPI Version Register	VERSTT	R	H'0000_0000	H'180	32
xSPI Common Status Register	COMSTT	R	H'0033_0000	H'184	32
xSPI Calibration Status Register CS0	CASTTCS0	R	H'0000_0000	H'188	32
xSPI Calibration Status Register CS1	CASTTCS1	R	H'0000_0000	H'18C	32
xSPI Interrupt Status Register	INTS	R	H'0000_0000	H'190	32
xSPI Interrupt Clear Register	INTC	W	H'0000_0000	H'194	32
xSPI Interrupt Enable Register	INTE	R/W	H'0000_0000	H'198	32

7.2.3.1 xSPI Configuration Registers

These registers configure xSPI Master function. These registers should be configured in the initialization phase before issuing xSPI transaction.

7.2.3.1.1 xSPI Wrapper Configuration Register (WRAPCFG)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	DSSFTCS1[4:0]					—	—	—	CKSFTCS1[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DSSFTCS0[4:0]					—	—	—	CKSFTCS0[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
28 to 24	DSSFTCS1 [4:0]	All 0	R/W	DS shift for slave1 The function is same as one of slave0.
23 to 21	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	CKSFTCS1 [4:0]	All 0	R/W	CK shift for slave1 The function is same as one of slave0.
15 to 13	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
12 to 8	DSSFTCS0 [4:0]	All 0	R/W	DS shift for slave0 These bits configure the number of delay cell for XSPI_DS pin. It is used to adjust the DS sampling timing. 1 cell delay is around 125 ps. When enabled automatic calibration, it can be updated automatically. H'00: No shift H'01: Add a delay of 1 cell ⋮ H'1E: Add a delay of 30 cells H'1F: Add a delay of 31 cells
7 to 5	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
4 to 0	CKSFTCS0 [4:0]	All 0	R/W	CK shift for slave0 This field configures the number of delay cell for a XSPI_SPCLK port. It is used to adjust the CK driving timing. 1 cell delay is around 125 ps. When enabled automatic calibration, it can be updated automatically. H'00: No shift H'01: Add a delay of 1 cell ⋮ H'1E: Add a delay of 30 cells H'1F: Add a delay of 31 cells

7.2.3.1.2 xSPI Common Configuration Register (COMCFG)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OENEGEX	OEASTEX
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

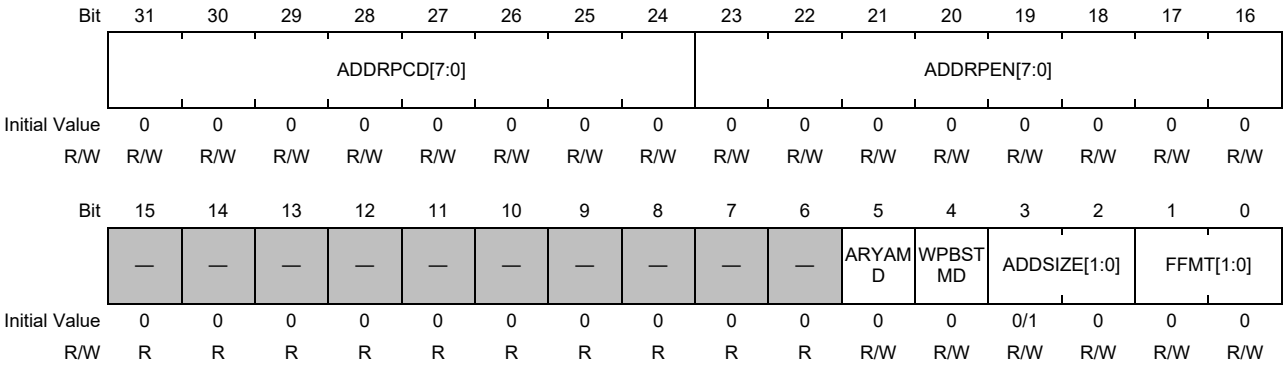
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
17	OENEGEX	0b	R/W	Output Enable Negating extension This bit extends 1 cycle output enable of Data and DS during output enable negating. This bit should not be used in case of no latency cycle. Because SPI output data could be conflicted with SPI input data. 0: No extend 1 cycle Output enable 1: Extend 1 cycle Output enable
16	OEASTEX	0b	R/W	Output Enable Asserting extension This bit extends 1 cycle output enable of Data and DS during output enable asserting. When set to 1, CS asserting should be extended (LIOCFGCSn.CSASTEX = 1 (n = 0, 1)). This bit shall not be used in case of no latency cycle. Because xSPI output data could be conflicted with xSPI input data. 0: No extend 1 cycle Output enable 1: Extend 1 cycle Output enable
15 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

7.2.3.1.3 xSPI Bridge Map Configuration Register (BMCFG)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMBTIM[7:0]								—	—	—	—	—	—	—	PREEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

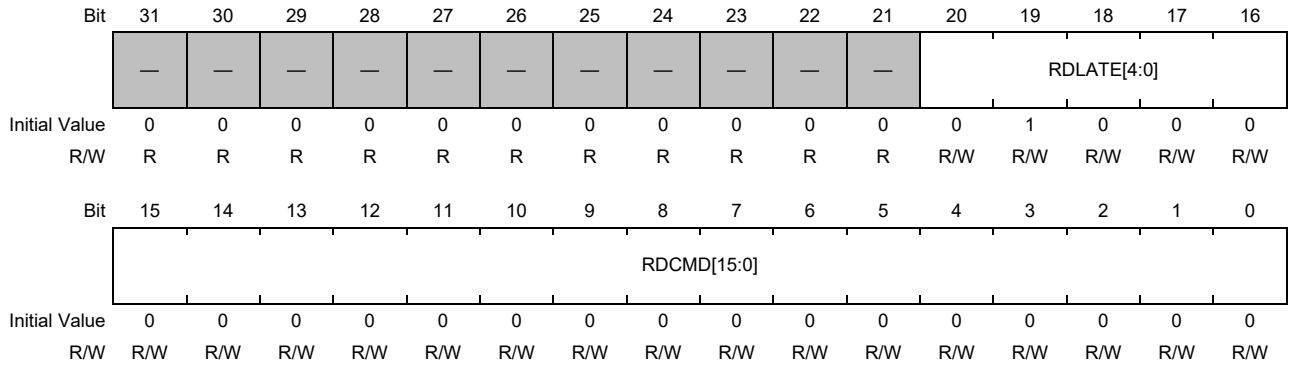


Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MWRSIZE[7:0]								MWRCOMB	—	—	—	—	—	—	WRMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CMBTIM[7:0]	All 0	R/W	Combination timer This field specifies expiration period of combination timer.H'00 means disabling the combination timer. When the timer is expired, the data in the combination buffer is pushed to memory device.
23 to 17	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
16	PREEN	0b	R/W	Prefetch enable This bit enables prefetch function for read transaction in memory-mapping mode. It could reduce the latency for AHB read transaction with incremental address. 0: Disable prefetch function 1: Enable prefetch function
15 to 8	MWRSIZE [7:0]	All 0	R/W	Memory Write Size These bits select the size to combine incremental address in memory-mapping mode. It transmits an xSPI frame with the data combined up to the configured size while the address is incremental. When detected non-incremental address or a read transaction before reaching to the target size, it transmits the pending data into xSPI bus. H'00: Combine incremental address up to 4 bytes H'01: Combine incremental address up to 8 bytes ⋮ H'0E: Combine incremental address up to 60 bytes H'0F: Combine incremental address up to 64 bytes Others: Setting prohibited
7	MWRCOMB	0b	R/W	Memory Write Combination mode This field selects to combine the xSPI data in write access of memory mapping-mode. When this field is set to "0", xSPI data size depends on system bus's burst type and size. When this field is set to "1", the data size depends on MWRSIZE field. *Note*: When this field is set to "1", any write transaction could be held in this xSPI master temporarily. 0: Disable combination mode 1: Enable combination mode
6 to 1	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	WRMD	0b	R/W	System bus Write Response mode This field selects the timing of system bus write response in memory-mapping mode. When this field is set to “1”, it returns the response after transmitting a frame on xSPI bus. *Note*: When this mode is enabled, Memory Write Combination mode shall be disabled. 0: Return response after storing to Internal Write Buffer 1: Return response after issuing write transaction to xSPI bus

7.2.3.1.4 xSPI Command Map Configuration Register 0 CSn (CMCFG0CSn) (n = 0, 1)



This register has functions to configure xSPI Master function.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ADDRPCD [7:0]	All 0	R/W	Address Replace Code These bits configure the code to replace the MSByte of system bus address in memory-mapping mode. It replaces the corresponding bits when Address Replace Enable bit is set to 1.
23 to 16	ADDRPEN [7:0]	All 0	R/W	Address Replace Enable These bits select the bits to replace for MSByte of system bus address in memory-mapping mode. 0: No replacement (xSPI frame address field is same as system bus address) 1: Replacement
15 to 6	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
5	ARYAMD	0b	R/W	Array address mode 0: Normal address mode 1: Array address mode When this field is set to 1, address for memory is mapped as {A [25:10], A [9:4], 6{RSV}, A [3:0]} where A [25:0] is normal address, and RSV is reserved value(0b). This field is effective only when FFMT [1:0] = 01b.
4	WPBSTMD	0b	R/W	Wrapping burst mode 0: Separate xSPI transfer at the wrapping address boundary 1: Not separate xSPI transfer at the wrapping address boundary
3, 2	ADDSIZE[1:0]	10b (n = 0) 00b (n = 1)	R/W	Address size These bits configure the number of address byte in memory-mapping mode. In case of 8D-8D-8D profile 2.0, it should be configured to 4 bytes. 0 0: 1 byte (256 bytes address space) 0 1: 2 bytes (64 Kbytes address space) 1 0: 3 bytes (16 Mbytes address space) 1 1: 4 bytes (4 Gbytes address space)
1, 0	FFMT[1:0]	00b	R/W	Frame format These bits configure xSPI frame format in memory-mapping mode. Please see **Table 7.2-10** for detail. 0 0: Normal format: Command 1 byte, Address ADDSIZE, Data to AHB transaction. 0 1: 8D-8D-8D profile 1.0 format: Command 2 bytes, Address ADDSIZE, Data to AHB transaction 1 0: 8D-8D-8D profile 2.0 Command Modifier format: Command & Modifier 6 bytes, Data to AHB transaction 1 1: 8D-8D-8D profile 2.0 Commands with Extended Command Modifier format: Command & Modifier 6 bytes, Data to AHB transaction

7.2.3.1.5 xSPI Command Map Configuration Register 1 CSn (CMCFG1CSn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	RDLATE[4:0]	H'08	R/W	Read latency cycle These bits configure the latency cycle of read transaction in memory-mapping mode. H'00: No latency H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
15 to 0	RDCMD[15:0]	All 0	R/W	Read command These bits configure the command field of read transaction in memory-mapping mode. Normal format and 8D-8D-8D profile 2.0 format use only upper 1 byte. 8D-8D-8D profile 1.0 format uses 2 bytes.

7.2.3.1.6 xSPI Command Map Configuration Register 2 CSn (CMCFG2CSn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	WRLATE[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WRCMD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	WRLATE[4:0]	H'08	R/W	Write latency cycle These bits configure the latency cycle of write transaction in memory-mapping mode. H'00: No latency H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
15 to 0	WRCMD [15:0]	All 0	R/W	Write command These bits configure the command field of write transaction in memory-mapping mode. Normal format and 8D-8D-8D profile 2.0 format use only upper 1 byte. 8D-8D-8D profile 1.0 format uses 2 bytes.

7.2.3.1.7 xSPI Link I/O Configuration Register CSn (LIOCFGCSn) (n = 0, 1)

This register has functions to configure xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DDRSMPEX[3:0]				SDRSMPSFT[3:0]				SDRSMPMD	SDRDRV	CSNEGEX	CSASTEX	CSMIN[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	WRMSKMD	LATEMD	PRTMD[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DDRSMPEX[3:0]	All 0	R/W	DDR sampling window extend These bits configure the cycle of extending the sampling window in DDR. In DDR, the input data is sampled during the expected cycle soon after latency cycle. The input data out of range is ignored. It can be configured depending on DS propagation delay. H'0: Expand no cycle H'1: Expand 1 cycle ⋮ H'6: Expand 6 cycles H'7: Expand 7 cycles Others: Setting prohibited
27 to 24	SDRSMPSFT[3:0]	All 0	R/W	SDR Sampling window shift These bits shift the timing of CK sampling in SDR. In case of using DS in SDR, there is no influence on the behavior. In case of DDR or using DS in SDR, it should be set to 0. H'0: Sample without delay H'1: Sample at 1 cycle delay ⋮ H'6: Sample at 6 cycle delay H'7: Sample at 7 cycle delay Others: Setting prohibited
23	SDRSMPMD	0b	R/W	SDR Sampling mode This bit selects the edge of sampling in SDR. In DDR, regardless of this setting, it samples data input ports with both edges of DS. When set to 1, it samples at rising-edge before falling-edge. 0: Samples data input at falling-edge 1: Samples data input at rising-edge
22	SDRDRV	0b	R/W	SDR driving timing This bit configures the timing of data output in SDR. This bit should not be used in case of no latency cycle. Because SPI output data could be conflicted with SPI input data. 0: Drive at 1/2 cycle before CK rising-edge 1: Drive at CK rising-edge
21	CSNEGEX	0b	R/W	CS negating extension This bit extends 1 cycle chip select pins when negating. 0: No extension 1: Extend 1 cycle

Bit	Bit Name	Initial Value	R/W	Description
20	CSASTEX	0b	R/W	CS asserting extension This bit extends 1 cycle chip select pins when asserting. 0: No extension 1: Extend 1 cycle
19 to 16	CSMIN[3:0]	H'7	R/W	CS minimum idle term This bit configures the minimum cycle between xSPI frames. H'0: 1 cycle H'1: 2 cycles ⋮ H'E: 15 cycles H'F: 16 cycles
15 to 12	—	0b	R	Reserved These bits are read as 0. The write value should be 0.
11	WRMSKMD	0b	R/W	Write mask mode This bit selects to use Data strobe port as write data mask. It could be useful for write access of odd byte. It is used only for 8D-8D-8D protocol mode. 0: Write mask disable 1: Write mask enable
10	LATEMD	0b	R/W	Latency mode This bit selects the behavior of initial access latency phase for both direct-manual mode and memory-mapping mode. When set to 0, the latency cycle is equal to each configured cycle from transmitting address field. When set to 1, the latency cycle is incremented from the last byte-pair of Address field and is extended 2 times of each configured cycle depending on data strobe port. It is used only for profile 2.0 frame format of 8D-8D-8D protocol mode with 6 bytes command/address field. Please refer to xSPI protocol for detail.
9 to 0	PRTMD[9:0]	All 0	R/W	Protocol mode These bits configure the protocol mode and the pin to sample data inputs. In case of using not SPI clock but Data strobe for sampling in SDR mode, it is required to set PRTMD[9] to 1. H'000: 1S-1S-1S H'3B2: 4S-4D-4D H'3FF: 8D-8D-8D H'090: 1S-4S-4S H'092: 4S-4S-4S Others: Setting prohibited

Value: Function	Frame format	Usage
0: Configurable latency	profile 2.0	The configurable latency cycle should be set as minus 1.
	Others	Latency cycle increments after address field.
1: Variable latency	profile 2.0	Latency cycle increments from address [23:16]. And it should not be set to 1.
	Others	Not support

7.2.3.2 xSPI Control Registers

These registers control xSPI Master function.

7.2.3.2.1 xSPI Bridge Map Control Register 0 (BMCTL0)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	W	R	W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved The write value should be 0.
10	PBUFCLR	0b	W	Prefetch Buffer clear This bit requests to clear the prefetch buffer when enabled the prefetch function. It should not be set during memory access (COMSTT.MEMACC = 1). 0: No command 1: Clear request
9	—	0b	R	Reserved The write value should be 0.
8	MWRPUSH	0b	W	Memory Write Data Push This bit requests to push the pending data in combination mode. 0: No command 1: Push request
7 to 0	—	All 0	R	Reserved The write value should be 0.

7.2.3.2.3 xSPI Command Map Control Register (CMCTL)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	XIPEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	XIPEXCODE[7:0]								XIPENCODE[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
16	XIPEN	0b	R/W	XiP mode enable This bit enables XiP mode in memory-mapping mode. When set to 1, XiP enter code is inserted in the latency field, and the command field in next transaction is omitted. When set to 0, XiP exit code is inserted in the latency field. And it is set to 0 automatically when transmitting XiP disable pattern. It should not be used for 8D-8D-8D protocol mode profile 2.0 frame format. 0: Disable XiP mode 1: Enable XiP mode
15 to 8	XIPEXCODE [7:0]	All 0	R/W	XiP mode exit code These bits configure the code to exit XiP mode in memory-mapping mode.
7 to 0	XIPENCODE [7:0]	All 0	R/W	XiP mode enter code These bits configure the code to enter XiP mode in memory-mapping mode.

7.2.3.2.4 xSPI Command Manual Control Register 0 (CDCTL0)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	PERREP[3:0]				—	—	—	PERITV[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TRNUM[1:0]		CSSEL	—	PERMD	TRREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
27 to 24	PERREP[3:0]	All 0	R/W	Periodic transaction repeat These bits configure the number of transaction repetitions in periodic manual-command mode. H'0: 1 (= 2^0) time H'1: 2 (= 2^1) times ⋮ H'E: 16384 (= 2^{14}) times H'F: 32768 (= 2^{15}) times
23 to 21	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	PERITV[4:0]	All 0	R/W	Periodic transaction interval These bits configure the interval of transaction in periodic manual-command mode. Too short interval compared with CPU bus cycle could result in no store into command buffer0. The interval should be longer than 4 times of CPU bus cycle. H'00: 2 (= 2^1) cycles H'01: 4 (= 2^2) cycles ⋮ H'1E: 2,147,483,648 (= 2^{31}) cycles H'1F: 4,294,967,296 (= 2^{32}) cycles
15 to 6	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
5, 4	TRNUM[1:0]	00b	R/W	Transaction number These bits configure the number of transactions in normal manual-command mode. In periodic manual-command, regardless of this setting, it issues the transaction using only command buffer 0. 0 0: Issue 1 command (using command buffer 0) 0 1: Issue 2 commands (using command buffer 0-1) 1 0: Issue 3 commands (using command buffer 0-2) 1 1: Issue 4 commands (using command buffer 0-3)
3	CSSEL	0b	R/W	Chip select This bit selects a target memory to issue manual-command. 0: CS0 1: CS1
2	—	0b	R	Reserved This bit is read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	PERMD	0b	R/W	Periodic mode This bit enables the periodic transaction mode. When set to 1, it repeats a transaction periodically and compares the read value with the expected value. It alternates the status polling operation for external memory. 0: Direct manual-command mode 1: Periodic manual-command mode
0	TRREQ	0b	R/W	Transaction request This bit requests to issue the transaction of manual-command. When set to 1, it starts the transaction. It is cleared to 0 when the transaction completed. The transaction is canceled by clearing to 0 while the transaction is ongoing. 0: No transaction 1: Request transaction

7.2.3.2.5 xSPI Command Manual Control Register 1 (CDCTL1)

This register has functions to control xSPI Master function.

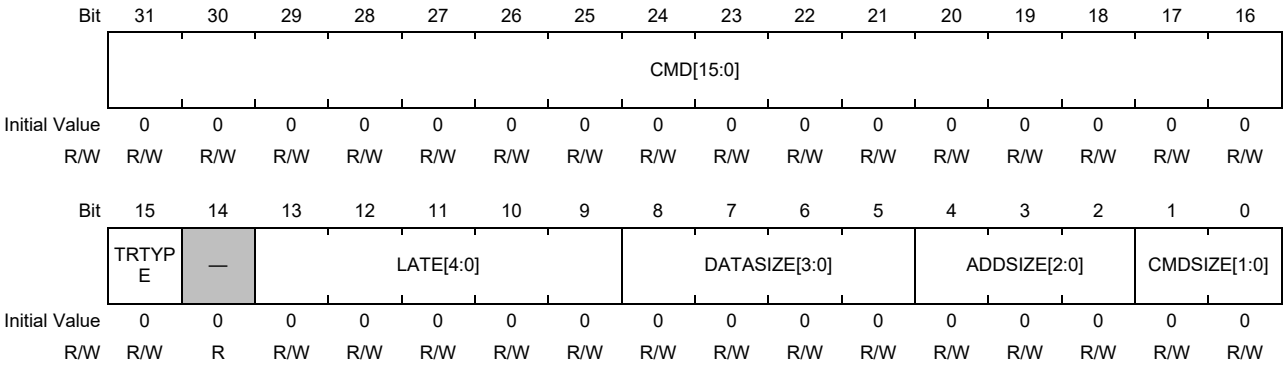
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PEREXP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEREXP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PEREXP [31:0]	All 0	R/W	Periodic transaction expected value These bits configure the expected value to compare with the read value in periodic manual- command mode. For example, in case of comparing 1 byte, the lower byte should be configured.

7.2.3.2.6 xSPI Command Manual Control Register 2 (CDCTL2)

This register has functions to control xSPI Master function.



Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PERMSK[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PERMSK[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PERMSK [31:0]	All 0	R/W	Periodic transaction masked value These bits configure the masked value for the expected value in periodic manual-command mode. When set 1 to any bit, the corresponding bit configured as expected value (CDCTL1.PEREXP[31:0]) is ignored. In 8D-8D-8D, the data bytes are transferred only in byte pairs on xSPI bus. It means the dummy read data could be stored. It should be masked for unused bits. For example, in case of read lower 1 byte, it should be configured to H'FFFF_FF00.

7.2.3.2.7 xSPI Command Manual Type Buf n (CDTBUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CMD[15:0]	All 0	R/W	Command (1-2 bytes) These bits configure the command field in manual-command mode. The number of bytes configured in Command Size bit is transferred. 1S-1S-1S, 4S-4D-4D: CMD[15:8] is command field, CMD[7:0] is not used. 8D-8D-8D profile 1.0: CMD[15:8] is command field, CMD[7:0] is extension field. 8D-8D-8D profile 2.0: CMD[15:0] is upper 2 bytes of command & modifier field. (bit 47-32 in xSPI protocol)
15	TRTYPE	0b	R/W	Transaction Type This bit selects the type of transaction. 0: Read transaction (Readout data from slave device) 1: Not read transaction
14	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
13 to 9	LATE[4:0]	All 0	R/W	Latency cycle These bits configure the latency cycle in manual-command mode. H'0: No latency H'1: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
8 to 5	DATASIZE[3:0]	All 0	R/W	Write/Read Data Size These bits configure the size of data field. In 8D-8D-8D, the data bytes are transferred only in byte pairs on xSPI bus. For example, even if configuring 1 byte for read, 2 bytes data is received. The last byte should be ignored. The 0 bytes must not be configured for read transaction. H'0: 0 bytes (No data phase) H'1: 1 byte : H'7: 7 bytes H'8: 8 bytes Others: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
4 to 2	ADDSIZE[2:0]	All 0	R/W	Address size These bits configure the size of address field. 0 0 0: 0 bytes (No address phase) 0 0 1: 1 byte 0 1 0: 2 bytes 0 1 1: 3 bytes 1 0 0: 4 bytes Others: Setting prohibited
1, 0	CMDSIZE [1:0]	All 0	R/W	Command Size These bits configure the size of command field. In case of 8D-8D-8D, it should be fixed to 10b. It should not be configured both command size and address size to zero. 0 0: 0 bytes (No command phase) 0 1: 1 byte 1 0: 2 bytes Others: Setting prohibited

7.2.3.2.8 xSPI Command Manual Address Buf n (CDABUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADD[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADD[31:0]	All 0	R/W	Address These bits configure the address field in manual-command mode. 1S-1S-1S, 4S-4D-4D, 8D-8D-8D profile 1.0: It is address field. 8D-8D-8D profile 2.0: It is lower 4 bytes of command & modifier field. (bit 31-0 in xSPI protocol)

7.2.3.2.9 xSPI Command Manual Data 0 Buf n (CDD0BUFn) (n = 0 to 3)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA[31:0]	All 0	R/W	Write/Read Data These bits configure the data field in manual-command mode. In case of write transaction, the write data should be configured. In case of read transaction, the read data is stored.

7.2.3.2.11 xSPI Link Pattern Control Register 0 (LPCTL0)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	XD2VAL	—	—	XD2LEN[4:0]					XD1VAL	—	—	XD1LEN[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	XDPIN[1:0]		CSSEL	—	—	PATREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	XD2VAL	0b	R/W	XiP Disable pattern 2nd phase value This bit selects the value of 2nd phase in XiP disable pattern. 0: Low drive 1: High drive
30, 29	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
28 to 24	XD2LEN[4:0]	All 0	R/W	XiP Disable pattern 2nd phase length These bits select the length of 2nd phase in XiP disable pattern. H'00: 0 cycles H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
23	XD1VAL	0b	R/W	XiP Disable pattern 1st phase value This bit selects the value of 1st phase in XiP disable pattern. 0: Low drive 1: High drive
22, 21	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	XD1LEN[4:0]	All 0	R/W	XiP Disable pattern 1st phase length These bits select the length of 1st phase in XiP disable pattern. The pattern with zero-length both 1st phase and 2nd phase should not be configured. H'0: 0 cycles H'1: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
15 to 6	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
5, 4	XDPIN[1:0]	00b	R/W	XiP Disable pattern pin These bits select the data output pins to transmit XiP Disable pattern. 0 0: 1 pin 0 1: 2 pins 1 0: 4 pins 1 1: 8 pins

Bit	Bit Name	Initial Value	R/W	Description
3	CSSEL	0b	R/W	Chip select This bit selects a target memory to issue a pattern. 0: slave0 (CS0) 1: slave1 (CS1)
2, 1	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
0	PATREQ	0b	R/W	Pattern request This bit requests to issue the pattern. When set to 1, it starts the pattern. It is cleared to 0 when the pattern completed. 0: No request XiP Disable pattern 1: Request XiP Disable pattern

7.2.3.2.12 xSPI Link Pattern Control Register 1 (LPCTL1)

This register has functions to control xSPI Master function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
14 to 12	RSTSU[2:0]	000b	R/W	Reset pattern data output setup time These bits configure the number of setup cycle for data output based on the edge of CS in reset pattern. It needs enough setup time because xSPI slave samples any data at the rising edge of CS. This cycle of setup time should be less than the cycle of reset pattern width (RSTWID[2:0]). 0 0 0: 1 cycle 0 0 1: 2 cycles ⋮ 1 1 0: 7 cycles 1 1 1: 8 cycles
11	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
10 to 8	RSTWID[2:0]	000b	R/W	Reset pattern width These bits configure the width of cycle in reset pattern and CS only pattern. It toggles CS with the configured cycle. 0 0 0: 2 (= 2^1) cycles 0 0 1: 4 (= 2^2) cycles ⋮ 1 1 0: 128 (= 2^7) cycles 1 1 1: 256 (= 2^8) cycles
7, 6	—	00b	R	Reserved These bits are read as 0. The write value should be 0.
5, 4	RSTREP[1:0]	00b	R/W	Reset pattern repeat These bits select the repeating time to toggle CS from LOW to HIGH. 0 0: 4 times (Specified on Reset Signaling Protocol) 0 1: 5 times 1 0: 6 times 1 1: 7 times
3	CSSEL	0b	R/W	Chip select This bit selects a target memory to issue a pattern. 0: slave0 (CS0) 1: slave1 (CS1)

Bit	Bit Name	Initial Value	R/W	Description
2	—	0b	R	Reserved This bit is read as 0. The write value should be 0.
1, 0	PATREQ[1:0]	00b	R/W	Pattern request These bits request to issue the pattern. When set to 01b or 10b, it starts the pattern. It is cleared to 00b when the pattern completed. 0 0: No request 0 1: Request Reset pattern 1 0: Request CS only pattern 1 1: Setting prohibited

7.2.3.2.13 xSPI Link I/O Control Register (LIOCTL)

This register has functions to control xSPI Master function.

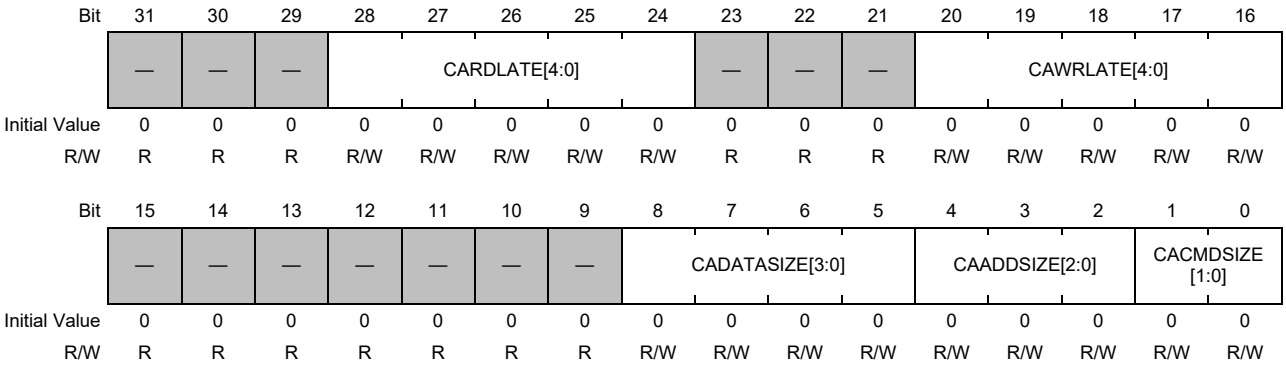
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSTCS1	RSTCS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WPCS1	WPCS0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved This bit is read as 0. The write value should be 0.
17	RSTCS1	1b	R/W	Reset drive for slave1 This function is same as RSTCS0. 0: Drive Low level 1: Drive High level
16	RSTCS0	1b	R/W	Reset drive for slave0 This bit controls the value of xSPI reset port. It can be useful only for xSPI slave with reset port. 0: Drive Low level 1: Drive High level
15 to 2	—	All 0	R	Reserved This bit is read as 0. The write value should be 0.
1	WPCS1	1b	R/W	WP drive for slave1 This function is same as WPCS0. 0: Drive Low level 1: Drive High level
0	WPCS0	1b	R/W	WP drive for slave0 This bit controls the value of Write Protect port. It can be useful only for xSPI slave with write protect port. 0: Drive Low level 1: Drive High level

7.2.3.2.14 xSPI Command Calibration Control Register 0 CSn (CCCTL0CSn) (n = 0, 1)

This register has functions to control xSPI Master function.



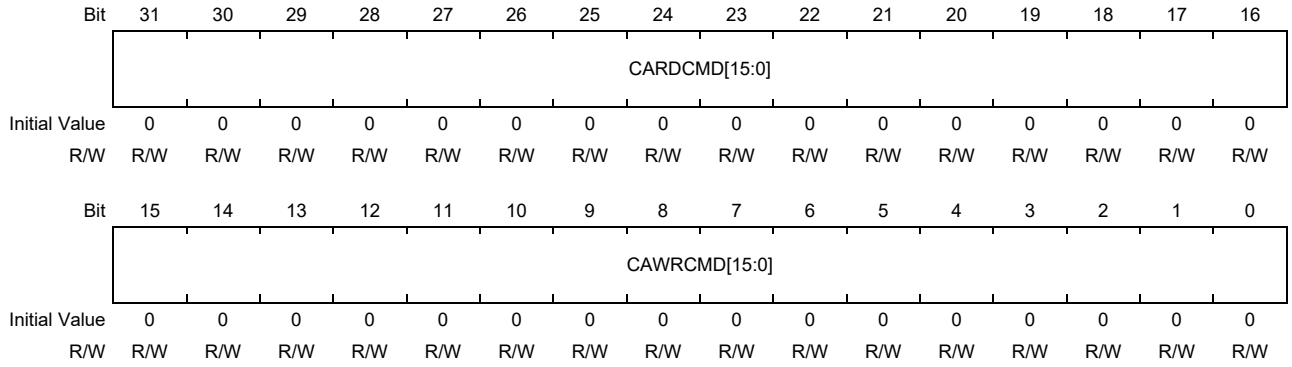
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CASFTEND[4:0]					—	—	—	CASFTSTA[4:0]				
Initial Value	0	0	0	1	1	1	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CAITV[4:0]					—	—	—	—	—	—	CANOWR	CAEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
28 to 24	CASFTEND [4:0]	All 1	R/W	Calibration DS shift end value These bits configure the end value of DS shift. It should be equal or more than the start value (CASFTSTA).
23 to 21	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	CASFTSTA [4:0]	All 0	R/W	Calibration DS shift start value These bits configure the start value of DS shift.
15 to 13	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
12 to 8	CAITV[4:0]	All 0	R/W	Calibration interval These bits configure the interval between calibration patterns. H'00: 2 (= 2^1) cycle wait H'01: 4 (= 2^2) cycle wait ⋮ H'1E: 2,147,483,648 (= 2^{31}) cycle wait H'1F: 4,294,967,296 (= 2^{32}) cycle wait
7 to 2	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
1	CANOWR	0b	R/W	Calibration no write mode This bit selects to omit write command in calibration sequence. It can be used for any slave device with fixed calibration pattern data. 0: Calibration sequence with write command 1: Calibration sequence without write command
0	CAEN	0b	R/W	Automatic Calibration Enable This bit enables the automatic calibration. When set to 1, it transmits the calibration sequence periodically and adjusts the value of phase shift. When set to 0 during the calibration sequence, it stops after completed ongoing calibration sequence, and then this bit is cleared. 0: Disable automatic calibration 1: Enable automatic calibration

7.2.3.2.15 xSPI Command Calibration Control Register 1 CSn (CCCTL1CSn) (n = 0, 1)

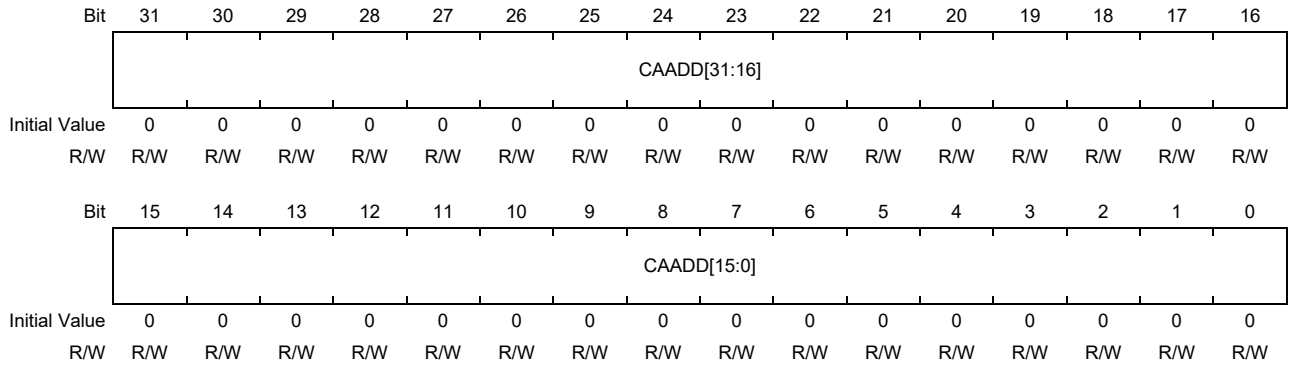
This register has functions to control xSPI Master function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
28 to 24	CARDLATE [4:0]	All 0	R/W	Read Latency cycle These bits configure the latency cycle in calibration frame. H'00: No latency H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
23 to 21	—	000b	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	CAWRLATE [4:0]	All 0	R/W	Write Latency cycle These bits configure the latency cycle in calibration frame. H'00: No latency H'01: 1 cycle ⋮ H'1E: 30 cycles H'1F: 31 cycles
15 to 9	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
8 to 5	CADATASIZE [3:0]	All 0	R/W	Write/Read Data Size These bits configure the size of data field. In 8D-8D-8D, it should be configured with even byte. H'0: 1 byte H'1: 2 bytes ⋮ H'E: 15 bytes H'F: 16 bytes
4 to 2	CAADDSIZE [2:0]	000b	R/W	Address size These bits configure the size of address field. 0 0 0: 0 bytes (No address phase) 0 0 1: 1 byte 0 1 0: 2 bytes 0 1 1: 3 bytes 1 0 0: 4 bytes Others: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CACMDSIZE [1:0]	00b	R/W	Command Size These bits configure the size of command field. In case of 8D-8D-8D, it should be fixed to 10b. It should not be configured both command size and address size to zero. 0 0: 0 bytes (No command phase) 0 1: 1 byte 1 0: 2 bytes 1 1: Setting prohibited

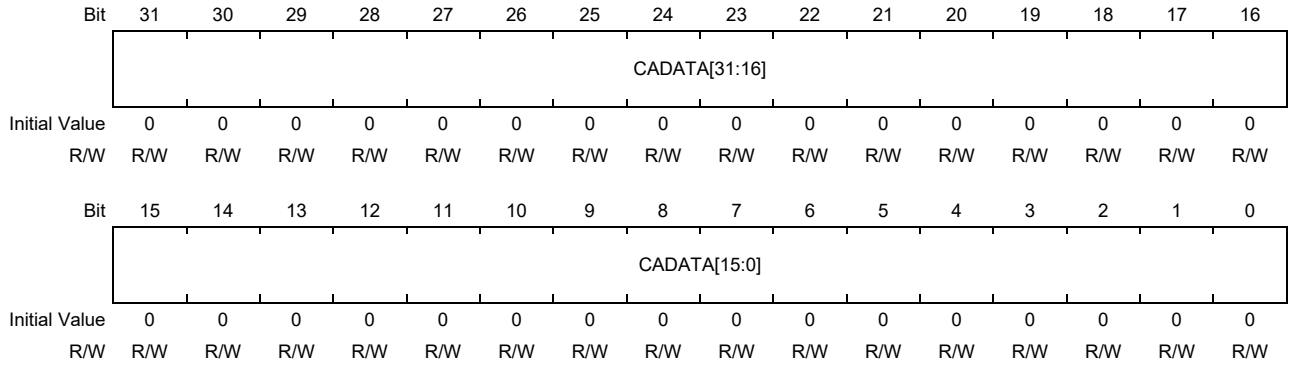
7.2.3.2.16 xSPI Command Calibration Control Register 2 CSn (CCCTL2CSn) (n = 0, 1)



This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CARDCMD [15:0]	All 0	R/W	Calibration pattern read command These bits configure the calibration pattern read command.
15 to 0	CAWRCMD [15:0]	All 0	R/W	Calibration pattern write command These bits configure the calibration pattern write command.

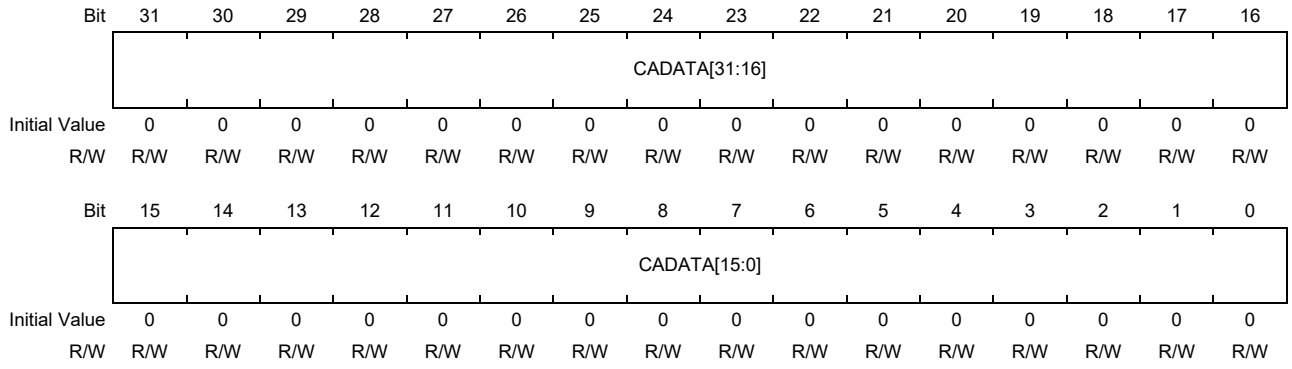
7.2.3.2.17 xSPI Command Calibration Control Register 3 CSn (CCCTL3CSn) (n = 0, 1)



This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAADD[31:0]	All 0	R/W	Calibration pattern address These bits configure the calibration pattern address.

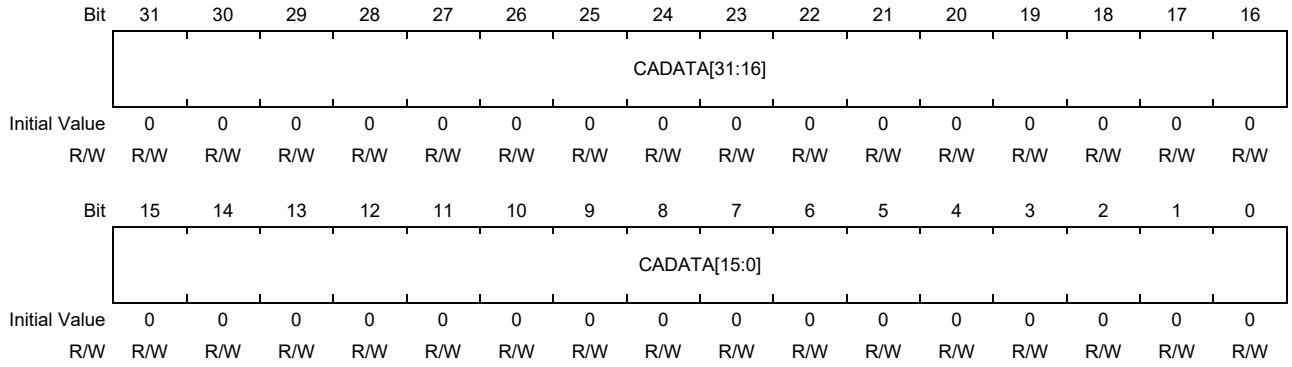
7.2.3.2.18 xSPI Command Calibration Control Register 4 CSn (CCCTL4CSn) (n = 0, 1)



This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA [31:0]	All 0	R/W	Calibration pattern data These bits configure the calibration pattern data.

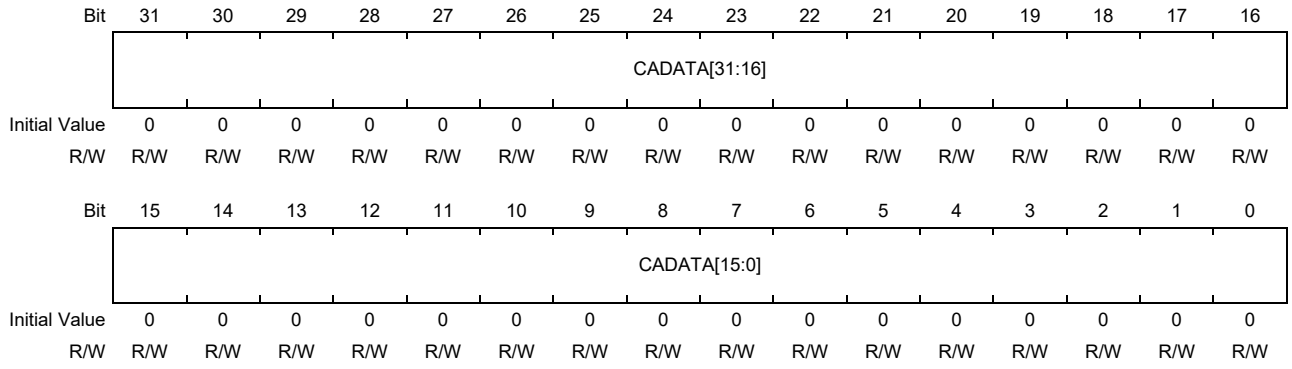
7.2.3.2.19 xSPI Command Calibration Control Register 5 CSn (CCCTL5CSn) (n = 0, 1)



This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA [31:0]	All 0	R/W	Calibration pattern data These bits configure the calibration pattern data.

7.2.3.2.20 xSPI Command Calibration Control Register 6 CSn (CCCTL6CSn) (n = 0, 1)

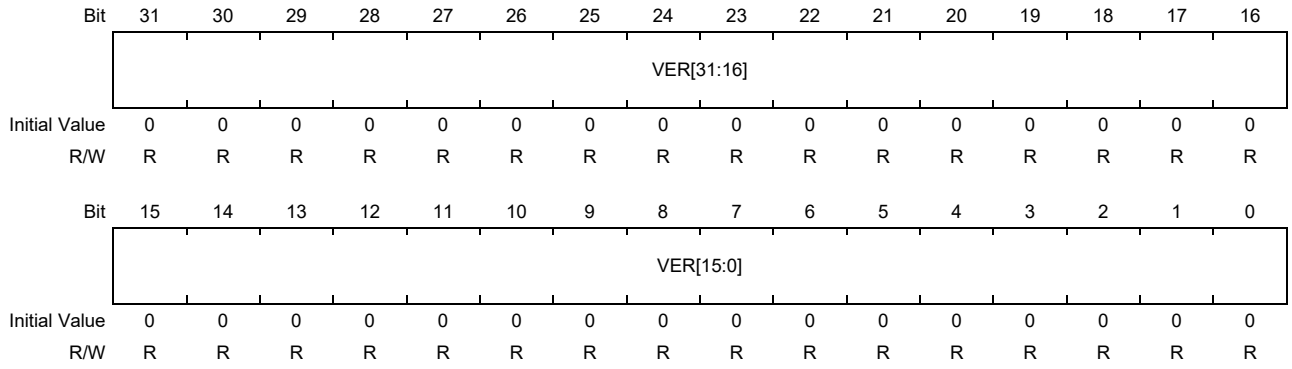


This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA [31:0]	All 0	R/W	Calibration pattern data These bits configure the calibration pattern data.

7.2.3.2.21 xSPI Command Calibration Control Register 7 CSn (CCCTL7CSn) (n = 0, 1)

This register has functions to control xSPI Master function. It should be updated while Automatic Calibration Enable is disabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CADATA [31:0]	All 0	R/W	Calibration pattern data These bits configure the calibration pattern data.

7.2.3.3 xSPI Status Registers

These registers monitor the status of xSPI Master.

7.2.3.3.1 xSPI Version Register (VERSTT)

This register indicates the status of xSPI Master.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VER[31:0]	All 0	R	Version These bits indicate this IP version.

7.2.3.3.2 xSPI Common Status Register (COMSTT)

This register indicates the status of xSPI Master.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	WRBUFNE	—	PBUFNE	—	—	—	MEMACC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	H'6600	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	WRBUFNE	0b	R	Write Buffer Not Empty 0: Empty 1: Not empty
5	—	0b	R	Reserved This bit is read as 0.
4	PBUFNE	0b	R	Prefetch Buffer Not Empty 0: Empty 1: Not empty
3 to 1	—	000b	R	Reserved These bits are read as 0.
0	MEMACC	0b	R	Memory access ongoing 0: System bus channel is not accessing to memory. 1: System bus channel is accessing to memory.

7.2.3.3.3 xSPI Calibration Status Register CSn (CASTTCSn) (n = 0, 1)

This register indicates the status of xSPI Master.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUC[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CASUC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CASUC[31:0]	All 0	R	Calibration Success These bits indicate the calibration success for each DS shift value. It is updated when completed each calibration sequence. CASUC[x] indicates calibration success in DS shift value = x.

7.2.3.4 xSPI Interrupt Registers

These registers control the interrupt function of xSPI Master.

7.2.3.4.1 xSPI Interrupt Status Register (INTS)

This register indicates the status of interrupt. The bits in this register are cleared to 0 when writing 1 on the corresponding bit of INTC register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUCCS1	CASUCCS0	CAFAILCS1	CAFAILCS0	—	—	—	—	—	—	—	BUSERR	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	DSTOCS1	DSTOCS0	PERTO	INICMP	PATCMP	CMDCMP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CASUCCS1	0b	R	Calibration success for slave1 This function is same as CASUCCS0. 0: No detection 1: Detection
30	CASUCCS0	0b	R	Calibration success for slave0 This bit is set to 1 when success calibration. 0: No detection 1: Detection
29	CAFAILCS1	0b	R	Calibration failed for slave1 This function is same as CAFAILCS0. 0: No detection 1: Detection
28	CAFAILCS0	0b	R	Calibration failed for slave0 This bit is set to 1 when failed calibration. 0: No detection 1: Detection
27 to 21	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	BUSERR	0b	R	System bus error This field is set to “1” when system bus responds error.
19 to 6	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	DSTOCS1	0b	R	DS timeout for slave1 This function is same as DSTOCS0. 0: No detection 1: Detection

Bit	Bit Name	Initial Value	R/W	Description
4	DSTOCS0	0b	R	DS timeout for slave0 This bit is set to 1 when lost DS in read transaction with using DS. It means not receiving the data during expected read phase. In this case, xSPI master stops the read transaction and the following transaction. 0: No detection 1: Detection
3	PERTO	0b	R	Periodic transaction timeout This bit is set to 1 when the read value does not match with the expected value in periodic manual-command mode. 0: No detection 1: Detection
2	INICMP	0b	R	Initial Sequence Completed This bit is set to 1 when completed the initial sequence. 0: No detection 1: Detection
1	PATCMP	0b	R	Pattern Completed This bit is set to 1 when completed the requested pattern. 0: No detection 1: Detection
0	CMDCMP	0b	R	Command Completed This bit is set to 1 when completed the requested manual-command. In direct manual-command, it means all transactions completed. In periodic manual-command, it means the read data matches with the expected data. 0: No detection 1: Detection

7.2.3.4.2 xSPI Interrupt Clear Register (INTC)

This register clears the status of interrupt.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUCCS1C	CASUCCS0C	CAFAILCS1C	CAFAILCS0C	—	—	—	—	—	—	—	BUSERRCH0C	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	R	R	R	R	R	R	R	W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	DSTOCS1C	DSTOCS0C	PERTOC	INICMPC	PATCMPC	CMDCMPC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	W	W	R	R	W	W	R	R	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31	CASUCCS1C	0b	W	Calibration success for slave1 interrupt clear 0: No change interrupt status 1: Clear interrupt status
30	CASUCCS0C	0b	W	Calibration success for slave0 interrupt clear 0: No change interrupt status 1: Clear interrupt status
29	CAFAILCS1C	0b	W	Calibration failed for slave1 interrupt clear 0: No change interrupt status 1: Clear interrupt status
28	CAFAILCS0C	0b	W	Calibration failed for slave0 interrupt clear 0: No change interrupt status 1: Clear interrupt status
27 to 21	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	BUSERRC	0b	W	System bus error for interrupt clear 0: No change interrupt status 1: Clear interrupt status
19 to 6	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	DSTOCS1C	0b	W	DS timeout for slave1 interrupt clear 0: No change interrupt status 1: Clear interrupt status
4	DSTOCS0C	0b	W	DS timeout for slave0 interrupt clear 0: No change interrupt status 1: Clear interrupt status
3	PERTOC	0b	W	Periodic transaction timeout interrupt clear 0: No change interrupt status 1: Clear interrupt status
2	INICMPC	0b	W	Initial Sequence Completed interrupt clear 0: No change interrupt status 1: Clear interrupt status
1	PATCMPC	0b	W	Pattern Completed interrupt clear 0: No change interrupt status 1: Clear interrupt status

Bit	Bit Name	Initial Value	R/W	Description
0	CMDCMPC	0b	W	Command Completed interrupt clear 0: No change interrupt status 1: Clear interrupt status

7.2.3.4.3 xSPI Interrupt Enable Register (INTE)

This register enables the interrupt.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CASUCCS1E	CASUCCS0E	CAFAILCS1E	CAFAILCS0E	—	—	—	—	—	—	—	BUSERRE	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CASUCCS1E	0b	R/W	Calibration success for slave1 interrupt enable 0: Disabled 1: Enabled
30	CASUCCS0E	0b	R/W	Calibration success for slave0 interrupt enable 0: Disabled 1: Enabled
29	CAFAILCS1E	0b	R/W	Calibration failed for slave1 interrupt enable 0: Disabled 1: Enabled
28	CAFAILCS0E	0b	R/W	Calibration failed for slave0 interrupt enable 0: Disabled 1: Enabled
27 to 21	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	BUSERRE	0b	R/W	System bus error for interrupt enable 0: Disabled 1: Enabled
19 to 6	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	DSTOCS1E	0b	R/W	DS timeout for slave1 interrupt enable 0: Disabled 1: Enabled
4	DSTOCS0E	0b	R/W	DS timeout for slave0 interrupt enable 0: Disabled 1: Enabled
3	PERTOE	0b	R/W	Periodic transaction timeout interrupt enable 0: Disabled 1: Enabled
2	INICMPE	0b	R/W	Initial Sequence Completed interrupt enable 0: Disabled 1: Enabled
1	PATCMPE	0b	R/W	Pattern Completed interrupt enable 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
0	CMDCMPE	0b	R/W	Command Completed interrupt enable 0: Disabled 1: Enabled

7.2.4 Operation

xSPI Master interface has the functions to issue the transaction for external memory with xSPI Slave interface. It allows to write to registers in external memory or read from it.

This xSPI Master mainly has two modes to issue the transaction. One is a manual-command mode; Software configures all fields of xSPI frame and starts the transaction by software request. The other is a memory-mapping mode; it automatically converts system bus access for pre-configured memory area into xSPI transaction. It enables to access from system bus to external memory area outside of chip via xSPI bus.

This section describes the xSPI bus operation, the direct control of xSPI frame (manual-command), the control of memory access (memory-mapping), the error operation, and the flow to operation.

7.2.4.1 xSPI Bus

This section describes the xSPI bus operation.

7.2.4.1.1 Supported Protocol Mode

This xSPI Master supports various protocol modes. It is configured by Protocol mode bits (LIOCFGCSn.PRTMD[9:0]). The table below shows the summary of protocol modes.

Table 7.2-5 Supported Protocol Mode

Protocol Mode	Function	PRTMD [9:0]	Note
1S-1S-1S	Command, Address, and Data fields are transferred at SDR with using 1 pin. Read data is sampled with CK.	H'000	Specified by xSPI protocol
4S-4D-4D	Command field is transferred at SDR with using 4 data pins. Address and Data fields are transferred at DDR with using 4 data pins. Read data is sampled with DS.	H'3B2	Specified by xSPI protocol
8D-8D-8D	Command, Address, and Data fields are transferred at DDR with using 8 pins. Read data is sampled with DS.	H'3FF	Specified by xSPI protocol
1S-4S-4S	Command field is transferred at SDR with using 1 pin. Address and Data fields are transferred at SDR with using 4 pins. Read data is sampled with CK.	H'090	—
4S-4S-4S	Command, Address, and Data fields are transferred at SDR with using 4 pins. Read data is sampled with CK.	H'092	—

Note: In case of XiP mode enable, XiP code is inserted in Latency field. It is valid only for memory-mapping mode.

The table below shows a description of the main internal signals.

Table 7.2-6 Internal Signals

Signal Name	I/O	Function
clk_spi	I	xSPI control clock
spi_ck	O	xSPI Clock (Same as XSPI_CKP pin)
spi_cs0	O	xSPI Chip Select for slave0 (Same as XSPI_CS0# pin)
spi_cs1	O	xSPI Chip Select for slave1 (Same as XSPI_CS1# pin)
spi_doe[7:0]	O	xSPI Data Output Enable
spi_do[7:0]	O	xSPI Data Output
spi_di[7:0]	I	xSPI Data Input
spi_dsoe	O	xSPI Data Strobe Output Enable
spi_dso	O	xSPI Data Strobe Output
spi_dsi	I	xSPI Data Strobe Input

The bytes of Command and Address fields are transferred in highest order to lowest order sequence. The sequential bytes of Data field are transferred in lowest address to highest address order. In case of using multiple pins, the least significant bit of each byte is placed on spi_do/di[0] with each higher order bit on the successively higher numbered spi_do/di signals.

The figure below shows timing-chart for 1S-1S-1S protocol mode. The spi_do[0] signal is used for output data and the spi_di[1] signal is used for input data.

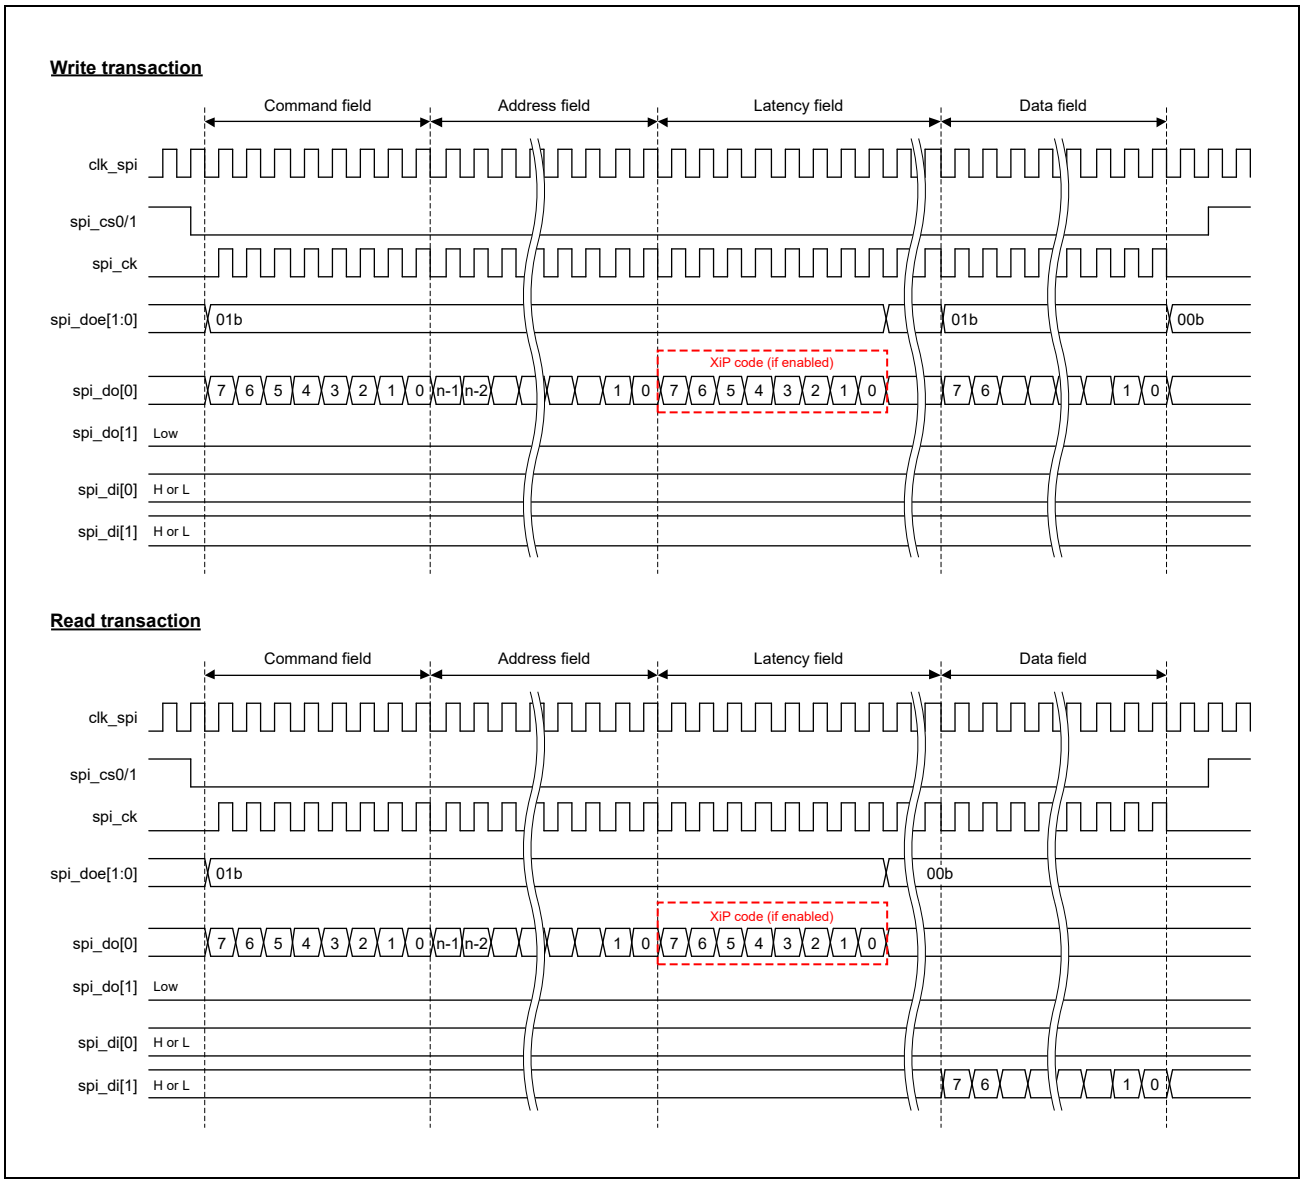

Figure 7.2-2 1S-1S-1S Timing-Chart

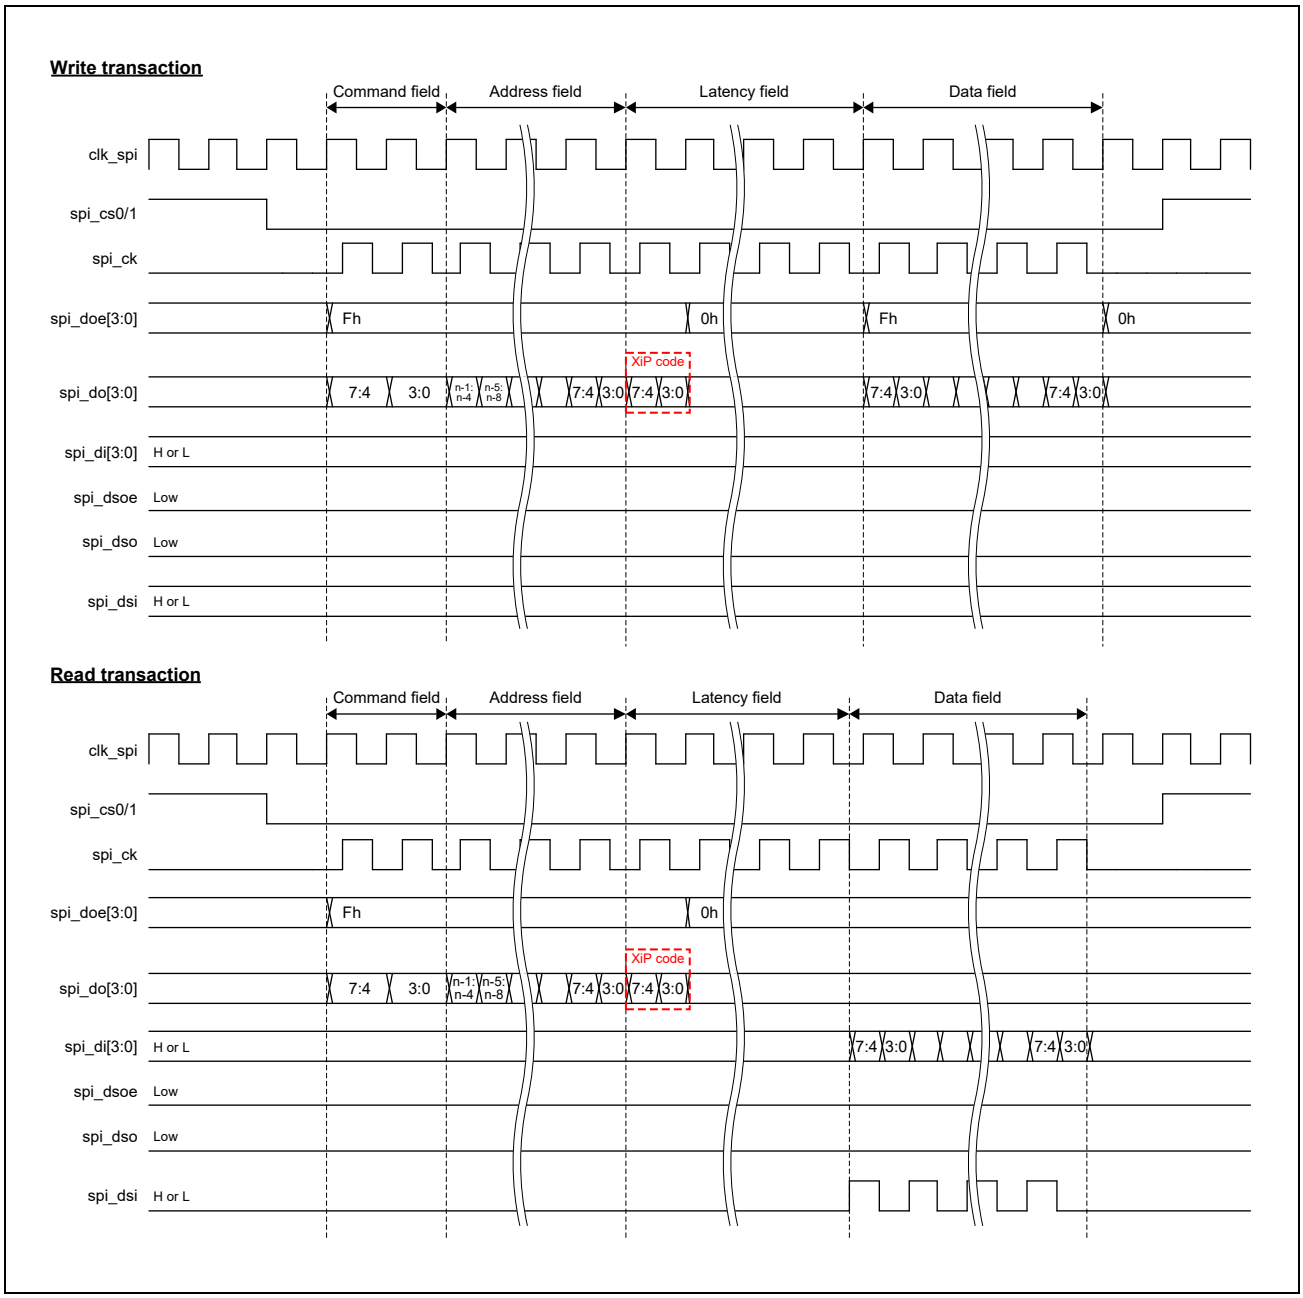

Figure 7.2-3 4S-4D-4D Timing-Chart

The figure below shows timing-chart for 8D-8D-8D profile 1.0 protocol mode. In 8D-8D-8D, the data is always transmitted with byte-pair. In case each field is odd byte, last one byte is padded with invalid data.

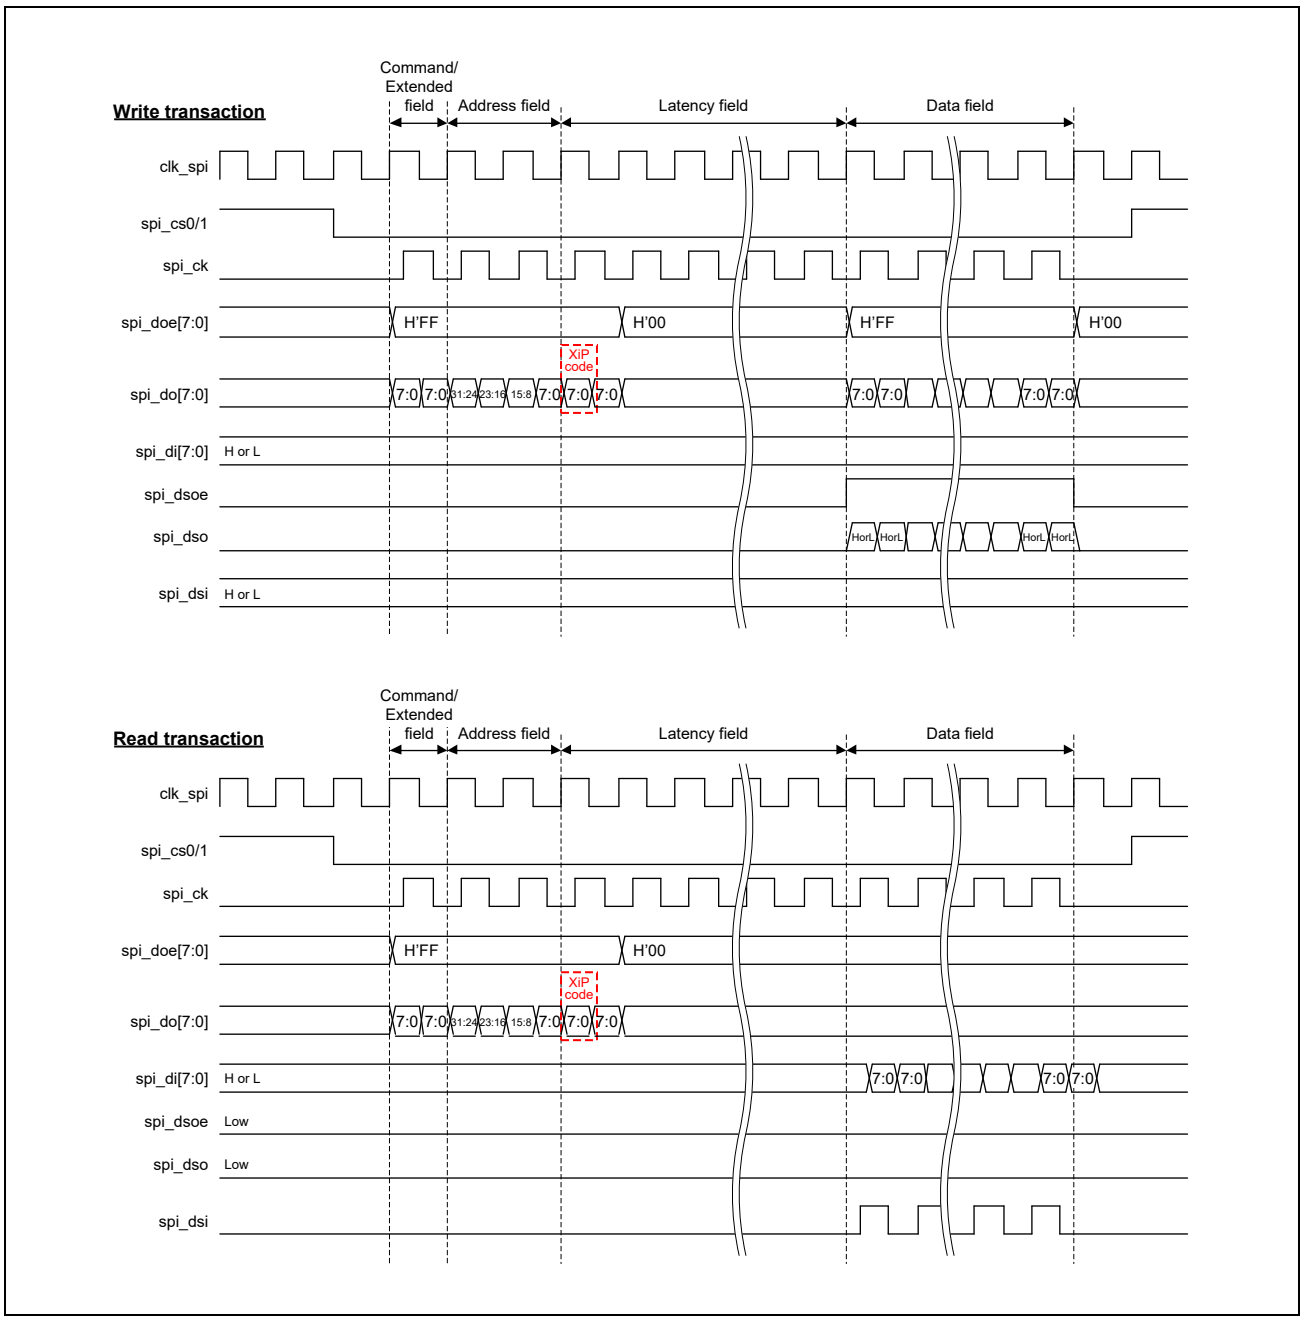

Figure 7.2-4 8D-8D-8D profile 1.0 Timing-Chart

The figure below shows timing-chart for 8D-8D-8D profile 2.0 protocol mode. In 8D-8D-8D, the data is always transmitted with byte-pair. In case each field is odd byte, last one byte is padded with invalid data.

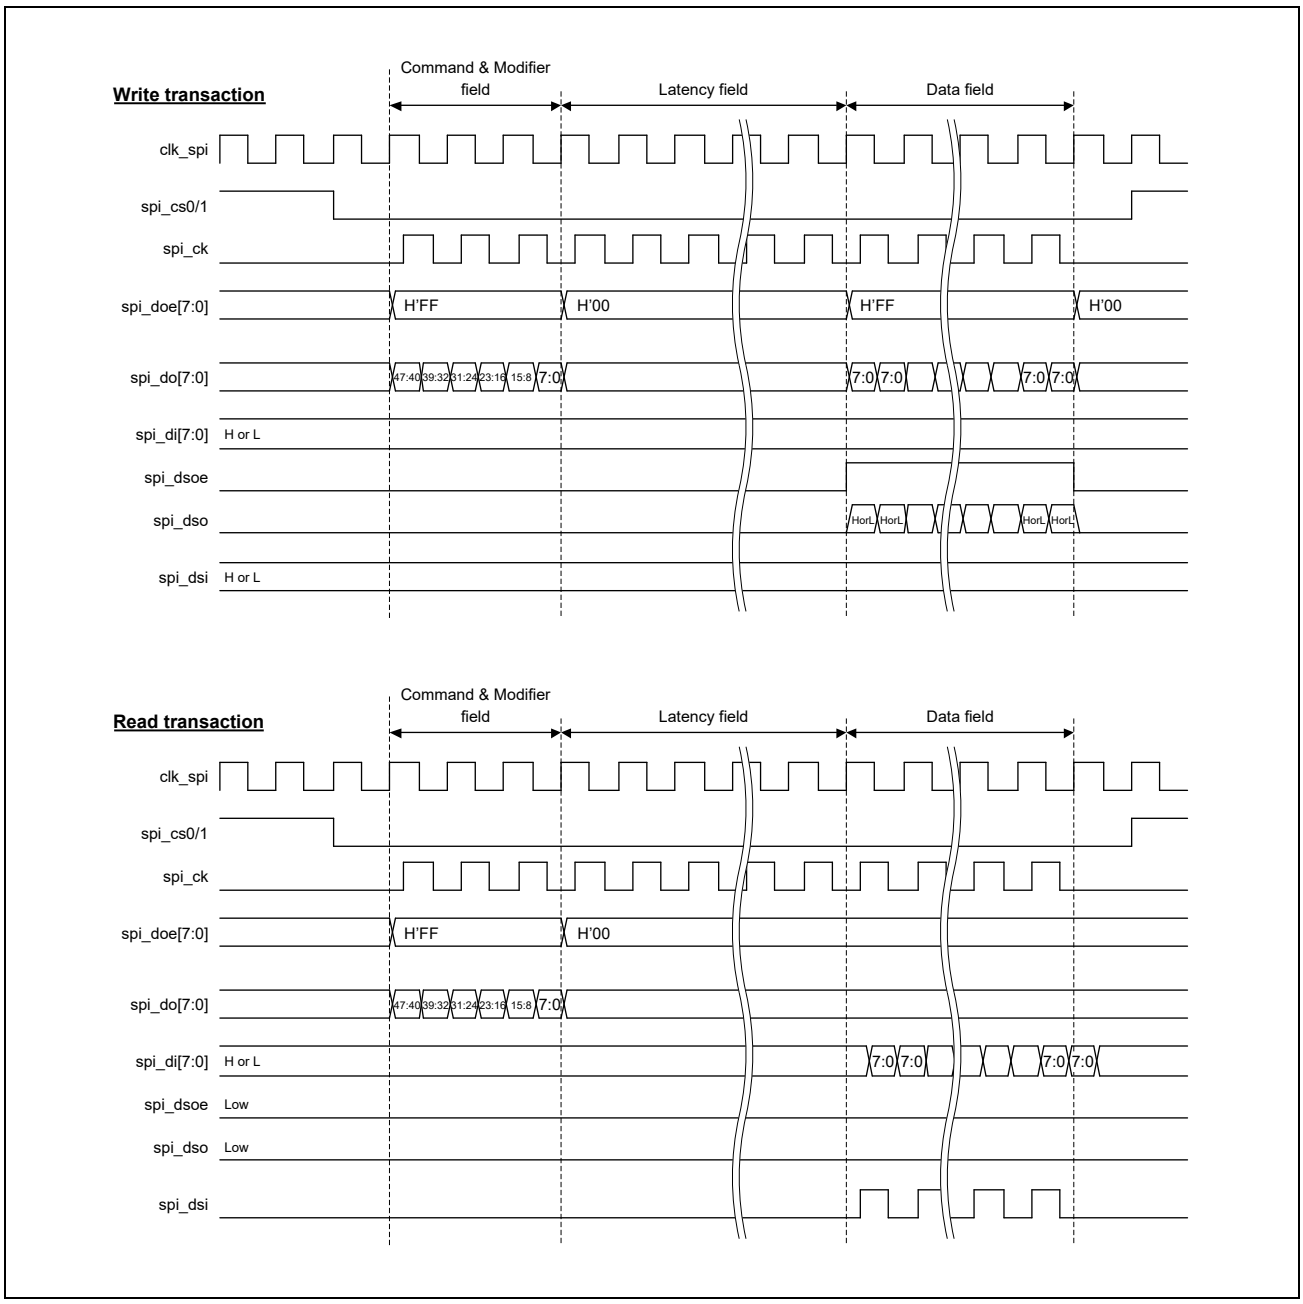

Figure 7.2-5 8D-8D-8D Profile 2.0 Timing-Chart

7.2.4.1.2 xSPI Frame Interval

The interval between xSPI frames is configured with CS minimum idle term bits (LIOCFGCSn.CSMIN[3:0]). It depends on the specification of xSPI slave device.

7.2.4.1.3 xSPI Signals Timing Control

This xSPI Master supports both SDR and DDR. And it is possible to sample input data with Data-Strobe (DS) signal at SDR. For the various mode support and easy implementation, this xSPI Master could adjust the timing to drive/sample xSPI interface signals statically. The table below shows the summary of xSPI Interface signal timing control.

Table 7.2-7 Summary of xSPI Signals Timing Control

Signal	Mode	Default Operation	Timing Control (n = 0, 1)
CS (spi_cs) drive	—	Asserting 1 cycle before the rising-edge of first spi_ck	1 cycle extension for asserting with LIOCFGCSn.CSASTEX bit
		Negating 1.5 cycle after the falling-edge of last spi_ck	1 cycle extension for negating with LIOCFGCSn.CSNEGEX bit
CK (spi_ck) drive	SDR without DS	Reference point	—
	SDR with DS		
	DDR with DS	Reference point	0 to 1 cycle phase shift with WRAPCFG.CKSFTCSx bit
DO/DOE (spi_do/doe) drive	SDR without DS	Falling edge of clk_spi	0 or 0.5 cycle shift with LIOCFGCSn.SDRDRV bit
	SDR with DS		
	DDR with DS	Both edges of clk_spi	—
DI (spi_di) sample	SDR without DS	Falling edge of spi_ck on expected data size	0 to 7 cycle shift (1 cycle unit) with LIOCFGCSn.SDRSMPSFT[3:0] bits 0 or 0.5 cycle shift with LIOCFGCSn.SDRSMPMD bit
	SDR with DS	Falling edge of spi_dsi signal on expected data size	Sample at rising edge with LIOCFGCSn.SDRSMPMD bit 0 to 1 cycle phase shift with WRAPCFG.DSSFTCSn[4:0] bits 0 to 7 cycle extension with LIOCFGCSn.DDRSMPEX[3:0] bits
	DDR with DS	Both edges of spi_dsi signal on expected data size	0 to 1 cycle phase shift with WRAPCFG.DSSFTCSn[4:0] bits 0 to 7 cycle extension with LIOCFGCSn.DDRSMPEX[3:0] bits

Note: In DDR on xSPI protocol, CK or DS should be aligned for center of data. It means to shift the phase by 0.25 cycle (90 degrees). This xSPI master supports to adjust this phase depending on the usage conditions.

The figure below shows the default operation and timing control for SDR without DS.

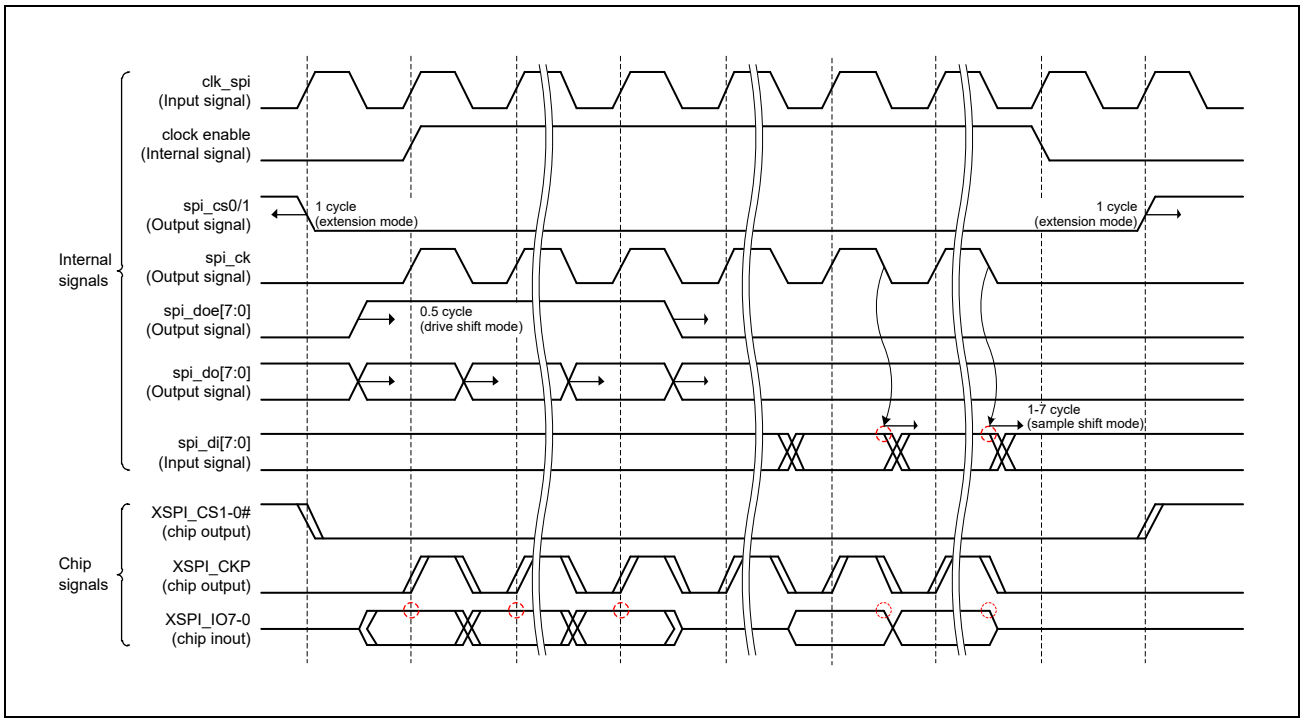

Figure 7.2-6 Timing Control for SDR without DS

The figure below shows the default operation and timing control for SDR with DS.

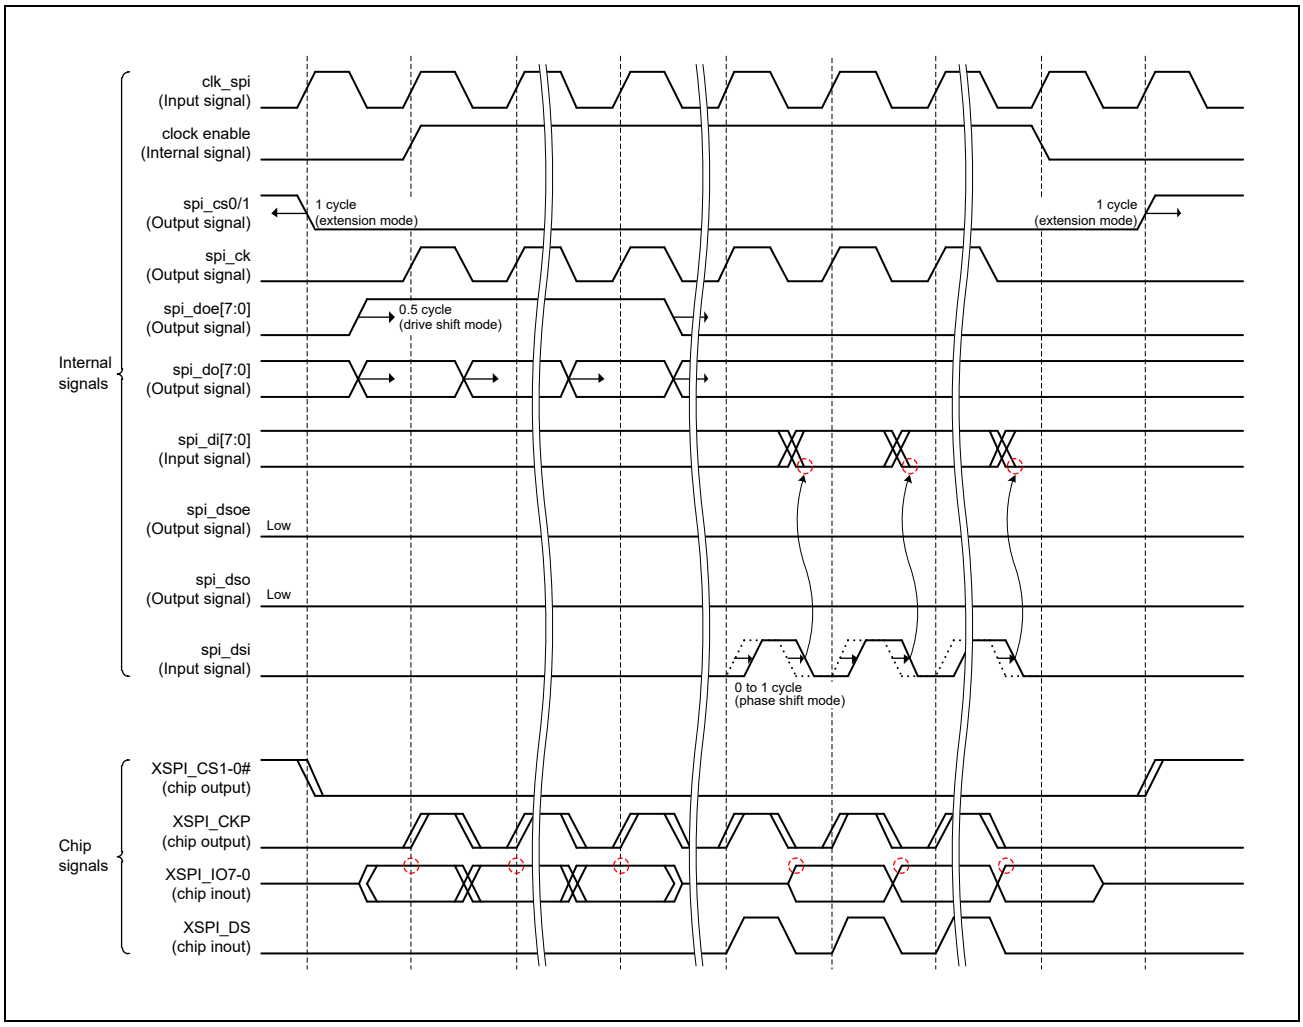

Figure 7.2-7 Timing Control for SDR with DS

The figure below shows the default operation and timing control for DDR with DS.

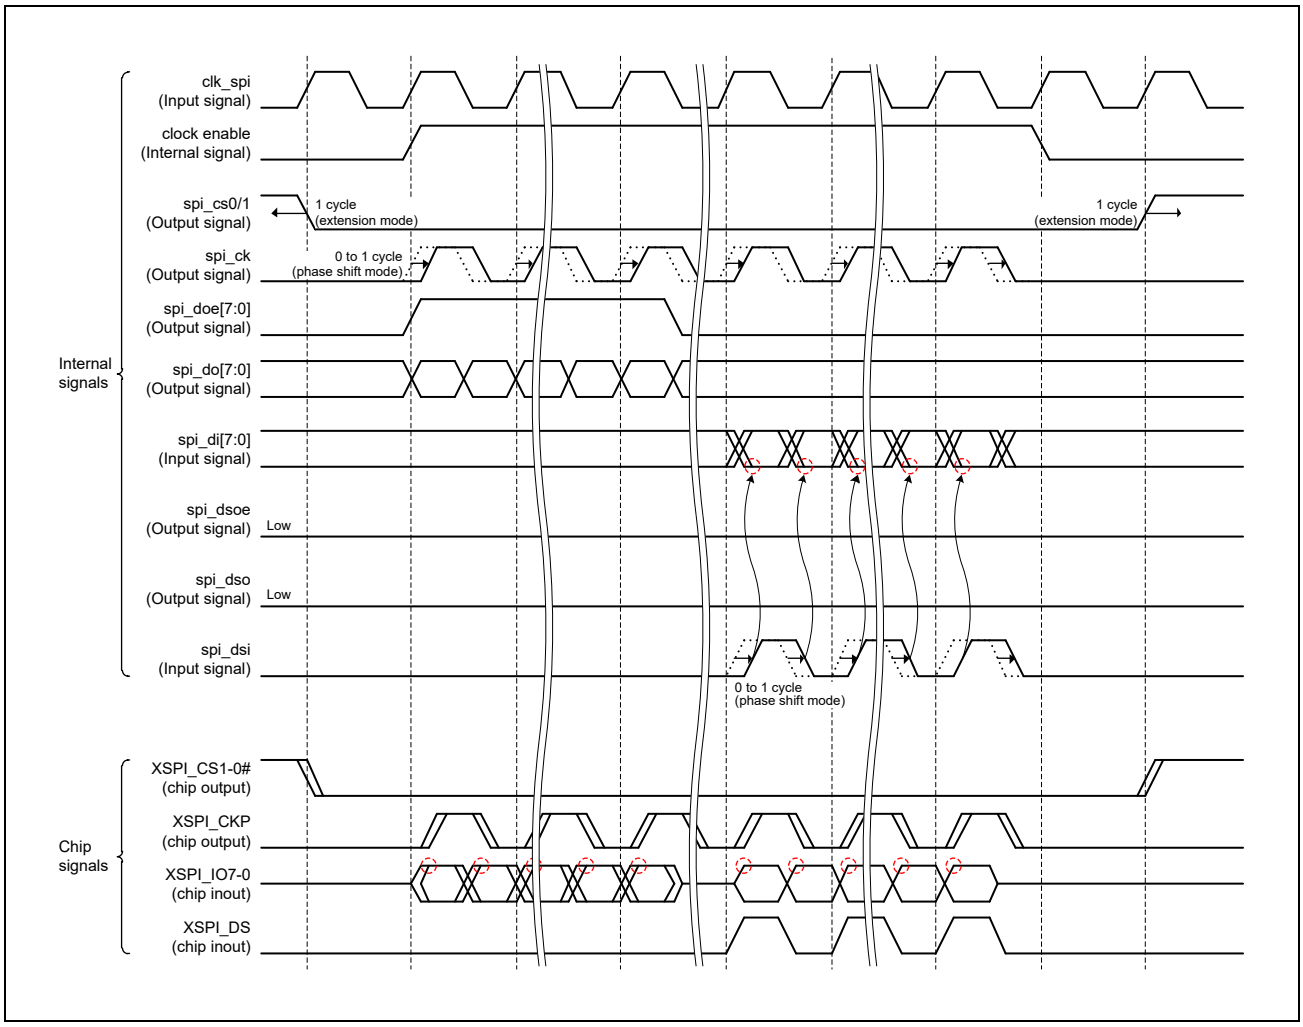

Figure 7.2-8 Timing Control for DDR with DS

7.2.4.2 Manual-command

This section describes the manual-command mode. The manual-command has two functional modes: direct mode and periodic mode.

7.2.4.2.1 Direct Mode

This mode sequentially can issue up to four xSPI transactions configured and requested by Software. A series of transaction can be issued by a transaction request (CDCTL0.TRREQ = 1 with PERMD = 0). The number of transactions (CDCTL0.TRNUM[1:0]) can be configured up to 4. It can be used to change the mode or read the status of xSPI slave device.

The table below shows the configured register bits for direct manual-command. The operating flow is illustrated in **Figure 7.2-21**.

Table 7.2-8 Manual-Command Configuration for Direct Mode

Transaction	Transaction Type	Command	Command Size	Address	Address Size	Data (x = 0, 1)	Data Size	Latency Cycle
1st Transaction	CDTBUF0.TRTYPE	CDTBUF0.CMD[15:0]	CDTBUF0.CMDSIZE[1:0]	CDABUF0.ADD[31:0]	CDTBUF0.ADDSIZE[2:0]	CDDxBUF0.DATA[31:0]	CDTBUF0.DATASIZE[3:0]	CDTBUF0.LATE[4:0]
2nd Transaction	CDTBUF1.TRTYPE	CDTBUF1.CMD[15:0]	CDTBUF1.CMDSIZE[1:0]	CDABUF1.ADD[31:0]	CDTBUF1.ADDSIZE[2:0]	CDDxBUF1.DATA[31:0]	CDTBUF1.DATASIZE[3:0]	CDTBUF1.LATE[4:0]
3rd Transaction	CDTBUF2.TRTYPE	CDTBUF2.CMD[15:0]	CDTBUF2.CMDSIZE[1:0]	CDABUF2.ADD[31:0]	CDTBUF2.ADDSIZE[2:0]	CDDxBUF2.DATA[31:0]	CDTBUF2.DATASIZE[3:0]	CDTBUF2.LATE[4:0]
4th Transaction	CDTBUF3.TRTYPE	CDTBUF3.CMD[15:0]	CDTBUF3.CMDSIZE[1:0]	CDABUF3.ADD[31:0]	CDTBUF3.ADDSIZE[2:0]	CDDxBUF3.DATA[31:0]	CDTBUF3.DATASIZE[3:0]	CDTBUF3.LATE[4:0]

7.2.4.2.2 Periodic Mode

This mode periodically issues an xSPI read transaction configured and requested by Software. And it can compare the read value up to 4 bytes with expected value. The transaction is issued by a transaction request (CDCTL0.TRREQ = 1 with PERMD = 1). It can be used to alternate the status polling operation of xSPI slave device.

The periodic term is configured in Periodic transaction interval bits (CDCTL0.PERITV[4:0]). The expected value is configured in Periodic transaction expected and masked value bits (CDCTL1.PEREXP[31:0] and CDCTL2.PERMSK[31:0]). The table below shows the configured register bits for periodic manual-command. The operating flow is illustrated in **Figure 7.2-22**.

Table 7.2-9 Manual-Command Configuration for Periodic Mode

Transaction	Transaction Type	Command	Command Size	Address	Address Size	Data (x = 0, 1)	Data Size	Latency Cycle
Read Transaction	CDTBUF0.TRTYPE = 0	CDTBUF0.CMD[15:0]	CDTBUF0.CMDSIZE[1:0]	CDABUF0.ADD[31:0]	CDTBUF0.ADDSIZE[2:0]	CDDxBUF0.DATA[31:0]	CDTBUF0.DATASIZE[3:0]	CDTBUF0.LATE[4:0]

7.2.4.3 Memory-mapping

This section describes the memory-mapping mode. This mode automatically converts system bus access for pre-configured memory area into xSPI transaction.

7.2.4.3.1 Configuration

In this operation, the payload of address and data field are delivered from system bus signals. The information of command field and size are delivered from the configured register bits. The table below shows the register bits configured for memory- mapping.

Table 7.2-10 Memory-Mapping Configuration for Memory Area Access (n = 0, 1)

AHB Transaction	Format Change Mode	Command	Command Size	Address Size	Latency Cycle
Write for slave n memory area	Normal	CMCFG2CSn.WRCMD [15:8]	1 byte	CMCFG0CSn.ADDSIZE[1:0]	CMCFG2CSn.WRLATE[4:0]
	8D-8D-8D profile 1.0	CMCFG2CSn.WRCMD [15:0]	2 bytes		
	8D-8D-8D profile 2.0 Command Modifier	CMCFG2CSn.WRCMD [15:8]	1 byte	5 bytes	
	8D-8D-8D profile 2.0 Extended Command Modifier	CMCFG2CSn.WRCMD [15:13]	3 bits	45 bits	
Read for slave n memory area	Normal	CMCFG1CSn.RDCMD [15:8]	1 byte	CMCFG0CSn.ADDSIZE[1:0]	CMCFG1CSn.RDLATE[4:0]
	8D-8D-8D profile 1.0	CMCFG1CSn.RDCMD [15:0]	2 bytes		
	8D-8D-8D profile 2.0 Command Modifier	CMCFG1CSn.RDCMD [15:8]	1 byte	5 bytes	
	8D-8D-8D profile 2.0 Extended Command Modifier	CMCFG1CSn.RDCMD [15:13]	3 bits	45 bits	

Note: The MSByte of Address can be replaced with Address Replace Enable and Code bits (CMCFG0CSn.ADDRPEN[7:0]/ADDRPCD[7:0]).

7.2.4.3.2 Write Access Operation

At accepting write access for memory area from system bus, this xSPI Master stores all payload data in internal bridge buffer and then issues a write transaction into xSPI slave. The figure below shows the operation summary.

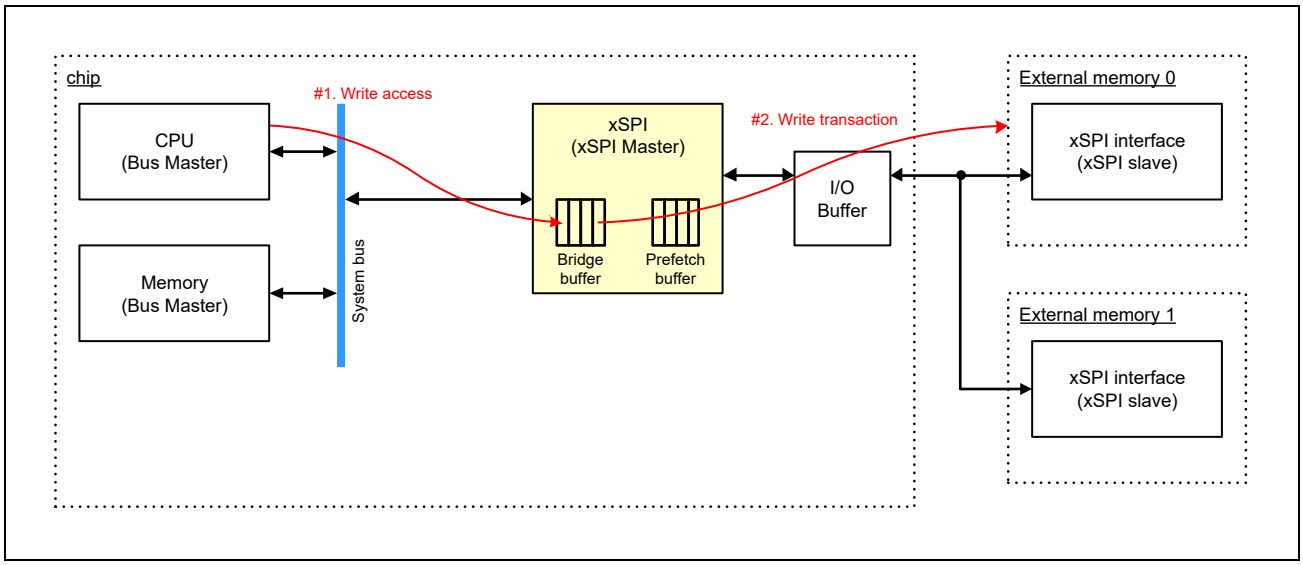

Figure 7.2-9 Write Access for Memory Area

The operation of xSPI bus changes depending on System bus's burst type. When HBURST is SINGLE or INCR, one AHB transaction occurs for one xSPI frame. When HBURST is INCR4, INCR8, or INCR16, AHB transactions equal to burst size occur for one xSPI frame. When HBURST is WRAP4, WRAP8, or WRAP16, AHB transactions occur for two xSPI frames. The figure below shows the relationship between AHB and xSPI frames.

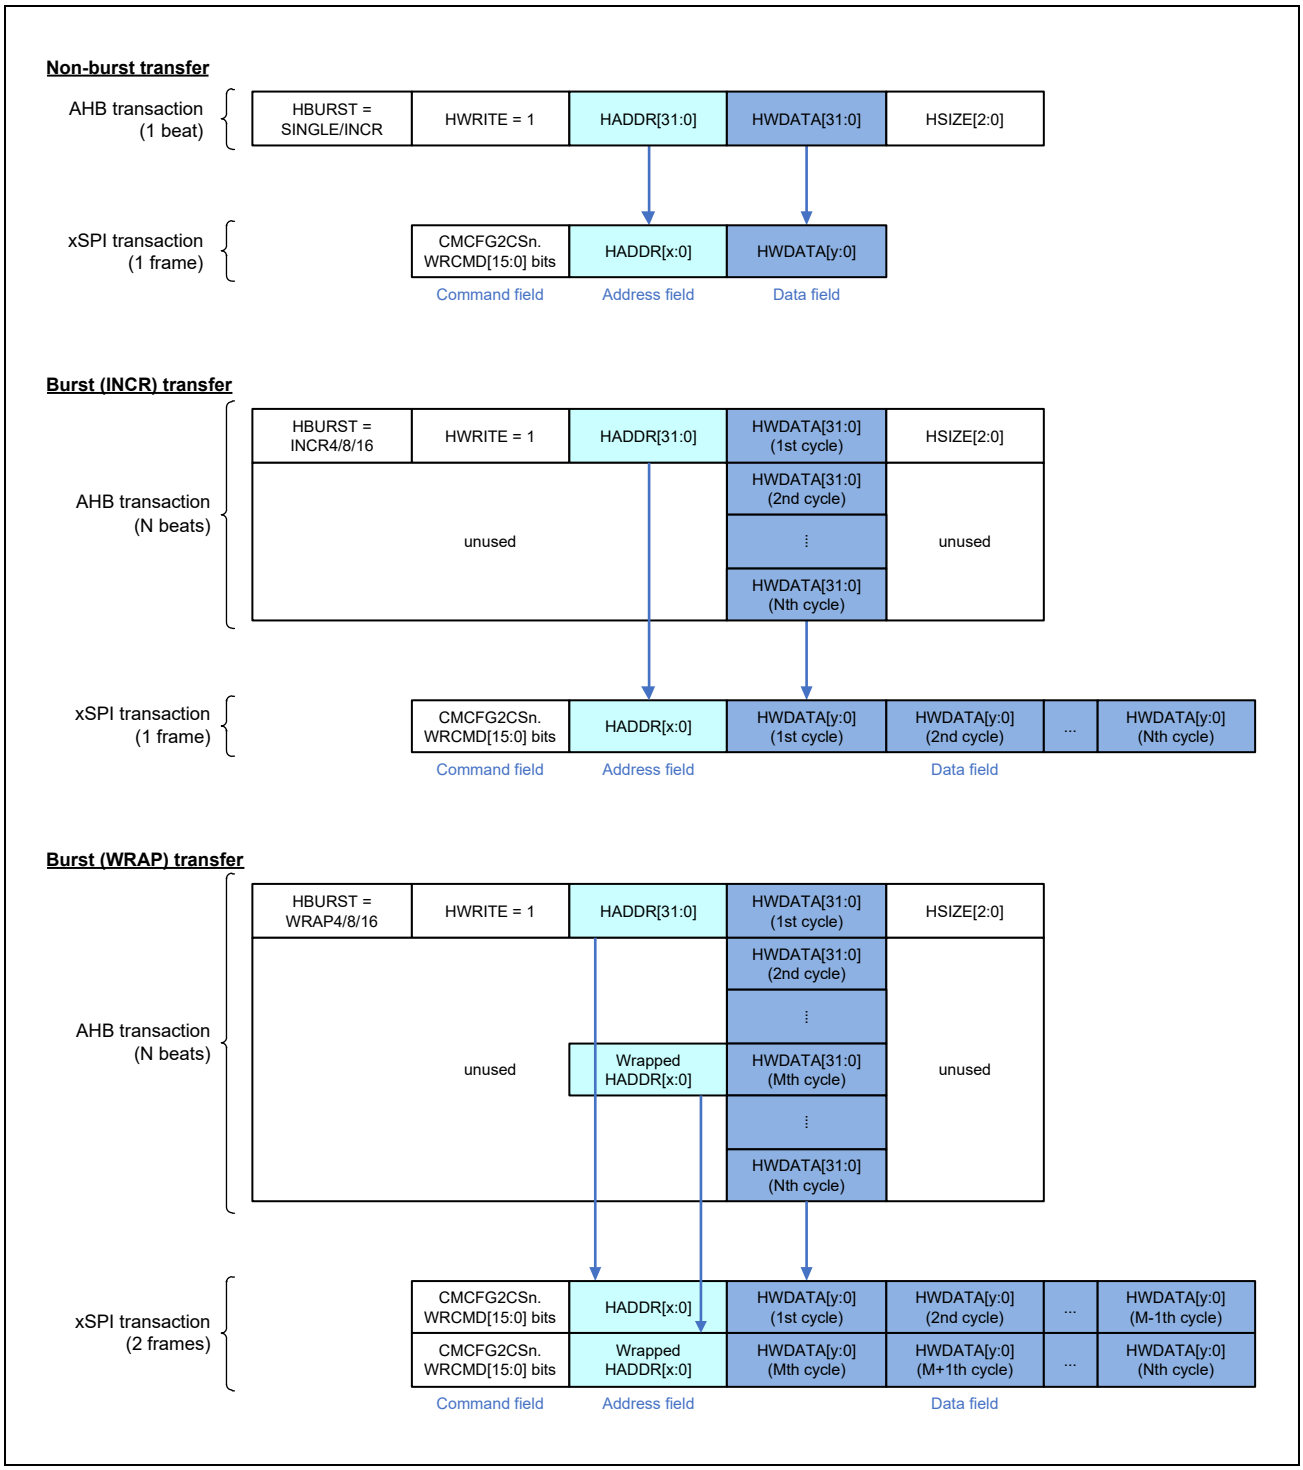

Figure 7.2-10 xSPI Frame Format in Write Access (Normal Format)

7.2.4.3.3 Combination Function

At the system bus write access for memory area, this xSPI master has the function to combinate the write data for high throughput on xSPI bus. When this function is enabled (BMCFG.MWRCOMB = 1), this xSPI master transmits a xSPI frame with the selected size while the sequential address is incremental. When non-incremental address access is detected, or when the access for different slave is detected, or when a read transaction is detected, even though reaching to the target size (BMCFG.MWRSIZE), this xSPI master transmits the pending data into xSPI bus. And also, when Memory Write Data Push bit (BMCTL1.MWRPUSH) is set, this xSPI master transmits the pending data into xSPI bus.

This function could be useful for any slave device to request a chunk of data at a time. In the case, system bus master shall continue to provide the fixed data size with incremental address. Ex. there is any device to request to write in page unit. The figure below shows the operation when enable the combination function.

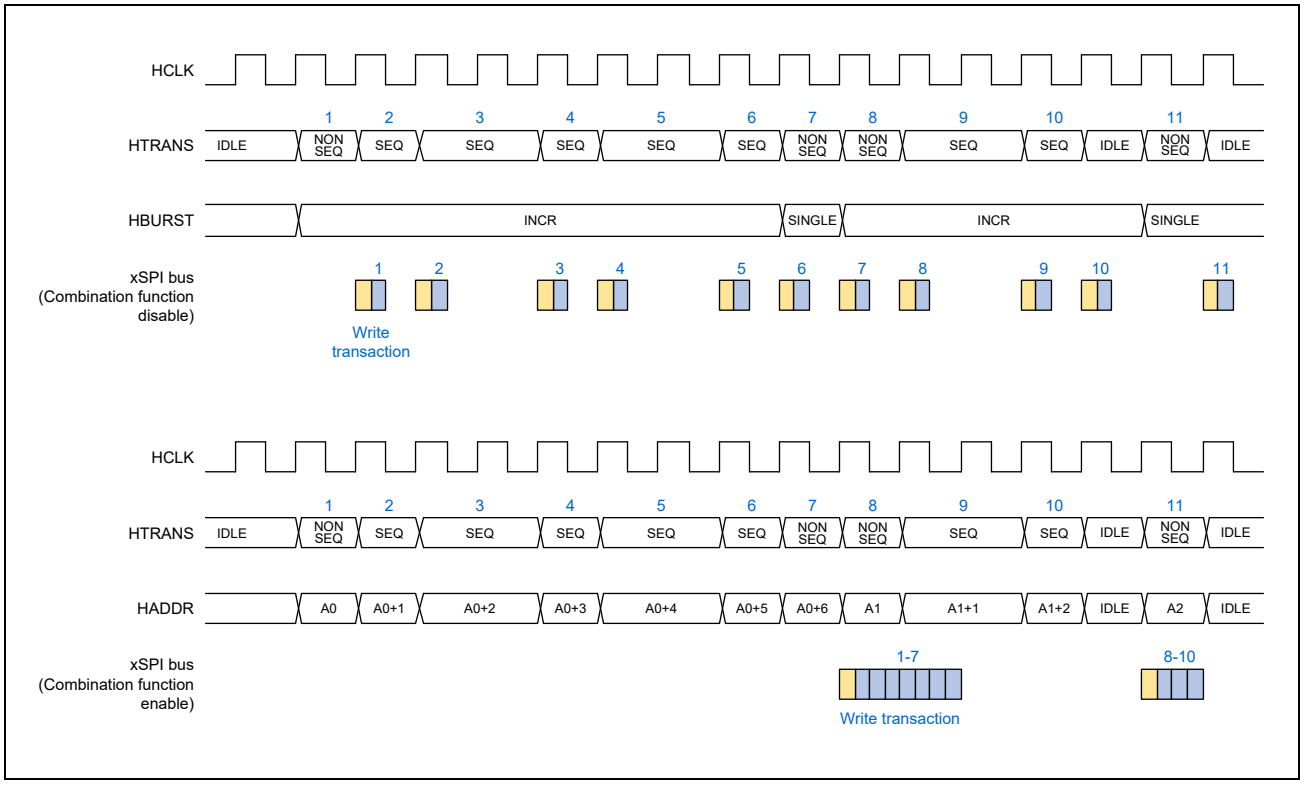

Figure 7.2-11 Combination Function

7.2.4.3.4 Read Access Operation

At the read access for memory area, soon after detected the read access, This xSPI Master issues a read transaction into xSPI slave. The figure below shows the operation summary.

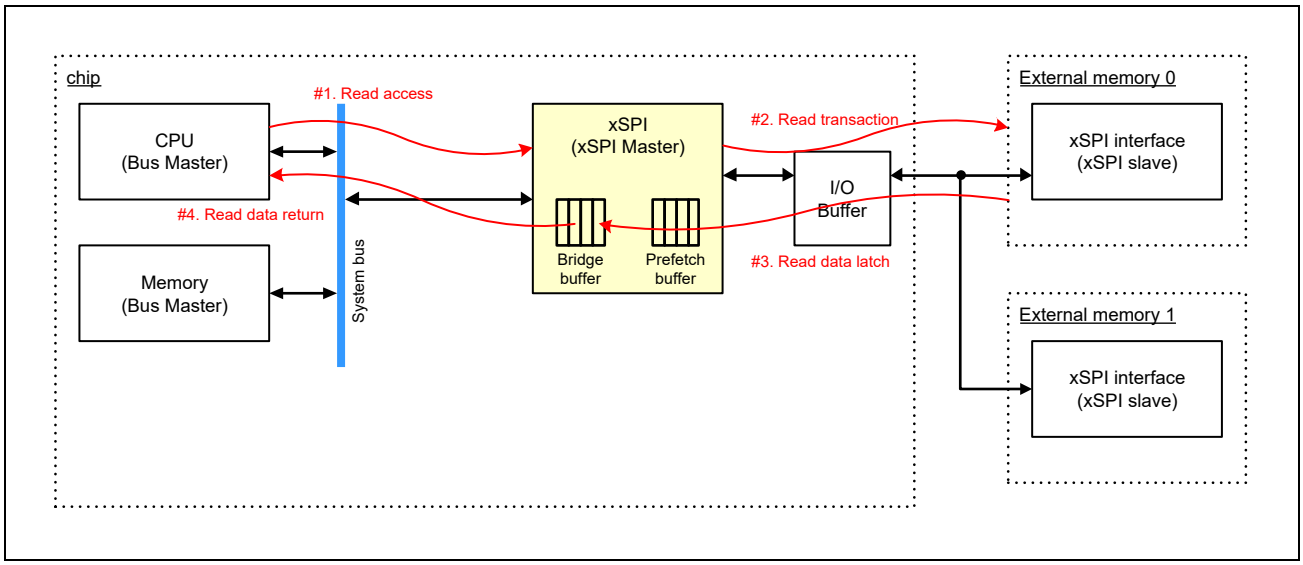

Figure 7.2-12 Read Access for Memory Area

The operation of xSPI bus changes depending on burst type. When the type is single or increment type, one system bus's read transaction triggers one xSPI frame. When the type is wrap type and the CMCFG0CSx.WPBSTMD is 0, one system bus read transactions triggers two xSPI frame. The figure below shows the relationship between AHB and xSPI frame.

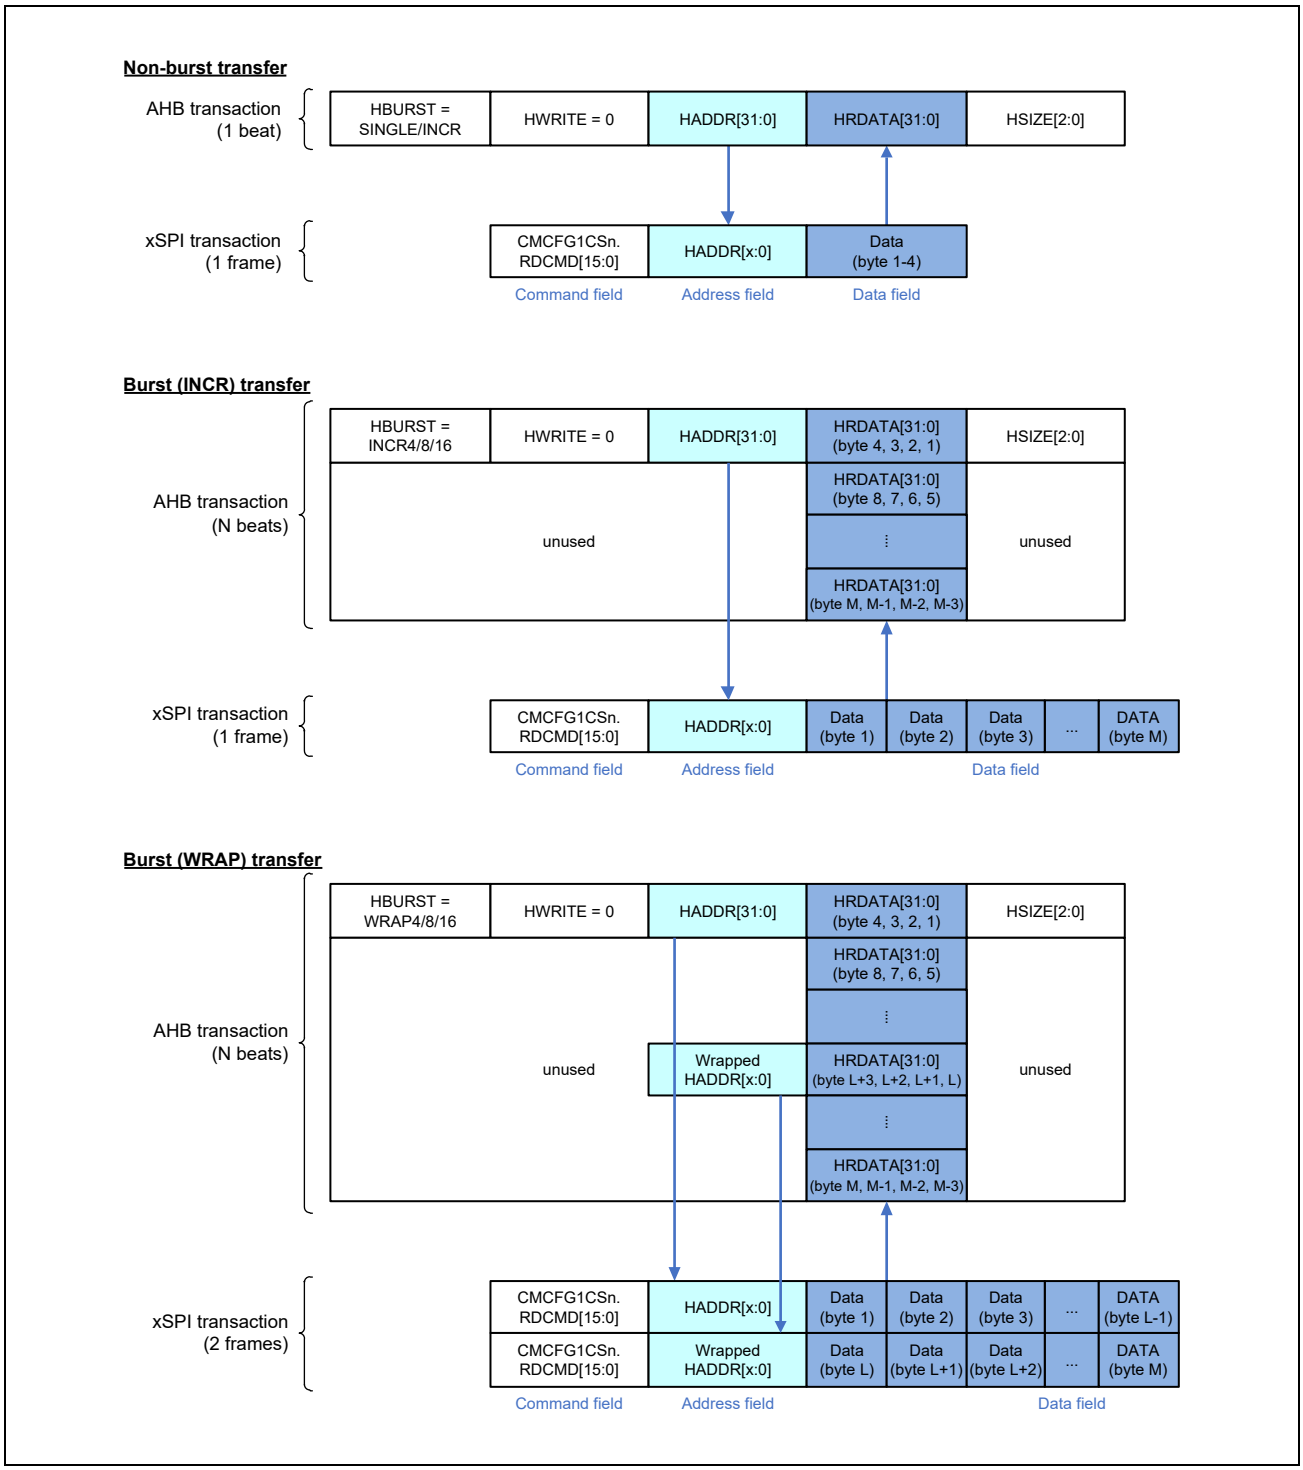

Figure 7.2-13 xSPI Frame Format in Read Access (Normal Format)

7.2.4.3.5 Prefetch Function

At the read access for memory area from system bus, this xSPI Master has the function to prefetch the read data for reducing the latency. When this function is enabled (BMCFG.PREEN = 1), this xSPI Master continues to read the incremental address and store the read data from xSPI slave in internal prefetch buffer. And this xSPI master searches in prefetch buffer for the following read access from system bus. If the target read data is found in prefetch buffer, this xSPI Master returns the data from prefetch buffer. If it is not found, this xSPI Master clears the prefetch buffer and newly issues a read transaction into xSPI slave. This function is effective in application such as the consecutive read addresses are close. But it is not effective in application such as the consecutive read addresses are not incremental because xSPI read frame for prefetch uses xSPI bus. The figure below shows the operation summary.

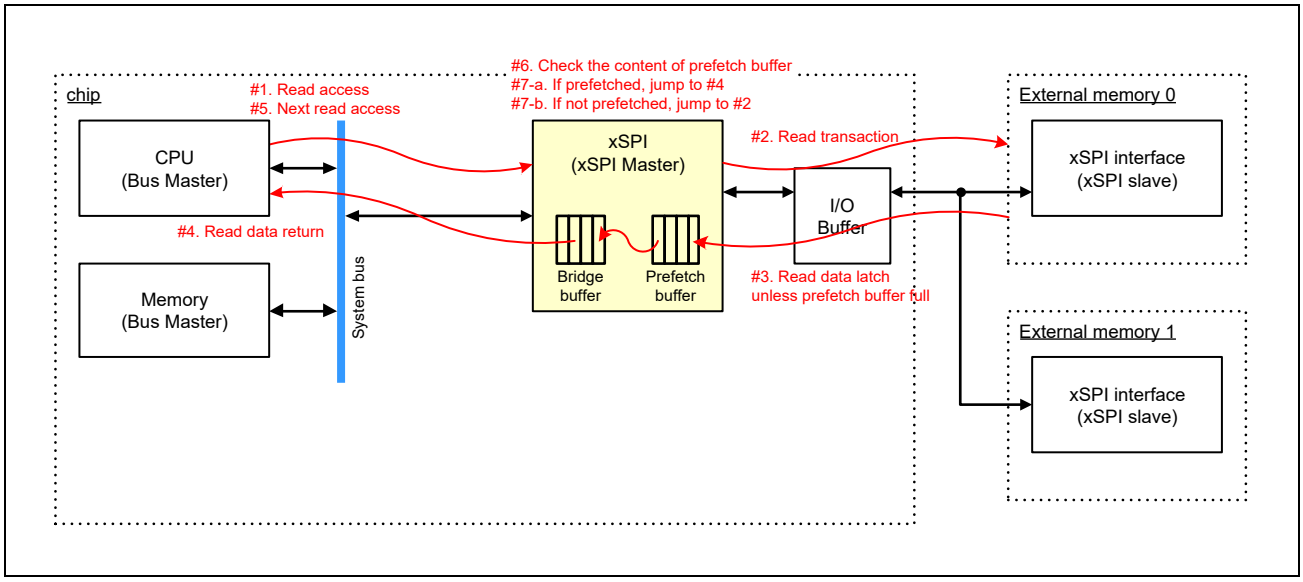

Figure 7.2-14 Read Access for Memory Area with Prefetch Enabled

NOTE

When this prefetch function is enabled, Bus Master could read from not a slave device but the internal prefetch buffer. When accessed to the same address from multiple Bus Masters, this xSPI Master does not guarantee to read the latest data. If Bus Master intend to read the latest data from a slave device, the Master shall clear the prefetch buffer (BMCTL1.PBUFCLR) before issuing read.

7.2.4.3.6 XiP Mode

Some slave devices have a mode (XiP mode) in which the command phase is not required for lower latency. While in this mode, the xSPI master skips sending the command and the slave device implicitly performs the command that was executed in the previous transaction. When enabled XiP mode bit (CMCTL.XIPEN = 1), this xSPI master inserts XiP enter code (CMCTL.XIPENCODE[7:0]) in latency field. When disabled XiP mode bit (CMCTL.XIPEN = 0), this xSPI master inserts XiP exit code (CMCTL.XIPEXCODE[7:0]) in latency field. This function is available only for memory-mapping mode.

And when this xSPI master transmits XiP disable pattern, this master clears XiP mode bit and disables XiP mode configured for both channels. Note that it is not possible to disable XiP mode for only one channel by transmitting XiP disable pattern.

NOTE

- When enough latency cycle does not exist for XiP code, this xSPI Master could not insert XiP code.
- XiP mode could be used only for unidirectional access to a slave. The write transaction and read transaction shall be separated.

7.2.4.4 Pattern Control

This xSPI Master has the function to transmit 3 type of patterns which is not xSPI frame format. The pattern is triggered by setting trigger bit (LPCTL0-1.PATREQ).

7.2.4.4.1 XiP Disable Pattern

XiP Disable pattern‘s length and value are configured by LPCTL0.XD1LEN / XD1VAL / XD2LEN / XD2VAL. It uses spi_ck, spi_doe/do signals. The number of output pin could be configured by XiP Disable pattern pin bit (LPCTL0.XDPIN). It may be used to disable XiP mode for legacy SPI. The figure below shows the timing-chart.

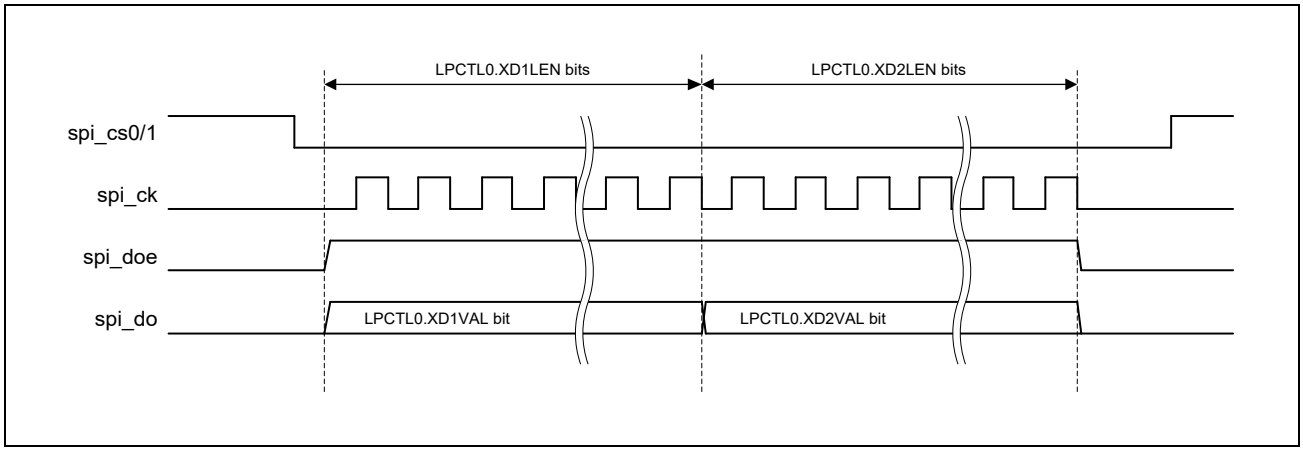

Figure 7.2-15 XiP Disable Pattern

NOTE

When transmitting XiP Disable pattern, spi_ck shall not be shifted (WRAPCFG.CKSFTCSx = 0).

7.2.4.4.2 Reset Pattern

Reset pattern is specified in Serial Flash Reset Signaling Protocol (JESD252). CS Low/High width is configured with Reset Pattern Length bit (LPCTL1.RSTWID). xSPI slave will sample the data input at the rising edge of CS. Setup time for data output is configured with Reset pattern data output setup time bit (LPCTL1.RSTSU). The setup time shall be always less than Reset pattern width. The figure below shows the timing-chart.

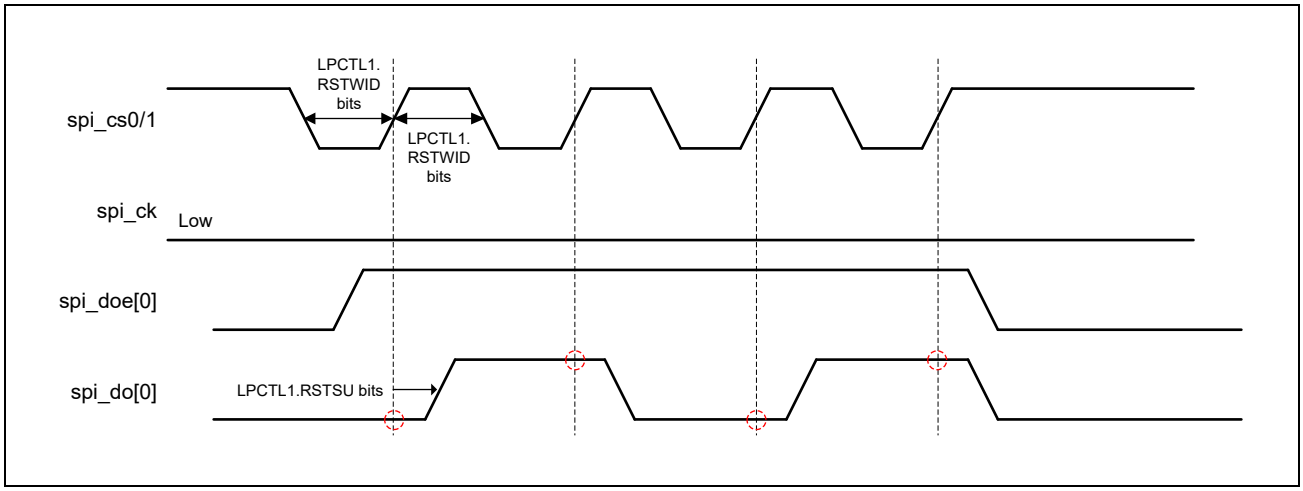

Figure 7.2-16 Reset Pattern

NOTE

In the protocol specification, CS Low/High width is defined as minimum 500 ns, and Setup time is defined as minimum 6 ns.

7.2.4.4.3 CS Only Pattern

CS Only pattern activates CS port with the configured length bit (LPCTL1.RSTWID). It may be used to resume from Deep Power Down state. The figure below shows the timing-chart.

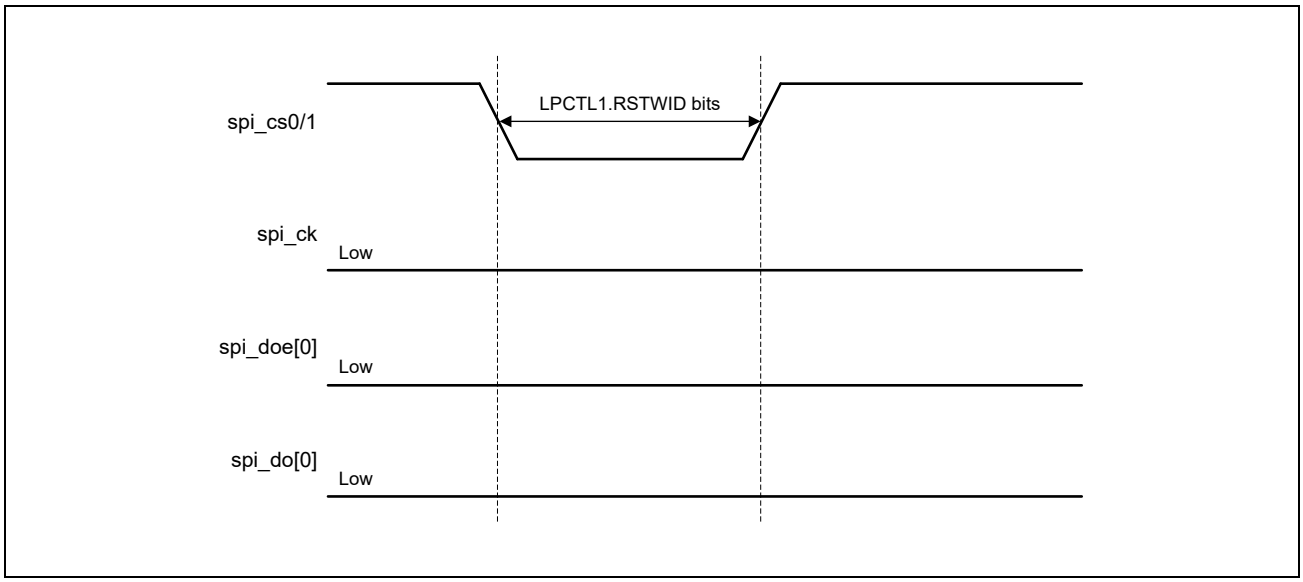

Figure 7.2-17 CS Only Pattern

7.2.4.5 Integrity Checking

This xSPI Master can detect some errors. The table below shows the error list and the detail behavior.

When reset of xSPI master is needed due to fatal error, set module reset register (MRCTLA) to reset xSPI master. After confirming it is reset surely, release module reset.

Table 7.2-11 Error List

Error Type	Event	Flag Bit	Note (Action)
Calibration failed	When the read data did not match the expected value during automatic calibration	INTS.CAFAILCS0-1	It results in writing unexpected data to xSPI slave.
System bus error	When an error response occurred on system bus slave interface for memory-mapping	INTS.BUSERR	This is a fatal error. This xSPI master shall be initialized. When detected this error in system bus write transaction, the internal bridge buffer is cleared. It means the pending write data is lost.
DS timeout	When DS does not toggle in read transaction with using DS	INTS.DSTOCS0-1	Both xSPI master and xSPI slave should be reset for fatal error.
Periodic transaction timeout	When the read value does not match with the expected value in periodic manual-command mode	INTS.PERTO	Depending on the status of function

7.2.4.6 Interrupts

This xSPI Master has an interrupt port.

It can monitor with Interrupt Status Register (INTS). In case of initialization phase, it can be programmable with Interrupt Enable register (INTE). The table below shows the related register bit.

Table 7.2-12 xSPI Interrupt Sources

Name	Interrupt Sources
XSPI_INT (int_spi_level)	Interrupt
XSPI_INTERR (int_spi_err_level)	Error interrupt

Table 7.2-13 Interrupt Register Bit

Flag Bit (INTS)	Enable Bit (INTE)	Clear Bit (INTC)	Interrupt Sources
CASUCCS1	CASUCCS1E	CASUCCS1C	XSPI_INT
CASUCCS0	CASUCCS0E	CASUCCS0C	
CAFAILCS1	CAFAILCS1E	CAFAILCS1C	XSPI_INTERR
CAFAILCS0	CAFAILCS0E	CAFAILCS0C	
BUSERR	BUSERRE	BUSERRC	XSPI_INTERR
DSTOCS1	DSTOCS1E	DSTOCS1C	XSPI_INTERR
DSTOCS0	DSTOCS0E	DSTOCS0C	
PERTO	PERTOE	PERTOC	XSPI_INTERR
INICMP	INICMPE	INICMPC	XSPI_INT
PATCMP	PATCMPE	PATCMPC	XSPI_INT
CMDCMP	CMDCMPE	CMDCMPC	XSPI_INT

7.2.4.7 Flows of Operations

7.2.4.7.1 Flow of Configuration

The figure below shows flow of configuration.

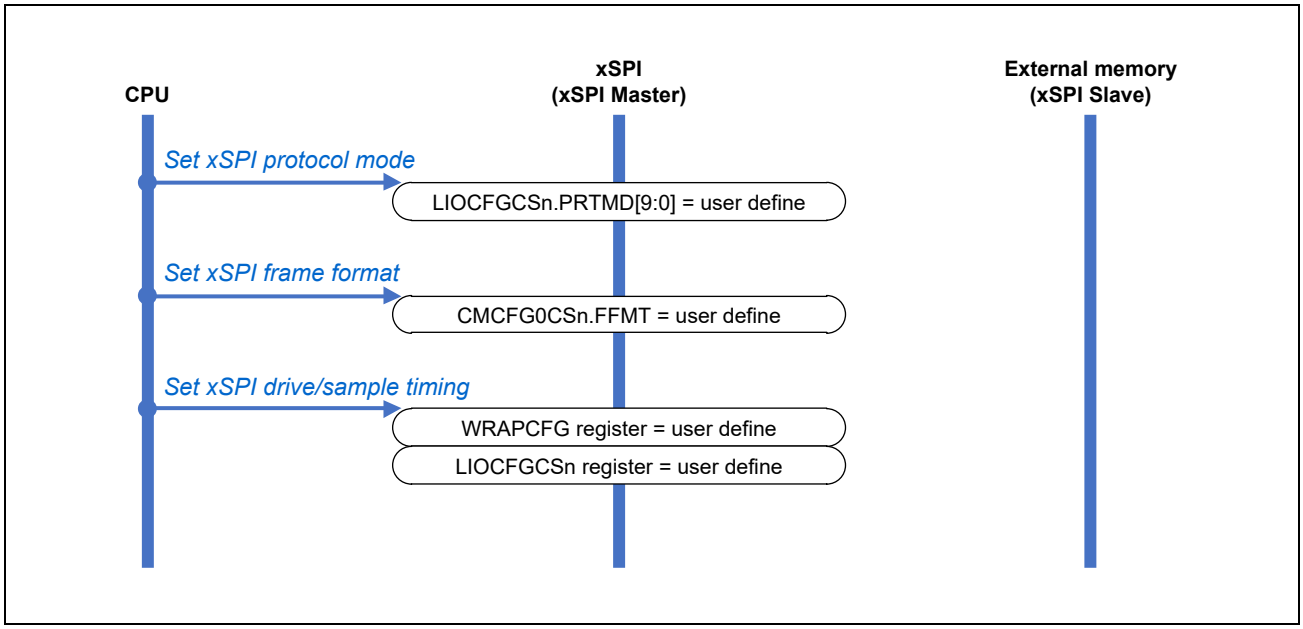

Figure 7.2-18 Flow of Configuration

7.2.4.7.2 Flow of Communication Stop

The figure below shows flow of communication stop.

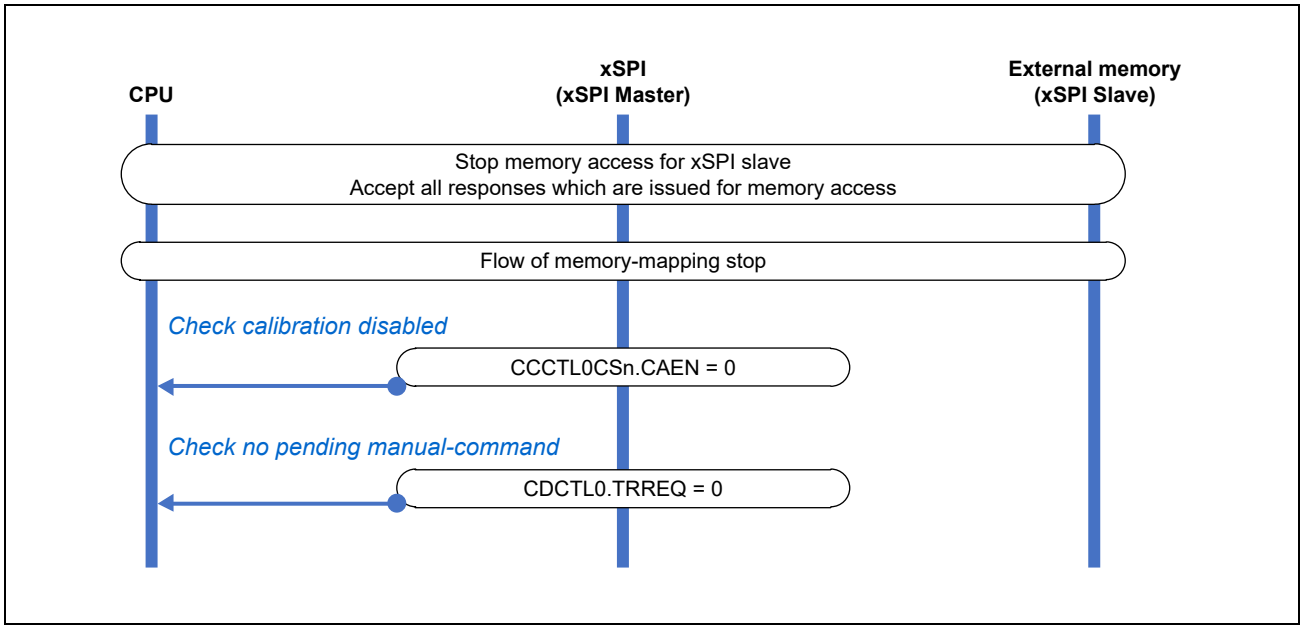

Figure 7.2-19 Flow of Communication Stop

NOTE

In case of re-config of any configuration register, all communication with xSPI slave shall be stopped completely. It means that the automatic calibration is disabled, and there is no pending manual-command and memory-mapping access.

7.2.4.7.3 Flow of Automatic Calibration

The figure below shows flow of automatic calibration.

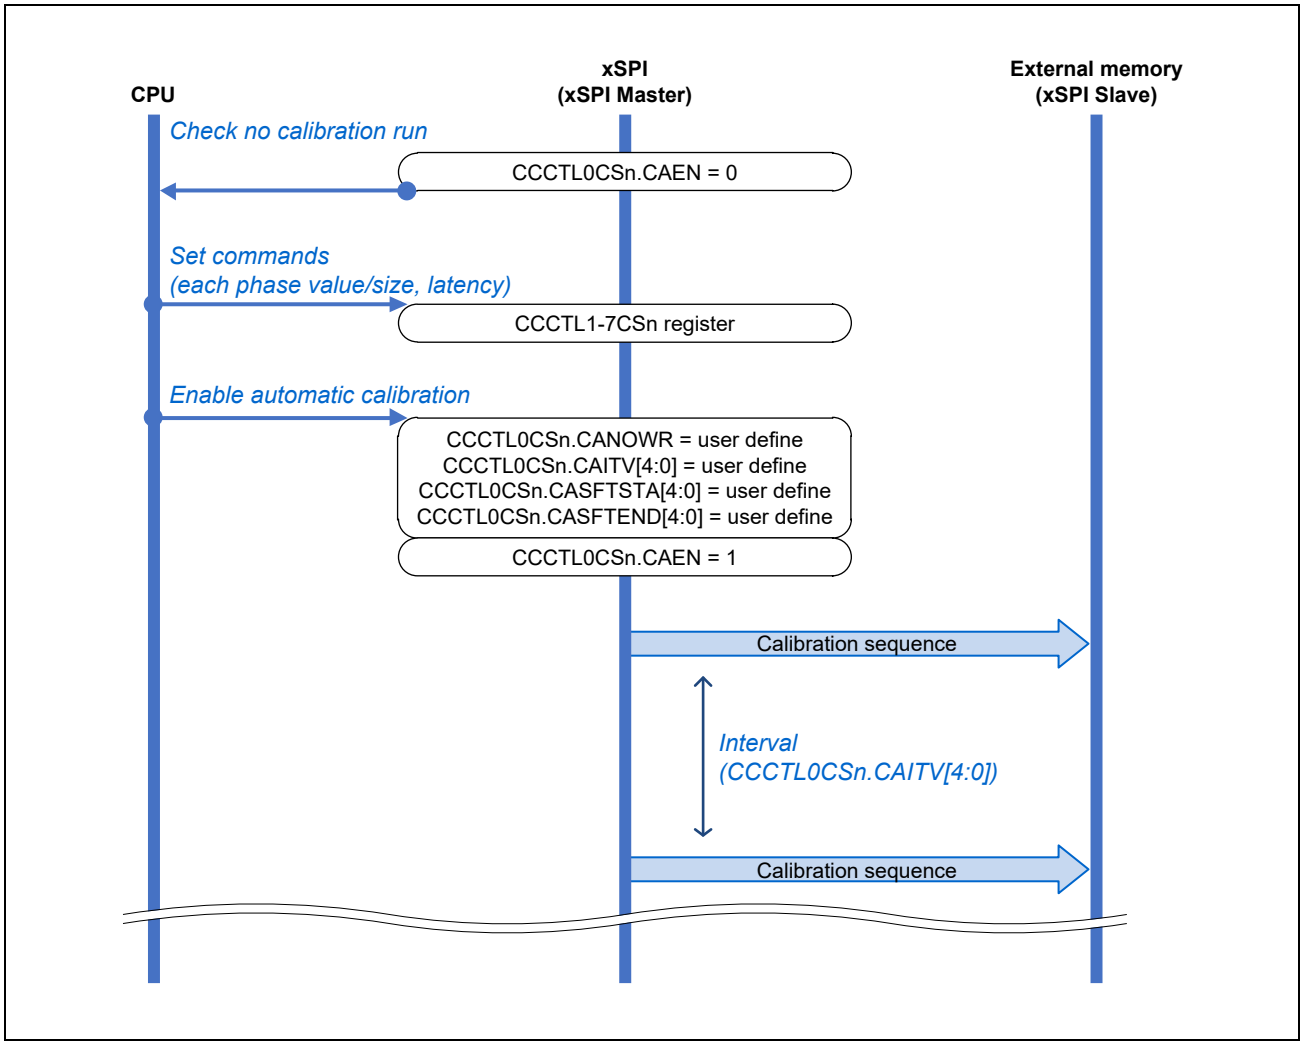

Figure 7.2-20 Flow of Automatic Calibration

7.2.4.7.4 Flow of Manual-command Procedure

The figure below shows manual-command procedure for direct mode.

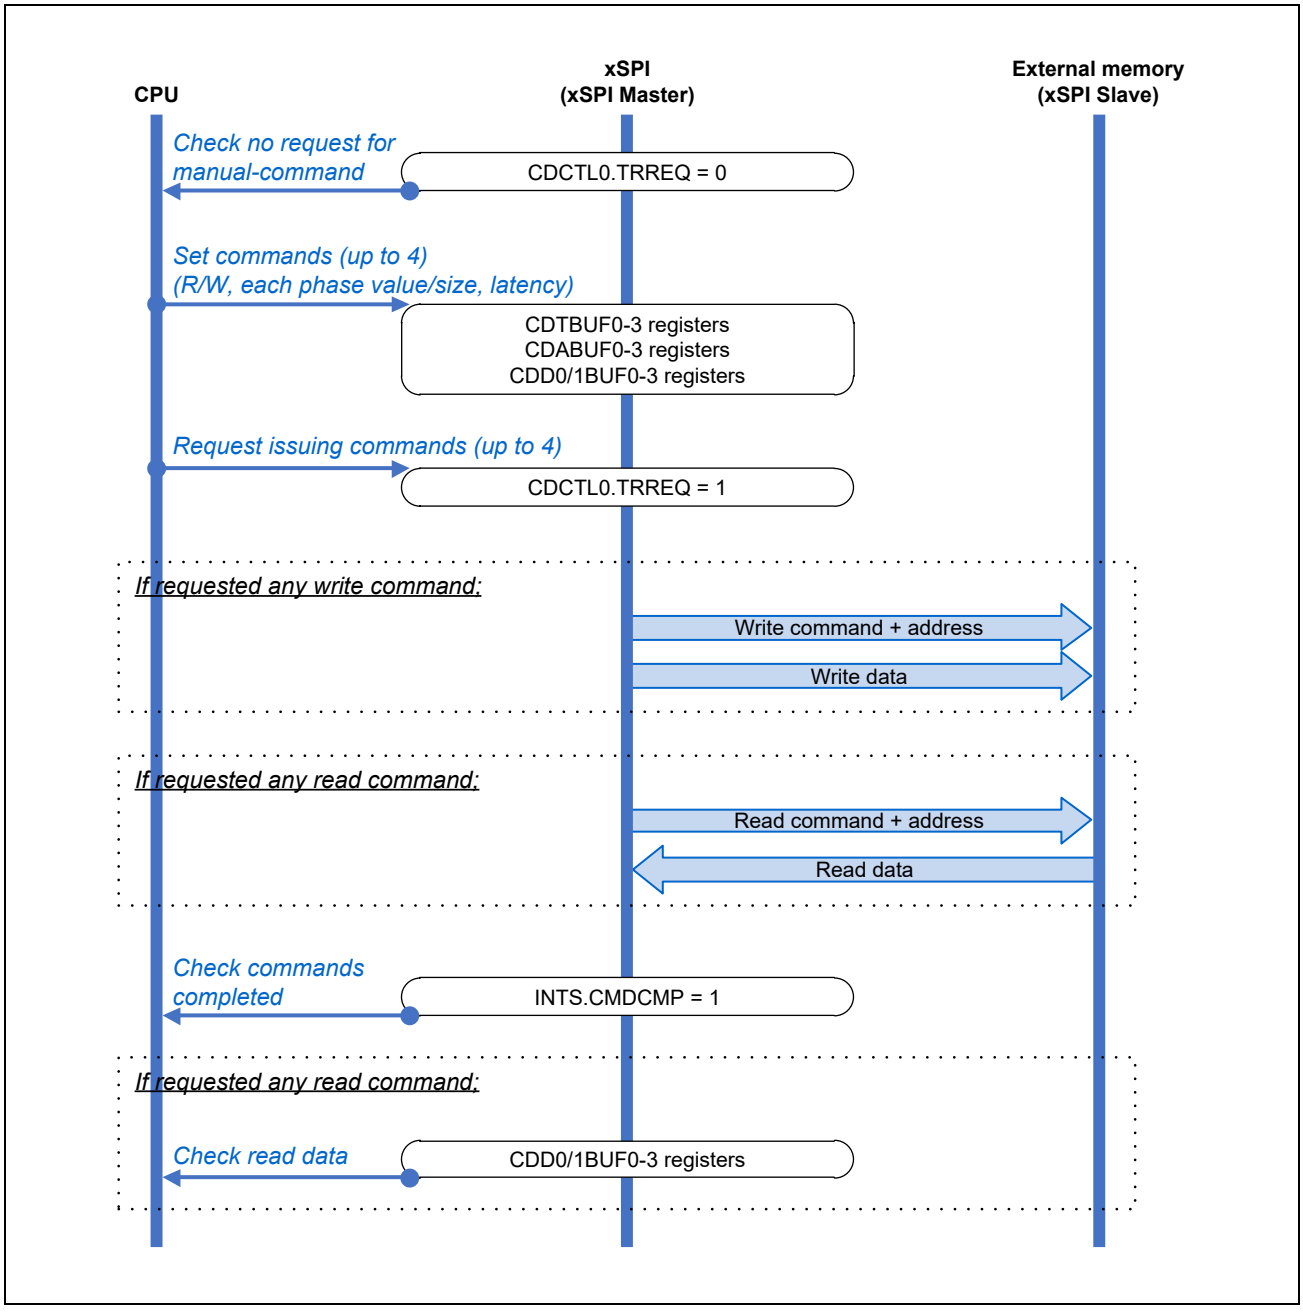

Figure 7.2-21 Flow of Manual-Command Procedure for Direct Mode

The figure below shows manual-command procedure for periodic mode.

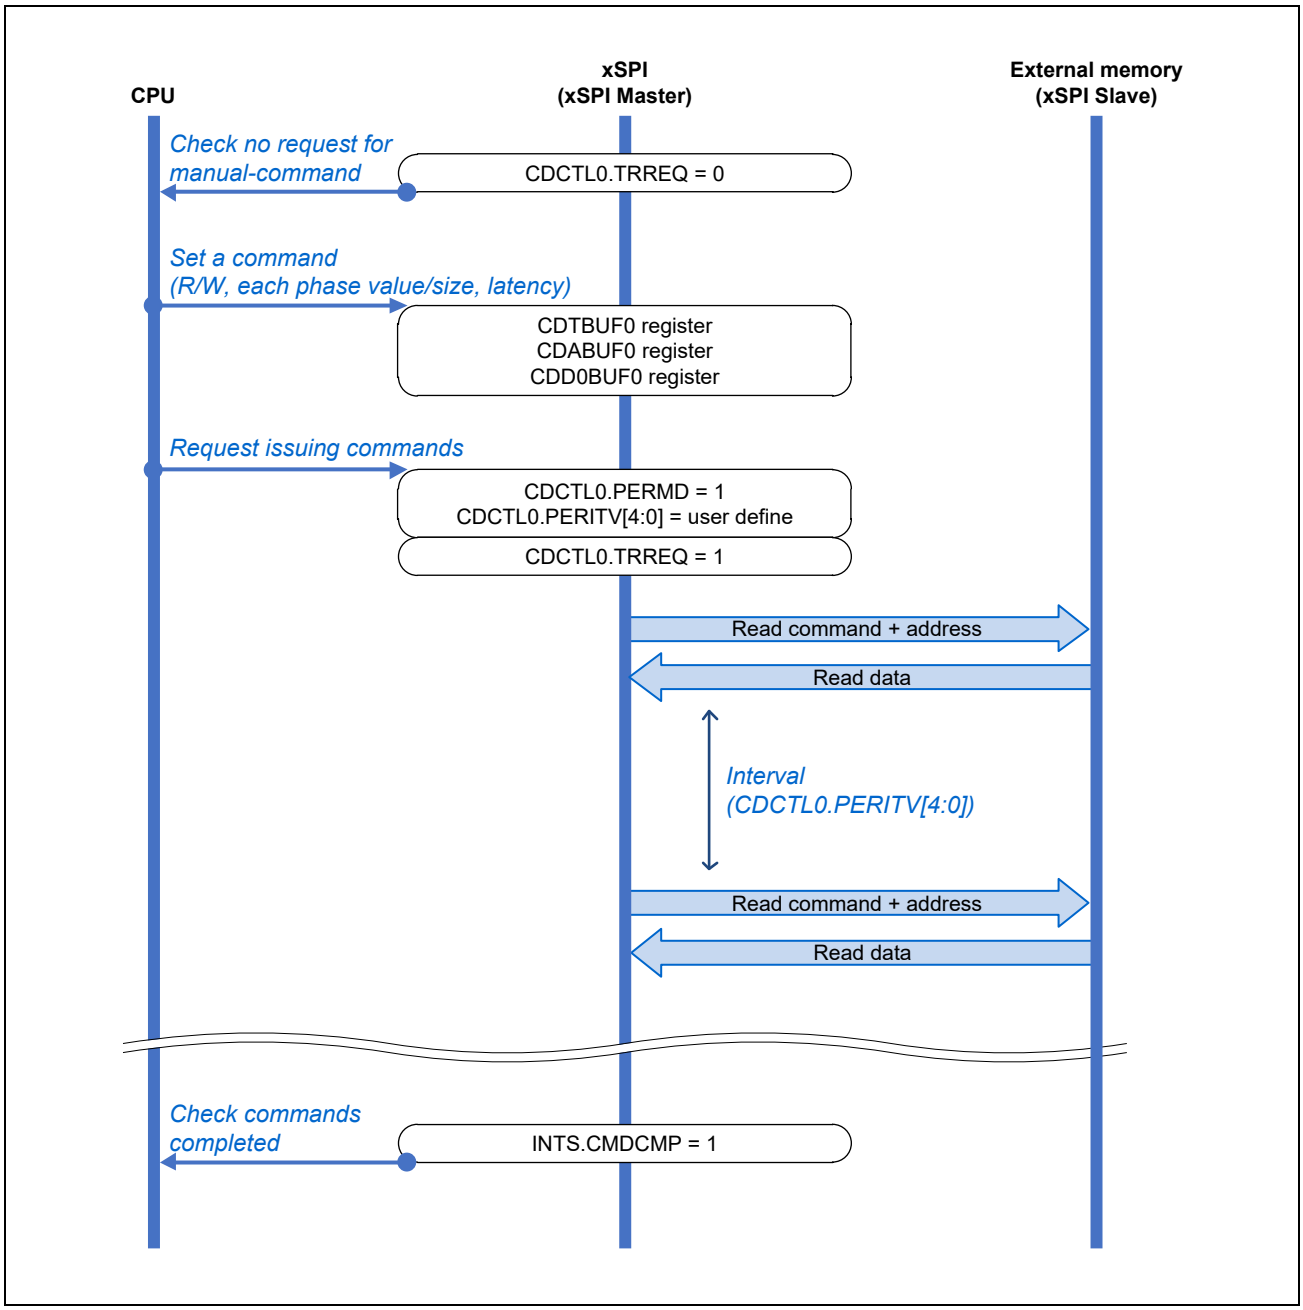

Figure 7.2-22 Flow of Manual-Command Procedure for Periodic Mode

7.2.4.7.5 Flow of Memory-Mapping

The figure below shows flow of memory-mapping.

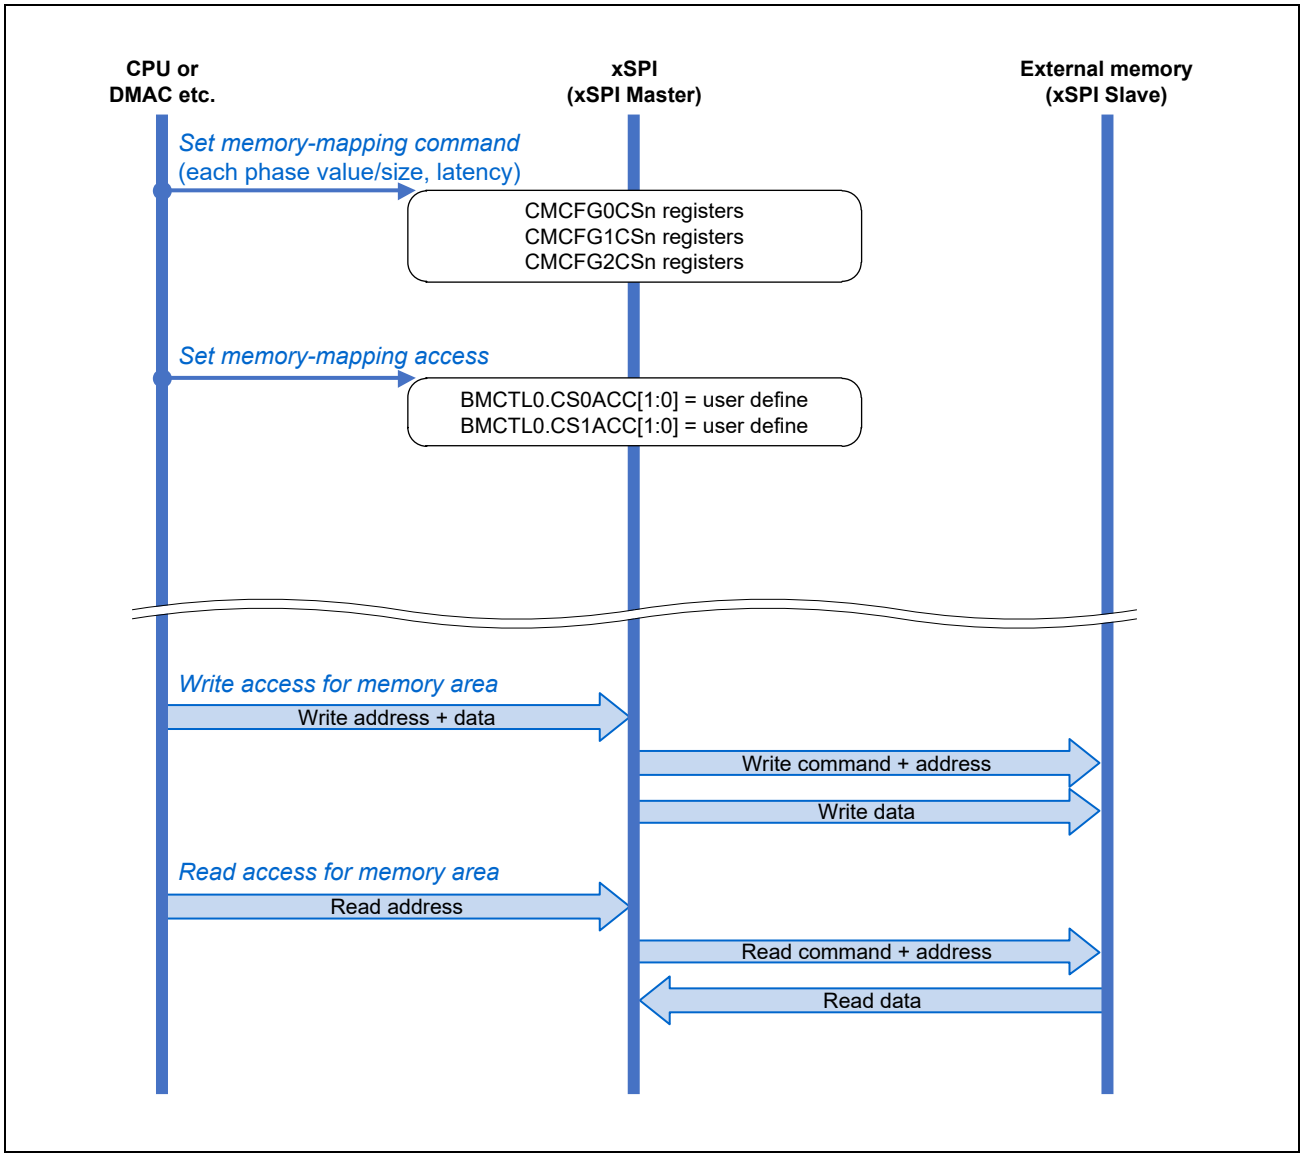

Figure 7.2-23 Flow of Memory-Mapping

7.2.4.7.6 Flow of Memory-mapping Stop

The figure below shows flow of memory-mapping stop.

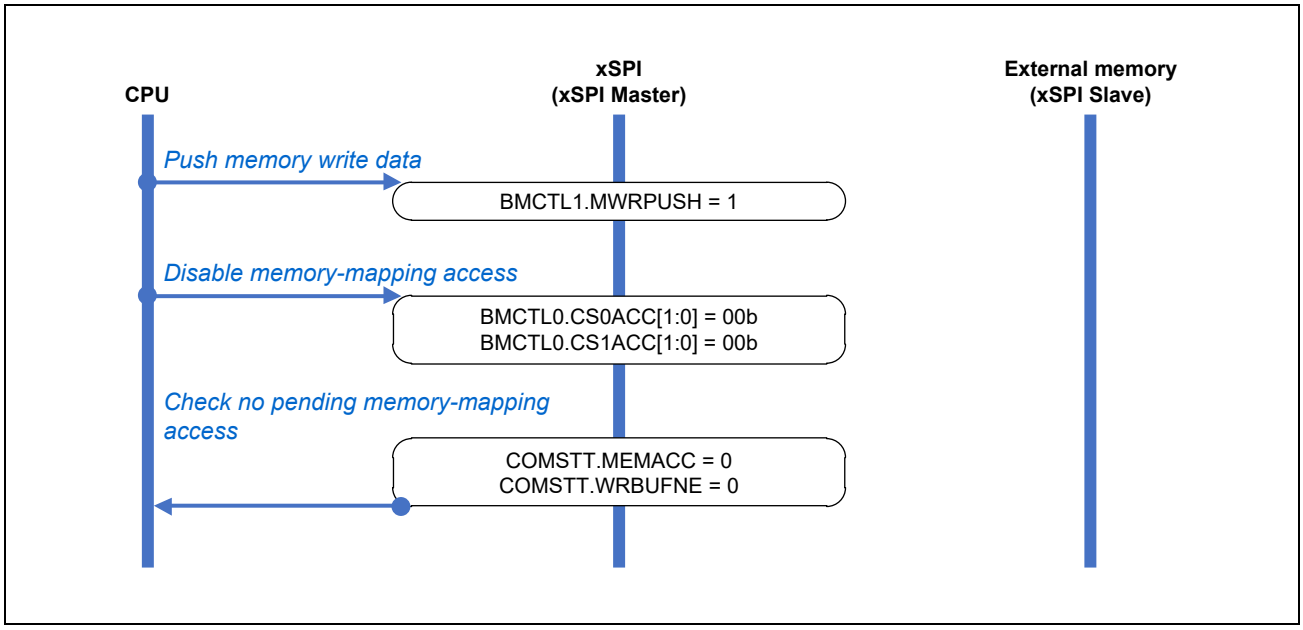

Figure 7.2-24 Flow of Memory-Mapping Stop

7.2.4.7.7 Flow of Pattern Request

The figure below shows flow of pattern request. Before requesting any pattern, any ongoing commands should be completed or canceled.

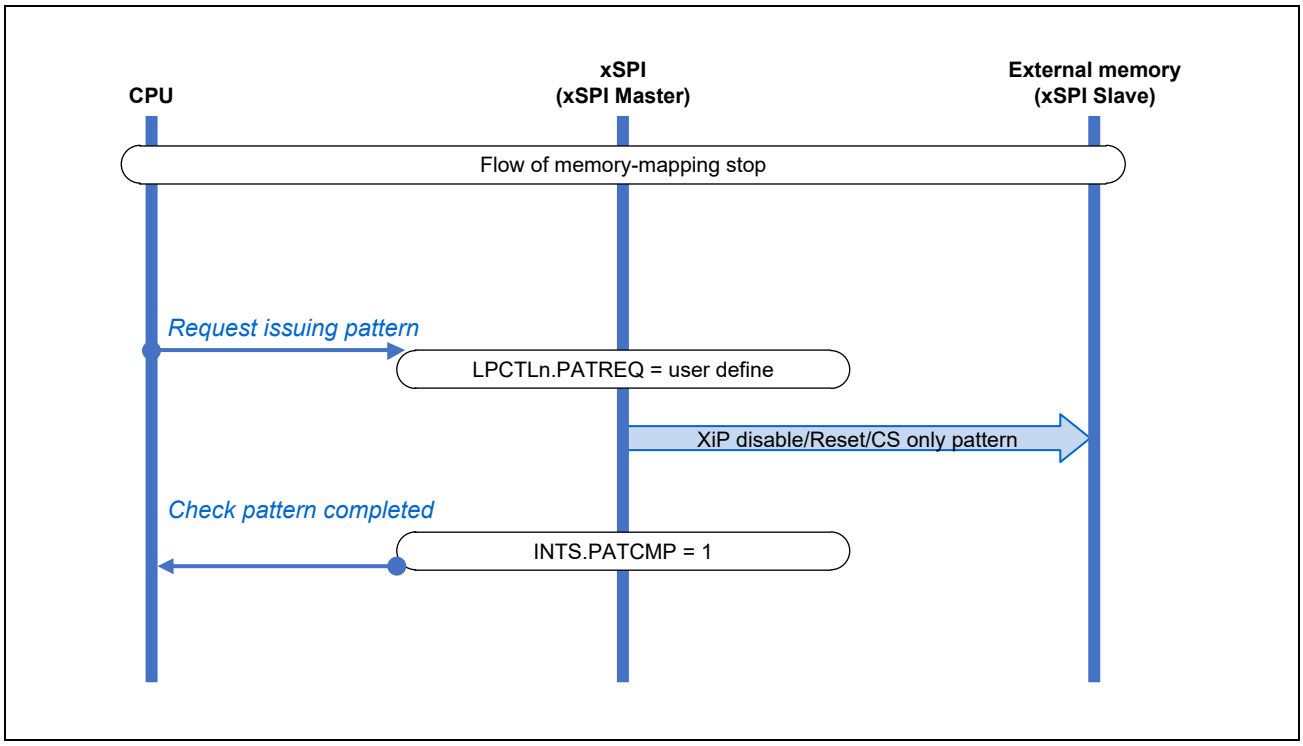

Figure 7.2-25 Flow of Pattern Request

7.2.4.7.8 Flow of XiP Mode

The figure below shows flow of XiP mode enable/disable.

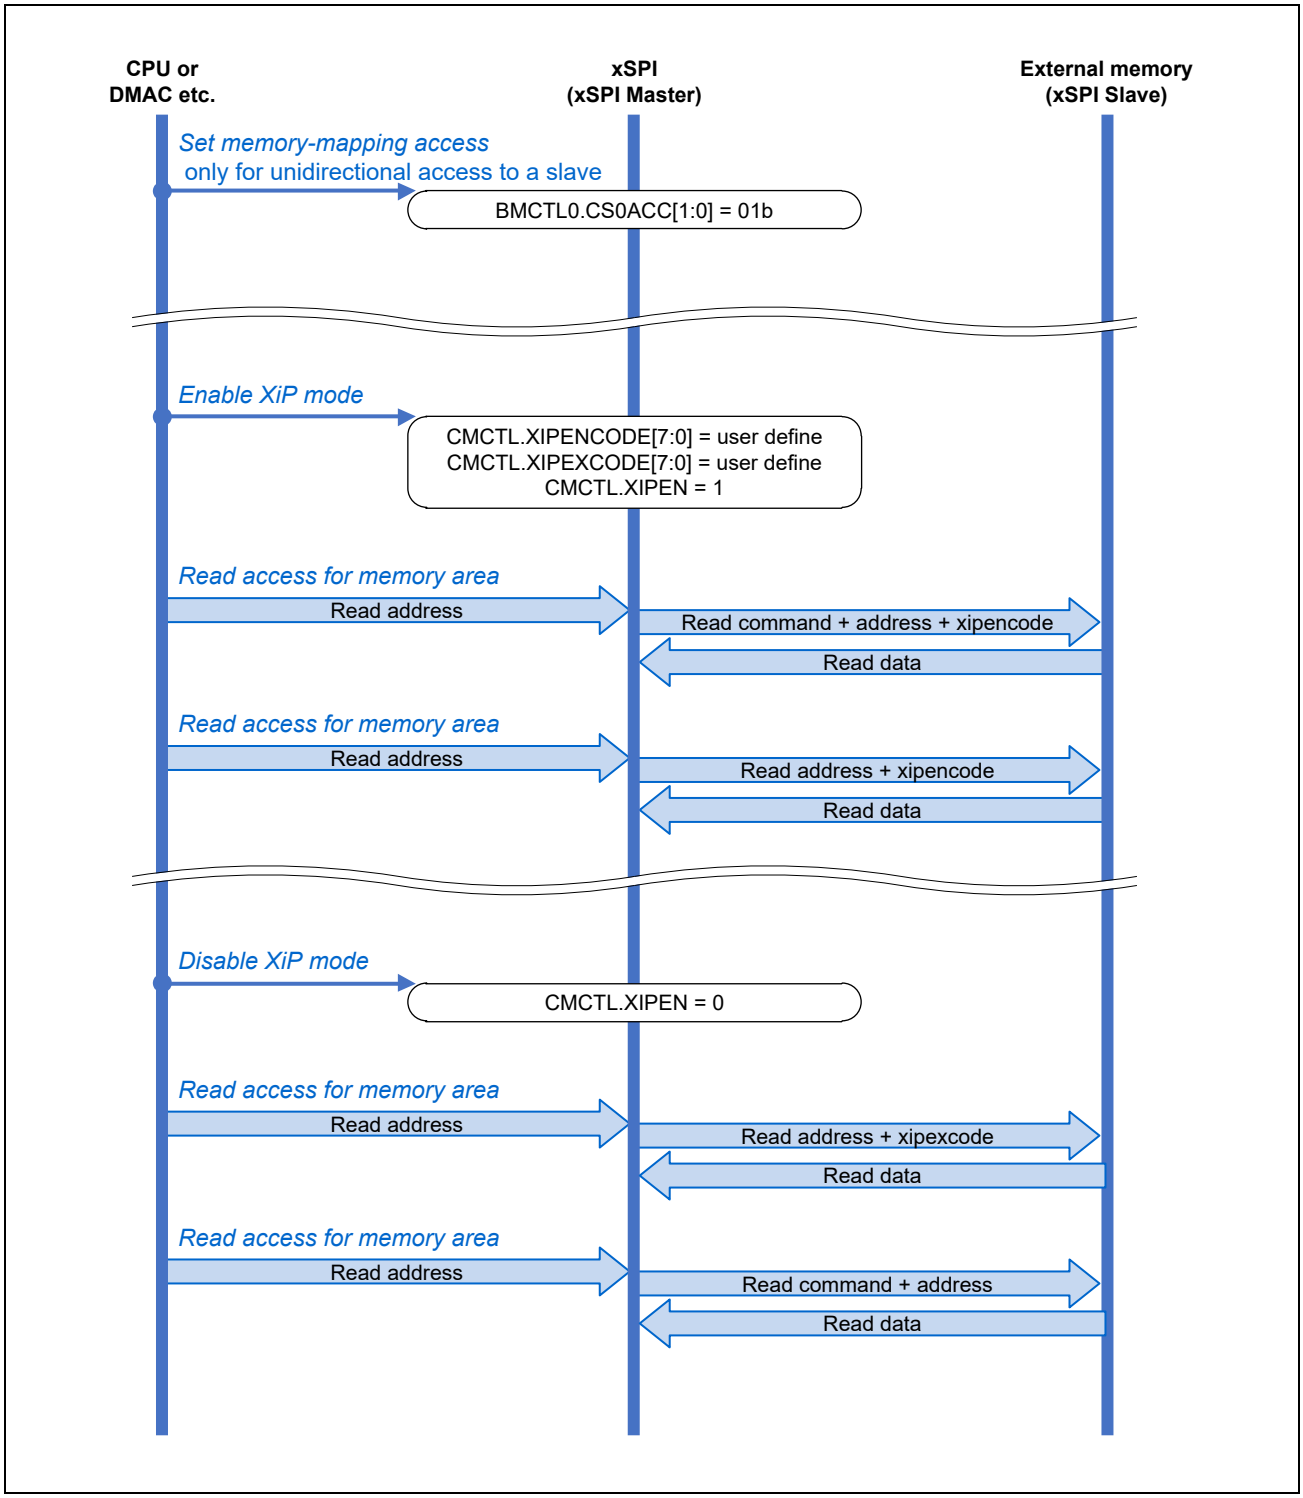

Figure 7.2-26 Flow of XiP Mode Enable/Disable

7.2.4.8 Usage Notes

DDR access without DS is not supported.

SECTION 7 LOW-SPEED INTERFACE

7.3 Serial Communications Interface (RSCI)

7.3.1 Overview

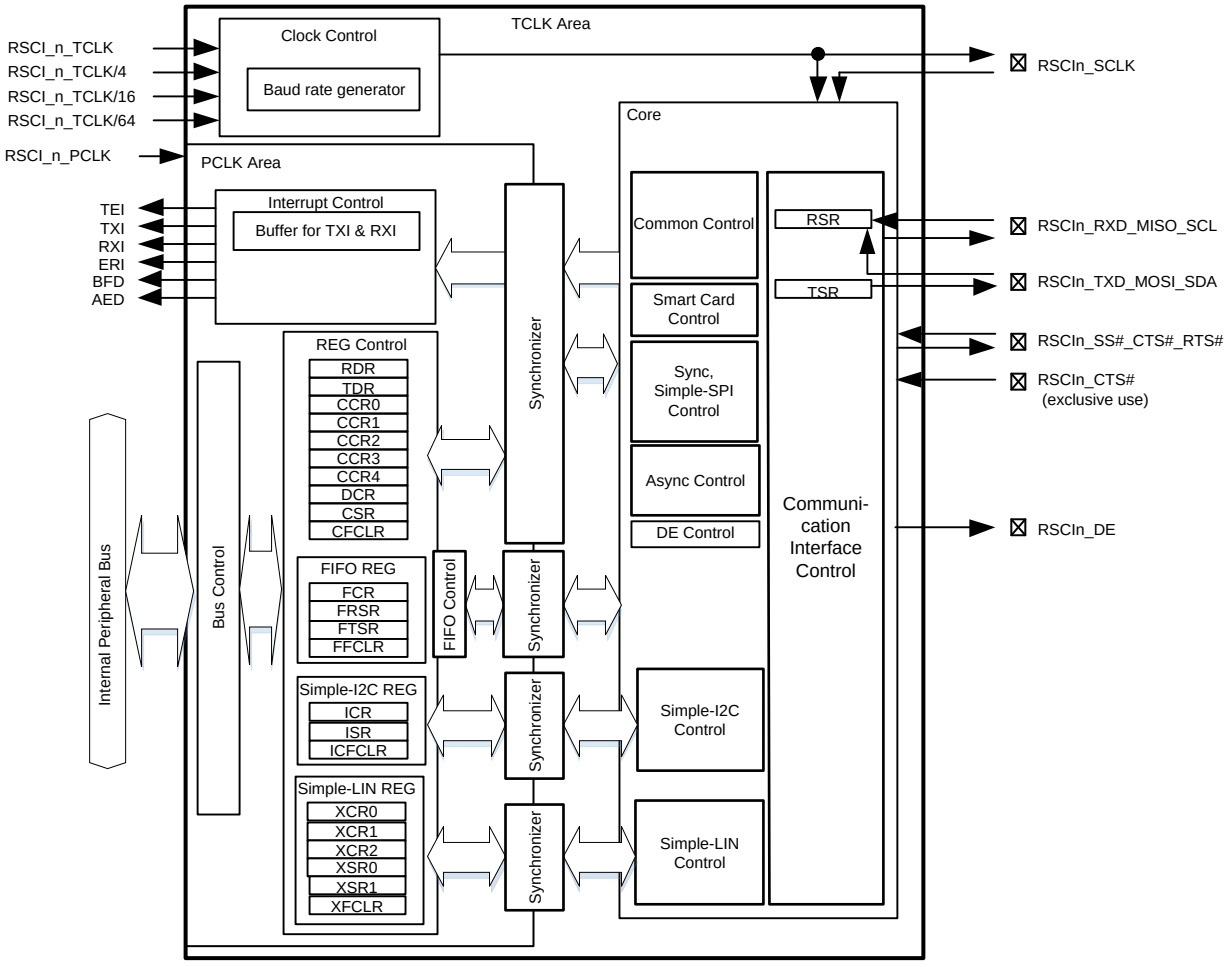
This LSI has four independent serial communications interface (RSCI) channels. The RSCI (hereinafter referred to as SCI) is configurable to six asynchronous and synchronous serial interfaces:

- Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))
- 8-bit clock synchronous interface
- Simple I2C (master-only)
- Simple SPI
- Smart card interface
- Simple LIN interface

The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. Each SCI has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using a baud rate generator.

Table 7.3-1 lists the SCI specifications, **Figure 7.3-1** shows a block diagram of SCI channel n, and **Table 7.3-2** lists the I/O pins.

Table 7.3-1 SCI Specifications (1/3)



Item	Specifications
Number of channels	4 channels
Serial communication modes	• Asynchronous • Clock synchronous • Smart card interface • Simple I2C • Simple SPI • Simple LIN
Transfer speed	Bit rate specifiable with the baud rate generator
Full-duplex communications	Transmitter: Continuous transmission possible using double- buffering Receiver: Continuous reception possible using double-buffering
Half-duplex communication	Possible by using TXD pins
Data transfer	Selectable as LSB-first or MSB-first transfer
RXD/TXD polarity	Selectable polarity for TXD and RXD independently
Interrupt sources	• Transmit end, transmit data empty, receive data full, receive error, receive data ready, and address match, break field detection/output, bus collision detection, active edge detection • Completion of generation of a start condition, restart condition, or stop condition (for simple I2C mode)
RS-485 driver control function	Output DE pin to enable transmission mode of external transceiver
Loopback function	Self-diagnosis of communication function inside module supported
Synchronizing circuit bypass function	Bus clock (RSCI_m_PCLK) can be used as operation clock (RSCI_m_TCLK) when bypass function is enabled.

Table 7.3-1 SCI Specifications (2/3)

Item		Specifications
Asynchronous mode	Data length	7, 8, or 9 bits
	Transmission stop bit	1 or 2 bits
	Reception sampling timing adjustment	Adjustable reception sampling timing from default timing
	Transmission timing adjustment	Adjustable timing of transmission wave edge by register
	Parity	Even parity, odd parity, or no parity
	Receive error detection	Parity, overrun, and framing errors
	Hardware flow control	Transmission and reception controllable with CTSm# and RTSm# pins
	Transmission/ reception	Selectable to 1-stage register or 32-stage FIFO
	Address match	Interrupt request/event output can be issued upon detecting a match between received data and the value in the compare match register. Note: This LSI does not support this function.
	Start-bit detection	Selectable to low level or falling edge detection
	Break detection	Breaks from framing errors detectable by reading register
	Clock source	Selectable to internal or external clock
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Multi-processor communications function	Serial communication enabled between multiple processors
	Noise cancellation	Digital noise filters included on signal paths from RXDn pin inputs
	Half data communication function	Half data communication function makes data “0” low pulse only in the first half of 1-bit period
Simple-LIN	Start frame transmission/ Start frame reception	• Break field output possible • Break field output complete interrupt output possible • Bus collision detection possible • Bus collision detection interrupt output possible • Break field detectable • Break field detected interrupt output possible • Control field 0/1 data comparison function • Control field 1 can set two types of comparison data of primary and secondary. • Priority interrupt bit can be set in control field 1b. • Bit rate measurement function
	Input/output control function	When the simple-LIN function is OFF, the RXD receive signal can be input to the core section.
Clock synchronous mode	Data length	8 bits
	Reception sampling timing adjustment	Adjustable reception sampling timing to backward from default timing in case internal clock used
	Receive error detection	Overrun error
	Clock source	Selectable to internal clock (master mode) or external clock (slave mode)
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Hardware flow control	Transmission and reception controllable with CTSm# and RTSm# pins
	Transmission/ reception	Selectable to 1-stage register or 32-stage FIFO

Table 7.3-1 SCI Specifications (3/3)

Item		Specifications
Smart card interface mode	Error processing	Error signal can be automatically transmitted on detecting a parity error during reception.
		Data can be automatically retransmitted on receiving an error signal during transmission.
	Data type	Both direct and inverse convention supported
Simple I2C mode	Transfer format	I2C bus format (MSB-first only)
	Operating mode	Master (single-master operation only)
	Transfer rate	Up to 400 kbps
	Noise cancellation	The signal paths from input on the SCLn and SDAn pins incorporate digital noise filters and provide an adjustable interval for noise cancellation.
Simple SPI mode	Data length	8 bits
	Error detection	Overrun error
	Clock source	Selectable to internal clock (master mode) or external clock (slave mode)
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Reception sampling timing adjustment	Adjustable reception sampling timing to backward from default timing in case internal clock used
	SS input pin function	High impedance state can be invoked on the output pins by driving the SSn# pin high.
	Clock settings	Configurable between four clock phase and clock polarity settings
	Transmission/ reception	Selectable to 1-stage register or 32-stage FIFO
Bit rate modulation function		Error reduction through correction of outputs from the baud rate generator

Note: n = 0 to 3

Figure 7.3-1 RSCI Block Diagram

Table 7.3-2 SCI Input/Output Pins

Channel	Pin Name	Signal Name in This Section	Input/ Output	Function
0 to 3	RSCIm_SCLK	SCKm	I/O	RSCIm clock input/output
	RSCIm_RXD_MISO_SCL	RXDm/SCLm/ MISOm	I/O	RSCIm receive data input RSCIm I2C clock input/output RSCIm data input (master), data output (slave)
	RSCIm_TXD_MOSI_SDA	TXDm/SDAm/ MOSIm	I/O	RSCIm transmit data output RSCIm I2C data input/output RSCIm data output (master), data input (slave)
	RSCIm_SS_CTS#_RTS#	SSm#/CTSm#/ RTSm#	I/O	RSCIm chip select input RSCIm transfer start control output RSCIm transfer start control input
	RSCIm_CTS	CTSm#	Input	RSCIm transfer start control input (exclusive use)
	RSCIm_DE	DEm	Output	RSCIm Driver Enable output

Note: m = 0 to 3

7.3.2 SCI Registers

This section explains each register specification.

Table 7.3-3 shows a list of registers/bits that cannot be rewritten during communication. Also, check the notes on register rewriting described in **7.3.18 Usage Notes**.

Table 7.3-3 Bits that cannot be Rewritten during Communication

Register	Bit	Write Constraint
CCR0	RE	In Clock synchronous mode, Simple-SPI and Simple-I2C, 1b can be written only when TE = 0b and RE = 0b. After setting TE or RE to 1b, only 0b can be written in TE and RE.
CCR0	TE	
CCR0	IDSEL	Writable only when TE = 0b and RE = 0b.
CCR0	SSE	Writable only when TE = 0b and RE = 0b.
CCR1	CTSE	Writable only when TE = 0b and RE = 0b.
CCR1	CTSPEN	Writable only when TE = 0b and RE = 0b.
CCR1	PE	Writable only when TE = 0b and RE = 0b.
CCR1	PM	Writable only when TE = 0b and RE = 0b.
CCR1	TINV	Writable only when TE = 0b and RE = 0b.
CCR1	RINV	Writable only when TE = 0b and RE = 0b.
CCR1	SPLP	Writable only when TE = 0b and RE = 0b.
CCR1	SHARPS	Writable only when TE = 0b and RE = 0b.
CCR1	NFCS[2:0]	Writable only when TE = 0b and RE = 0b.
CCR1	NFEN	Writable only when TE = 0b and RE = 0b.
CCR2	All bits	Writable only when TE = 0b and RE = 0b.
CCR3	All bits	Writable only when TE = 0b and RE = 0b.
CCR4	All bits	Writable only when TE = 0b and RE = 0b.
ICR	IICDL[4:0]	Writable only when TE = 0b and RE = 0b.
ICR	IICINTM	Writable only when TE = 0b and RE = 0b.
ICR	IICCSC	Writable only when TE = 0b and RE = 0b.
FCR	All bits	Writable only when TE = 0b and RE = 0b.
DCR	All bits	Writable only when TE = 0b and RE = 0b.
XCR0	All bits	Writable only when TE = 0b and RE = 0b.
XCR1	TCST	Writable only when TE = 0b and RE = 0b.
XCR1	SDST	Writable only when TE = 0b and RE = 0b.
XCR1	PCF1D [7:0]	Writable only when TE = 0b and RE = 0b.
XCR1	SCF1D [7:0]	Writable only when TE = 0b and RE = 0b.
XCR1	CF1CE [7:0]	Writable only when TE = 0b and RE = 0b.
XCR2	All bits	Writable only when TE = 0b and RE = 0b.
HCH	All bits	Writable only when TE = 0b and RE = 0b.

The base addresses for the respective channels are as follows.

Table 7.3-4 Register Base Addresses

Base Register Name	Ch	Base Address
<RSCI0_base>	RSCI0	0_100B_8000h (500B_8000h*1, 400B_8000h*2)
<RSCI1_base>	RSCI1	0_100F_1000h (500F_1000h*1, 400F_1000h*2)
<RSCI2_base>	RSCI2	0_100F_2000h (500F_2000h*1, 400F_2000h*2)
<RSCI3_base>	RSCI3	0_100F_3000h (500F_3000h*1, 400F_3000h*2)

Note 1. CM33 Address Space Non-Secure

Note 2. CM33 Address Space Secure

7.3.2.1 List of Registers

The registers are listed below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Receive Data Register	RSCIm_RDR	0000_0000h	0000h	32
Transmit Data Register	RSCIm_TDR	FFFF_FFFFh	0004h	8, 16, 32*1
Common Control Register 0	RSCIm_CCR0	0000_0000h	0008h	8, 16, 32*1
Common Control Register 1	RSCIm_CCR1	0000_0010h	000Ch	8, 16, 32*1
Common Control Register 2	RSCIm_CCR2	FF00_FF04h	0010h	8, 16, 32*1
Common Control Register 3	RSCIm_CCR3	0000_1203h	0014h	8, 16, 32*1
Common Control Register 4	RSCIm_CCR4	0000_0000h	0018h	8, 16, 32*1
Communication Enable Status Register	RSCIm_CESR	00h	001Ch	8
Reserve	-	-	001Dh	-
Half data communication Control Register	RSCIm_HCR	00h	001Eh	8
Reserve	-	-	001Fh	-
Simple I2C Control Register	RSCIm_ICR	0000_0000h	0020h	8, 16, 32*1
FIFO Control Register	RSCIm_FCR	1F1F_0000h	0024h	8, 16, 32*1
Reserve	-	-	0028h to 002Fh	-
Driver Control Register	RSCIm_DCR	0000_0000h	0030h	8, 16, 32*1
Simple-LIN(SCIX) Control Register 0	RSCIm_XCR0	0000_0000h	0034h	8, 16, 32*1
Simple-LIN(SCIX) Control Register 1	RSCIm_XCR1	0000_0000h	0038h	8, 16, 32*1
Simple-LIN(SCIX) Control Register 2	RSCIm_XCR2	FFFE_0000h	003Ch	8, 16, 32*1
Reserve	-	-	0040h to 0047h	-
Common Status Register	RSCIm_CSR	6000_8000h	0048h	32
Simple I2C Status Register	RSCIm_ISR	0000_0000h	004Ch	32
FIFO Receive Status Register	RSCIm_FRSR	0000_0000h	0050h	32
FIFO Transmit Status Register	RSCIm_FTSR	0000_0000h	0054h	32
Reserve	-	-	0058h to 005Bh	-
Simple-LIN(SCIX) Status Register 0	RSCIm_XSR0	0000_0000h	005Ch	32
Simple-LIN(SCIX) Status Register 1	RSCIm_XSR1	0000_0000h	0060h	32
Reserve	-	-	0064h to 0067h	-
Common Flag Clear Register	RSCIm_CFCLR	0000_0000h	0068h	8, 16, 32*1
Simple I2C Flag Clear Register	RSCIm_ICFCLR	0000_0000h	006Ch	8, 16, 32*1
FIFO Flag Clear Register	RSCIm_FFCLR	0000_0000h	0070h	8, 16, 32*1
Reserve	-	-	0074h to 0077h	-
Simple-LIN(SCIX) Flag CLear Register	RSCIm_XFCLR	0000_0000h	0078h	8, 16, 32*1

Note 1. The read access size is fixed at 32 bits.

7.3.2.2 SCI Register Descriptions

The prefix (RSCIm_) of the register names is omitted in this and subsequent sections.

7.3.2.2.1 Receive Shift Register (RSCIm_RSR)

RSR is a shift register which is used to receive serial data input from the RXDn pin and converts it into parallel data. When one frame of data has been received, it is automatically transferred to the RDR register.

The RSR register cannot be directly accessed by the CPU.

7.3.2.2.2 Receive Data Register (RSCIm_RDR)

In FIFO mode (CCR3.FM = 1b), this register has 32-stage FIFO structure.

Access Size : 32 bits
Address : <RSCIm_base> + 0000h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	FER	PER	-	-	ORER	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	FFER	FPER	DR	MPB	RDAT[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read.
28	FER	0h	R	Framing error flag CSR.FER can be read.
27	PER	0h	R	Parity error flag CSR.PER can be read.
26, 25	-	All 0	R	Reserved Whenever it is read, 0b is read.
24	ORER	0h	R	Overrun Error flag CSR.ORER can be read.
23 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read.
12	FFER	0h	R	FIFO framing error flag (Valid only in Asynchronous mode) 0b: There is no framing error in the data read from the receive FIFO. 1b: There is framing error in the data read from the receive FIFO.
11	FPER	0h	R	FIFO parity error flag (Valid only in Asynchronous mode) 0b: There is no parity error in the data read from the receive FIFO. 1b: There is parity error in the data read from the receive FIFO.
10	DR	0h	R	Receive data ready flag FRSR.DR can be read.
9	MPB	0h	R	Multi-processor flag 0b: Data transmission cycles 1b: ID transmission cycles
8 to 0	RDAT[8:0]	0h	R	Serial receive data RDAT is a 9-bit register for storing received data. Received data is stored in [6:0] when 7-bit data is selected, in [7:0] when 8-bit data is selected, and in [8:0] when 9-bit data is selected. And 0 is stored in the unused bit.

RDAT[8:0] bits (Serial receive data)

After one frame of data is received, the received data is transferred from the RSR register to this registers, thus allowing the RSR register to receive the next data.

The RSR and RDR registers have a double-buffered structure to enable continuous reception.

In Non-FIFO mode (CCR3.FM=0b), read RDR only once when a receive data full interrupt (RXI) request is issued. Without reading received data from RDR, if the next one frame is received, an overrun error occurs.

In FIFO mode, continuous reception is executed until 32 stages are stored. If data is read when there is no received data in the receive FIFO (RDR), the value is undefined. When the receive FIFO (RDR) are full of received data, subsequent serial receive data is lost.

The CPU cannot write to RDR.

0b is stored in the bit position which is not received (bit 8 or bit 7 of RDR) at the time of 7-bit or 8-bit communication in asynchronous mode.

MPB bit (Multi-processor flag)

In asynchronous mode, during multi-processor communication (CCR3.MP = 1b), the value of the multi-processor bit corresponding to the received data (RDAT[8:0]) can be read.

FPER bit (FIFO parity error flag)

Indicates whether the data read from the receive FIFO has a parity error.

In Non-FIFO mode (CCR3.FM=0b), 0b is stored.

FFER bit (FIFO framing error flag)

Indicates whether the data read from receive FIFO has a framing error.

In Non-FIFO mode (CCR3.FM=0b), 0b is stored.

7.3.2.2.3 Transmit Data Register (RSCIm_TDR)

In FIFO mode (CCR3.FM = 1b), this register has 32-stage FIFO structure.

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0004h
Initial Value : FFFF_FFFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MPBT	TDAT[8:0]								
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 1	RW	Reserved Whenever it is read, 1b is read. The written value should always be 1b.
9	MPBT	1h	RW	Multi-processor transfer bit flag Value of the multi-processor bit in the transmission frame. This bit is use in Asynchronous mode. When writing to this bit when not used, write the initial value. 0b: Data transmission cycles 1b: ID transmission cycles
8 to 0	TDAT[8:0]	1FFh	RW	Serial transmit data TDAT is a 9-bit register for setting transmit data. Transmit data is set in [6:0] when 7-bit data is selected, in [7:0] when 8-bit data is selected, and in [8:0] when 9-bit data is selected. When byte access for 9-bit data, write TDR[15:8] and then write TDR[7:0].

Note: The read access size is fixed at 32 bits.

TDAT[8:0] bits (Serial transmit data)

The TDR is a 9-bit register for storing transmit data.

When empty space is detected in the TSR register, the transmit data stored in the TDR registers is transferred to TSR, and transmitting is started.

The TSR and TDR registers have a double-buffer structure to realize continuous transmission. When the next data to be transmitted is stored in TDR after one frame of data has been transmitted, the transmitting operation is continued by transfer to the TSR register.

In Non-FIFO mode, when a transmit data empty interrupt (TXI) request is issued and CCR0.TE is 1b, write transmit data to the TDR only once.

In FIFO mode, when the SCI detects that the transmit shift register (TSR) is empty, it transmits data in the transmit FIFO (TDR) into TSR and starts serial transmission. Continuous serial transmission is executed until there is no transmit data left in the transmit FIFO (TDR).

When transmit FIFO is full of transmit data (32 frames), no more data can be written. If new data is written, the data is ignored.

When using bytes access, write TDR[15:8] and then write TDR[7:0].

MPBT bit (Multi-processor transfer bit flag)

Selects the multi-processor bit of transmit frame.

7.3.2.2.4 Transmit Shift Register (RSCIm_TSR)

TSR is a shift register that transmits serial data. TSR cannot be directly accessed by the CPU.

To perform serial data transmission, the SCI first automatically transfers transmit data from TDR to TSR, and then sends the data to the TXDn pin.

7.3.2.2.5 Common Control Register 0 (RSCIm_CCR0)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0008h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	SSE	-	-	TEIE	TIE	-	-	-	RIE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	IDSEL	DCME	MPIE	-	-	-	TE	-	-	-	RE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
24	SSE	0h	RW	SSn# Pin Function Enable (Valid in Simple-SPI mode.) In slave mode (CCR3.CKE[1:0] = 1xb), set 1b to this bit. 0b: SSn# pin function is disabled. 1b: SSn# pin function is enabled.
23, 22	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
21	TEIE	0h	RW	Transmit End Interrupt Enable This bit should be set to 0 in smart card interface mode. 0b: TEI interrupt request is disabled. 1b: TEI interrupt request is enabled.
20	TIE	0h	RW	Transmit Interrupt Enable 0b: TXI interrupt request is disabled. 1b: TXI interrupt request is enabled.
19 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	RIE	0h	RW	Receive Interrupt Enable 0b: RXI and ERI interrupt requests are disabled. 1b: RXI and ERI interrupt requests are enabled.
15 to 11	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
10	IDSEL	0h	RW	ID frame select (Valid only in asynchronous mode with multi-processor mode) 0b: All data is to be compared. 1b: The data with RDR.MPB = 1b is to be compared.
9	DCME	0h	RW*2	Data Compare Match Enable (Valid only in asynchronous mode) 0b: Address match function is disabled. 1b: Address match function is enabled.
8	MPIE	0h	RW*2	Multi-Processor Interrupt Enable (Valid in asynchronous mode when CCR3.MP = 1b.) This bit should be set to 0 in smart card interface mode. When the data with the multiprocessor bit set to 1b is received, the MPIE bit is automatically cleared to 0b, and non-multiprocessor reception is resumed. If you want to continue receiving operation using the multiprocessor function, set this bit to 1 sufficiently earlier than receiving the STOP bit of the next received frame. (Consider the synchronization delay time.) 0b: Non-Multi-Processor reception 1b: Multi-Processor reception
7 to 5	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
4	TE*3	0h	RW*1	Transmit Enable 0b: Serial transmission is disabled. 1b: Serial transmission is enabled.
3 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	RE*3	0h	RW*1	Receive Enable In clock synchronous mode and simple-SPI mode, receive only setting is prohibited (TE = 0 and RE = 1b setting prohibited). 0b: Serial reception is disabled. 1b: Serial reception is enabled.

Note: The read access size is fixed at 32 bits.

Note 1. In clock-synchronous mode (CCR3.MOD[2:0] = 010b), simple-SPI mode (CCR3.MOD[2:0] = 011b), and simple-I2C mode (CCR3.MOD[2:0] = 100b), 1b can be written only when TE = 0b and RE = 0b. After setting TE or RE to 1b, only 0b can be written in TE and RE. In other mode, writing is enabled under any condition.

Note 2. This bit is a bit that is cleared by hardware. Note that writing to a bit other than this bit with a bit manipulation instruction may cause this bit to be unintentionally set to 1b by a read-modify-write operation.

Note 3. In clock-synchronous mode or simple-SPI mode and internal clock (master mode), the receive-only setting is prohibited (TE = 0b and RE = 1b settings are prohibited).

RE bit (Receive Enable)

Enables or disables serial receive operation.

When this bit is set to 1b, serial reception becomes possible after the synchronization delay time has elapsed in asynchronous mode or the synchronous clock input in clock synchronous mode or start bit in smart-card-interface mode.

Note that CCR3 should be set prior to setting the RE bit to 1b in order to designate the reception format.

Except smart-card-interface-mode, even if reception is halted by setting the RE bit to 0b, the CSR.RDRF, FER, PER, ORER, FRSR.DR flags are not affected and the previous values are retained. In smart-card-interface-mode, even if reception is halted by setting the RE bit to 0b, the CSR.FER, PER, ORER flags are not affected and the previous value is retained. Also, to stop the reception operation, synchronization delay time will be required from when the RE bit is set to 0b until the reception operation is stopped.

TE bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1b, serial transmission becomes possible after the synchronization delay time has elapsed. After the synchronization delay time, transmission is started by writing transmit data to TDR. Note that CCR3 should be set prior to setting the TE bit to 1b in order to designate the transmission format. In addition, the synchronization delay time is required until the transmission control circuit is stopped after the TE bit is set to 0b.

MPIE bit (Multi-Processor Interrupt Enable)

When this bit is set to 1b and the data with the multi-processor bit set to 0b is received, the data is not read and setting the status flags (CSR.RDRF, ORER, FER, FRSR.DR) are not set.

When the data with the multi-processor bit set to 1b is received, the MPIE is automatically cleared to 0b, and normal reception is resumed. For details, see **7.3.4 Multi-Processor Communication Function**. If you want to continue receiving operation using the multiprocessor function, set this bit to 1b sufficiently earlier than receiving the STOP bit of the next received frame.

When the receive data includes the MPB bit set to 0b, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER and FER to 1b is disabled.

When the receive data includes the MPB bit set to 1b, the MPIE bit is automatically cleared to 0b, the RXI and ERI interrupt requests are enabled (if CCR0.RIE is set to 1b), and setting the flags ORER, FER to 1b is enabled.

MPIE should be set to 0b if multi-processor communications function is not to be used.

DCME bit (Data Compare Match Enable)

It can select whether the Address match function (data compare match function) uses or not.

When DCME is 1b, if SCI detects the match to the comparison data (CCR4.CMPD) with receive data, DCME is cleared automatically, and after that, SCI operation mode will be receive mode without data compare match function.

See **7.3.3.6 Address Match (Receive Data Match Detection) Function**.

The write value should be 0b other than asynchronous mode.

IDSEL bit (ID frame select)

It can select whether it's compared in spite of the value of MPB bit or it's compared only the data of MPB bit = 1b (ID frame) when the Address match function is valid. Please set at the same time as DCME.

RIE bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.

RXI and ERI interrupt request is disabled by setting the RIE bit to 0b.

An ERI interrupt request can be canceled by reading 1b from the CSR.ORER, FER, or PER and then setting the flag to 0, or setting the RIE bit to 0b.

TIE bit (Transmit Interrupt Enable)

Enables or disables a TXI interrupt request.

A TXI interrupt request is disabled by setting the TIE bit to 0b. At the beginning of transmission, set 1b to CCR0.TE and CCR0.TIE simultaneously. Then the TXI interrupt request is generated.

TEIE bit (Transmit End Interrupt Enable)

Enables or disables a TEI interrupt request.

A TEI interrupt request is disabled by setting the TEIE bit to 0b.

In simple I2C mode, the TEI is allocated to the interrupt on completion of issuing a start, restart, or stop condition (STI). In this case, the TEIE bit can be used to enable or disable the STI.

SSE bit (SSn# Pin Function Enable)

Set this bit to 1b if the SSn# pin is to be used in control of transmission and reception (in simple SPI mode). Set this bit to 0b in any other mode. Do not set both the SSE and CTSE (even if this setting is made, operation is the same as that when these bits are set to 0b).

In the slave mode (CCR3.CKE[1:0] = 10b or 11b), SSE should be set to 1b.

In the master mode (CCR3.CKE[1:0] = 00b or 01b) and single-master, the SSn# pin on the master side is not required to control reception and transmission, so SSE should be set to 0b.

7.3.2.2.6 Common Control Register 1 (RSCIm_CCR1)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 000Ch

Initial Value : 0000_0010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	NFEN	-	NFCS[2:0]			-	-	-	SHARPS	-	-	-	SPLP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
28	NFEN	0h	RW	Digital Noise Filter Function Enable (Valid in asynchronous mode, simple-LIN mode and simple-I2C mode) Noise filter function is available for RXD only in asynchronous mode and simple-LIN mode, for SCL and SDA inputs in simple-I2C mode. 0b: Noise filter disabled 1b: Noise filter enabled
27	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
26 to 24	NFCS[2:0]	0h	RW	Noise Filter Clock Select (Valid in asynchronous mode, simple-LIN mode and simple-I2C mode.) Select for the noise filter's clock source. In simple-I2C mode, 000b setting is prohibited. "The baud rate generator source clock" means the clock selected by CCR2.CKS[1:0]. 000b: The base clock signal divided by 1. 001b: The baud rate generator source clock divided by 1. 010b: The baud rate generator source clock divided by 2. 011b: The baud rate generator source clock divided by 4. 100b: The baud rate generator source clock divided by 8. Others: Setting prohibited
23 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20	SHARPS	0h	RW	Half-duplex communication select In the simple I2C mode or in the simple SPI mode, this bit should be set to 0. 0b: The TXD pin and the RXD pin independent 1b: Half-duplex communication using TXD pin
19 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	SPLP	0h	RW	Loopback Control This function is available in asynchronous mode and clock synchronous mode. 0b: Normal mode 1b: Loopback mode
15, 14	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
13	RINV	0h	RW	RXD invert 0b: Received data from RXD is not inverted and input.*2 1b: Received data from RXD is inverted and input.
12	TINV	0h	RW	TXD invert 0b: Transmit data is not inverted and output to TXD.*2 1b: Transmit data is inverted and output to TXD.
11, 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
9	PM	0h	RW	Parity Mode (Valid only when PE = 1b) 0b: Selects even parity 1b: Selects odd parity
8	PE	0h	RW	Parity Enable (Valid only in asynchronous mode. In Smart Card Interface mode, set 1b to this bit.) 0b: Parity bit addition is not performed during transmission. Parity bit checking is not performed during reception. 1b: The parity bit is added during transmission. The parity bit is checked during reception.
7, 6	-	All 0	RW	Reserved Whenever it is read, 10b is read. The written value should always be 10b.
5	SPB2IO	0h	RW	Serial port break I/O This bit selects output or no output on the TXD pin when CCR0.TE = 0b.*1 0b: The value of SPB2DT bit is not output on the TXD pin. 1b: The value of SPB2DT bit is output on the TXD pin.
4	SPB2DT	1h	RW	Serial port break data select The output level of TXD pin is selected when CCR0.TE = 0b.*1 0b: Low level is output on the TXD pin when TINV = 0b. High level is output on the TXD pin when TINV = 1b. 1b: High level is output on the TXD pin when TINV = 0b. Low level is output on the TXD pin when TINV = 1b.
3, 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1	CTSPEN	0h	RW	CTS external pin Enable 0b: 1-pin mode, CTS and RTS share 1 pin. 1b: 2-pin mode, CTS and RTS have dedicated pins.
0	CTSE	0h	RW	CTS Enable 0b: CTS function is disabled (RTS output function is enabled). 1b: CTS function is enabled.

Note: The read access size is fixed at 32 bits.

Note 1. Use this bit in asynchronous mode. Operation in any other mode is not guaranteed.

Note 2. RINV/TINV should be set to 0b in smart card interface mode and simple I2C mode.

CTSE bit (CTS Enable)

Set this bit to 1b if the SSn# pin is to be used for CTS input. The RTS signal is output when this bit is set to 0b. Set this bit to 0b in smart card interface mode, simple SPI mode, simple-LIN mode, and simple I2C mode. Do not set both the CTSE and SSE bits (even if this setting is made, operation is the same as that when these bits are set to 0b).

CTSPEN bit (CTS external pin Enable)

When CTSE is 1b, select the terminals usage method when using the CTS and RTS functions. Set this bit to 1b when assigning the CTS/RTS function to 2 terminals and using them at the same time. Set it to 0b except in asynchronous mode.

Table 7.3-5 shows the relationship between the CTSE bit and CTSPEN bit settings and the functions of the CTSn#/RTSn# terminals.

Table 7.3-5 CTSE Bit and CTSPEN Bit Settings and Pin Functions

CTSE Bit	CTSPEN Bit	CTSn#/RTSn# Pin	CTSn# Pin
0	0	Output RTS	Not used
1	0	Input CTS	Not used
1	1	Output RTS	Input CTS
0	1	Prohibited	Prohibited

SPB2DT bit (Serial port break data select), SPB2IO bit (Serial port break I/O)

The TXD pin status decided by combination of CCR0.TE bit, CCR1.SPB2IO bit and CCR1.SPB2DT bit is indicated in **Table 7.3-6**.

Table 7.3-6 TXD Pin Status

CCR0.TE	CCR1.SPB2IO	CCR1.SPB2DT	TXD Pin Status (when CCR1.TINV = 0b)
0	0	x	Hi-Z (initial value)
0	1	0	Low level output
0	1	1	High level output
1	x	x	Serial transmission data is output.

PE bit (Parity Enable)

When PE bit to 1b, the parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

In the multiprocessor format, the parity bit is not added or checked regardless of this bit setting.

PM bit (Parity Mode)

Selects the parity mode for transmission and reception (even or odd). In multi-processor mode, this bit is invalid.

For details on the usage of this bit in smart card interface mode, see **7.3.5.2 Data Format (Except in Block Transfer Mode)**.

TINV bit (TXD invert), RINV bit (RXD invert)

The data of RDR is controlled by RINV and CCR3.SINV. And the data from TXD pin is controlled by TINV and CCR3.SINV. The control by RINV/TINV are done to communication pins (RXD/TXD), so they can control not only data- bits but also other bits (start bit, stop bit, parity bit). For details, see **Figure 7.3-2**.

During half-duplex communication and slave operation in simple SPI mode, use the TXD pin for reception, so set the inversion control of the received data with the TINV bit.

Note: Description and timing charts in this section assumes CCR1.TINV = 0b and CCR1.RINV = 0b when TINV and RINV value are not specified.

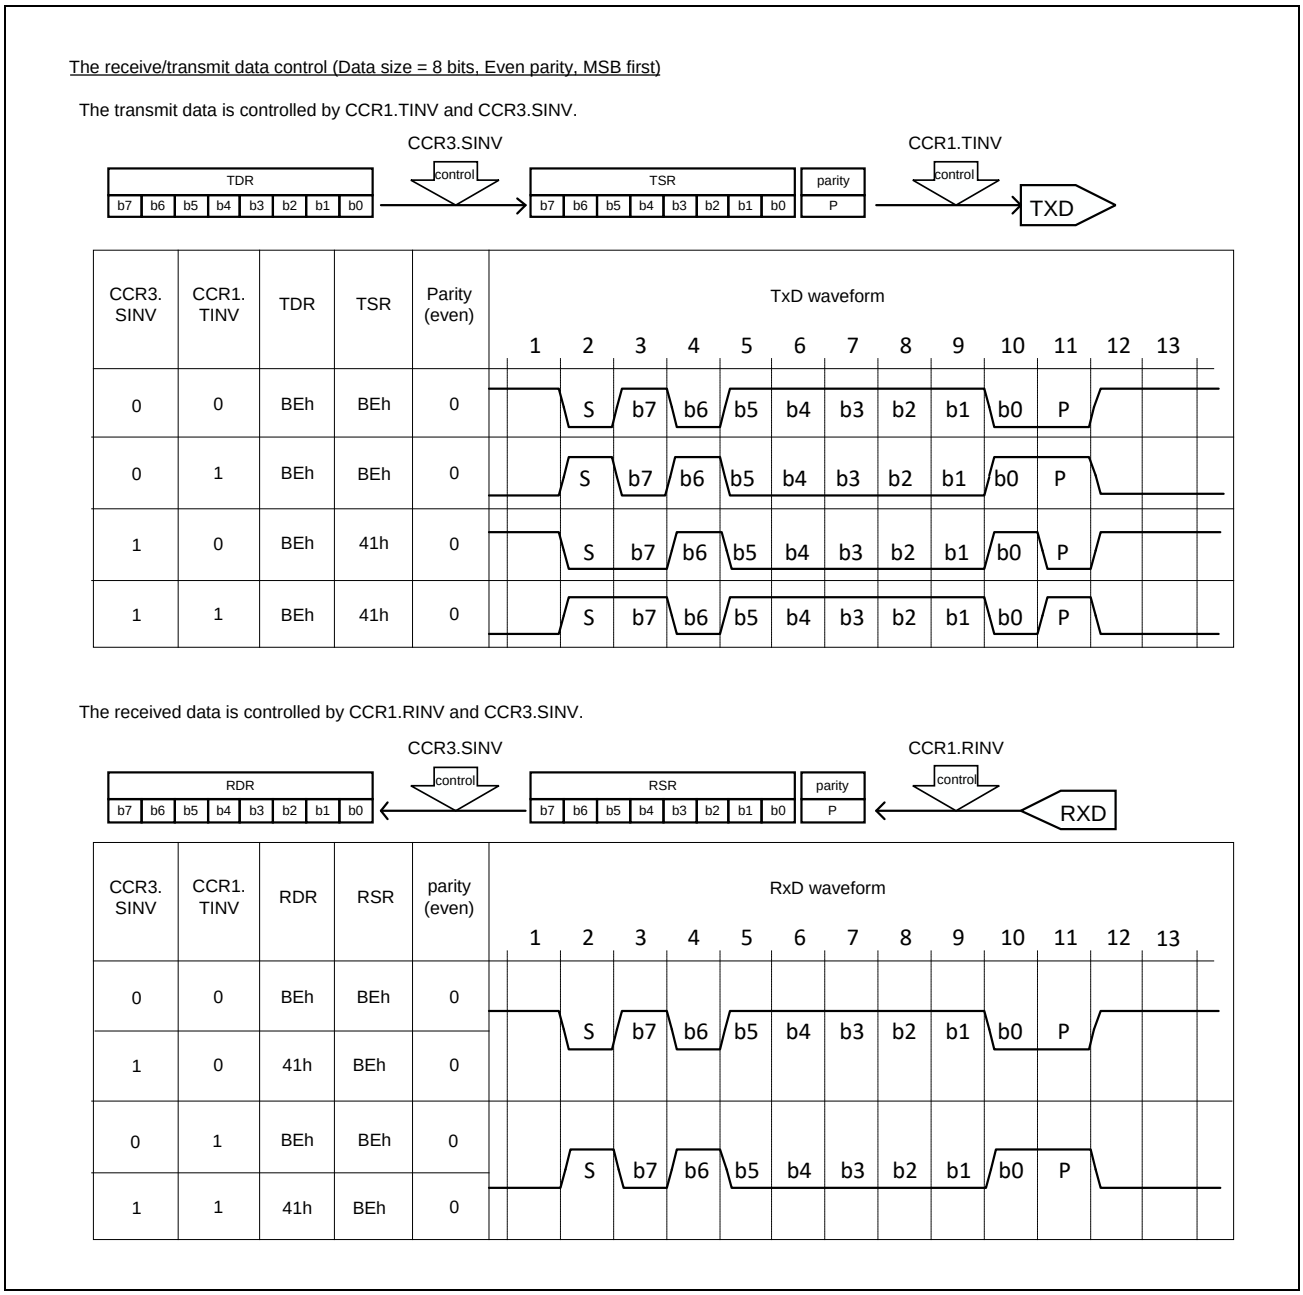

Figure 7.3-2 Example of the Receive/Transmit Data Control

SPLP bit (Loopback Control)

When SPLP = 1b, TXD is connected to RXD internally.

Transmit data can be inverted and received by TINV = 1b.

Set to 0b in asynchronous mode with external clock, clock synchronous mode, slave, and Simple-LIN mode.

SHARPS bit (Half-duplex communication select)

Setting this bit to 1b enables half-duplex communication using the TXD pin. However, it cannot be used in Simple-SPI mode, Simple-I2C mode, and Smart Card Interface mode.

If this bit is set to 1b and CCR0.TE = 1b, CCR0.RE = 0b, the TXD pin is for communication output. If this bit is set to 1b and CCR0.TE = 0b, CCR0.RE = 1b, the TXD pin is for communication input. For details, see **7.3.12 RS-485 Driver Control Function**.

NFCS[2:0] bits (Noise Filter Clock Select)

These bits select the sampling clock for the digital noise filter.

To use the noise filter in asynchronous mode and simple-LIN mode, set these bits from 000b to 100b. In simple I2C mode, set the bits to a value in the range from 001b to 100b.

NFEN bit (Digital Noise Filter Function Enable)

This bit enables or disables the digital noise filter function. When the function is enabled, noise cancellation is applied to the RXDn input in asynchronous mode and simple-LIN mode, and noise cancellation is applied to the SDAn and SCLn input in simple I2C mode. In any mode other than above, set the NFEN bit to 0b.

7.3.2.2.7 Common Control Register 2 (RSCIm_CCR2)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0010h

Initial Value : FF00_FF04h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MDDR[7:0]								-	-	CKS[1:0]		-	-	-	BRME
Initial Value	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRR[7:0]								-	ABCSE	ABCS	BGDM	-	BCP[2:0]		
Initial Value	1	1	1	1	1	1	1	1	0	0	0	0	0	1	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MDDR[7:0]	FFh	RW	Modulation Duty setting MDDR corrects the bit rate adjusted by the BRR register.
23, 22	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
21, 20	CKS[1:0]	0h	RW	Clock Select 00b: RSCI_m_TCLK clock (n = 0)*2 01b: RSCI_m_TCLK/4 clock (n = 1)*2 10b: RSCI_m_TCLK/16 clock (n = 2)*2 11b: RSCI_m_TCLK/64 clock (n = 3)*2
19 to 17	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
16	BRME	0h	RW	Bit Rate Modulation Enable 0b: Bit rate modulation function is disabled. 1b: Bit rate modulation function is enabled.
15 to 8	BRR[7:0]	FFh	RW	Bit rate setting BRR is an 8-bit register that adjusts the bit rate.
7	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
6	ABCSE	0h	RW	Asynchronous Mode Extended Base Clock Select (Valid only in asynchronous mode and CCR3.CKE[1] = 0b) 0b: Clock cycles for 1-bit period are decided in combination with CCR2.BGDM and CCR2.ABCS. 1b: 6 base clock cycles for 1-bit period and doubled frequency is output from the baud rate generator.
5	ABCS	0h	RW	Asynchronous Mode Base Clock Select (Valid only in Asynchronous mode and simple-LIN mode) 0b: Selects 16 base clock cycles for 1-bit period. 1b: Selects 8 base clock cycles for 1-bit period.
4	BGDM	0h	RW	Baud Rate Generator Double-Speed Mode Select Valid in asynchronous/clock-synchronous/simple-SPI mode and CCR3.CKE[1] = 0b. 0b: Baud rate generator outputs the clock with single frequency. 1b: Baud rate generator outputs the clock with doubled frequency.
3	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
2 to 0	BCP[2:0]	4h	RW	Base Clock Pulse Selects the number of base clock cycles in smart card interface mode. 000b: 93 clock cycles (S = 93)*1 001b: 128 clock cycles (S = 128)*1 010b: 186 clock cycles (S = 186)*1 011b: 512 clock cycles (S = 512)*1 100b: 32 clock cycles (S = 32)*1 (Initial value) 101b: 64 clock cycles (S = 64)*1 110b: 372 clock cycles (S = 372)*1 111b: 256 clock cycles (S = 256)*1

Note: The read access size is fixed at 32 bits.

Note 1. S is the value of S in **Table 7.3-8**.

Note 2. n is the decimal notation of the value of n in **Table 7.3-8**.

BCP[2:0] bits (Base Clock Pulse)

The BCP[2:0] bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode.

For details, see **7.3.5.4 Receive Data Sampling Timing and Reception Margin**.

BGDM bit (Baud Rate Generator Double-Speed Mode Select)

The BGDM bit is valid when the baud rate generator is selected as the clock source (CCR3.CKE[1] = 0b) in asynchronous mode, clock synchronous mode, simple-SPI mode. When external clock is selected (CCR3.CKE[1] = 1b), set it to 0b. For the clock output from the baud rate generator, either single or doubled frequency can be selected. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1b, the base clock cycle is halved and the bit rate is doubled.

Set this bit to 0b in modes other than asynchronous mode or clock synchronous mode or simple-SPI.

ABCS bit (Asynchronous Mode Base Clock Select)

Selects the clock cycles for 1-bit period.

Set it to 0b in modes other than asynchronous mode and simple-LIN mode.

ABCSE bit (Asynchronous Mode Extended Base Clock Select)

The pulse number for a base clock at 1-bit period is 6b and the clock of a double frequency is output from baud rate generator. Only when the bit rate is set to 6 dividing frequency of the bus clock, please use this bit and set CCR2.CKS[1:0] = 00b and BRR = 0b.

Set it to 0b in modes other than asynchronous mode. Even in asynchronous mode, set it to 0b when using external clock.

Table 7.3-7 Base Clock Cycle Number per 1-Bit

ABCSE Bit	ABCS Bit	BGDM Bit	The Base Clock Cycles/1 Bit	The Frequency of the Baud Rate Generator
0	0	0	16	×1
0	0	1	16	×2
0	1	0	8	×1
0	1	1	8	×2
1	x	x	6	×2

BRR[7:0] bits (Bit rate setting)

BRR is an 8-bit register that adjusts the bit rate.

SCI has independent baud rate generator control, different bit rates can be set for each. **Table 7.3-8** shows the relationship between the setting (N) in the BRR and the bit rate (B) for asynchronous mode, multiprocessor transfer, clock synchronous mode, smart card interface mode, simple SPI mode, and simple I2C mode.

Table 7.3-8 Relationship between N Setting in BRR and Bit Rate B

Mode	BGDM Bit	ABCS Bit	ABCSE Bit	BRR[7:0] Setting	Error (%)
Asynchronous multiprocessor transfer	0	0	0	$N = \frac{RSCI_{m_{TCLK}} \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	$Error = \left\{ \frac{RSCI_m_TCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$
Simple-LIN*2	1	0	0		
	0	1	0	$N = \frac{RSCI_m_TCLK \times 10^6}{32 \times 2^{2n-1} \times B} - 1$	$Error = \left\{ \frac{RSCI_m_TCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$
	1	1	0	$N = \frac{RSCI_m_TCLK \times 10^6}{16 \times 2^{2n-1} \times B} - 1$	$Error = \left\{ \frac{RSCI_m_TCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$
	x	x	1	$N = \frac{RSCI_m_TCLK \times 10^6}{12 \times 2^{2n-1} \times B} - 1$	$Error = \left\{ \frac{RSCI_m_TCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$
Clock synchronous, Simple-SPI	0	0	0	$N = \frac{RSCI_m_TCLK \times 10^6}{8 \times 2^{2n-1} \times B} - 1$	—
	1	0	0	$N = \frac{RSCI_m_TCLK \times 10^6}{4 \times 2^{2n-1} \times B} - 1$	—
Smart card interface				$N = \frac{RSCI_m_TCLK \times 10^6}{S \times 2^{2n+1} \times B} - 1$	$Error = \left\{ \frac{RSCI_m_TCLK \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1 \right\} \times 100$
Simple-I2C*1				$N = \frac{RSCI_m_TCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	—

Note: B: Bit rate (bps)
N: BRR setting for baud rate generator (0 ≤ N ≤ 255)
RSCI_m_TCLK: Operating frequency (MHz)
n and S: Determined by the settings of the CCR2 registers as listed in the table below. Please be careful about 2^{2n+1} is used in the expression for Smart card interface, 2^{2n-1} is used in other modes.

Note 1. Adjust the bit rate so that the widths at high and low level of the SCL output in simple I2C mode satisfy the I2C standard.

Note 2. In simple-LIN mode, BGDM = 0b and ABCSE = 0b can be selected.

Table 7.3-9 Calculating Widths at High and Low Level for SCL

Mode	SCL	Formula (Result in Seconds)
I^2C	Width at high level (minimum value)	$(N+1) \times 4 \times 2^{2n-1} \times 7 \times \frac{1}{RSCI_m_TCLK \times 10^6}$
	Width at low level (minimum value)	$(N+1) \times 4 \times 2^{2n-1} \times 8 \times \frac{1}{RSCI_m_TCLK \times 10^6}$

Table 7.3-10 Clock Source Settings

CCR2 Setting	Clock Source	n
CKS[1:0] = 00b	RSCI_m_TCLK clock	0
CKS[1:0] = 01b	RSCI_m_TCLK/4 clock	1
CKS[1:0] = 10b	RSCI_m_TCLK/16 clock	2
CKS[1:0] = 11b	RSCI_m_TCLK/64 clock	3

Table 7.3-11 Base Clock Settings in Smart Card Interface Mode

CCR2 Setting	Base Clock Cycles for 1-Bit Period	S
BCP[2:0] = 000b	93 clock cycles	93
BCP[2:0] = 001b	128 clock cycles	128
BCP[2:0] = 010b	186 clock cycles	186
BCP[2:0] = 011b	512 clock cycles	512
BCP[2:0] = 100b	32 clock cycles	32
BCP[2:0] = 101b	64 clock cycles	64
BCP[2:0] = 110b	372 clock cycles	372
BCP[2:0] = 111b	256 clock cycles	256

Table 7.3-12 lists examples of N settings in BRR in asynchronous mode. **Table 7.3-13** and **Table 7.3-18** list the maximum bit rate settable for each operating frequency. Examples of BRR (N) settings in clock synchronous mode and simple SPI mode are listed in **Table 7.3-15**. Examples of BRR (N) settings in smart card interface mode are listed in **Table 7.3-17**. Examples of BRR (N) settings in simple I2C mode are listed in **Table 7.3-19**. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, see **7.3.5.4 Receive Data Sampling Timing and Reception Margin**. **Table 7.3-14** and **Table 7.3-16** list the maximum bit rates with external clock input. **Table 7.3-20** lists the minimum widths at high and low level for SCL at various bit rates.

When either the asynchronous mode base clock select bit (ABCS) or the baud rate generator double-speed mode select bit (BGDM) is set to 1b in asynchronous mode, the bit rate becomes twice that listed in **Table 7.3-12**.

When both of those registers are set to 1b, the bit rate becomes four times the listed value.

Table 7.3-12 Examples of BRR Settings for Various Bit Rates (Asynchronous Mode)

	RSCI_m_TCLK = 100 MHz		
Bit Rate (bps)	n	N	Error (%)
9600	—	—	—
19200	0	162	−0.15
38400	0	80	0.47
57600	0	53	0.47
115200	0	26	0.47

Note: This is an example when CCR2.ABCS = 0b, CCR2.BGDM = 0b and CCR2.ABCSE = 0b.
When either ABCS bit or BGDM bit is set to 1b, the bit rate doubles.
When both ABCS = 1b and BGDM = 1b, the bit rate increases four times.

Table 7.3-13 Maximum Bit Rate for Each Operating Frequency (Asynchronous Mode)

RSCI_m_TCLK (MHz)	BGDM Bit	ABCS Bit	ABCSE Bit	n	N	MAX Baud Rate (Baud)
100	0	0	0	0	0	3,125,000
		1	0	0	0	6,250,000
	1	0	0	0	0	
		1	0	0	0	12,500,000
	x	x	1	0	0	16,666,667

Table 7.3-14 Maximum Bit Rate with External Clock Input (Asynchronous Mode)

RSCI_m_TCLK (MHz)	External Clock (MHz)	Max Baud Rate (Baud)	
		CCR2.ABCS = 0b	CCR2.ABCS = 1b
100	25	1,562,500	3,125,000

Table 7.3-15 BRR Settings for Various Bit Rates (Clock Synchronous Mode, Simple SPI Mode)

	RSCI_m_TCLK = 100 MHz		
Bit Rate (bps)	BGDM Bit	n	N
2.5 M	0	0	9
4 M	—	—	—
5 M	0	0	4
7.5 M	—	—	—
8 M	—	—	—
10 M	1	0	4
12 M	—	—	—
12.5 M	0	0	1
24 M	—	—	—
18.75 M	—	—	—
25 M	0	0	0
37.5 M	—	—	—

Note: '—' can be set, but an error over 10% will occur.

Table 7.3-16 Maximum Bit Rate with External Clock Input (Clock Synchronous Mode, Simple SPI Mode)

RSCI_m_TCLK (MHz)	External Clock (MHz)	MAX Bit Rate (Mbps)
100	25.00	25.00

Note: 37.5 MHz is max AC spec in this LSI.

Table 7.3-17 BRR Settings for Various Bit Rates (Smart Card Interface Mode, n = 0, S = 372)

	RSCI_m_TCLK = 100 MHz		
Bit Rate (bps)	n	N	Error (%)
9600	0	13	0.01

Table 7.3-18 Maximum Bit Rate for Each Operating Frequency (Smart Card Interface Mode, S = 32)

RSCI_m_TCLK (MHz)	MAX Bit Rate (bps)	n	N
100	1,562,500	0	0

Table 7.3-19 BRR Settings for Various Bit Rates (Simple I2C Mode)

Bit Rate (kbps)	RSCI_m_TCLK = 100 MHz		
	n	N	Error (%)
100	0	30	0.81
400	0	7	−2.34

Table 7.3-20 Minimum Widths at High and Low Level for SCL at Various Bit Rates (Simple I2C Mode)

	RSCI_m_TCLK = 100 MHz		
Bit Rate (kbps)	n	N	Minimum Width of High/Low Level (µs)
100	0	30	4.34/4.96
400	0	7	1.12/1.28

BRME bit (Bit Rate Modulation Enable)

Enables and disables the bit rate modulation function. The bit rate generated by baud rate generator is evenly corrected when this function is enabled.

Set to 0b in Clock-synchronous mode, Simple-SPI mode, Smart Card Interface mode and simple-LIN mode.

CKS[1:0] bits (Clock Select)

These bits select the clock source for the baud rate generator.

For the relationship between the settings of these bits and the baud rate, refer to BRR explanation.

MDDR[7:0] bits (Modulation Duty setting)

When the BRME bit is set to 1b, the bit rate generated by the baud rate generator is evenly corrected according to the settings of MDDR (M/256). The relationship between the MDDR setting (M) and the bit rate (B) is given in **Table 7.3-21**.

The initial value of MDDR is FFh. Bit 7 in this register is fixed to 1b.

Table 7.3-21 Relationship between MDDR Setting (M) and Bit Rate (B) Using Bit Rate Modulation Function

Mode*1	BGDM Bit	ABCS Bit	ABCSE Bit	BRR Setting	Error (%)
Asynchronous Multiprocessor transfer	0	0	0	$N = \frac{RSCI_m_TCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error = \left\{\frac{RSCI_m_TCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\right\} \times 100$
	1	0	0	$N = \frac{RSCI_m_TCLK \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error = \left\{\frac{RSCI_m_TCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\right\} \times 100$
	0	1	0		
	1	1	0	$N = \frac{RSCI_m_TCLK \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error = \left\{\frac{RSCI_m_TCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\right\} \times 100$
	x	x	1	$N = \frac{RSCI_m_TCLK \times 10^6}{12 \times 2^{2n-1} \times (256/M) \times B} - 1$	$Error = \left\{\frac{RSCI_m_TCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\right\} \times 100$
Simple-I2C*2				$N = \frac{RSCI_m_TCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	

Note: B: Bit rate (bps)
M: MDDR setting (128 ≤ M ≤ 255)
N: BRR setting for bound rate generator (0 ≤ N ≤ 255)
RSCI_m_TCLK: Operating frequency (MHz)
n and S: Determined by the settings of the CCR2.BCP[2:0] and CKS[1:0] as listed in **Table 7.3-10** and **Table 7.3-11**.
Please be careful about 2^{2n+1} is used in the expression for Smart card interface, 2^{2n-1} is used in other modes.

Note 1. Do not use this function in Clock-synchronous mode, Simple-SPI mode, Smart card Interface mode and Simple-LIN mode.

Note 2. Adjust the bit rate so that the widths at high and low level of the SCL output in simple I2C mode satisfy the I2C standard.

Table 7.3-22 lists examples of N settings in BRR and M settings in MDDR in asynchronous mode.

Table 7.3-22 Examples of BRR and MDDR Settings for Various Bit Rates (Asynchronous Mode)

	RSCI_m_TCLK = 100 MHz				
Bit Rate (bps)	n	N	M	BGDM Bit	Error (%)
38400	0	47	151	0	0.00
57600	0	31	151	0	0.00
115200	0	15	151	0	0.00
230400	0	7	151	0	0.00
460800	0	3	151	0	0.00

Note: In this example when CCR2.ABCS = 0b and CCR2.ABCSE = 0b.
CCR2.BRME = 0b (M = 256) disables the bit rate modulation function.

7.3.2.2.8 Common Control Register 3 (RSCIm_CCR3)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0014h

Initial Value : 0000_1203h

Bit	Bit Name	Initial Value	R/W	Description
31, 30	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
29	BLK	0h	RW	Block Transfer Mode (Valid only in Smart card interface mode) 0b: Non-block transfer mode operation 1b: Block transfer mode operation
28	GM	0h	RW	GSM Mode (Valid only in Smart card interface mode) 0b: Non-GSM mode operation 1b: GSM mode operation
27, 26	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
25, 24	CKE[1:0]	0h	RW	Clock enable In the case of asynchronous mode When using the external clock 16 times the bit rate should be input from the SCKm pin when CCR2.ABCS bit is 0b. Input a clock signal with a frequency 8 times the bit rate when the CCR2.ABCS bit is 1b. 00b: The baud rate generator The SCKm pin is available for use as an I/O port in accord with the I/O port settings. 01b: The baud rate generator The clock with the same frequency as the bit rate is output from the SCKm pin. 1xb: External clock In the case of simple-LIN mode 00b:The baud rate generator The SCKm pin is available for use as an I/O port in accord with the I/O port settings. Others: Setting prohibited In the case of Clock synchronous mode, Simple-SPI 0xb: Internal clock (Master operation) The SCKm pin functions as the clock output pin. 1xb: External clock (Slave operation) The SCKm pin functions as the clock input pin. In the case of Smart card interface mode When CCR3.GM = 0b 00b: Output disabled (The SCKm pin can be used for other peripherals.) 01b: Clock output 1xb: Setting prohibited When CCR3.GM = 1b 00b: Output fixed low 10b: Output fixed high x1b: Clock output
23, 22	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
21	DEN	0h	RW	Driver enable (Valid only in Asynchronous mode) 0b: RS-485 Driver control function disable. 1b: RS-485 Driver control function enable.
20	FM	0h	RW	FIFO Mode select (Valid in Asynchronous mode (including multi-processor mode), Clock synchronous mode, and Simple SPI mode) 0b: Non-FIFO mode (TDR and RDR registers are non-FIFO). 1b: FIFO mode (TDR and RDR registers are FIFO). Note: When using DMAC, set to 1b
19	MP	0h	RW	Multi-Processor Mode (Valid in Asynchronous mode) 0b: Multi-processor communications function is disabled. 1b: Multi-processor communications function is enabled.
18 to 16	MOD[2:0]	0h	RW	Communication mode select Select the SCI communication mode. 000b: Asynchronous mode (Multi-processor mode) 001b: Smart card interface mode 010b: Clock synchronous mode 011b: Simple SPI mode 100b: Simple I2C mode 110b: Simple-LIN mode Others: Setting prohibited
15	RXDESEL	0h	RW	Asynchronous Start Bit Edge Detection Select (Valid only in asynchronous mode) Set this bit to 1b in simple-LIN mode. 0b: The low level on the RXDn pin is detected as the start bit. 1b: A falling edge on the RXDn pin is detected as the start bit.
14	STP	0h	RW	Stop Bit Length (Valid in asynchronous mode and simple-LIN mode) 0b: 1 stop bit / Break delimiter length = 1 bit length 1b: 2 stop bits / Break delimiter length = 2 bits length
13	SINV	0h	RW	Transmitted/Received Data Invert The level of communication pins (RXD/TXD) is controlled by the combination of this bit and CCR1.TINV/RINV. For details, see **Figure 7.3-2**. Set this bit to 0 in simple-I2C mode. 0b: TDR contents are transmitted to TSR as they are. RSR contents are stored to RDR as they are. 1b: TDR contents are inverted before being transmitted to TSR. RSR contents are inverted and stored to RDR.
12	LSBF	1h	RW	LSB First select Set this bit to 0b in simple I2C mode. Set this bit to 1b in simple-LIN mode. 0b: MSB first 1b: LSB first
11, 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9, 8	CHR[1:0]	2h	RW	Character Length (Valid in Asynchronous mode)*1 Select the data length for transmission and reception. 00b: Transmit/receive in 9-bit data length 01b: Transmit/receive in 9-bit data length 10b: Transmit/receive in 8-bit data length (initial value) 11b: Transmit/receive in 7-bit data length*2
7	BPEN	0h	RW	Synchronizer bypass enable This bit controls whether to bypass the synchronizer circuit between the bus clock and operation clock. When BPEN = 1, PCLKSPIn (operation clock) is input from RSCI_m_PCLK (Bus clock) and the synchronization circuit is bypassed. See **4.4 Clock Pulse Generator (CPG)**. 0b: Synchronizer circuit is not bypassed. 1b: Synchronizer circuit is bypassed.
6 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
1	CPOL	1h	RW	Clock Polarity Select (Valid in Clock-synchronous mode and Simple-SPI mode. Set this bit only when CCR0.TE = 0b and RE = 0b.) 0b: SCKm in idle state is 0. 1b: SCKm in idle state is 1.
0	CPHA	1h	RW	Clock Phase Select (Valid in Clock-synchronous mode and Simple-SPI mode. Set this bit only when CCR0.TE = 0b and RE = 0b.) 0b: Data is sampled at an odd edge and changes at an even edge. (Clock is delayed.) 1b: Data changes at an odd edge and is sampled at an even edge. (Clock is not delayed.)

Note: The read access size is fixed at 32 bits.

Note 1. In modes other than asynchronous mode, the setting of these bits is invalid and a fixed data length of 8 bits is used. In simple-LIN mode, the data length of 8 bits can only be used, so set these bits to their initial value.

Note 2. LSB first is fixed and the MSB (bit 7) in TDR is not transmitted in transmission.

CPHA bit (Clock Phase Select)

This bit selects the phase of the clock signal output through the SCKm pin. For details, see **Figure 7.3-96**.

Set the bit to 1b in other than simple SPI mode and clock synchronous mode.

CPOL bit (Clock Polarity Select)

This bit selects the polarity of the clock signal output through the SCKm pin. For details, see **Figure 7.3-96**.

Set the bit to 1b in other than simple SPI mode and clock synchronous mode.

BPEN bit (Synchronizer bypass enable)

The synchronization circuit can be bypassed by this bit only when the same clock is input to the bus clock and the operation clock (RSCI_m_TCLK). For details, see **7.3.15 Synchronizer Bypass Function**.

CHR[1:0] bits (Character Length)

Selects the data length for transmission and reception.

Except of asynchronous mode, a fixed data length of 8 bits is used.

LSBF bit (LSB First select)

Select whether to transmit/receive data in MSB first or LSB first.

SINV bit (Transmitted/Received Data Invert)

SINV can invert the transmit data-bit from TDR to TSR, and also can invert the received data from RSR to RDR. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the CCR1.PM.

STP bit (Stop Bit Length)

Selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0b, it is treated as the start bit of the next transmit frame.

In addition, it is used as the Break delimiter length setting when sending Start Frame in simple-LIN mode.

RXDESEL bit (Asynchronous Start Bit Edge Detection Select)

Selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data receiving operation depends on the settings of this bit. Set this bit to 1b when reception should be stopped while a break occurs or

when reception should be started without retaining the RXDn pin input at high level for the period of one data frame or longer after completion of the break.

Set this bit to 1b in simple-LIN mode. Set this bit to 0b in modes other than asynchronous mode and simple-LIN mode.

MOD[2:0] bits (Communication mode select)

Selects the SCI communication mode.

Table 7.3-23 Relationship between Communication Mode Selection Bits (MOD[2:0]), Other Operation Mode Setting Bits

Communication Mode	Asynchronous								SMIF*1	Clock Synchronous		Simple SPI		Simple I2C	Simple LIN
CCR3.MOD[2:0]	000b								001b	010b		011b		100b	110b
CCR3.MP	0				1				—	—		—		—	—
CCR3.FM	0		1		0		1		—	0	1	0	1	—	—
CCR3.DEN	0	1	0	1	0	1	0	1	—	—		—		—	—
CCR0.SSE	—								—	—		0	1	—	—

Note: '—' means setting prohibited.

Note 1. Smart card interface

MP bit (Multi-Processor Mode)

Disables/enables the multi-processor communications function. The settings of the PE bit and PM bit are invalid in multi- processor mode.

FM bit (FIFO Mode select)

When FM = 1b, the TDR register/RDR register switches to FIFO mode.

DEN bit (Driver enable)

Select RS-485 Driver control function disable or enable.

CKE[1:0] bits (Clock enable)

These bits select the clock source and SCKm pin function.

In smart card interface mode, these bits control the clock output from the SCKm pin.

In GSM mode, clock output can be dynamically switched. For details, see **7.3.5.8 Clock Output Control**.

GM bit (GSM Mode)

Setting this bit to 1b allows GSM mode operation.

In GSM mode, the CSR.TEND flag set timing is put forward to 11.0 etu (elementary time unit = 1-bit transfer time) from the start and the clock output control function is appended. For details, see **7.3.5.6 Serial Data Transmission (Except in Block Transfer Mode)** and **7.3.5.8 Clock Output Control**.

BLK bit (Block Transfer Mode)

Setting this bit to 1b allows block transfer mode operation.

For details, see **7.3.5.3 Block Transfer Mode**.

7.3.2.2.9 Common Control Register 4 (RSCIm_CCR4)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0018h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AET	ATT[2:0]			AJD	AST[2:0]			-	-	-	-	-	-	ATEN	ASEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CMPD[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	AET	0h	RW	Adjustment edge for transmit timing (Valid in Asynchronous mode using internal clock and simple-LIN mode using internal clock) The adjustable edge is set by this bit. This bit is valid only when ATEN = 1b. For details, see **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)**. The function of adjust transmit timing (Asynchronous Mode). 0b: Adjust the rising edge timing, when CCR1.TINV = 0b. Adjust the falling edge timing, when CCR1.TINV = 1b. 1b: Adjust the falling edge timing, when CCR1.TINV = 0b. Adjust the rising edge timing, when CCR1.TINV = 1b.
30 to 28	ATT[2:0]	0h	RW	Adjustment value for Transmit timing (Valid in Asynchronous mode using internal clock and simple-LIN mode using internal clock) This bit is valid only when ATEN is 1b. The selected edge timing of TxD is adjusted by the following formula. Adjustment edge timing = base clock × the setting value of ATT[2:0] This setting timing is limited by setting the base clock cycles. For details, see **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)**. The function of adjust transmit timing (Asynchronous Mode).
27	AJD	0h	RW	Adjustment Direction for receive sampling timing (Valid in Asynchronous mode using internal clock and simple-LIN mode using internal clock) This bit is valid only when ASEN is 1b. Adjustment direction for RxD receive sampling timing is determined by this bit. For details, see **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)**. The function of adjust receive sampling timing (Asynchronous Mode). 0b: The sampling timing is adjusted backward to the middle of bit. 1b: The sampling timing is adjusted forward to the middle of bit.
26 to 24	AST[2:0]	0h	RW	Adjustment value for receive Sampling Timing This bit is valid only when ASEN is 1b. In asynchronous mode and simple-LIN mode using internal clock The sampling timing of RXDn pin is adjusted from the middle of bit by the following formula. Adjustment sampling timing = base clock × the setting value of AST[2:0]. In Clock-synchronous mode and Simple-SPI mode using internal clock The RxD sampling timing can be adjusted by delaying by 1 to 4 RSCI_m_TCLK. 000b: 1 RSCI_m_TCLK delay 001b: 2 RSCI_m_TCLK delay 010b: 3 RSCI_m_TCLK delay 011b: 4 RSCI_m_TCLK delay Others: Setting prohibited
23 to 18	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
17	ATEN	0h	RW	Adjust transmit timing enable (Valid only in asynchronous mode using internal clock) 0b: Adjust transmit timing disable. 1b: Adjust transmit timing enable.

Bit	Bit Name	Initial Value	R/W	Description
16	ASEN	0h	RW	Adjust receive sampling timing enable (Valid in Asynchronous mode using internal clock, simple-LIN mode using internal clock, Clock-synchronous mode operating as master, and Simple-SPI mode operating as master) 0b: Adjust sampling timing disable. 1b: Adjust sampling timing enable.
15 to 9	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
8 to 0	CMPD[8:0]	0h	RW	Compare Match Data (Valid only in Asynchronous mode) Set the compare data pattern for address match function.

Note: If the description in this document and the timing chart do not specify the ASEN / ATEN setting value, it means that the reception sampling adjustment function and transmission timing adjustment function are OFF (CCR4.ASEN = 0b, CCR4.ATEN = 0b).

Note: The read access size is fixed at 32 bits.

CMPD[8:0] bits (Compare Match Data)

Set the comparison data for receive data when the address match function is enabled (CCR0.DCME = 1b). CCR4.CMPD[8:0] should be written while CCR0.DCME is 0b.

For the comparison data, the length can be selected from 3 types: these are CMPD[6:0] for 7-bit length, CMPD[7:0] for 8-bit length, and CMPD[8:0] for 9-bit length.

ASEN bit (Adjust receive sampling timing enable)

When this bit is 1b, the receive sampling timing adjustment function is enabled. Control is different in Asynchronous mode, Simple-LIN mode, Clock-synchronous mode, and Simple-SPI mode.

For Asynchronous mode using internal clock, see **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)** in details.

For Clock-synchronous mode operating as master and Simple-SPI mode operating as master, see **7.3.8.7 Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with Internal Clock Used** in details. Only the digital delay of the master mode receive sampling clock (MRCLK) can be controlled by this bit.

ATEN bit (Adjust transmit timing enable)

When this bit is 1b, the transmission timing adjustment function is enabled. The transmission timing adjustment function can adjust the edge timing of the waveform output from the TXD pin. See **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)** in details.

AST[2:0] bits (Adjustment value for receive Sampling Timing)

When ASEN = 1b, the receive sampling timing can be adjusted according to this bit setting value.

In Asynchronous mode and Simple-LIN mode using internal clock

The sampling timing of RXD pin is adjusted from the middle of bit by the following formula. This setting value is limited by setting the base clock cycles. For details, see **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)**.

Adjustment sampling timing = base clock × the setting value of AST[2:0].

In Clock-synchronous mode and Simple-SPI mode using internal clock

The RxD sampling timing can be adjusted by delaying 1 to 4 RSCI_m_TCLK. For details, see **7.3.8.7 Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with Internal Clock Used**.

000: 1 RSCI_m_TCLK delay

001: 2 RSCI_m_TCLK delay

010: 3 RSCI_m_TCLK delay

011: 4 RSCI_m_TCLK delay 1xx: Setting prohibited

AJD bit (Adjustment Direction for receive sampling timing)

Set the RXD pin sampling timing adjustment direction from the bit center to the rear or front. See **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)** for details.

ATT[2:0] bits (Adjustment value for Transmit timing)

The edge timing of the TXD pin specified by the AET bit is adjusted by the base clock × ATT[2:0] setting value. The upper limit of the adjustment time that can be set is limited by the number of base clock cycles. See **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)** for details.

AET bit (Adjustment edge for transmit timing)

Set the TXD pin edge for timing adjustment. See **7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)** for details.

7.3.2.2.10 Communication Enable Status Register (RSCIm_CESR)

Access Size : 8 bits
Address : <RSCIm_base> + 001Ch
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	-	-	-	TIST	-	-	-	RIST
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read.
4	TIST	0h	R	0b: TE signal internal state value “0” 1b: TE signal internal state value ”1”
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read.
0	RIST	0h	R	0b: RE signal internal state value “0” 1b: RE signal internal state value “1”

The operation clocks of the communication module and control register can be used asynchronously. Since some control register values are transmitted internally via the synchronization circuit so that they operate correctly even if they are asynchronous, it takes some time for the state to be reflected internally after rewriting the control register.

Communication enable CCR0.TE and CCR0.RE correspond to this register, and when these control bits are changed from 1b to 0b to rewrite the control bits for the next communication, it is necessary to rewrite these control bits after the internal state of the TE and RE signals becomes 0b. If a very slow clock is used as the clock for the communication module, the TE and RE bit values will be reflected slowly internally. At this time, you can check the internal state using this register.

7.3.2.2.11 Half Data Communication Control Register (RSCIm_HCR)

Access Size : 8 bits
Address : <RSCIm_base> + 001Eh
Initial Value : 00h

Bit	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	HDEN
Initial Value	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	HDEN	0h	RW	0b: HDC(Half data communication) function is disabled. 1b: HDC function is enabled.

HDEN (Half Data Communication Enable)

When this bit is 1b, data 0b is communicated as a low pulse only in the first half of the 1-bit period. This function permits setting to 1b only in asynchronous mode.

7.3.2.2.12 Simple I2C Control Register (RSCIm_ICR)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	IICSCLS[1:0]		IICSDAS[1:0]		-	IICSTPREQ	IICRSTAREQ	IICSTAREQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	IICACKT	-	-	-	IICCSC	IICINTM	-	-	-	IICDL[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
23, 22	IICSCLS[1:0]	0h	RW	SCL Output Select 00b: Serial clock output 01b: Generate a start, restart, or stop condition. 10b: Output the low level on the SCLn pin. 11b: Place the SCLn pin in the high-impedance state.
21, 20	IICSDAS[1:0]	0h	RW	SDA Output Select 00b: Serial data output 01b: Generate a start, restart, or stop condition. 10b: Output the low level on the SDAn pin. 11b: Place the SDAn pin in the high-impedance state.
19	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
18	IICSTPREQ	0h	RW	Stop Condition Generation 0b: A stop condition is not generated. 1b: A stop condition is generated. *2 *3 *4 *5
17	IICRSTAREQ	0h	RW	Restart Condition Generation 0b: A restart condition is not generated. 1b: A restart condition is generated. *2 *3 *4 *5
16	IICSTAREQ	0h	RW	Start Condition Generation 0b: A start condition is not generated. 1b: A start condition is generated. *1 *3 *4 *5
15, 14	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
13	IICACKT	0h	RW	ACK Transmission Data 0b: ACK transmission 1b: NACK transmission and reception of ACK/NACK
12 to 10	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
9	IICCSC	0h	RW	Clock Synchronization 0b: No synchronization with the clock signal 1b: Synchronization with the clock signal
8	IICINTM	0h	RW	I2C Interrupt Mode Select 0b: Use ACK/NACK interrupts. 1b: Use reception and transmission interrupts.
7 to 5	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	IICDL[4:0]	0h	RW	SDA Delay Output Select (Cycles below are of the clock signal from the baud rate generator.) 00h: No output delay 01h: 0 to 1 cycle 02h: 1 to 2 cycles 03h: 2 to 3 cycles 04h: 3 to 4 cycles 05h: 4 to 5 cycles ⋮ 1Eh: 29 to 30 cycles 1Fh: 30 to 31 cycles

Note: The read access size is fixed at 32 bits.

Note 1. In the bus free state, perform the start condition generation.

Note 2. In the bus busy state, perform restart or stop condition generation when the SCLn pin after acknowledgment described in **7.3.7 Simple I2C Mode** in **Figure 7.3-66** and **Figure 7.3-67** is low level.

Note 3. Do not set more than one from among the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits to 1b at a given time.

Note 4. Execute the generation of a condition after the value of the IICSTIF flag is 0b.

Note 5. Do not write 0b to this bit while it is 1b. Generation of a condition is suspended by writing 0b to this bit while it is 1b.

IICDL[4:0] bits (SDA Delay Output Select)

These bits are used to set a delay for output on the SDAn pin relative to the falling edge of the output on the SCLn pin. The available delay settings range from no delay to 31 cycles, with the clock signal from the baud rate generator as the base. The signal obtained by frequency-dividing RSCI_m_TCLK by the divisor set in CCR2.CKS[1:0] is supplied as the clock signal from the baud rate generator.

Set these bits to 00h unless operation is in simple I2C mode. In simple I2C mode, set these bits from 01h to 1Fh.

IICINTM bit (I2C Interrupt Mode Select)

This bit selects the sources of interrupt requests in simple I2C mode.

IICCSC bit (Clock Synchronization)

Set the IICCSC bit to 1b if the internally generated SCLn clock signal is to be synchronized when the SCLn pin has been placed at the low level in the case of a wait inserted by the other device, etc.

The SCLn clock signal is not synchronized if the IICCSC bit is 0b. The SCLn clock signal is generated in accord with the rate selected in the BRR regardless of the level being input on the SCLn pin.

Set the IICCSC bit to 1b except during debugging.

IICACKT bit (ACK Transmission Data)

Transmitted data contains ACK bits. Set this bit to 1b when ACK and NACK bits are received.

IICSTAREQ bit (Start Condition Generation)

When a start condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICSTAREQ bit to 1b.

If you want to generate the start condition after generating the stop condition, start the generation of the start condition with a half cycle period of the bit rate from the stop condition generation interrupt request output.

[Setting condition]

- Writing 1b to the bit

[Clearing condition]

- Completion of generation of the start condition

IICRSTAREQ bit (Restart Condition Generation)

When a restart condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICRSTAREQ bit to 1b.

[Setting condition]

- Writing 1b to the bit

[Clearing condition]

- Completion of generation of the restart condition

IICSTPREQ bit (Stop Condition Generation)

When a stop condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICSTPREQ bit to 1b.

[Setting condition]

- Writing 1b to the bit

[Clearing condition]

- Completion of stop condition

IICSDAS[1:0] bits (SDA Output Select)

These bits control output from the SDAn pin.

IICSCLS[1:0] bits (SCL Output Select)

These bits control output from the SCLn pin.

7.3.2.2.13 FIFO Control Register (RSCIm_FCR)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0024h

Initial Value : 1F1F_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	RSTRG[4:0]					RFRST	-	-	RTRG[4:0]				
Initial Value	0	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	W	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TFRST	-	-	TTRG[4:0]					-	-	-	-	-	-	-	DRES
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
28 to 24	RSTRG[4:0]	1Fh	RW	RTS# Output Active Trigger Number Select (Valid in Asynchronous mode (including multi-processor mode) and Clock-synchronous mode) These bits are valid only when CCR3.FM = 1b and CCR1.CTSE = 0b and CCR0.SSE = 0b. Trigger number must be set to 31 or less. 00h: Trigger number 0 ⋮ 1Fh: Trigger number 31
23	RFRST	0h	W	The read value is undefined Receive FIFO Data Register Reset This bit is valid only when CCR3.FM is 1b. The read value is always 0b. 0b: Invalid. This does not affect the operation. 1b: The number of data stored in receive FIFO (RDR register) is 0.
22 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	RTRG[4:0]	1Fh	RW	Receive FIFO data trigger number (Valid in Asynchronous mode (including multi-processor mode), Clock-synchronous mode, and Simple-SPI mode) Trigger number must be set to 31 or less. When DMAC transfer is used, set RTRG[4:0] = 00h. 00h: Trigger number 0 ⋮ 1Fh: Trigger number 31
15	TFRST	0h	W	The read value is undefined Transmit FIFO Data Register Reset This bit is valid only when CCR3.FM is 1b. The read value is always 0b. 0b: Invalid. This does not affect the operation. 1b: The number of data stored in transmit FIFO (TDR register) is 0.
14 to 13	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
12 to 8	TTRG[4:0]	0h	RW	Transmit FIFO data trigger number (Valid in Asynchronous mode (including multi-processor mode), Clock-synchronous mode, and Simple-SPI mode) Trigger number must be set to 31 or less. When DMAC transfer is used, set TTRG[4:0] = 1Fh. 00h: Trigger number 0 ⋮ 1Fh: Trigger number 31

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	DRES	0h	RW	Receive data ready error select (Valid in Asynchronous mode) This bit selects the interrupt request for receive data ready detection. 0b: Receive data full interrupt (RXI) 1b: Receive error interrupt (ERI)

Note: The read access size is fixed at 32 bits.

DRES bit (Receive data ready error select)

Select whether the detection of receive data ready (FRSR.DR = 1b) is the cause of RXI interrupt request or the cause of ERI interrupt request.

TTRG[4:0] bits (Transmit FIFO data trigger number)

The TDRE flag is set to 1b when the quantity of transmit data in the transmit FIFO (TDR register) is equal to or less than the specified transmit triggering number. If CCR0.TIE = 1b, TXI interrupt request is occurred.

TFRST bit (Transmit FIFO Data Register Reset)

When the TFRST bit is set to 1b, the number of the transmission data stored in transmit FIFO (TDR register) is made 0b.

RTRG[4:0] bits (Receive FIFO data trigger number)

The CSR.RDRF flag is set to 1b when the quantity of receive data in the receive FIFO (RDR register) is equal to or greater than the specified receive triggering number. If CCR0.RIE = 1b, RXI interrupt request is occurred. When FCR.RTRG is set to 0b, RDRF bit is set if the quantity of data in receive FIFO is greater than or equal to 1b.

RFRST bit (Receive FIFO Data Register Reset)

When the RFRST bit is set to 1b, the number of the reception data stored in receive FIFO (RDR register) is made 0b.

RSTRG[4:0] bits (RTS# Output Active Trigger Number Select)

When the quantity of receive data stored in the receive FIFO (RDR register) is equal to or greater than this number, the RTS# signal is in the High state. When FCR.RSTRG is set to 0b, RTS# is in the high state if the quantity of data in receive FIFO is greater than or equal to 1b.

7.3.2.2.14 Driver Control Register (RSCIm_DCR)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0030h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	DENGT[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	DEAST[4:0]					-	-	-	-	-	-	-	DEPOL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
20 to 16	DENGT[4:0]	0h	RW	Driver negation time (Valid only in Asynchronous mode) Set the driver negation time. When CCR3.DEN = 1b, the driver negation time is inserted after STOP bit transmission end. Setting DENGT[4:0] = 00h is prohibited.
15 to 13	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
12 to 8	DEAST[4:0]	0h	RW	Driver Assertion Time (Valid only in Asynchronous mode) Set the driver assertion time. When CCR3.DEN = 1b, the driver assertion time is inserted in addition to the normal transmission waiting time. Setting DEAST[4:0] = 00h is prohibited.
7 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	DEPOL	0h	RW	Driver effective polarity select (Valid only in Asynchronous mode) 0b: The DE signal is active high. 1b: The DE signal is active low.

Note: The read access size is fixed at 32 bits.

DEPOL bit (Driver effective polarity select)

Select the active level of the DE signal.

DEAST[4:0] bits (Driver Assertion Time)

Set the driver assertion time (= time from the activation of the DE (Driver Enable) signal to the start of the start bit). It is expressed in base clock units (1/8 or 1/16 bit period) as follows.

Driver assertion time = value of DEAST[4:0] × base clock period + transmission waiting time

DENGT[4:0] bits (Driver negate time)

Set the driver negation time (= time from the end of the last stop bit of the transmitted message until the DE (Driver Enable) signal is disabled). It is expressed in base clock units (1/8 or 1/16 bit period) as follows.

Driver negation time = value of DENGT[4:0] × base clock period

If the transmission data is written during the driver negate time, transmit starting operation is different depends on the writing timing. (The DE signal remains valid, and transmission of the start bit may start after the transmission wait time

has elapsed. Also, the DE signal may become invalid once, and start bit transmission may start after the Driver assertion time + transmission wait time has elapsed.)

7.3.2.2.15 Simple-LIN (SCIX) Control Register 0 (RSCIm_XCR0)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0034h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	BCCS[1:0]		-	AEDIE	COFIE	BFDIE	-	-	BCDIE	BFOIE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBS[2:0]			PIBE	CF1DS[1:0]		CF0RE	BFE	-	-	-	-	-	-	TCSS[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
25, 24	BCCS[1:0]	0h	RW	Select the sampling clock for the bus conflict detection circuit. When CCR2.ABCS=1b, setting BCCS[1:0]=1xb is prohibited. 00b: Base clockNote2 01b: Base clock/2 10b: Base clock/4 11b: Prohibited (same as 10b)
23	-	0h	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
22	AEDIE	0h	RW	Select whether to output an AED interrupt when a valid edge is detected. 0b: Active edge detection interrupt disabled 1b: Active edge detection interrupt enabled
21	COFIE	0h	RW	Select whether to include counter overflow as an ERI interrupt factor. 0b: Counter overflow is not included as an ERI interrupt factor 1b: Counter overflow is included as an ERI interrupt factor
20	BFDIE	0h	RW	Select whether to output a BFD interrupt when a break field is detected. 0b: Break Field detection interrupt disabled 1b: Break Field detection interrupt enabled
19, 18	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
17	BCDIE	0h	RW	Select whether to output an ERI interrupt when a bus collision is detected. 0b: Bus conflict detection is not included as an ERI interrupt factor 1b: Bus conflict detection is included as an ERI interrupt factor
16	BFOIE	0h	RW	Select whether to include Break Field output completion as a TXI interrupt factor. 0b: Break field output completion is not included as a TXI interrupt factor 1b: Break Field output completion is included as a TXI interrupt factor
15 to 13	PIBS[2:0]	0h	RW	Specify one of bits 0 to 7 of Control Field 1 as the priority interrupt bit. 000b: bit 0 of Control Field 1 001b: bit 1 of Control Field 1 010b: bit 2 of Control Field 1 011b: bit 3 of Control Field 1 100b: bit 4 of Control Field 1 101b: bit 5 of Control Field 1 110b: bit 6 of Control Field 1 111b: bit 7 of Control Field 1 *2
12	PIBE	0h	RW	0b: Priority interrupt bit disable 1b: Priority interrupt bit enable

Bit	Bit Name	Initial Value	R/W	Description
11, 10	CF1DS[1:0]	0h	RW	Select the compare data for Control Field 1 00b: Select XCR1.PCF1D[7:0] as the compare data 01b: Select XCR1.SCF1D[7:0] as the compare data 10b: Select both XCR1.PCF1D[7:0] and XCR1.SCF1D[7:0] as the compare data 11b: Prohibited (same as 10b) *2
9	CF0RE	0h	RW	Set the presence or absence of Control Field 0 of Start Frame 0b: No Control Field 0 1b: With Control Field 0 *2
8	BFE	0h	RW	Set the presence or absence of Break Field of Start Frame. 0b: No Break Field 1b: With Break Field *2
7 to 2	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
1, 0	TCSS[1:0]	0h	RW	(Valid in Simple-LIN mode) Select the clock source of the timer in the LIN module. 00b: TCLK 01b: TCLK/4 10b: TCLK/16 11b: TCLK/64 *1

Note: The read access size is fixed at 32 bits.

Note: Base clock: 1/16 period of 1 bit period when CCR2.ABCS = 0b, 1/8 period of 1 bit period when CCR2.ABCS = 1b.

Note 1. You can rewrite TCSS[1:0] only when the timer is stopped (TCST = 0b and SDST = 0b and BMEN = 0b)

Note 2. This bit is a setting bit required for Start Frame reception operation. Rewrite this bit when Start Frame reception or transmission is not in progress (XCR1.SDST = 0b and XCR1.TCST = 0b).

TCSS[1:0] (Timer count clock source select)

Select the clock source of the timer in Simple-LIN module.

BFE (Break Field enable)

Set the presence or absence of Break Field of Start Frame.

CF0RE (Control Field 0 enable)

Set the presence or absence of Control Field 0b of Start Frame.

CF1DS[1:0] (Control Field 1 compare data select)

Select the compare data for Control Field 1b.

PIBE (Priority interrupt bit enable)

Select whether to enable comparison of the priority interrupt bit with Control Field 1b. When this bit is 1b, regardless of the XCR1.CF1CE[7:0] setting value, the bit specified in PIBS[2:0] is compared with the primary comparison data for Control Field 1b (XCR1.PCF1D[7:0]).

PIBS[2:0] (Priority interrupt bit select)

Specify bit N (N = 0 to 7) of Control Field 1 as the priority interrupt bit.

BFOIE (Break Field output completion interrupt enable)

Select whether to include Break Field output completion as a TXI interrupt factor. Set CCR0.TIE = 1b and CCR3.MOD[1:0] = 110b, to output TXI upon completion of Break Field output.

BCDIE (Bus conflict detection interrupt enable)

Select whether to output an ERI interrupt when a bus collision is detected. In Simple-LIN mode (CCR3.MOD[1:0] = 110b), ERI output control is performed with this bit. When CCR3.MOD[1:0] = 110b and BCDIE = 1b, an ERI interrupt is issued when a bus collision is detected even if CCR0.RIE = 0b.

COFIE (Conter overflow interrupt enable)

Select whether to include counter overflow as an ERI interrupt factor. Setting CCR0.RIE = 1b and CCR3.MOD[1:0] = 110b is required to output ERI upon counter overflow.

AEDIE (Active edge detection interrupt enable)

Select whether to output an AED interrupt when a valid edge is detected. To output AED with valid edge detection, XCR1.BMEN = 1b and CCR3.MOD[1:0] = 110b must be set.

BCCS[1:0] (Bus conflict detection clock select)

Select the sampling clock for the bus conflict detection circuit.

7.3.2.2.16 Simple-LIN (SCIX) Control Register 1 (RSCIm_XCR1)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 0038h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CF1CE[7:0]								SCF1D[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PCF1D[7:0]								-	-	BMEN	SDST	-	-	-	TCST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CF1CE[7:0]	0h	RW	Select whether to compare bit N of Control Field 1. (N = 0 - 7) 0b: Control Field 1 bit N compare disabled 1b: Control Field 1 bit N compare enabled
23 to 16	SCF1D[7:0]	0h	RW	The secondary compare data for Control Field 1
15 to 8	PCF1D[7:0]	0h	RW	The priority compare data for Control Field 1
7, 6	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
5	BMEN	0h	RW	0b: Bit rate measurement disabled 1b: Bit rate measurement enabled Set this bit to 1b simultaneously with the SDST bit. When this bit is set to 0b, it can be set to 0b at any timing.
4	SDST	0h	RW	0b: Start Frame/Break Field detection disabled 1b: Start Frame/Break Field detection enabled Do not set this bit and TCST bit to 1b at the same time.
3 to 1	-	All 0	RW	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
0	TCST	0h	RW	0b: Break Field output timer count stopped 1b: Break Field output timer count start Do not set this bit and SDST bit to 1b at the same time.

Note: The read access size is fixed at 32 bits.

TCST (Break Field output start trigger)

[Clearing conditions]

- When 0b is written to TCST. Break Field output timer count is stopped and TXD output becomes idle.
- When Break Field output for the period set in XCR2.BFLW[15:0] is completed.

[Setting condition]

- When 1b is written to TCST. Start Break Field output from TXD. Holds 1b during Break Field output.

SDST (Start Frame detection start enable)

When 1b is written to this bit, Start Frame detection starts. When XCR0.BFE = 1b is set, Break Field can be detected during and after Start frame detection. When XCR0.BFE = 0b is set, Break Field is not detected. When 0b is written to this bit, Start Frame detection and Break Field detection are stopped. However, if XSR0.RXDSF = 0b when stopped, it is not possible to stop data reception of the SCI core with this bit. Write 0b to CCR0.RE to stop the reception operation or perform reception completion processing (CSR.RDRF clear or RDR read) after reception is completed.

BMEN (Bit rate measurement enable)

Set this bit to 1b simultaneously with the SDST bit. When this bit is set to 1b, the valid edge interval of Control Field 0b and Control Field 1b data is measured.

PCF1D[7:0] (Priority compare data for Control Field 1)

Set the priority compare data for Control Field 1.

SCF1D[7:0] (Secondary compare data for Control Field 1)

Set the secondary compare data for Control Field 1.

CF1CE[7:0] (Control Field 1 compare bit enable)

Select whether to compare bit N of Control Field 1. (N = 0 to 7)

When all of these bits are set to 0b (CF1CE[7:0] = 00h), it is always judged that Control Field 1 matches when reception is completed, and XSR0.CF1MF is set. This bit is a comparison enable with PCF1D[7:0] or SCF1D[7:0], and it is not a priority interrupt bit comparison enable.

7.3.2.2.17 Simple-LIN (SCIX) Control Register 2 (RSCIm_XCR2)

Access Size : 8, 16, 32 bits
Address : <RSCIm_base> + 003Ch
Initial Value : FFFE_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BFLW[15:0]															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CF0CE[7:0]								CF0D[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	BFLW[15:0]	FFFEh	RW	This register sets the Break Field length. The break field length is (BFLW [15:0] setting value + 1) x clock of the timer. The upper limit for setting this register is FFFEh. (Setting prohibited for FFFFh)
15 to 8	CF0CE[7:0]	0h	RW	Select whether to compare bit N of Control Field 0. (N = 0 - 7) 0b: Control Field 0 bit N compare disabled 1b: Control Field 0 bit N compare enabled
7 to 0	CF0D[7:0]	0h	RW	The compare data for Control Field 0

Note: The read access size is fixed at 32 bits.

CF0D[7:0] (Control Field 0 compare data)

The compare data for Control Field 0.

CF0CE[7:0] (Control Field 0 compare bit enable)

Select whether to compare bit N of Control Field 0. (N = 0 to 7)

When all of these bits are set to 0b (CF0CE[7:0] = 00h), it is always judged that Control Field 0 matches when reception is completed, and XSR0.CF0MF is set.

BFLW[15:0] (Break Field length setting)

BFLW[15:0] are 16-bit Break Field length setting bits and the initial value is FFFEh.

Set the break field length to 1 frame or more. The LIN standard stipulates that the Break Field length is 13 bits or more.

When sending the Break Field, write 1b to TCST. SCI starts output of the Break Field on TXD. Up-counting is performed with the clock of the timer selected by XCR0.TCSS[1:0]. When the count value matches the value set in this register, up-counting is stopped and Break Field output from TXD is also stopped.

When receiving the Break Field, write 1b to SDST to enable Start-Frame detection. SCI starts counting from the negative edge of RXD. The clock of the timer is selected by XCR0.TCSS[1:0]. When the count value matches the value set in this register, it is determined that a break field has been detected. Up-counting continues until the next valid edge or counter overflow.

7.3.2.2.18 Common Status Register (RSCIm_CSR)

Access Size : 32 bits

Address : <RSCIm_base> + 0048h

Initial Value : 6000_8000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	RDRF	0h	R	Receive Data Full Flag 0b: No received data is in RDR register (Non-FIFO mode) The quantity of receive data written in receive FIFO falls below the specified receive triggering number (FIFO mode) 1b: Received data is in RDR register (Non-FIFO mode) The quantity of receive data written in receive FIFO is equal to or greater than the specified receive triggering number (FIFO mode)
30	TEND	1h	R	Transmit End Flag 0b: A character is being transmitted or standing by for transmission. 1b: Character transfer has been completed or Break field is being transmitted.
29	TDRE	1h	R	Transmit Data Empty Flag 0b: Transmit data is in TDR register (Non-FIFO mode) The quantity of transmit data written in transmit FIFO exceeds the specified transmit triggering number. (FIFO mode) 1b: No transmit data is in TDR register (Non-FIFO mode) The quantity of transmit data written in transmit FIFO is equal to or less than the specified transmit triggering number. (FIFO mode)
28	FER	0h	R	Framing Error Flag 0b: No framing error occurred (Non-FIFO mode) No framing error in all received data in receive FIFO (FIFO mode) 1b: A framing error has occurred (Non-FIFO mode) One or more framing errors occurred in received data in receive FIFO (FIFO mode)
27	PER	0h	R	Parity Error Flag 0b: No parity error occurred (Non-FIFO mode) No parity error in all received data in receive FIFO (FIFO mode) 1b: A parity error has occurred (Non-FIFO mode) One or more parity errors occurred in received data in receive FIFO (FIFO mode)
26	MFF	0h	R	Mode Fault Error Flag (Valid only in Simple-SPI mode) 0b: No mode fault error 1b: Mode fault error
25	-	0h	R	Reserved Whenever it is read, 0b is read.
24	ORER	0h	R	Overrun Error Flag 0b: No overrun error occurred. 1b: An overrun error has occurred.
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read.
18	DFER	0h	R	Data Compare Match Framing Error Flag (Valid only in Asynchronous mode) 0b: No framing error occurred at address match detection. 1b: A framing error has occurred at address match detection.

Bit	Bit Name	Initial Value	R/W	Description
17	DPER	0h	R	Data Compare Match Parity Error Flag (Valid only in Asynchronous mode) 0b: No parity error occurred at address match detection. 1b: A parity error has occurred at address match detection.
16	DCMF	0h	R	Data Compare Match Flag (Valid only in Asynchronous mode) 0b: Not matched 1b: Matched
15	RXDMON	1h	R	Serial input data monitor The state of the RXD pin without synchronizing by bus clock is shown. 0b: RXD pin is at the Low level when CCR1.RINV = 0b. RXD pin is at the High level when CCR1.RINV = 1b. 1b: RXD pin is at the High level when CCR1.RINV = 0b. RXD pin is at the Low level when CCR1.RINV = 1b.
14 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read.
4	ERS	0h	R	Error Signal Status Flag (Valid only in Smart card interface mode) 0b: Error signal Low not responded 1b: Error signal Low responded
3 to 0	-	All 0	R	Reserved Whenever it is read, 0b is read.

ERS bits (Error Signal Status Flag)

[Setting condition]

- When an error signal LOW is sampled.

[Clearing condition]

- When 1b is written to CFCLR.ERSC.

DCMF bit (Data Compare Match Flag)

Indicates that SCI detects the match to the comparison data (CCR4.CMPD) with receive data.

Clearing the CCR0.RE bit to 0b does not affect the DCMF flag, which retains its previous state.

[Setting condition]

- Matching of the comparison data (CCR4.CMPD) with receive data, while CCR0.DCME = 1b.

[Clearing condition]

- When 1b is written to CFCLR.DCMFC.

DPER bit (Data Compare Match Parity Error Flag)

Indicates that a parity error occurred at Address Match detection (reception data match detection).

Clearing the CCR0.RE bit to 0b does not affect the DPER flag, which retains its previous state.

[Setting condition]

- When a parity error was detected by the frame in which an address match was detected.

[Clearing condition]

- When 1b is written to CFCLR.DPERC.

DFER bit (Data Compare Match Framing Error Flag)

Indicates that a framing error occurred at Address Match detection (reception data match detection).

Clearing the CCR0.RE bit to 0b does not affect the DFER flag, which retains its previous state.

[Setting condition]

- When a stop bit of the frame in which an Address Match was detected is 0b.
  When it is a 2-stop mode, the 1st bit of stop bit judges only whether it's 1 and does not check the 2nd bit of stop bit.

[Clearing condition]

- When 1b is written to CFCLR.DFERC.

ORER bit (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

Clearing the CCR0.RE bit to 0b does not affect the ORER flag, which retains its previous state. In simple-I2C mode, this bit is not use.

[Setting condition in Non-FIFO mode (CCR3.FM = 0b)]

- When the next data is received before reading out RDR with no-error reception data stored in RDR.
  In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1b, reception data is not forwarded to RDR register.
  Note that, in clock synchronous mode and simple-SPI mode, serial reception will be stopped.

[Setting condition in FIFO mode (CCR3.FM = 1b)]

- When the next serial reception is completed while the receive FIFO is full of NFIFO (= 32) receive data. (NFIFO: Indicates the number of available FIFO stages)

[Clearing condition]

- When 1b is written to CFCLR.ORERC.

MFF bit (Mode Fault Error Flag)

This bit indicates mode fault errors. In a multi-master mode, determine the mode fault error occurrence by reading the MFF flag.

[Setting condition]

- Input on the SSn# pin being at the low level during master operation (CCR3.CKE[1:0] = 00b or 01b) in simple SPI mode.

[Clearing condition]

- When 1b is written to CFCLR.MFFC.

PER bit (Parity Error Flag)

Indicates that a parity error has occurred during reception and the reception ends abnormally.

Clearing the CCR0.RE bit to 0b does not affect the PER flag, which retains its previous state.

In Clock-synchronous mode, Simple-SPI mode, and Simple-I2C mode, this bit is not used.

[Setting condition]

- When a parity error is detected during reception.
  In FIFO mode, when one or more parity errors are detected in receive FIFO data.
  In non-FIFO mode, although receive data where the parity error has occurred is transferred to RDR, no RXI interrupt request occurs. Note that while the PER flag is set to 1b, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 1b is written to CFCLR.PERC.

FER bit (Framing Error Flag)

Indicates that a framing error has occurred during reception and the reception ends abnormally.

Clearing the CCR0.RE bit to 0b does not affect the FER flag, which retains its previous state.

In Clock-synchronous mode, Simple-SPI mode, and Simple-I2C mode, this bit is not used.

[Setting condition]

- When 0 is sampled as the stop bit during reception.
  In FIFO mode, when one or more framing errors are detected in receive FIFO data. In simple-LIN mode, even if a condition that the bit changes to 1b occurs when XCR1.SDST = 1b, the FER set timing is delayed up to the Break Field judgment timing at the longest, since it may be a Break Field. If an edge is detected on the RXD signal before the Break Field judgment timing, FER is detected. If no edge is detected in the RXD signal before the Break Field judgment timing, Break Field is detected.
  In 2-stop-bit mode, only the first stop bit is checked whether it is 1b but the second stop bit is not checked. Note that in non-FIFO mode, although receive data where the framing error has occurred is transferred to RDR, no RXI interrupt request occurs. In addition, while the FER flag is set to 1b, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 1b is written to CFCLR.FERC.

TDRE bit (Transmit Data Empty Flag)

[Non-FIFO selected (CCR3.FM = 0b)]

Indicates the presence of transmit data in the TDR register.

The condition of CCR0.TE = 0b has priority over the condition of 0b.

If other conditions that become 1b and conditions that become 0b are satisfied at the same time, the TDRE flag is set to 0b.

[Setting condition]

- When CCR0.TE is 0b.
- When data is transmitted from the TDR register to the TSR register.

[Clearing condition]

- When 1b is written to CFCLR.TDREC.
- When the transmission data is written to the TDR register during CCR0.TE = 1b.

[FIFO selected (CCR3.FM = 1b)]

- Indicates that data has been transferred from the transmit FIFO (TDR) into the transmit shift register (TSR), the quantity of data in transmit FIFO has fallen below the specified transmit triggering number.
  When the condition which becomes 1b and the condition which becomes 0b were formed at the same time, TDRE flag will be 0b. After that, when the number of data stored in transmit FIFO is judged, and if that is equal to or less than TTRG value, TDRE is set to 1b after 1b RSCI_m_PCLK.

[Setting condition]

- When the quantity of transmit data written in transmit FIFO is equal to or less than the specified transmit triggering number.*[1]

[Clearing condition]

- When 1b is written to CFCLR.TDREC.

- When the transmission data is written to transmit FIFO by the DMAC.

Note 1. The transmit FIFO is 32-stage FIFO, the maximum number of data that can be written when the TDRE flag is 1b is “NFIFO (= 32) - FTSR.T[5:0]”. Even if data any more is written, data is discarded.

TEND bit (Transmit End Flag)

[Non-FIFO selected (CCR3.FM = 0b), and Not Smart card interface mode (CCR3.MOD[2:0] ≠ 001b)]

Indicates completion of transmission.

[Setting condition]

- When CCR0.TE is 0b.
- When the CCR0.TE bit is changed from 0b to 1b, the TEND flag is not affected and retains the value 1b.
- When the TDR register is not updated at transmission of the tail-end bit of a character.
- When the TDR register is not updated at the end of DE negate time with DE control function enable (CCR3.DEN = 1b).
- When Break Field is sent.

[Clearing condition]

- After the synchronization delay time has elapsed since the transmission data was written to the TDR register during CCR0.TE = 1b.
- When 1b is written to CFCLR.TDREC during CCR0.TE = 1b.

[Non-FIFO selected (CCR3.FM = 0b), and Smart card interface mode (CCR3.MOD[2:0] = 001b)]

With no error signal from the receiving side, this bit is set to 1b when next data is ready to be transferred to the TDR register.

[Setting condition]

- When CCR0.TE is 0b.
- When the CCR0.TE bit is changed from 0b to 1b, the TEND flag is not affected and retains the value 1.
- When ERS flag is 0b and TDR register is not updated after 1-byte transmission + fixed time, the set timing is determined by setting CCR3 register as listed below.
  - When GM = 0b and BLK = 0b, 12.5 etu after the start of transmission
  - When GM = 0b and BLK = 1b, 11.5 etu after the start of transmission
  - When GM = 1b and BLK = 0b, 11.0 etu after the start of transmission
  - When GM = 1b and BLK = 1b, 11.0 etu after the start of transmission

[Clearing condition]

- After the synchronization delay time has elapsed since the transmission data was written to the TDR register during CCR0.TE = 1b.
- When 1b is written to CFCLR.TDREC during CCR0.TE = 1b.

[FIFO selected (CCR3.FM = 1b)]

Indicates that the transmit FIFO does not contain valid data when transmitting the last bit of a serial character, so the transmission is halted.

[Setting condition]

- TEND is set to 1b when transmit FIFO does not contain transmit data when the last bit of a one-byte serial character is transmitted.
- When the TDR register is not updated at the end of DE negate time with DE control function enable (CCR3.DEN = 1b).

[Clearing condition]

- After the synchronization delay time has elapsed since the transmission data was written to the TDR register during CCR0.TE = 1b.

RDRF bit (Receive Data Full Flag)

[Non-FIFO selected (CCR3.FM = 0b)]

Indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register.

[Clearing condition]

- When 1b is written to CFCLR.RDRFC.
- When a data is read from the RDR register.

[FIFO selected (CCR3.FM = 1b)]

Indicates that receive data has been transferred to the receive FIFO data register (RDR), and the quantity of data in receive FIFO is equal to or greater than the specified receive triggering number. When FCR.RTRG is set to 0b, RDRF is set if receive FIFO is not empty.

[Setting condition]

RDRF is set to 1b when the quantity of receive data in receive FIFO is equal to or greater than the specified receive triggering number.*[1]

[Clearing condition]

- When 1b is written to CFCLR.RDRFC.
- When the reception data is read from receive FIFO by the DMAC.
  When setting condition and clearing condition are occurred at the same time, RDRF flag will be 0b. After that, if the data count in receive FIFO is equal to or greater than RTRG value, RDRF is set to 1b after 1 RSCI_m_PCLK.

Note 1. Since the receive FIFO is NFIFO (= 32) stage, the maximum quantity of data that can be read when RDRF is 1b is equal to FRSR.R[5:0]. Further data can be read, but the value is undefined.

Note: In Non-FIFO mode, except when interrupting communication, RDRF and TDRE should not be cleared by CFCLR register.

7.3.2.2.19 Simple I2C Status Register (RSCIm_ISR)

Access Size : 32 bits

Address : <RSCIm_base> + 004Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	IICSTIF	-	-	IICACKR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read.
5 to 4	-	All 0	R	Reserved Whenever it is read, initial value is read.
3	IICSTIF	0h	R	Issuing of Start, Restart, or Stop Condition Completed Flag 0b: There are no requests for generating conditions or a condition is being generated. 1b: A start, restart, or stop condition is completely generated.
2	-	0h	R	Reserved Whenever it is read, initial value is read.
1	-	0h	R	Reserved Whenever it is read, 0b is read.
0	IICACKR	0h	R	ACK Reception Data Flag 0b: ACK received 1b: NACK received

IICACKR bit (ACK Reception Data Flag)

Received ACK and NACK bits can be read from this bit.

The IICACKR flag is updated at the rising of SCLn clock for the ACK/NACK receiving bit.

IICSTIF bit (Issuing of Start, Restart, or Stop Condition Completed Flag)

After generating a condition, this bit indicates that the generation is completed. When using the IICSTAREQ, IICRSTAREQ, or IICSTPREQ, do it after clearing the IICSTIF flag.

When the IICSTIF flag is 1b while CCR0.TEIE = 1b, an STI request is output.

[Setting condition]

Completion of the generation of a start, restart, or stop condition (when setting condition and clearing condition are occurred at the same time, IICSTIF will be 0b).

[Clearing condition]

- Writing 1b to ICFCLR.IICSTIFC bit
- When operation is not in simple-I2C
- Writing 0b to CCR0.TE bit

7.3.2.2.20 FIFO Receive Status Register (RSCIm_FRSR)

Access Size : 32 bits
Address : <RSCIm_base> + 0050h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	FNUM[5:0]						-	-	PNUM[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	R[5:0]						-	-	-	-	-	-	-	DR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved Whenever it is read, 0b is read.
29 to 24	FNUM[5:0]	0h	R	Framing Error Count (Valid only in Asynchronous mode) Indicates the quantity of data with a framing error among the data in receive FIFO.
23 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read.
21 to 16	PNUM[5:0]	0h	R	Parity Error Count (Valid only in Asynchronous mode) Indicates the quantity of data with a parity error among the data in receive FIFO.
15 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read.
13 to 8	R[5:0]	0h	R	Receive FIFO Data Count (Valid in Asynchronous mode (including multi-processor), Clock synchronous mode, Simple SPI mode, when CCR3.FM is 1b.) Indicate the quantity of data in receive FIFO.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read.
0	DR	0h	R	Receive Data Ready flag 0b: Receiving is in progress, or no received data has remained in receive FIFO after normally completed reception. (Receive FIFO is empty.) 1b: The following receive data does not come for a fixed period after storing data below the threshold.

DR bit (Receive Data Ready flag)

Indicates that the quantity of data stored in the receive FIFO falls below the specified receive triggering number, and that no next data has been received yet after the elapse of 15 etu from the last stop bit in asynchronous mode. This bit is valid only asynchronous mode (including multi-processor mode) and FIFO selected. In other modes, this bit does not set to 1b.

[Setting conditions]

DR is set to 1b when both of the following conditions are met.

- Data in receive FIFO is less than the specified receive triggering number, and no next data is received after the elapse of 15 etu*1 from the last stop bit.
- CSR.FER, PER flags are 0b.

[Clearing conditions]

- When all receive data in the receive FIFO is read and 1b is written to FFCLR.DRC.

- When CCR3.FM bit is 0b.

Note 1. This is equivalent to one and a half (1.5) frames in the 8-bit format with one stop bit (etu: elementary time unit).

R[5:0] bits (Receive FIFO Data Count)

Indicate the quantity of receive data stored in receive FIFO.

00h means no receive data. NFIFO (= 32) means receive FIFO is full.

PNUM[5:0] bits (Parity Error Count)

Indicate the quantity of data with parity error in the received FIFO.

FNUM[5:0] bits (Framing Error Count)

Indicate the quantity of data with framing error in the received FIFO.

7.3.2.2.21 FIFO Transmit Status Register (RSCIm_FTSR)

Access Size : 32 bits

Address : <RSCIm_base> + 0054h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	T[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read.
5 to 0	T[5:0]	0h	R	Transmit FIFO Data Count (Valid in Asynchronous mode (including multi-processor), Clock synchronous mode, and Simple SPI mode, when CCR3.FM is 1b.) Indicate the quantity of non-transmitted data stored in transmit FIFO.

T[5:0] bits (Transmit FIFO Data Count)

Indicate the quantity of non-transmitted data stored in transmit FIFO.

00h means no un-transmit data. NFIFO (= 32) means transmit FIFO is full.

7.3.2.2.22 Simple-LIN (SCIX) Status Register 0 (RSCIm_XSR0)

Access Size : 32 bits

Address : <RSCIm_base> + 005Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CF1RD[7:0]								CF0RD[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AEDF	COF	PIBDF	CF1MF	CF0MF	BFDF	BCDF	BFOF	-	-	-	-	-	-	RXDSF	SFSF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CF1RD[7:0]	0h	R	Control Field 1 received data
23 to 16	CF0RD[7:0]	0h	R	Control Field 0 received data
15	AEDF	0h	R	0b: No valid edge detected 1b: Detected a valid edge
14	COF	0h	R	0b: Break Field detection counter has not overflowed 1b: Break Field detection counter
13	PIBDF	0h	R	0b: Priority interrupt bit is not detected 1b: Priority interrupt bit is detected
12	CF1MF	0h	R	0b: Control Field 1 received data does not match the setting data 1b: Control Field 1 received data matches the setting data
11	CF0MF	0h	R	0b: Control Field 0 received data does not match the setting data 1b: Control Field 0 received data matches the setting data
10	BFDF	0h	R	0b: BF is not detected 1b: BF is detected
9	BCDF	0h	R	0b: No bus collision detected 1b: Detected a bus collision
8	BFOF	0h	R	0b: Break Field is being output or is not being output 1b: Completed BF output
7 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read.
1	RXDSF	0h	R	0b: RXD input to RSCI core is enabled 1b: RXD input to RSCI core is disabled (RXD is not input to the RSCI core)
0	SFSF	0h	R	0b: Start Frame detection disabled or Start Frame detection complete 1b: Before Start Frame detection or during detection

Note: When RSCI_m_PCLK is faster than RSCI_m_TCLK, the flag set timing is delayed from the receive data full interrupt (RXI) output. To see this flag under these conditions, wait at least 1 RSCI_m_TCLK cycle after the receive data full interrupt (RXI) before reading this register.

SFSF (Start Frame status flag)

Indicates whether Start Frame is being detected.

[Setting conditions]

- When 1b is written to XCR1.SDST.
- When a Break Field is detected in the Control Field 0/ Control Field 1/Information Field phase and the transition to the Control Field 0 or Control Field 1 reception state occurs.

[Clearing conditions]

- When XCR1.SDST is 0b.
- When Start Frame detection is completed.

RXDSF (RXD input status flag)

Indicates the RXD input status to the SCI core. When this bit is 1b, RXD input is received only by the simple LIN module and the Break Field is detected and is not input to the SCI core.

BFOF (Break Field output completion flag)

Indicates the completion of Break Field output.

[Setting condition]

- When Break Field output is completed

[Clearing condition]

- When 1b is written to XFCLR.BFOC

BCDF (Bus conflict detection flag)

Indicates the detection of bus conflict in Simple-LIN transmit operation.

[Setting condition]

- When Bus Conflict is detected

[Clearing condition]

- When 1b is written to XFCLR.BCDC

BFDF (Break Field detection flag)

Indicates Break Field detection.

[Setting condition]

- When Break Field is detected

[Clearing condition]

- When 1b is written to XFCLR.BFDC

CF0MF (Control Field 0 compare match flag)

Indicates compare match between Control Field 0 and compare data.

[Setting condition]

- When Control-Field-0 data and the compare data match

[Clearing condition]

- When 1b is written to XFCLR.CF0MC

CF1MF (Control Field 1 compare match flag)

Indicates the detection of a compare match between Control Field 1 and compare data.

[Setting condition]

- When Control-Field-1 data and the compare data match

[Clearing condition]

- When 1b is written to XFCLR.CF1MC

PIBDF (Priority interrupt bit detection flag)

Indicates the detection of a compare match between Control Field 1 and priority interrupt bit.

[Setting condition]

- When the priority interrupt bit is detected

[Clearing condition]

- When 1b is written to XFCLR.PIBDC

COF (Counter overflow flag)

Indicates that the 16-bit counter in the simple LIN module has overflowed.

[Setting condition]

- When the counter for Break Field detection overflows

[Clearing condition]

- When 1b is written to XFCLR.COFC

AEDF (Active edge detection flag)

Indicates active edge detection.

[Setting condition]

- When Active edge is detected

[Clearing condition]

- When 1b is written to XFCLR.AEDC
- When XSR1.TCNT[15:0] are read out

CF0RD[7:0] (Control Field 0 received data)

Stores the received data with a Control Field 0 match detected.

CF1RD[7:0] (Control Field 1 received data)

Stores the received data with a Control Field 1 match detected.

7.3.2.2.23 Simple-LIN (SCIX) Status Register 1 (RSCIm_XSR1)

Access Size : 32 bits
Address : <RSCIm_base> + 0060h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read.
15 to 0	TCNT[15:0]	0h	R	Stores the 16-bit counter capture value. The initial value is 0000h.

TCNT[15:0] (Timer count capture value)

Stores the capture value of the 16-bit counter of the simple-LIN module.

When sending Start Frame, this register holds the previous value.

When receiving Start frame with Bit rate measurement disabled, if a break field is detected in the break field detection state (see **Figure 7.3-61**), the break field length is captured and held (counter value is captured at the rising edge of RXD). If a Break Field is detected in a state other than the Break Field detection state, the previous value is retained. If the counter overflows, it will not be captured.

When receiving Start frame with Bit rate measurement enabled, the count value is captured and held at the valid edge (both RXD edges). However, in the Break Field detection state, the count value is not captured even if a valid edge occurs. Counter capture value retention is canceled by reading this register. Even if a valid edge occurs before reading, the counter value is not captured.

7.3.2.2.24 Common Flag Clear Register (RSCIm_CFCLR)

Access Size : 8, 16, 32 bits

Address : <RSCIm_base> + 0068h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDRFC	-	TDREC	FERC	PERC	MFFC	-	ORERC	-	-	-	-	-	DFERC	DPERC	DCMFC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All0	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.
15	AEDC	0h	W	Setting this bit to 1b clears the XSR0.AEDF bit and cancels holding the XSR1 register. The read value is always 0b.
14	COFC	0h	W	Setting this bit to 1b clears the XSR0.COFbit. The read value is always 0b.
13	PIBDC	0h	W	Setting this bit to 1b clears the XSR0.PIBDFbit. The read value is always 0b.
12	CF1MC	0h	W	Setting this bit to 1b clears the XSR0.CF1MF bit. The read value is always 0b.
11	CF0MC	0h	W	Setting this bit to 1b clears the XSR0.CF0MF bit. The read value is always 0b.
10	BFDC	0h	W	Setting this bit to 1b clears the XSR0.BFDFbit. The read value is always 0b.
9	BCDC	0h	W	Setting this bit to 1b clears the XSR0.BCDFbit. The read value is always 0b.
8	BFOC	0h	W	Setting this bit to 1b clears the XSR0.BFOF bit. The read value is always 0b.
7 to 0	-	All 0	W	Reserved Whenever it is read, 0b is read. The written value should always be 0b.

Note: The read access size is fixed at 32 bits.

7.3.3 Asynchronous Mode

Figure 7.3-3 shows the general format for asynchronous serial communications.

One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level).

In asynchronous serial communications, the communications line is held in the mark state (high level) when not communicating.

The SCI monitors the communications line. When the SCI detects a start bit, it starts serial communication. The detection condition of the start bit changes according to the CCR3.RXDESEL setting. SCI regards space (Low level) as a start bit when CCR3.RXDESEL is 0b. SCI regards a fall edge as a start bit when RXDESEL is 1b.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and the receiver also have a double-buffered structure (it has also FIFO mode), so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

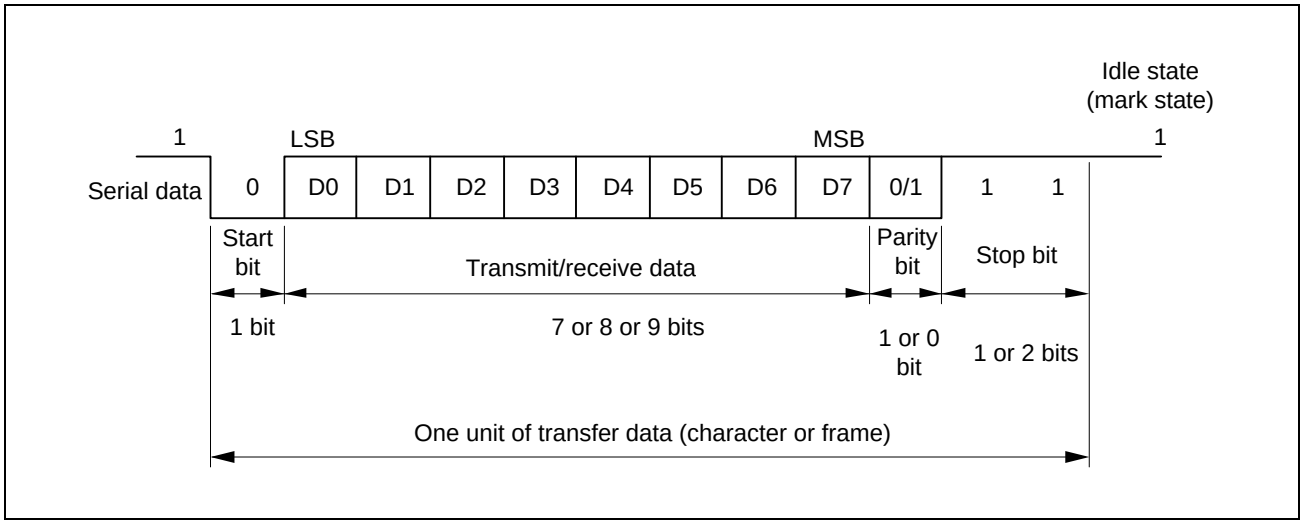

Figure 7.3-3 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, 2 Stop Bits)

7.3.3.1 Serial Data Transfer Format

Table 7.3-24 lists the serial data transfer formats that can be used in asynchronous mode. Any of 18 transfer formats can be selected according to the CCR1 and CCR3 settings.

For details of multi-processor function, see **7.3.4 Multi-Processor Communication Function**.

Table 7.3-24 Serial Transfer Formats (Asynchronous Mode)

CCR3				CCR1	Serial Transfer Format and Frame Length
CHR[1]	CHR[0]	MP	STP	PE	1 2 3 4 5 6 7 8 9 10 11 12 13
0	0	0	0	0	St | 9-bit data | STP
0	0	0	1	0	St | 9-bit data | STP | STP
0	0	0	0	1	St | 9-bit data | P | STP
0	0	0	1	1	St | 9-bit data | P | STP | STP
1	0	0	0	0	St | 8-bit data | STP
1	0	0	1	0	St | 8-bit data | STP | STP
1	0	0	0	1	St | 8-bit data | P | STP
1	0	0	1	1	St | 8-bit data | P | STP | STP
1	1	0	0	0	St | 7-bit data | STP
1	1	0	1	0	St | 7-bit data | STP | STP
1	1	0	0	1	St | 7-bit data | P | STP
1	1	0	1	1	St | 7-bit data | P | STP | STP
0	0	1	0	—	St | 9-bit data | MPB | STP
0	0	1	1	—	St | 9-bit data | MPB | STP | STP
1	0	1	0	—	St | 8-bit data | MPB | STP
1	0	1	1	—	St | 8-bit data | MPB | STP | STP
1	1	1	0	—	St | 7-bit data | MPB | STP
1	1	1	1	—	St | 7-bit data | MPB | STP | STP

Note: St: Start bit
STP: Stop bit
P: Parity bit
MPB: Multi-processor bit

7.3.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times*1 the bit rate. In reception, the SCI samples the falling edge of the start bit using the base clock and performs internal synchronization*2. When sampling timing does not adjust (“CCR4.ASEN = 0b” or ”CCR4.ASEN = 1b and CCR4.AST[2:0] = 000b”), receive data is sampled at the rising edge of the 8th pulse*1 of the base clock, data is latched at the middle of each bit, as shown in **Figure 7.3-4**. Thus, the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100[\%] \cdots \text{Equation (1)}$$

M: Reception margin
N: Ratio of bit rate to clock

(N = 16, when CCR2.ABCSE = 0b and CCR2.ABCS = 0b, N = 8, when CCR2.ABCS = 1b, N = 6, when CCR2.ABCSE = 1b)

D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 13)
F: Absolute value of clock frequency deviation

Assuming values of N = 16, F = 0 and D = 0.5 in formula (1), the reception margin is determined by the formula below.

$$M = \left\{\frac{0.5 - 1}{2 \times 16}\right\} \times 100(\%) = 46.875\%$$

However, this is only the computed value, and a margin of 20% to 30% should be allowed in system design.

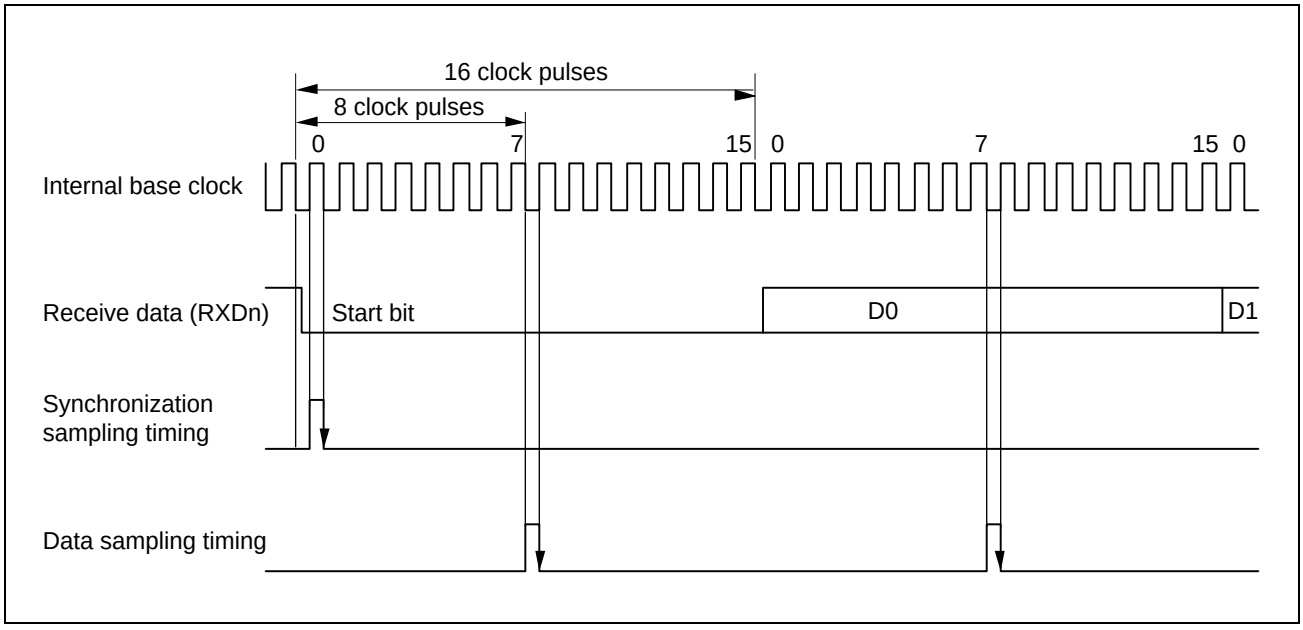

Figure 7.3-4 Receive Data Sampling Timing in Asynchronous Mode

Note 1. This is an example when CCR2.ABCS = 0b and CCR2.ABCSE = 0b. When CCR2.ABCS = 1b and CCR2.ABCS = 0b, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at

the rising edge of the 4th pulse of the base clock. When CCR2.ABCSE is 1b, a sextuple frequency of a bit rate is a base clock and receive data is sampled at the rising edge of the 3rd pulse of the base clock.

Note 2. The determination condition of the start bit is as follows.
In the case of the function of adjust sampling timing is OFF (CCR4.ASEN = 0b):
The determination condition of a start bit is that Low beyond half bit length continues. It is same as the sampling timing.
In **Figure 7.3-4**, the low period should be kept over 8 cycles to detect a start bit. If Low period does not keep over 8 cycles, the module judges this as a noise. So, the module does not start reception and wait start bit.
In the case of the function of adjust sampling timing is ON (CCR4.ASEN = 1b):
The determination condition of a start bit is that Low keeps up until the sampling timing.
Adjusting the sampling timing forward (CCR4.AJD = 1b) increases the possibility of erroneously determining a noise as the start bit.

7.3.3.3 Clock

Either an internal clock generated by the baud rate generator or an external clock input to the SCKm pin can be selected as the SCI's transfer clock, according to the setting of CCR3.CKE[1:0]. When an external clock is input to the SCKm pin, the clock frequency should be 16 times the bit rate (when CCR2.ABCS = 0b) and 8 times the bit rate (when CCR2.ABCS = 1b).

When the SCI is operated on an internal clock, the clock can be output from the SCKm pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in **Figure 7.3-5**.

If you selected an internal clock, the SCK pin is outputted after CCR0.TE is set to 1b or CCR0.RE is set to 1b.

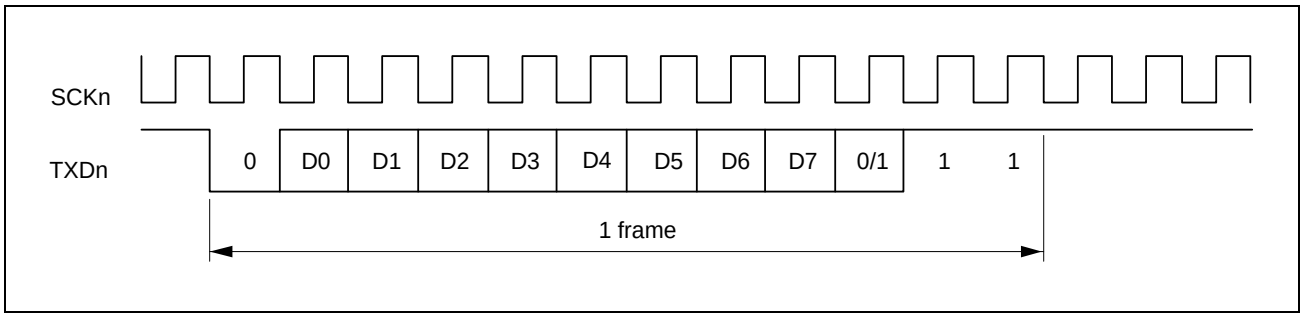

Figure 7.3-5 Phase Relationship between Output Clock and Transmit Data (Asynchronous Mode: CHR[1:0] = 10b, PE = 1b, MP = 0b, STP = 1b)

7.3.3.4 Double-Speed Operation and Frequency of 6 Times the Bit Rate

When CCR2.ABCS is set to 1b, the SCI operates on the bit rate twice that in the case where ABCS is set to 0b. And when CCR2.BGDM is set to 1b, the cycle of the base clock is halved and the bit rate is doubled from that in the case where BGDM is set to 0b. When CCR3.CKE[1] is set to 0b and the baud rate generator is selected, setting the ABCS and BGDM bits to 1b allows the SCI to operate on a bit rate four times that in the case ABCS = 0b and BGDM = 0b.

When CCR2.ABCSE is set to 1b, the number of base clock pulses are 6 during a period of 1 bit, and the base clock frequency is half. And SCI works 16/3 times of bit rate compared with a case of CCR2.ABCS = 0b, CCR2.BGDM = 0b and CCR2.ABCSE = 0b.

As shown by Formula (1) in **7.3.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode**, the reception margin decreases when CCR2.ABCS is set to 1b or CCR2.ABCSE is set to 1b.

Therefore, if the desired bit rate can be obtained with CCR2.ABCS set to 0b and/or CCR2.ABCSE set to 0b, it is recommended to use the SCI with CCR2.ABCS set to 0b and/or CCR2.ABCSE set to 0b.

7.3.3.5 CTS and RTS Function

The CTS function is the transmission control function by the CTSm# pin. Setting the CCR1.CTSE bit to 1b enables the CTS function. For the functions of CTS and RTS, you can select the alternate setting that uses either function with one terminal or the dedicated setting that uses each function independently with two terminals. This setting is done with the CCR1.CTSPEN bit.

When the CTS function is enabled, placing the low level on the CTSm# pin, causes transmission to start.

Even if the CTSm# pin goes high after transmission starts, the frame being transmitted is not affected and transmission will continue.

The RTS function is the transmission request function by the RTSn# pin. In the RTS function, the RTSm# pin output low level, when reception becomes possible. Conditions for output of the low and high levels are shown below.

[Conditions of low-level output]

(1) Non-FIFO selected when all of the following conditions are satisfied.

- CCR0.RE is 1b
- When in receivable state
- There are no received data yet to be read and not receiving.
- CSR.ORER, FER, PER flags are all 0b

(2) FIFO selected when all of the following conditions are satisfied.

- CCR0.RE is 1b
- When the quantity of receive data written in receive FIFO (RDR) are less than the setting value of FCR.RSTRG[4:0]
- CSR.ORER (RDR.ORER) is 0b

[Condition for high-level output]

When the conditions of low-level output have not been satisfied.

7.3.3.6 Address Match (Receive Data Match Detection) Function

The address match function can be used only for the asynchronous mode.

If CCR0.DCME is set to 1b,*2 when one frame of data has been received, SCI compares that receive data with the data which is set to CCR4.CMPD. If SCI detects the match to the comparison data (CCR4.CMPD*1) with receive data, SCI can issue RXI interrupt request.

If CCR3.MP bit is set to 0b, this comparative target in communication data is valid only data field in receive format. In multi- processor mode (CCR3.MP = 1b), if CCR0.IDSEL bit is set to 1b, the reception data at which MPB bit is 1b detects an address match or mismatch, and the reception data at which MPB bit is 0b detects always a mismatch. If CCR0.IDSEL bit is set to 0b, SCI detects an address match or mismatch despite the value of the MPB bit of the reception data at every reception complete.

Until SCI detects the match to the comparison data (CCR4.CMPD) with receive data, the communication data is skipped (discarded), and SCI cannot detect parity error, framing error.

When SCI detects the match, the CCR0.DCME is automatically cleared, and CSR.DCMF is set to 1b. If CCR0.IDSEL bit is set to 1b at this time, CCR0.MPIE bit is automatically cleared. If CCR0.IDSEL bit is set to 0b at this time, CCR0.MPIE bit is kept. At the same time, if CCR0.RIE is set to 1b, SCI issues RXI interrupt request.

If SCI detects framing error in comparative receive data which is detected the match, CSR.DFER is set to 1b, and if SCI detects parity error in that frame, CSR.DPER is set to 1b. That comparative receive data and MPB bit are not stored to RDR register, and CSR.RDRF is retained to 0b.

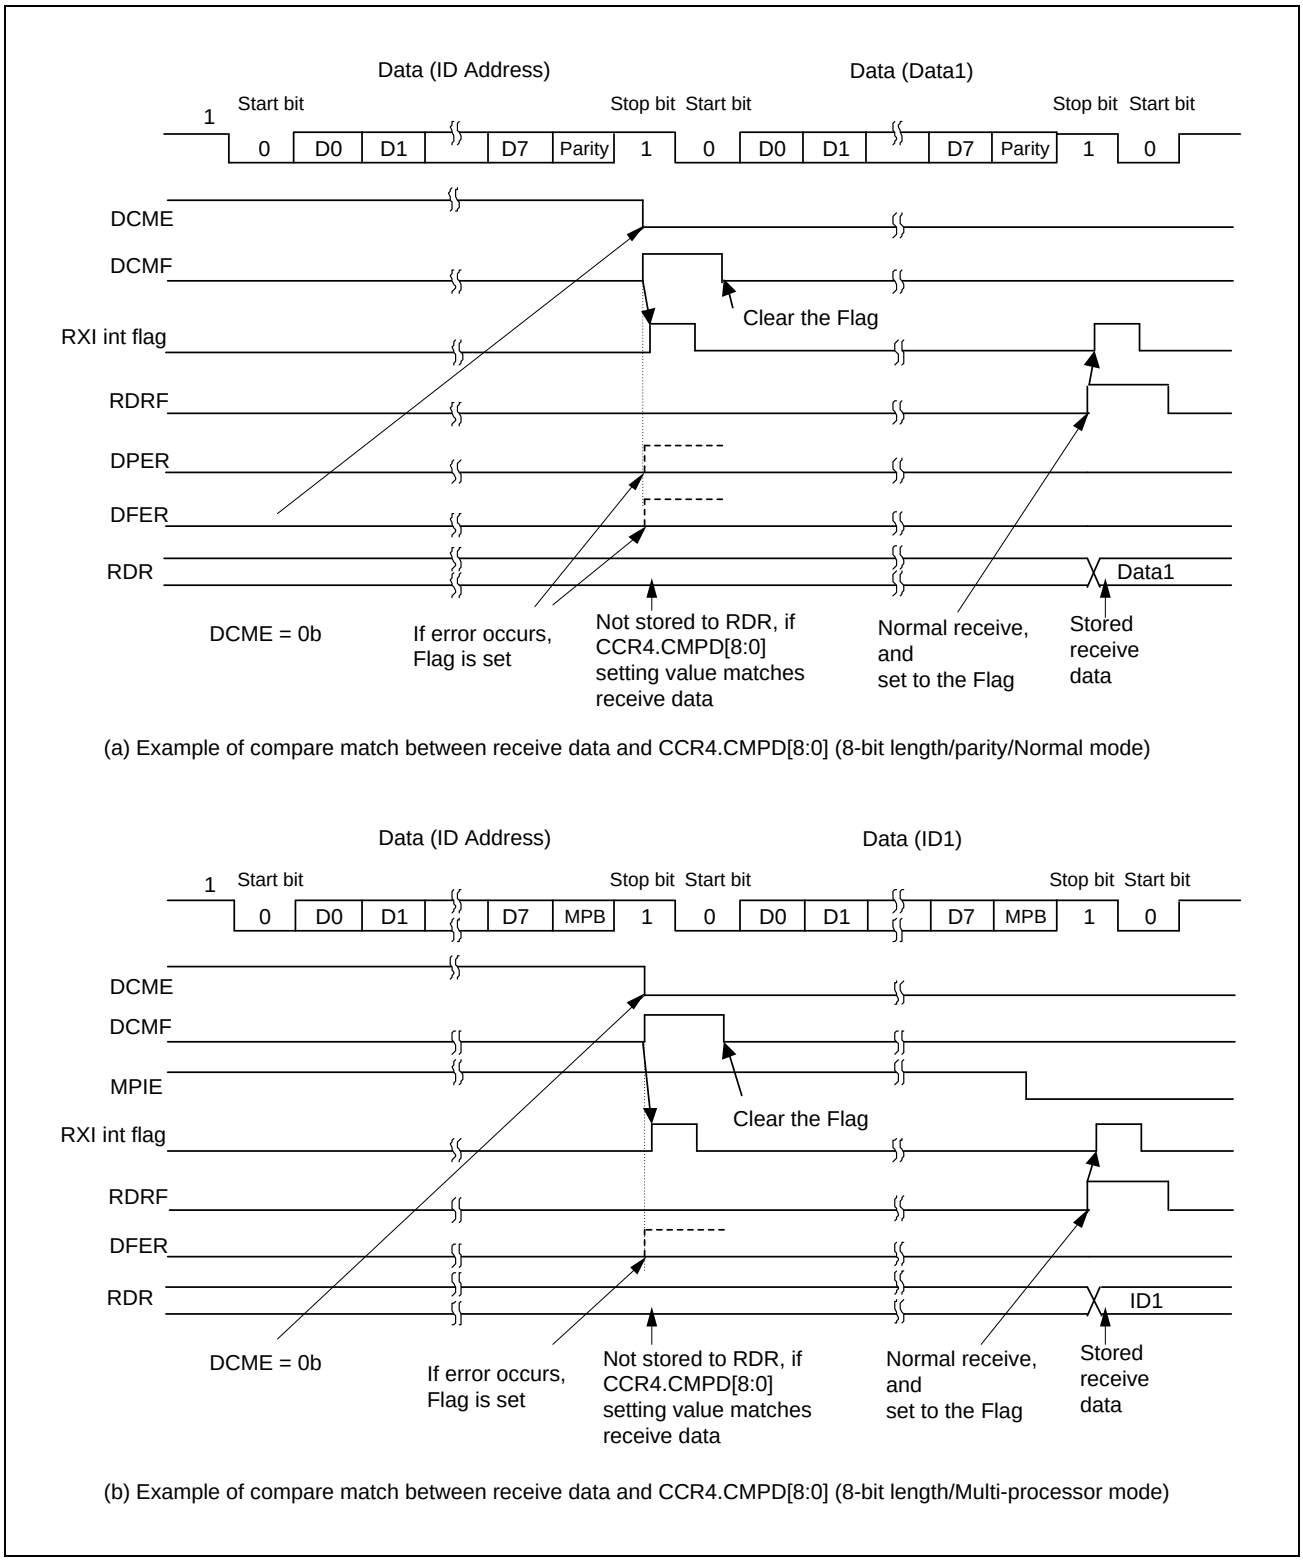
After SCI detects the match, and the CCR0.DCME is automatically cleared, it receives next data continuously in current register setting.

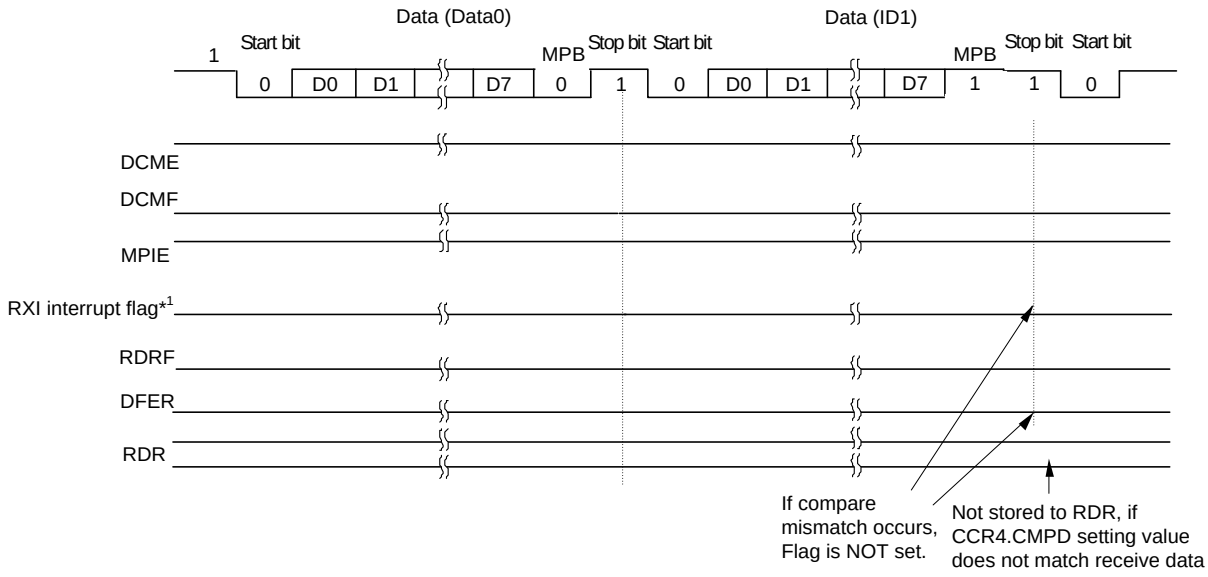
When CSR.DFER flag or CSR.DPER flag is set, the address much is not detected. Before making the address match function effective, please be sure to set CSR.DFER and CSR.DPER flag as 0b.

Figure 7.3-6 and **Figure 7.3-7** show the address match function example.

Note 1. This comparative target can select one length of 3 types, they are CMPD[6:0] with 7-bit length enable, CMPD[7:0] with 8-bit, and CMPD[8:0] with 9-bit length.

Note 2. Set the CCR0.DCME bit to 1b before receiving the start bit of the received frame that performs address matching.





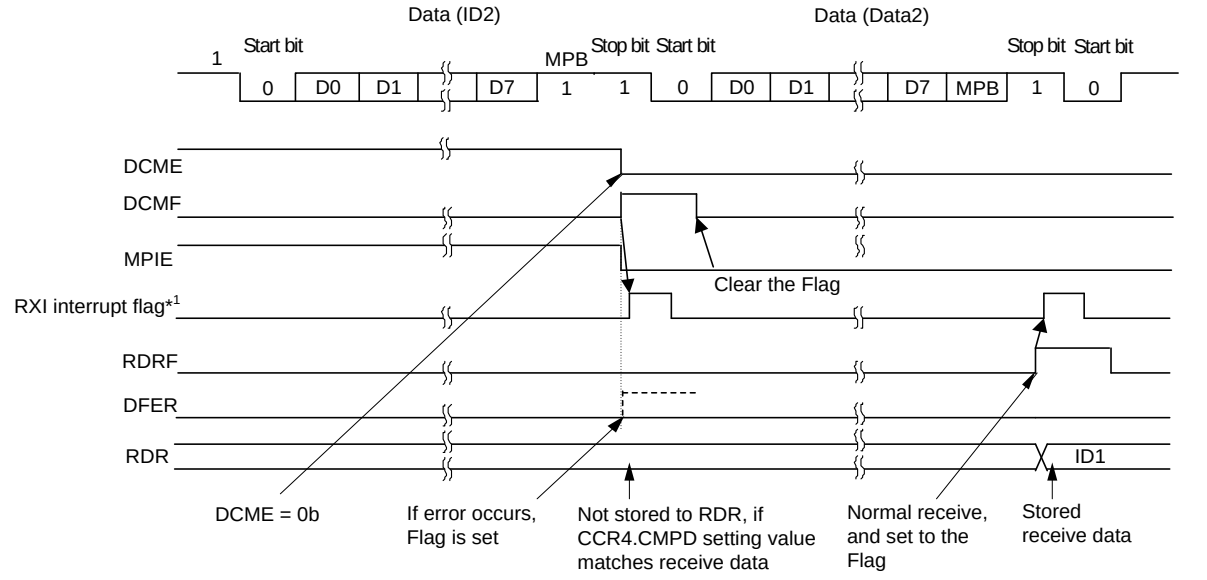


Figure 7.3-6 Example of Address Match (1) 8-Bit Data

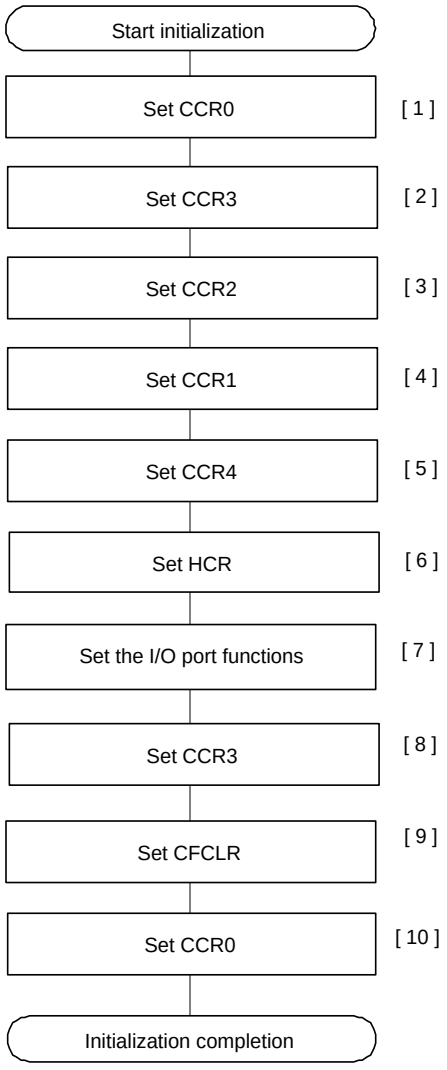
(a) Example of compare mismatch between receive data and CCR4.CMPD (8-bit length / IDSEL = 1 / Multi-processor mode)

(b) Example of compare match between receive data and CCR4.CMPD (8-bit length / IDSEL = 1 / Multi-processor mode)

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-7 Example of Address Match (2) Multi-Processor Mode/8-Bit Data

7.3.3.7 SCI Initialization (Asynchronous Mode)



Before transmitting and receiving data, start by writing 0b to CCR0.TE and CCR0.RE (or writing the initial value to CCR0) and then continue through the Procedure (select to Non-FIFO or FIFO) for SCI given in **Figure 7.3-8** or **Figure 7.3-9**. Whenever the operating mode or transfer format is changed, CCR0.TE and CCR0.RE must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied even during initialization.

Note that setting the CCR0.RE bit to 0b initializes neither the ORER, FER, PER, RDRF, DR and RDAT. When FIFO selected, even if the TE bit is set as 0b, the TEND flag is not initialized, so please be careful.

Please be also careful at the time of change in the operation mode.

Moreover, note that switching the value of the CCR0.TE bit from 0b to 1b while the CCR0.TIE bit is 1b leads to the generation of a TXI interrupt request.

[1] Set the following bits of CCR0 to 0.
TEIE, TIE, RIE, TE, RE
If you have not changed from the initial settings, you can skip this step.

[2] Set up following function and communication mode.
Driver control function for RS-485
FIFO no-use
Multi-Processor mode
Communication mode (MOD[2:0] = 000b)
Transmission / reception format
Clock enable (Leave the initial value in this step when outputting the clock)
Leave unused bits at their initial values.

[3] Set up the bit-rate-modulation function*1,*2, select clock, set bit rate*2.

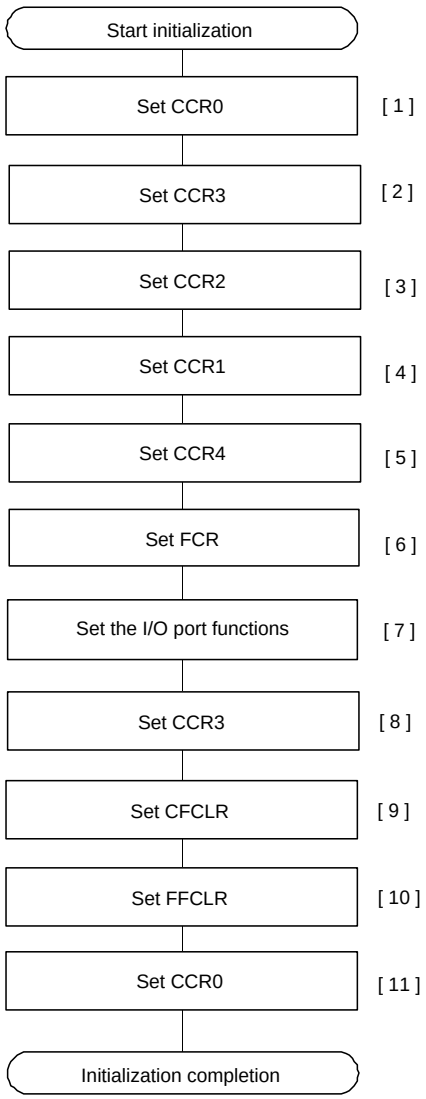
[4] Set up the Noise-filter function, the loop-back function, communication terminal status, the parity check function, and the CTS/RTS function.

[5] Set up the adjust sampling timing function and the adjust transmit timing function.

[6] When using the half data communication function, enable or set the function. If this function is not used, leave the default value.

[7] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.

[8] Set clock enable bit (CKE[1:0]) at this step when outputting the clock. After this register setting, a clock will be output immediately.



[9] Write 1 to the following bits and clear the corresponding flag.
CFCLR.RDRFC, FERC, PERC, MFFC, ORERC, DFERC, DPERC, DCMFC, ERSC
If it's initialization flow after a reset, you can skip this step.

[10] Set the TE or RE bit to 1.
To enable interrupts, set the TE bit and TIE bit, and the RE bit and RIE bit to 1 with one instruction at the same time.
Setting the TE and RE bits allows TXDn and RXDn to be used.

Note 1. If you do not use the bit rate modulation function, you do not need to set it.

Note 2. If you use an external clock, you do not need to set it.

Figure 7.3-8 Sample SCI Initialization Flowchart (Asynchronous Mode/Non-FIFO Selected)

[1] Set the following bits of CCR0 to 0.
TEIE, TIE, RIE, TE, RE
If you have not changed from the initial settings, you can skip this step.

[2] Set up following function and communication mode.
Driver control function for RS-485
FIFO use
Multi-Processor mode
Communication mode (MOD[2:0] = 000b)
Transmission / reception format
Clock enable (Leave the initial value in this step when outputting the clock)
Leave unused bits at their initial values.

[3] Set up the bit-rate-modulation function*1,*2, select clock, set bit rate*2.

[4] Set up the Noise-filter function, the loop-back function, communication terminal status, the parity check function, and the CTS/RTS function.

[5] Set up the adjust sampling timing function and the adjust transmit timing function.

[6] Set the TFRST and RFRST to 1 to empty FIFO.
Set the DRES, TTRG[4:0], RTRG[4:0], and RSTRG[4:0] bits

[7] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.

[8] Set clock enable bit (CKE[1:0]) at this step when outputting the clock. After this register setting, a clock will be output immediately.

[9] Write 1 to the following bits and clear the corresponding flag.
CFCLR.RDRFC, FERC, PERC, MFFC, ORERC, DFERC, DPERC, DCMFC, ERSC
If it's initialization flow after a reset, you can skip this step.

[10] Write 1 to the FFCLR.DRC and clear the corresponding flag.
If it's initialization flow after a reset, you can skip this step.

[11] Set the TE or RE bit to 1.
To enable interrupts, set the TE bit and TIE bit, and the RE bit and RIE bit to 1 with one instruction at the same time.
Setting the TE and RE bits allows TXDn and RXDn to be used.

Note 1. If you do not use the bit rate modulation function, you do not need to set it.

Note 2. If you use an external clock, you do not need to set it.

Figure 7.3-9 Sample SCI Initialization Flowchart (Asynchronous Mode/FIFO Selected)

Figure 7.3-10 shows an example of the timing when data is transmitted after reset is released, and SCI is set to asynchronous mode according to **Figure 7.3-8** or **Figure 7.3-9**. As shown in the figure, when the pin function is set to the TXD pin, the CCR0.TE bit is 0b, so the pin is high impedance. When transmit data is written after setting the CCR0.TE bit to 1b, data transmission starts. There is a transmission wait time from writing TDR to data transmission starts. In asynchronous mode, TXD is high during this period.

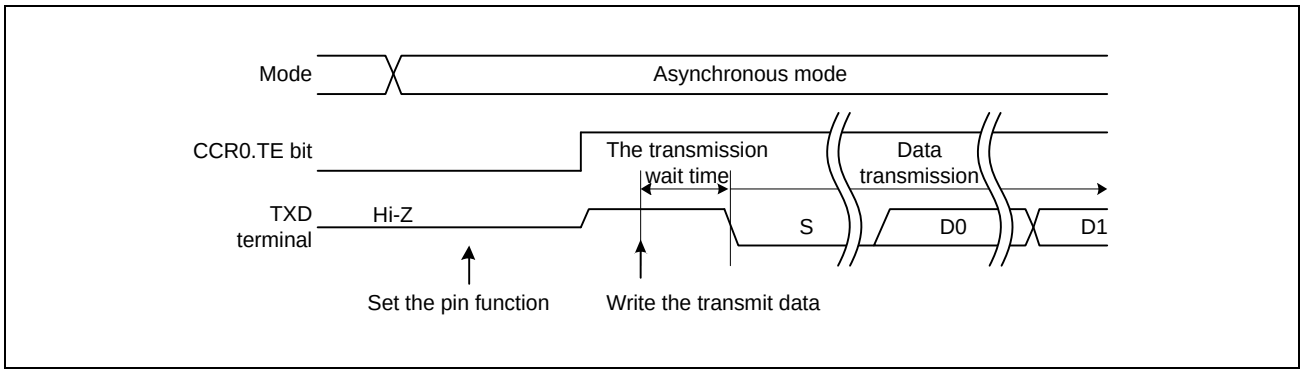


Figure 7.3-10 Data Transmission Timing Example in Asynchronous Mode

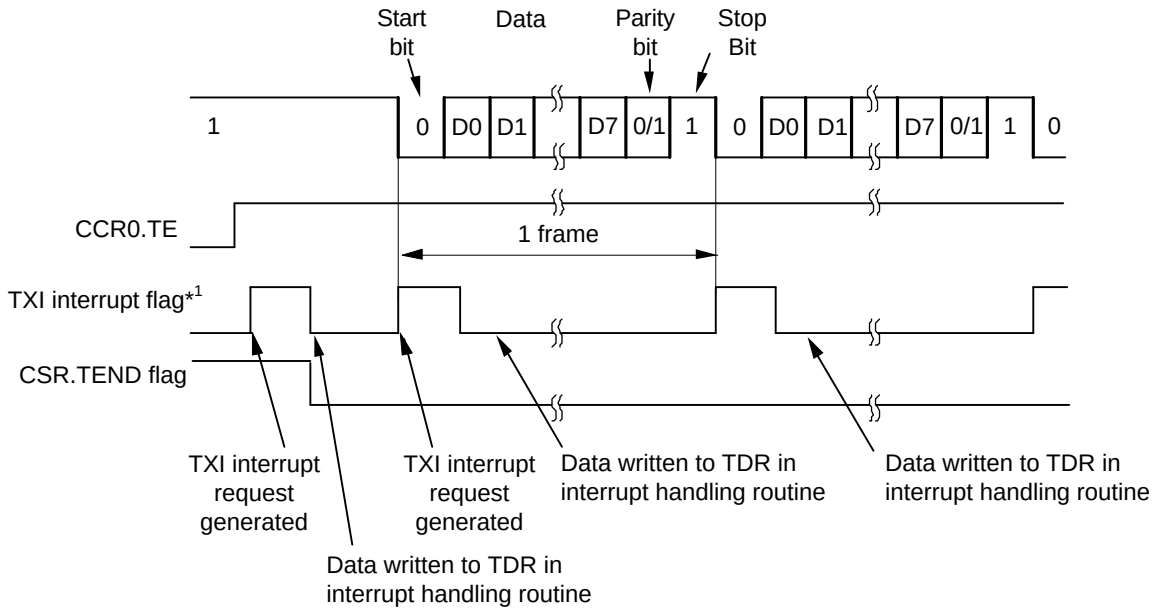
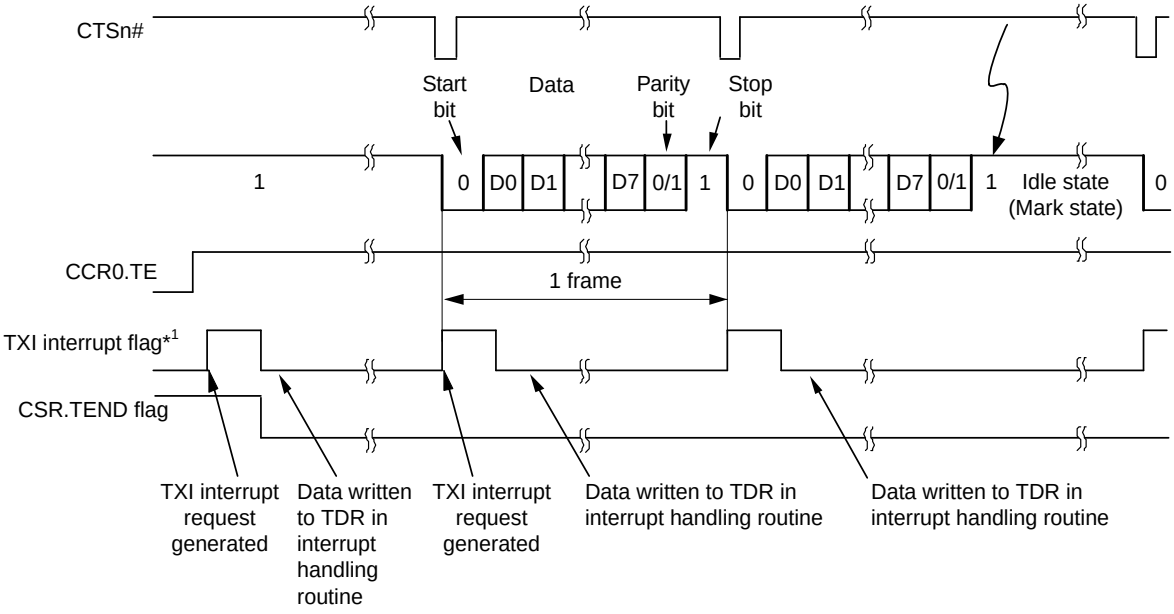


7.3.3.8 Serial Data Transmission (Asynchronous Mode)

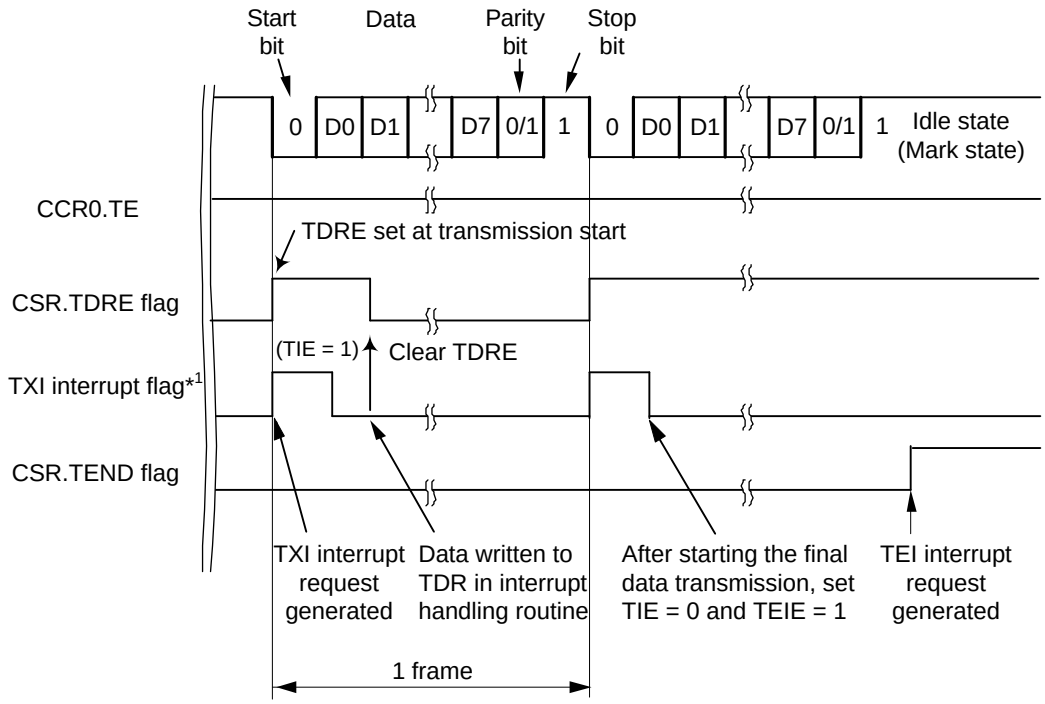
(1) Non-FIFO selected

Figure 7.3-11, **Figure 7.3-12**, and **Figure 7.3-13** show an example of the operation for serial transmission in asynchronous mode. In serial transmission, the SCI operates as described below.



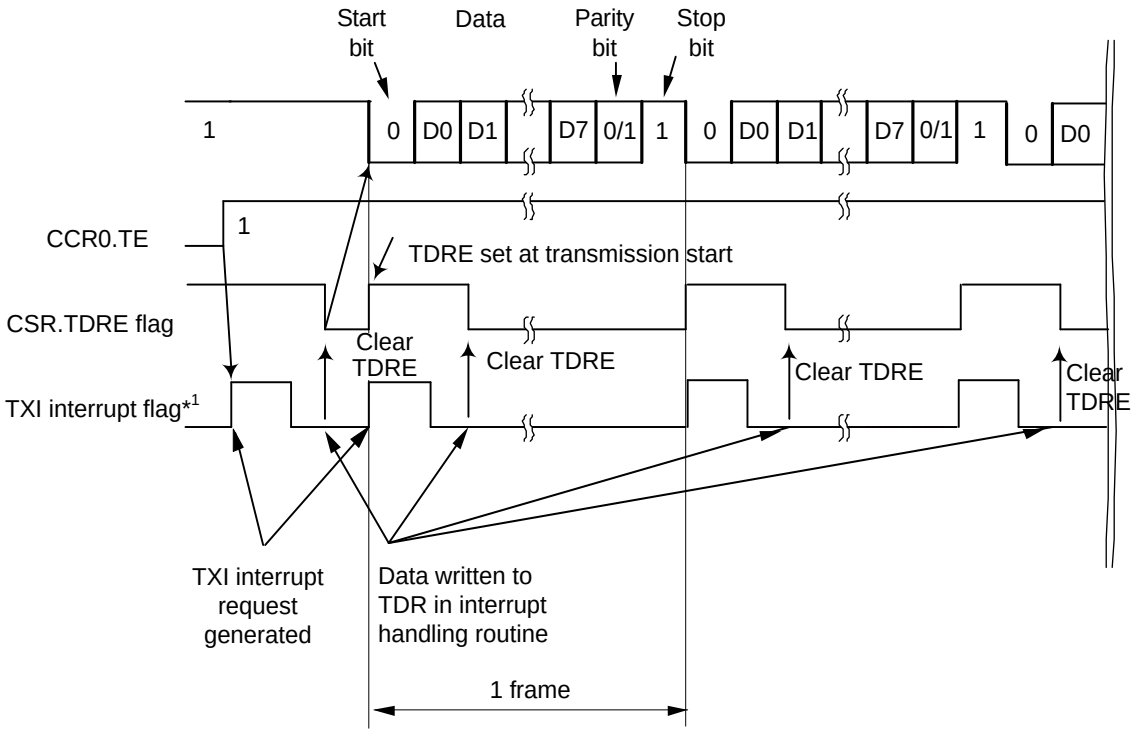
1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt handling routine. At the beginning of transmission, set 1b to CCR0.TE and CCR0.TIE simultaneously. Then the TXI interrupt request is generated.
2. Transmission starts at data transfer from TDR to TSR when CCR1.CTSE = 0b (CTS function is disabled) or when the CTS# pin level is low. If CCR0.TIE is 1b at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next transmit data to TDR in the TXI interrupt handling routine before transmission of the current transmit data is completed. Write the last transmission data, then the last data transmit start, and TXI is generated. When TEI interrupt requests are in use, before the last data transmit end, set the CCR0.TIE bit to 0b (a TXI interrupt request is disabled) and the CCR0.TEIE bit to 1b (a TEI interrupt request is enabled) using the TXI handling routine.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks for updating of (writing to) TDR at the time of stop bit output.
5. When TDR is updated, setting of CCR1.CTSE to 0b (CTS function is disabled) or a low level input on the CTSn# pin cause the next transfer of the next transmit data from TDR to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If TDR is not updated, CSR.TEND is set to 1b, the stop bit is sent, and then the mark state is entered in which 1 is output. If the CCR0.TEIE is 1b at this time, a TEI interrupt request is generated.

Figure 7.3-15 shows the example of Serial Transmission Flowchart.



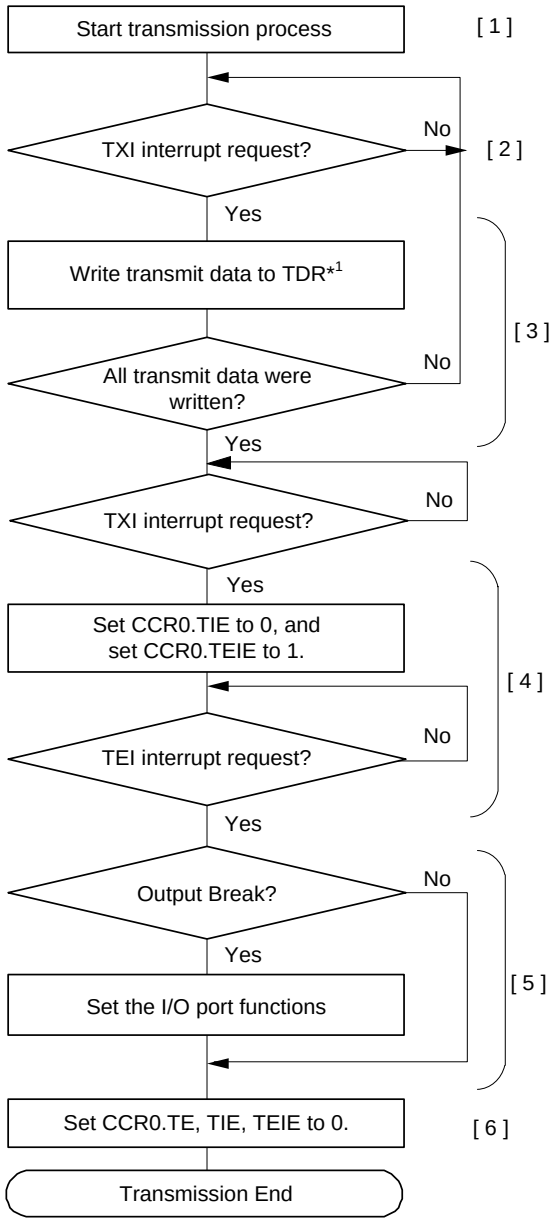
Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-11 Example of Operation for Serial Transmission in Asynchronous Mode (1) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, at the Beginning of Transmission)



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-12 Example of Operation for Serial Transmission in Asynchronous Mode (2) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Used, at the Beginning of Transmission)



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-13 Example of Operation for Serial Transmission in Asynchronous Mode (3) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, from the Middle of Transmission until Transmission Completion)

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-14 Example of Operation for Serial Transmission in Asynchronous Mode (4) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, in the Middle of Transmission)

[1] Start transmission process

[2] TXI interrupt request:
The transmit-data-empty-interrupt (TXI) is generated at following conditions.
When set TE and TIE to 1 at same time.
When transmission-data forwards to TSR from TDR.

[3] Serial transmission continuation procedure:
To continue serial transmission write transmit data to TDR*1 once by using a TXI.
Transmit data can also be written by activating the DMAC.

[4] If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR*1 and transmission is started.

[5] Break output at the end of serial transmission:
To output a break, it is necessary to set SPB2IO and SPB2DT, for output status setting when TE is 0.
(If you set these bits at initialization, you can skip this step.)

[6] Set CCR0.TE, TIE, TEIE to 0.

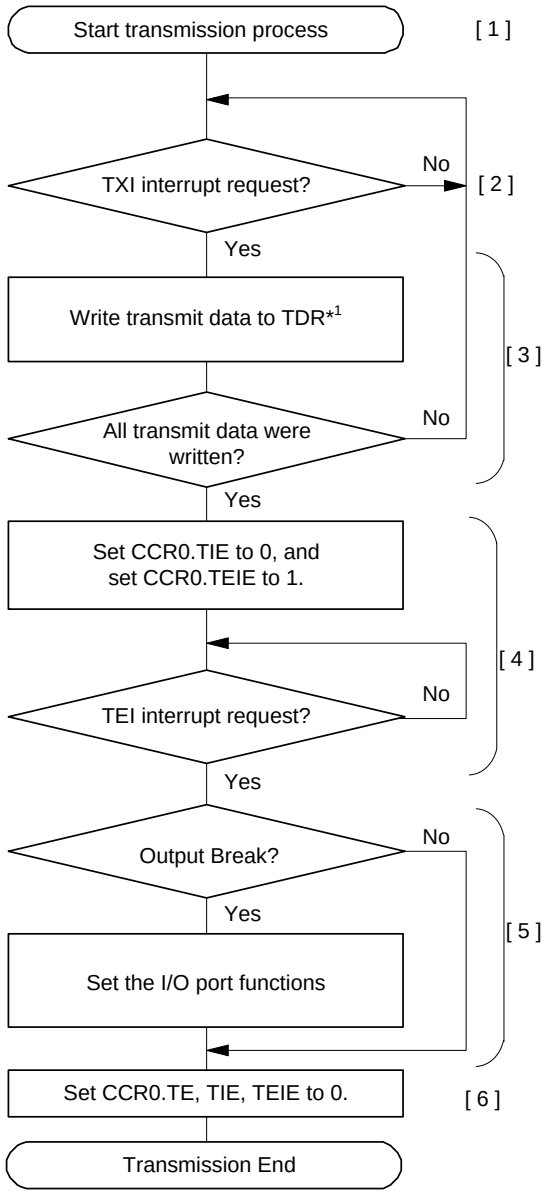
Note 1. In case of byte access with data length 9 bits, write transmit data in order of TDR[15:8] and TDR[7:0].

Figure 7.3-15 Example of Serial Transmission Flowchart in Asynchronous Mode (Non-FIFO Selected)

(2) FIFO selected

Figure 7.3-16 shows an example of data format that is written to transmit FIFO (TDR) in asynchronous mode with FIFO selected. MPBT write to transmit FIFO (TDR) bit 9. Data is set to TDR.TDAT[8:0] corresponded to data length. It should write to 0b for unused bits. It should write it in order of the TDR[15:8] register and the TDR[7:0] register at byte-access.

Data Length	Register Setting CCR3.CHR[1:0]		Transmit data in TDR[15:0]															
			b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	1	—	—	—	—	—	—	MPBT	—	—	TDAT[6:0]						
8 bits	1	0	—	—	—	—	—	—	MPBT	—	TDAT[7:0]							
9 bits	0	x	—	—	—	—	—	—	MPBT	TDAT[8:0]								



Note: —: Do not used. It should write to 0b

Figure 7.3-16 Data Format that is Written to Transmit FIFO (TDR) (FIFO Selected)

In serial transmission, the SCI operates as described below.

1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt handling routine. The writable transmit data number is until (NFIFO (= 32) − FTSR.T) bytes. At the beginning of transmission, set 1b to CCR0.TE and CCR0.TIE simultaneously. Then the TXI interrupt request is generated.
2. Transmission starts at data transfer from TDR to TSR when CCR1.CTSE = 0b (CTS function is disabled) or when the CTS# pin level is low. When the quantity of transmit data written in transmit FIFO (TDR) is equal to or less than the specified transmit triggering number, CSR.TDRE is set to 1b. If CCR0.TIE is 1b at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next transmit data to TDR in the TXI interrupt handling routine before transmission of the current transmit data is completed. Write the last transmission data, then the last data transmit start, and TXI is generated. When TEI interrupt requests are in use, before the last data transmit end, set the CCR0.TIE bit to 0b (a TXI interrupt request is disabled) and the CCR0.TEIE bit to 1b (a TEI interrupt request is enabled) using the TXI handling routine.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks whether non-transmitted data in transmit FIFO (TDR) or not at the time of stop bit output.
5. When data is set to transmit FIFO (TDR), setting of CCR1.CTSE to 0b (CTS function is disabled) or a low level input on the CTSn# pin cause the next transfer of the next transmit data from transmit FIFO (TDR) to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If data is not set to transmit FIFO (TDR), CSR.TEND is set to 1b, the stop bit is sent, and then the mark state is entered in which 1 is output. If CCR0.TEIE is 1b at this time, a TEI interrupt request is generated.

Figure 7.3-17 shows a sample flowchart for serial transmission in asynchronous mode at FIFO selected.

[1] Start transmission process:
Set transmit-data to the transmit FIFO (TDR):
The number of transmittable data that can be set is 32.

[2] TXI interrupt request:
The transmit-data-empty-interrupt (TXI) is generated when transmission-data forwards to TSR from the transmit FIFO (TDR) and the number of transmit-data written in the transmit FIFO is equal to or less than the transmit FIFO threshold.

[3] Serial transmission continuation procedure:
To continue serial transmission, write all transmit data to the transmit FIFO (TDR) by using a TXI interrupt and clear TDRE flag to 0. (Transmit data can also be written to the transmit FIFO (TDR) by activating the DMAC. In this case, the TDRE flag is cleared automatically, so please do not operate the TDRE flag.)
The number of transmission data it's possible to write in is N_{FIFO} (= 32) - (the number of stored transmit FIFO data).

[4] If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR.*1

[5] Break output at the end of serial transmission:
To output a break, it is necessary to set SPB2IO and SPB2DT, for output status setting when TE is 0.
(If you set these bits at initialization, you can skip this step.)

[6] Set CCR0.TE, TIE, TEIE to 0.

Note 1. In case of byte access with data length 9 bits, write transmit data in order of TDR[15:8] and TDR[7:0].

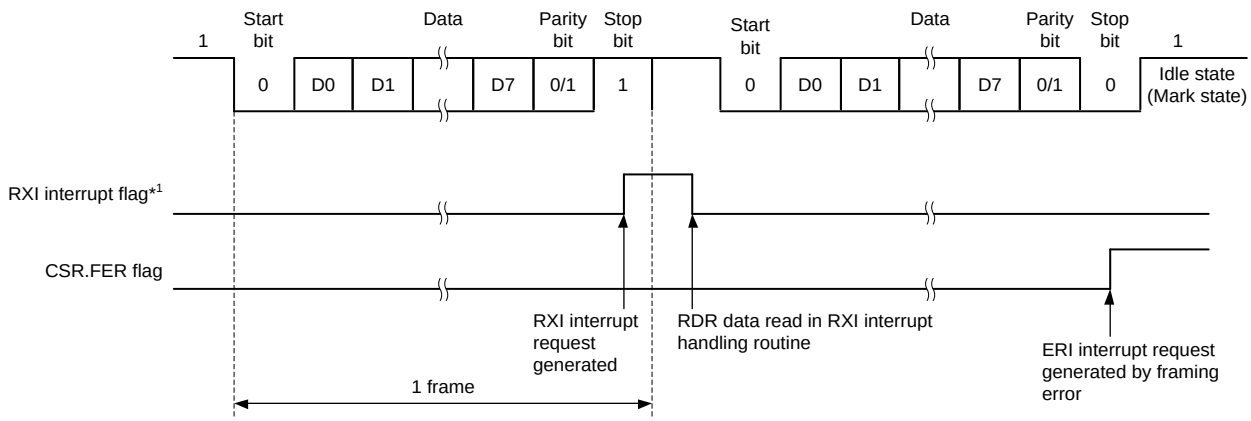


Figure 7.3-17 Example of Serial Transmission Flowchart in Asynchronous Mode (FIFO Selected)

7.3.3.9 Serial Data Reception (Asynchronous Mode)

(1) Non-FIFO selected

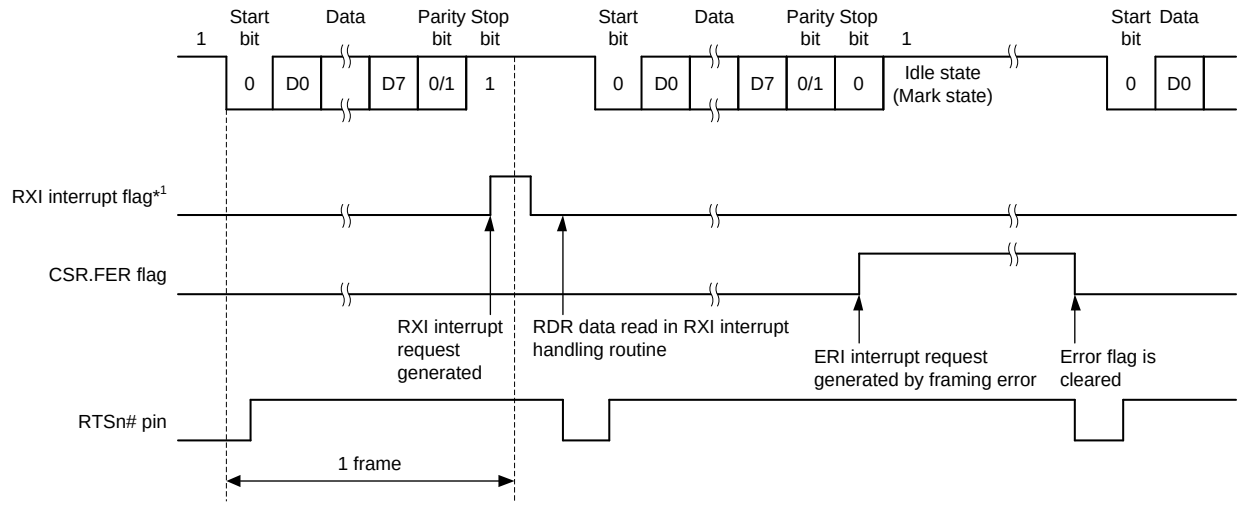

Figure 7.3-18 and **Figure 7.3-19** show an example of the operation for serial data reception in asynchronous mode. In serial data reception, the SCI operates as described below.

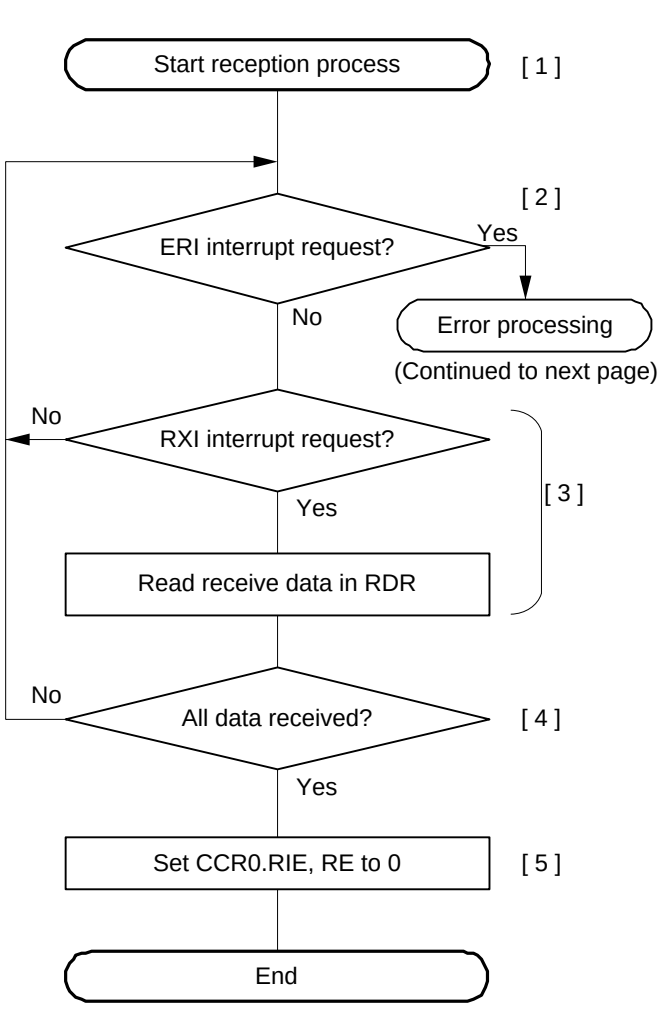
1. When the value of CCR0.RE becomes 1b, the output signal on the RTSn# pin goes to the low level in the case of RTS function use.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If an overrun error occurs, CSR.ORER is set to 1b. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
4. If a parity error is detected, CSR.PER is set to 1b and receive data is transferred to RDR. If the CCR0.RIE is 1b at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0b) is detected, CSR.FER is set to 1b and receive data is transferred to RDR. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated.
6. When reception finishes successfully, receive data is transferred to RDR. If CCR0.RIE is 1b at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in this RXI interrupt handling routine before reception of the next receive data is completed. Reading the received data that have been transferred to RDR causes the RTSn# pin to output the low level in the case of RTS function use. If you do not want to turn the RTSn# pin output low after receiving the last data, set CCR0.RE bit to 0b, before reading the RDR.

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-18 Example of SCI Operation for Serial Reception in Asynchronous Mode (1) (Example with 8-Bit Data, Parity, 1 Stop Bit, RTS Function is Not Used)



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-19 Example of SCI Operation for Serial Reception in Asynchronous Mode (2) (Example with 8-Bit Data, Parity, 1 Stop Bit, RTS Function is Used)

Table 7.3-25 lists the states of the flags in CSR status register and receive data handling when a receive error is detected. If a receive error is detected, an ERI interrupt request is generated but an RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Accordingly, set the ORER, FER, and PER bits to 0b before resuming reception. Moreover, be sure to read the RDR during overrun error processing. When a reception is forcibly terminated by setting CCR0.RE bit to 0b during operation, read the RDR register because received data which has not yet been read may be left in RDR. **Figure 7.3-20** and **Figure 7.3-21** show samples of flowcharts for serial data reception.

Table 7.3-25 Flags in the CSR Status Register and Receive Data Handling

Flags in the CSR Status Register			Receive Data	Receive Error Type
ORER	FER	PER		
1	0	0	Lost	Overrun error
0	1	0	Transferred RDR	Framing error
0	0	1	Transferred RDR	Parity error
1	1	0	Lost	Overrun error + Framing error
1	0	1	Lost	Overrun error + Parity error
0	1	1	Transferred RDR	Framing error + Parity error
1	1	1	Lost	Overrun error + Framing error + Parity error

[1] Start reception process
(Set CCR0.RE, RIE to 1.)

[2] Receive error processing and break detection:
If a receive error occurs, an ERI interrupt is generated. After performing the appropriate error processing, be sure to set the ORER, PER, and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1. In the case of a framing error, a break can be detected by reading the value of the input port corresponding to the RXDn pin.

[3] Read the receive data in RDR once in the RXI interrupt handling routine.

[4] Serial reception continuation procedure:
To continue serial reception, before the stop bit of the current frame is received, read data from RDR in the RXI interrupt handling routine. The RDR data can also be read by activating the DMAC.

[5] Set CCR0.RIE, RE to 0.

Figure 7.3-20 Example Flowchart of Serial Reception in Asynchronous Mode (Non-FIFO Selected) (1)

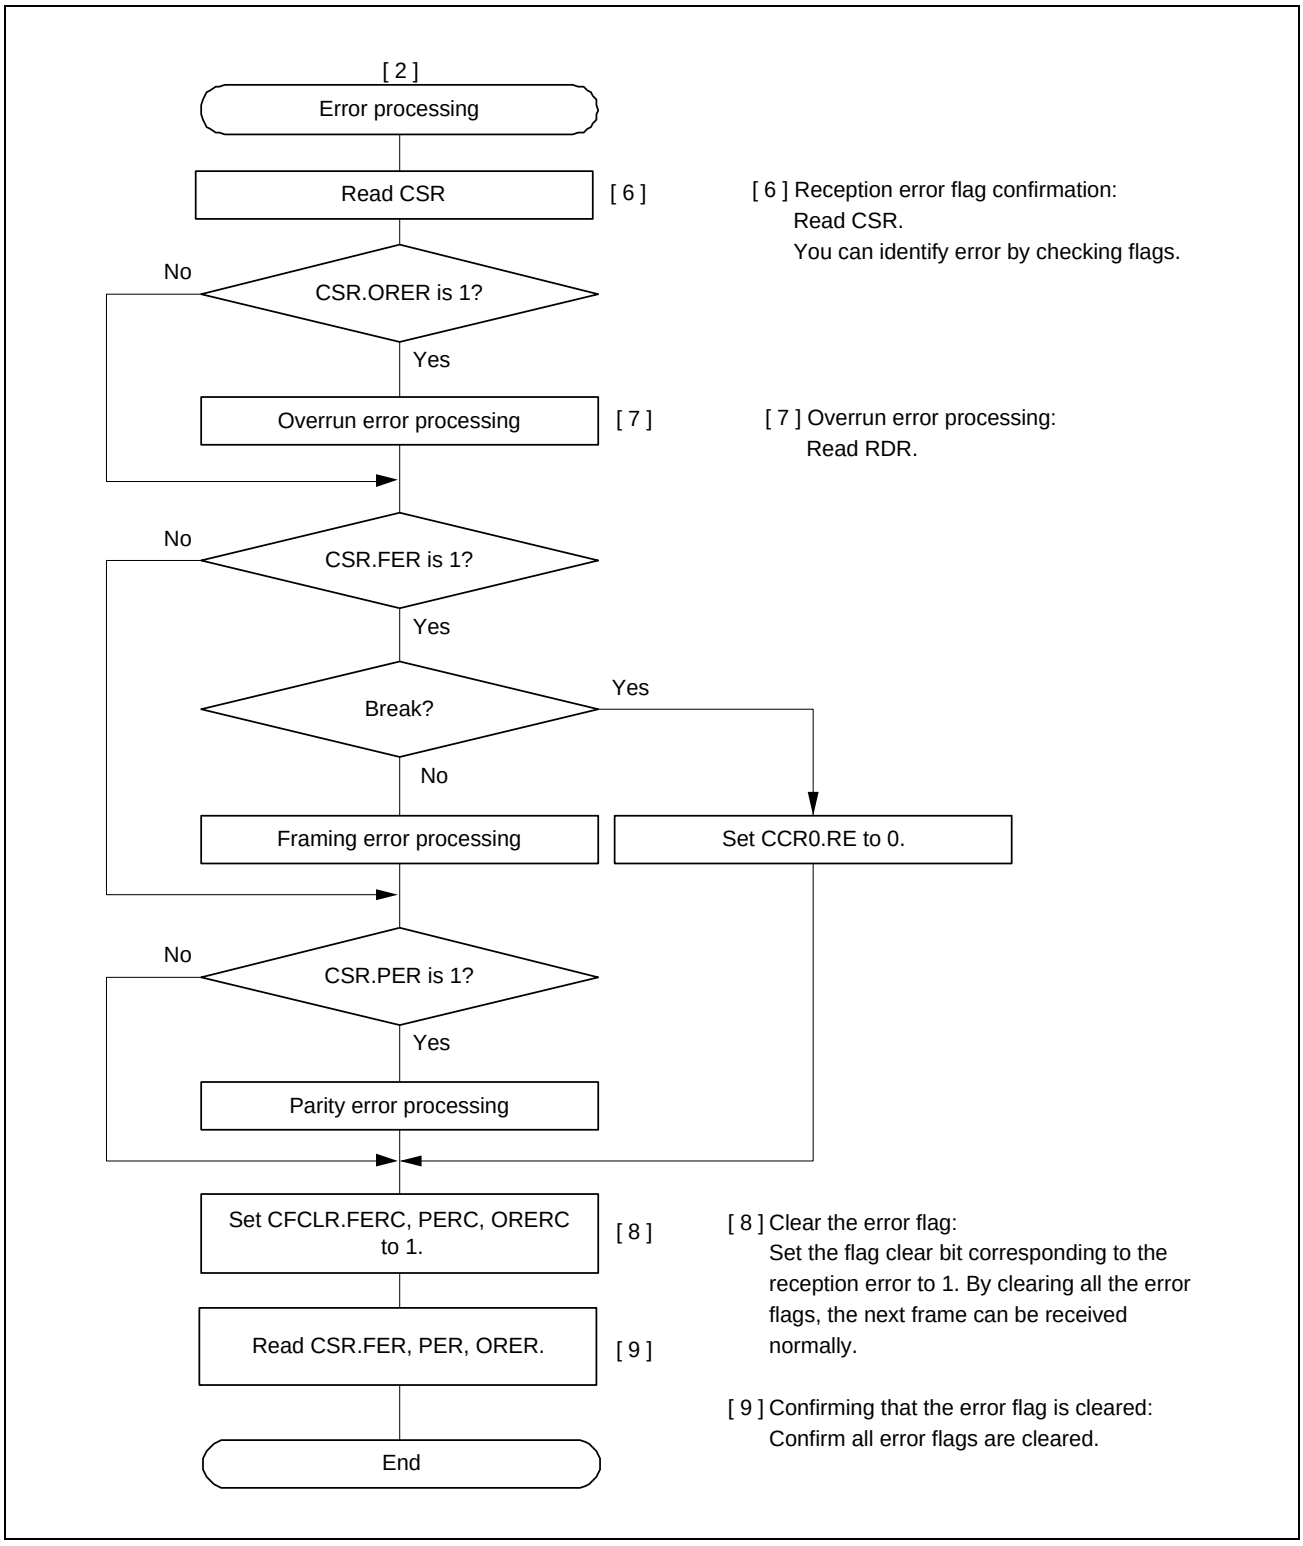


Figure 7.3-21 Example Flowchart of Serial Reception in Asynchronous Mode (Non-FIFO Selected) (2)

(2) FIFO selected

Figure 7.3-22 shows an example of data format that is stored to receive FIFO (RDR) in asynchronous mode.

MPB (Receive FIFO (RDR) bit 9) is stored 0. Data is stored to receive FIFO (RDR) corresponded to data length. It is stored 0 for unused bits. If reading receive FIFO (RDR), SCI updates to next data which are FER, PER and receive data

(RDAT[8:0]) in receive FIFO. The flags which are BRK, RDRF, ORER and DR in receive FIFO, are always indicated to the flags corresponded to CSR register.

Data Length	Register Setting CCR3.CHR[1:0]		Receive flag in RDR[31:0], MPB, RDAT[8:0] b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	1	—	—	—	FFER	FPER	DR	MPB	0	0	RDAT[6:0]						
8 bits	1	0	—	—	—	FFER	FPER	DR	MPB	0	RDAT[7:0]							
9 bits	0	x	—	—	—	FFER	FPER	DR	MPB	RDAT[8:0]								
Data Length	Register Setting CCR3.CHR[1:0]		b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
7 bits	1	1	—	—	—	FER	PER	—	—	ORER	—	—	—	—	—	—	—	—
8 bits	1	0	—	—	—	FER	PER	—	—	ORER	—	—	—	—	—	—	—	—
9 bits	0	x	—	—	—	FER	PER	—	—	ORER	—	—	—	—	—	—	—	—

Note: The MPB flag, the RDR[9] bit, is always read as 0b.
When a 7-bit data length is selected, the RDAT[8:7] bits are read as 00b.
When an 8-bit data length is selected, the RDAT[8] bit is read as 0b.

Figure 7.3-22 Data Format that is Stored to Receive FIFO (RDR) (FIFO Selected)

Table 7.3-26 lists the states of the flags in CSR status register and receive data handling when a receive error is detected with FIFO selected. **Figure 7.3-23** and **Figure 7.3-24** show samples of flowcharts for serial data reception with FIFO selected.

In serial data reception, the SCI operates as described below.

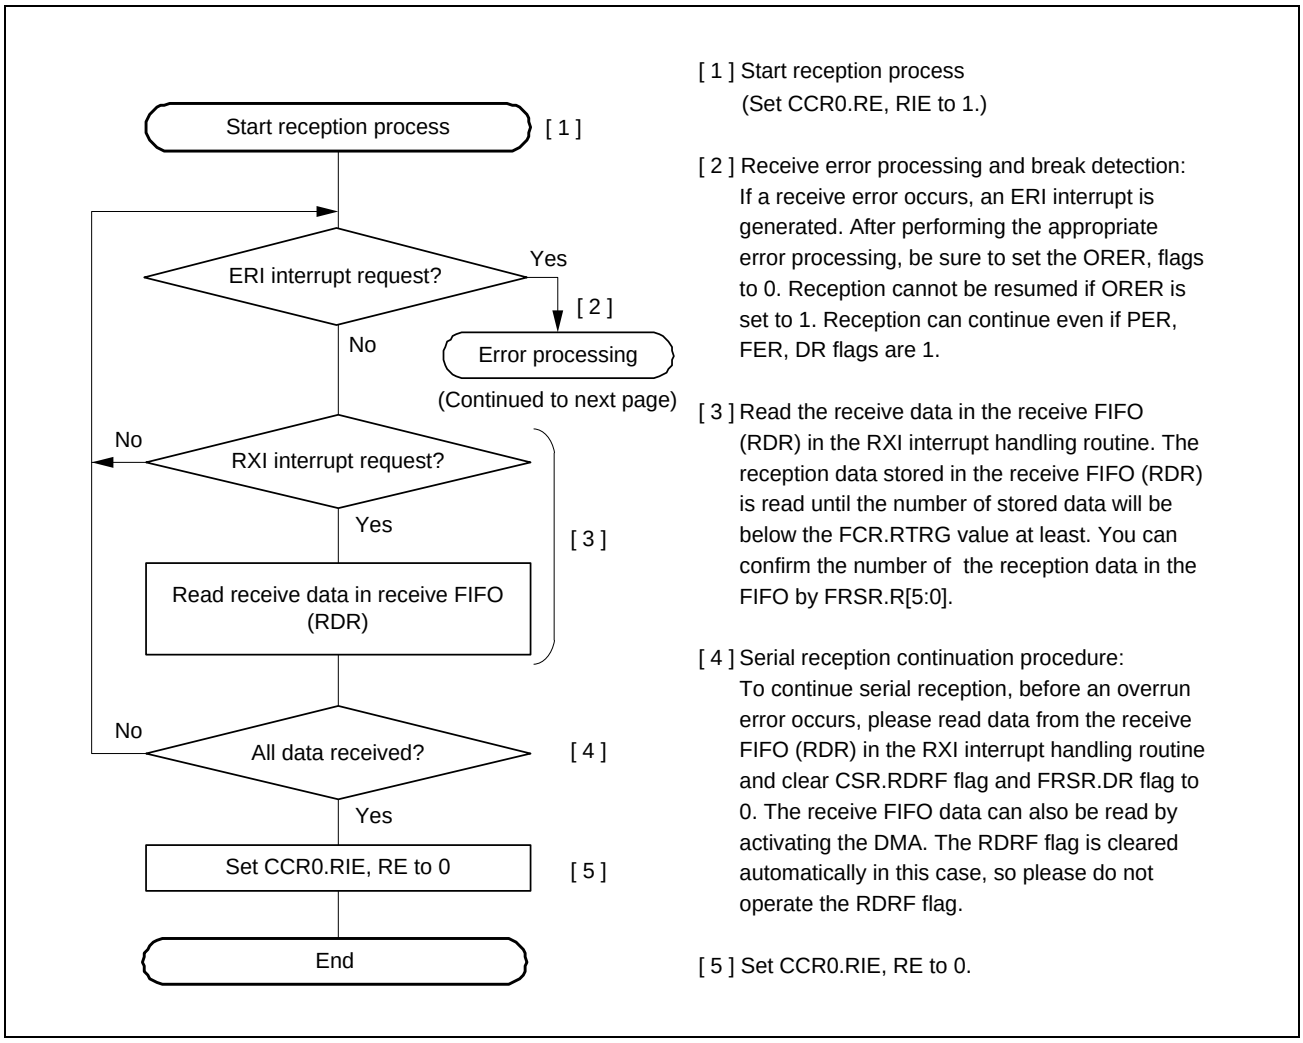
1. When the value of CCR0.RE becomes 1b, the output signal on the RTSn# pin goes to the low level in the case of RTS function use.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If there is no space in RDR, CSR.ORER is set to 1b. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated. Receive data is not transferred to receive FIFO (RDR).
4. If a parity error is detected, CSR.PER is set to 1b and receive data is transferred to receive FIFO (RDR). If the CCR0.RIE is 1b at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0b) is detected, CSR.FER is set to 1b and receive data is transferred to RDR. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated.
6. After framing error is detected, when SCI detects that continuous receive data is 0b for 1 frame, reception stops.
7. When quantity of data stored in the receive FIFO data register (RDR) falls the specified receive triggering number, and that no next data has been received yet after the elapse of 15 etu from the last stop bit in asynchronous mode, FRSR.DR is set to 1b. If RIE bit is set to 1b, SCI occurs RXI interrupt request when FCR.DRES bit is 0b and SCI occurs ERI interrupt request when FCR.DRES = 1b.
8. When reception finishes successfully, receive data is transferred to receive FIFO (RDR). RDRF is set to 1b when the quantity of receive data which is equal to or greater than the specified receive triggering number are stored in receive FIFO (RDR). If CCR0.RIE is 1b at this time, an RXI interrupt request is generated. Continuous reception

is enabled by reading the receive data transferred to receive FIFO (RDR) in this RXI interrupt handling routine before overrun error is occurred. Reading the received data that have been transferred to receive FIFO (RDR), and if it is less than RTS trigger number, causes the RTSn# pin to output the low level in the case of RTS function use.

Table 7.3-26 Flags in the CSR Status Register and Receive Data Handling (FIFO Selected)

CSR Value			Receive FIFO (RDR)	
ORER	FER*1	PER*1	RDAT[8:0]	Receive Error Type
1	0	0	Lost	Overrun error
0	1	0	Transferred RDR	Framing error
0	0	1	Transferred RDR	Parity error
1	1	0	Lost	Overrun error + Framing error
1	0	1	Lost	Overrun error + Parity error
0	1	1	Transferred RDR	Framing error + Parity error
1	1	1	Lost	Overrun error + Framing error + Parity error

Note 1. This flag indicates whether there is an error in received data when reception is completed.



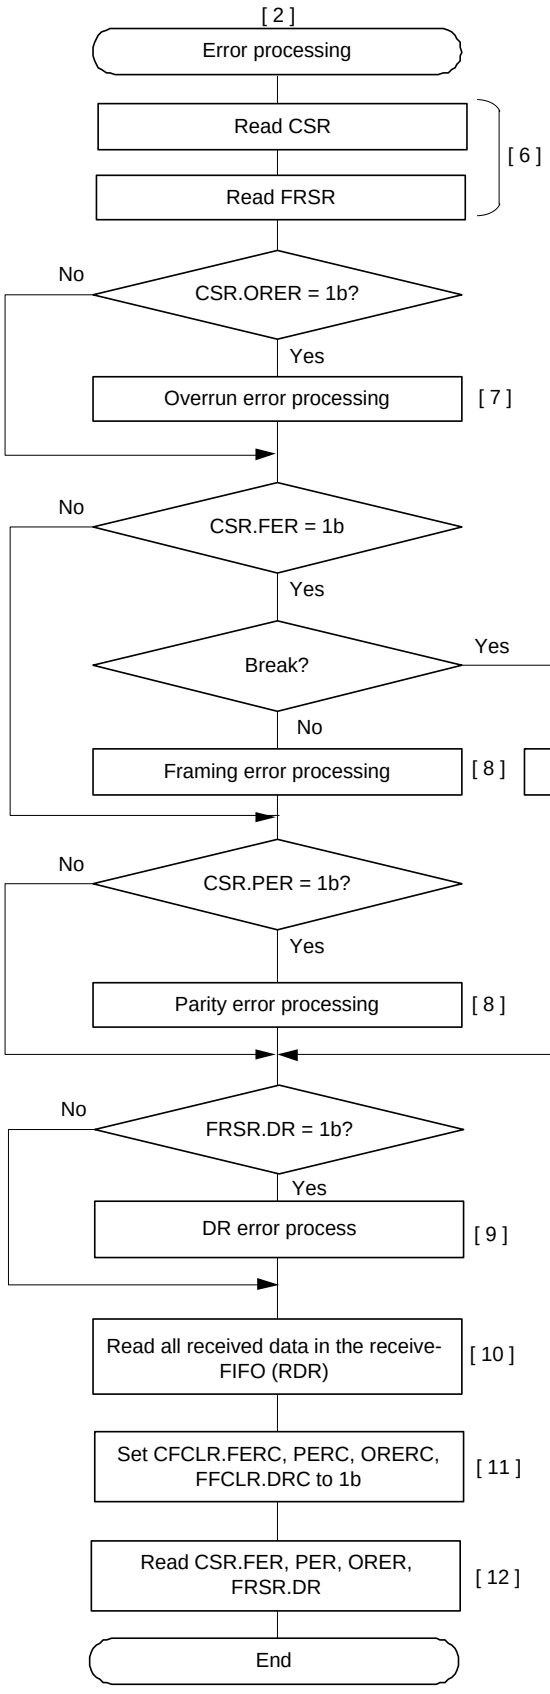


Figure 7.3-23 Example Flowchart of Serial Reception in Asynchronous Mode (FIFO Selected) (1)

[6] Reception error flag confirmation:
Read CSR and FRSR.
You can identify error by checking flags.

[7] Overrun error processing:
Read the receive FIFO (RDR) and make space in the receive FIFO (RDR).

[8] Break processing:
When CCR3.RXDESEL is 0b, the latest receive data in the receive FIFO (RDR) is the break-data which has framing error and all data-bits are 0b. So, discard the latest receive data.

[8] Framing error / Parity error processing:
Read all error occurrence data stored in the receive FIFO (RDR). (You can substitute to write 1b in FCR.RFRST bit and empty the receive FIFO (RDR).)
When [10] is handled in addition to this processing, the next frame can be normally received.

[9] DR error process when FCR.DRES is 1b.
Performs error processing required for the system (for example, setting a counter for data number management).

[10] Read all received data in the receive-FIFO (RDR).

[11] Clear the error flag:
Make clear FER, PER, ORER, DR

[12] Confirming that the error flag is cleared:
Confirm FER, PER, ORER, DR are cleared.

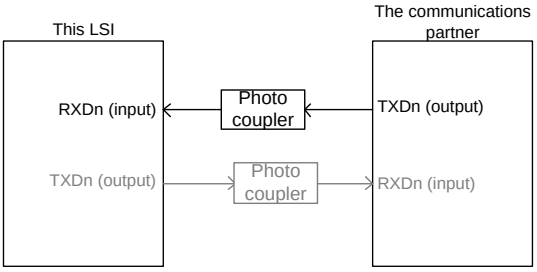
Figure 7.3-24 Example Flowchart of Serial Reception in Asynchronous Mode (FIFO Selected) (2)

7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)

When there is the difference between the rising transfer time and the falling transfer time through a photo coupler, the receive sampling timing at middle of bit affects the reception margin. In this case, the receive sampling timing can adjust from the middle of bit to the optimum timing by using this function.

The receive sampling timing is adjusted from the middle of bit by following formula. And the adjustable direction is set by CCR4.AJD. You can select forward or backward from the middle of bit. When adjusting backward (CCR4.AJD = 0b), substitute AJD = +1 and substitute AJD = -1 when adjusting forward (CCR4.AJD = 1b).

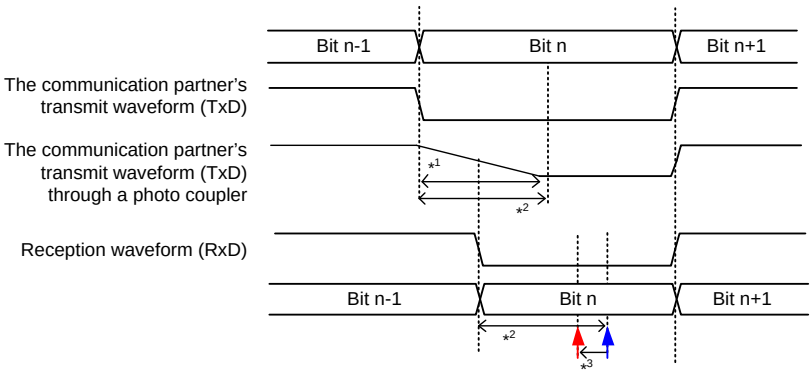
Adjusted sampling timing = the middle of bit + AJD × (base clock × the setting value of CCR4.AST[2:0]) The setting timing is limited by base clock cycles per 1 bit. Please see **Table 7.3-27** in detail.



A reception movement image figure of the communication through a photo coupler with this function is shown in **Figure 7.3-25** and **Figure 7.3-26**, the movement explanation of this function is shown in **Figure 7.3-27**.

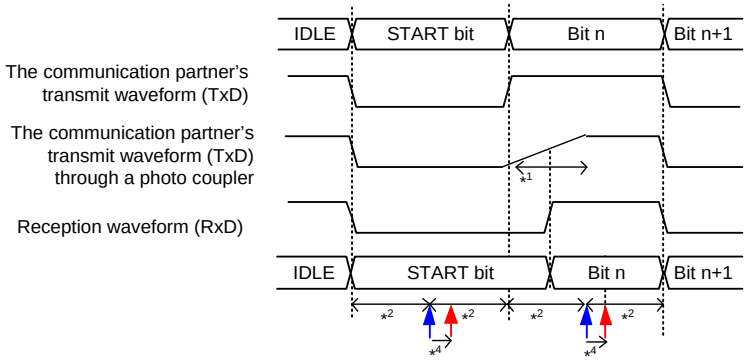
Do not use this function when there is no difference between the rising transfer time and the falling transfer time, because there is a possibility of deteriorating the reception margin.

Table 7.3-27 The Acceptable Value of Setting Register (Asynchronous Mode Using Internal Clock)



CCR2.ABCSE	CCR2.ABCS	The Number of Base Cycles/1 Bit	The Acceptable Value	
			CCR4.AJD	CCR4.AST
1	x	6	0	000b to 010b*1
			1	
0	1	8	0	000b to 011b*1
			1	
0	0	16	0	000b to 111b
			1	

Note 1. When the value of CCR4.AST is over the acceptable value, sampling is done at default timing. (Adjustment of sampling is not done.)



(a) In the case of the falling transfer time >> rising transfer time

The falling edge of reception waveform is made dull like following chart.
In this case, you can sampling at the middle of bit if you adjust the receive sampling timing to forward (AJD = 1b).

(b) In the case of the falling transfer time << rising transfer time

The rising edge of reception waveform is made dull like following chart.
So, the reception margin of communications partner will be bad. In this case, you can improve the reception margin if you adjust the receive sampling timing to back.

The receive sampling timing when unadjusted (middle of bit)

The adjusted receive sampling timing

Note: This waveform shows the operation image of adjustment receive sampling timing.

Note 1. The dull period by a photo coupler

Note 2. Bit center timing at set communication rate

Note 3. When CCR4.AJD is 1b, the receive sampling timing is shifted to forward by the setting value of CCR4.AST[2:0].

Note 4. When CCR4.AJD is 0b, the Receive sampling timing is shifted to backward by the setting value of CCR4.AST[2:0].

Figure 7.3-25 The Reception Movement Image Figure of the Communication through a Photo Coupler

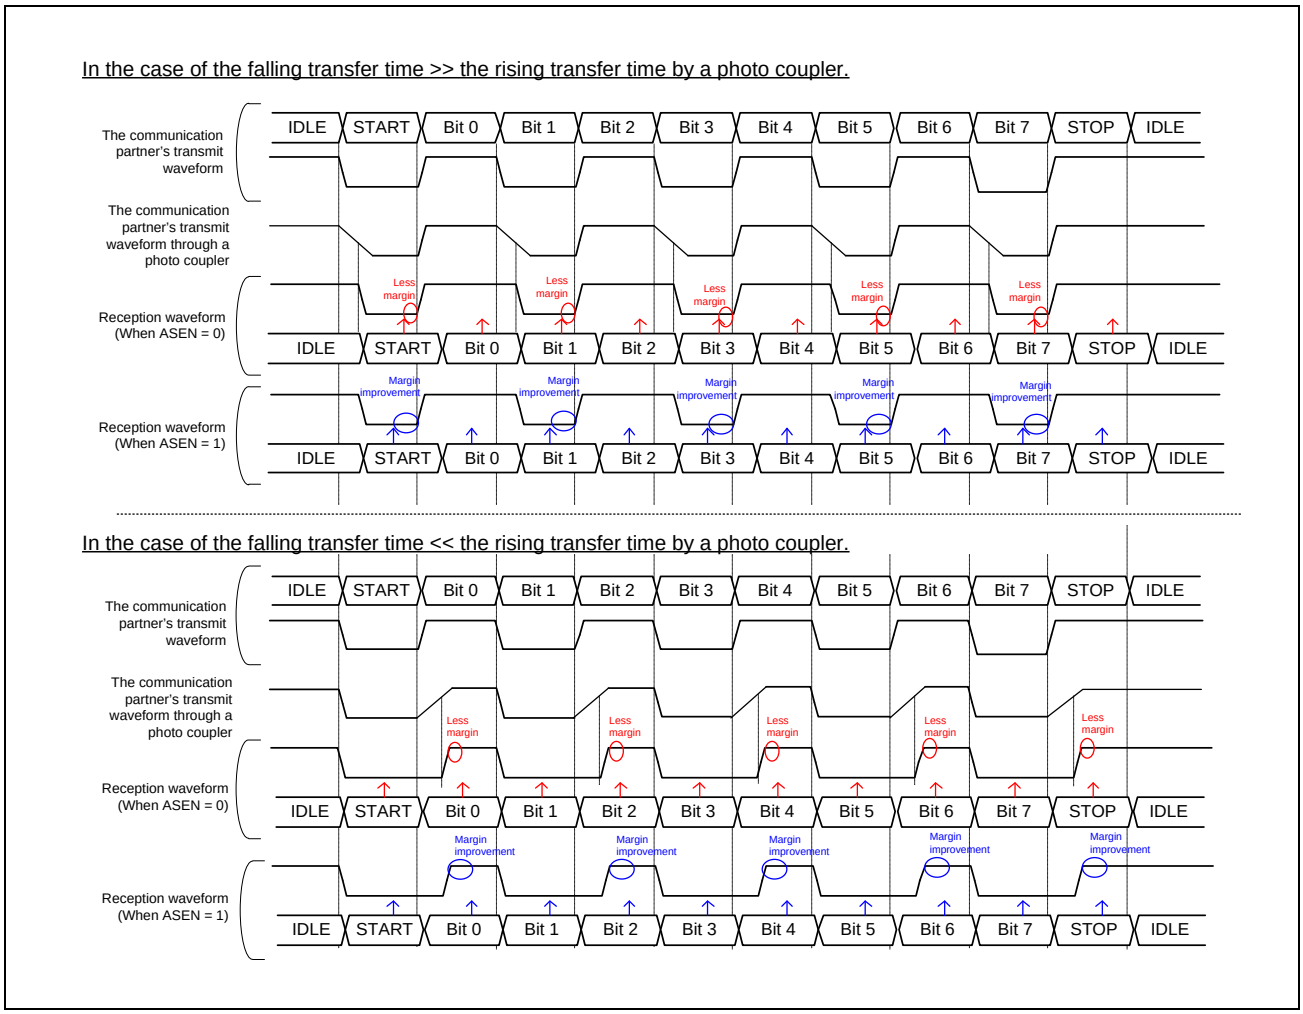


Figure 7.3-26 Improvement of Reception Margin when Receive Sampling Timing Adjustment Function Image

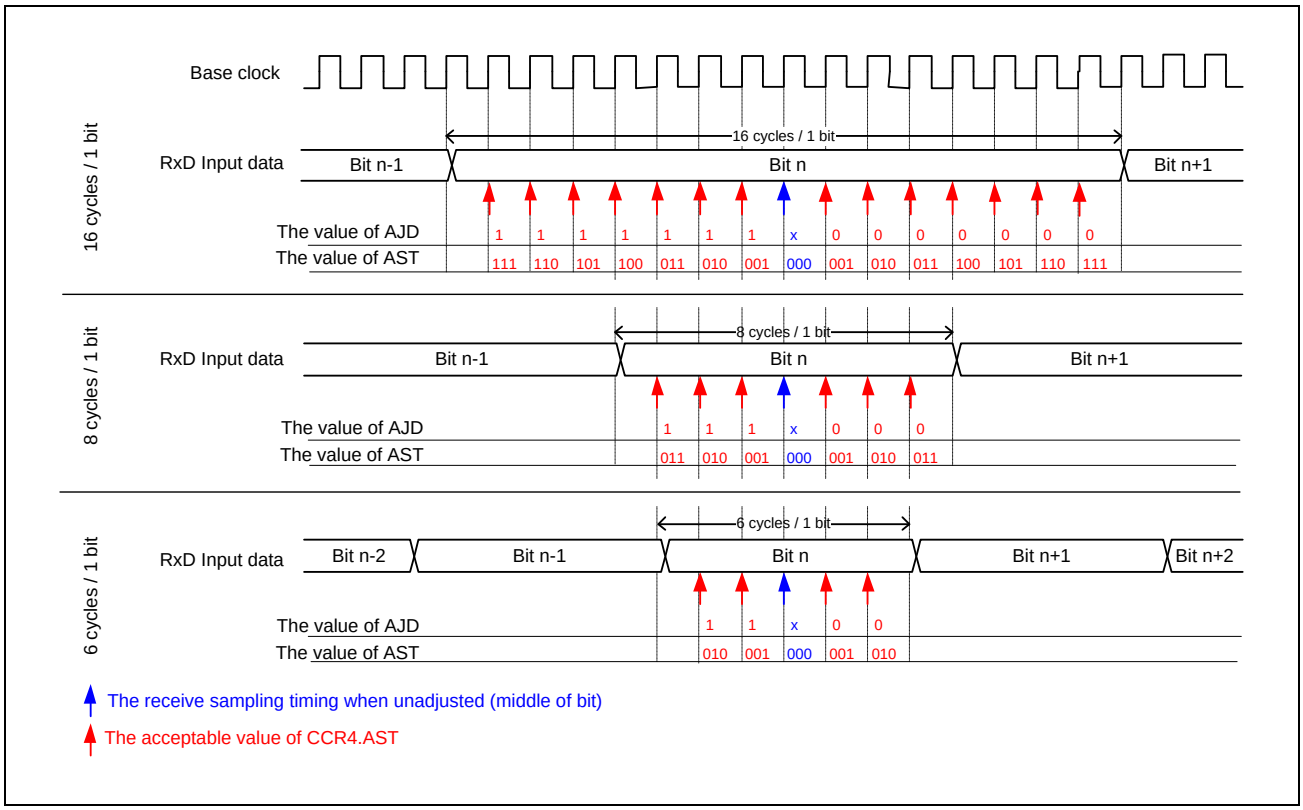

Figure 7.3-27 The Adjustment Operation Explanation for the Receive Sampling Timing (Asynchronous Mode Using Internal Clock)

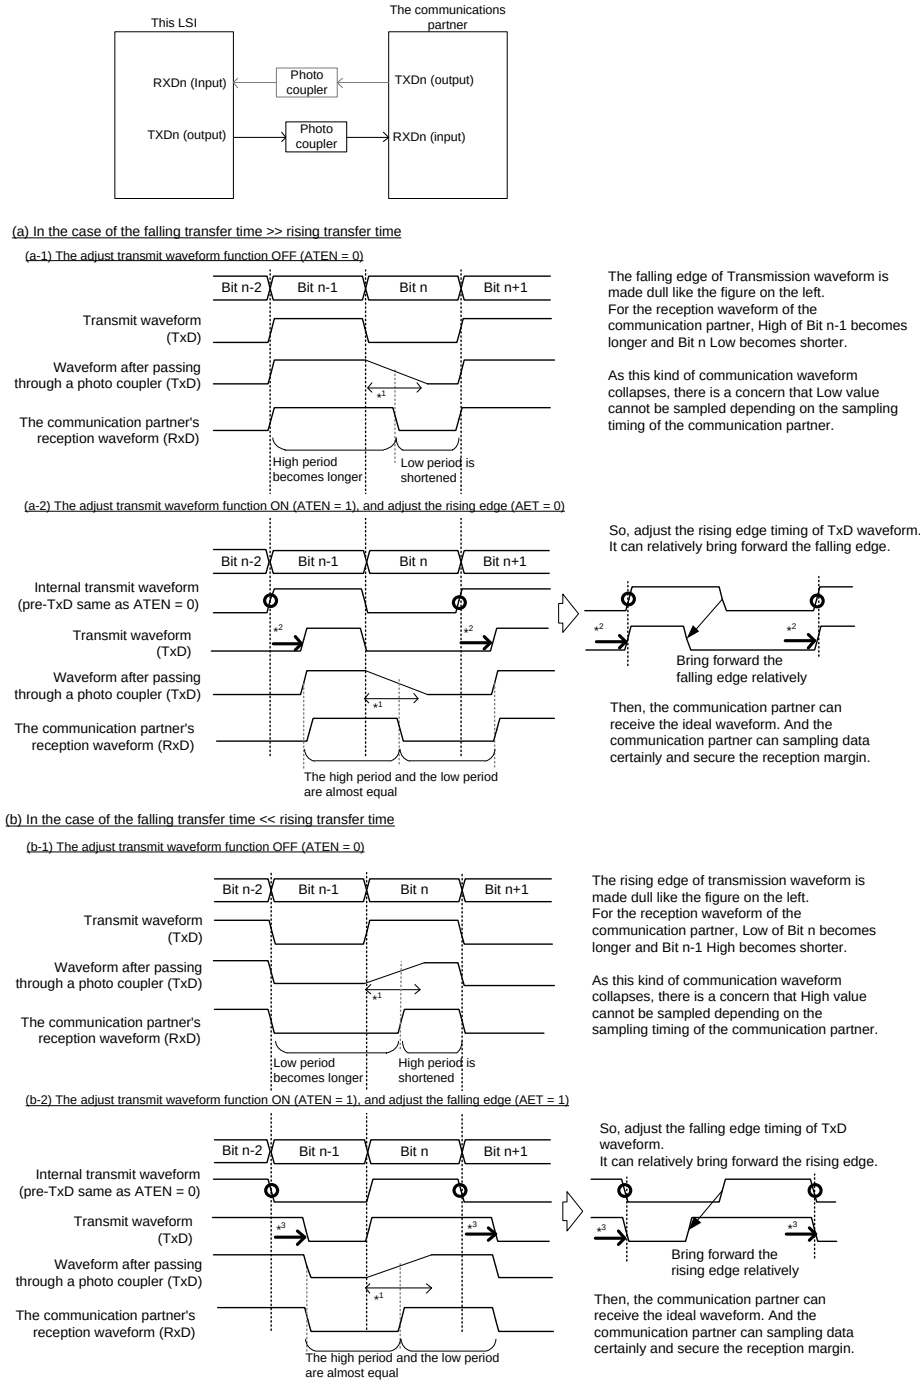
7.3.3.11 The Function of Adjust Transmit Timing (Asynchronous Mode)

In communication via a photo coupler or the like, when either the rising or falling transition time of the TxD output signal is long, then a communication partner receive dulled waveform. In this case, the reception margin may be affected.

In these cases, make a communication partner to be sampling at middle of bit using the function of adjust transmit timing. When CCR4.ATEN is 1b, this function can adjust the edge timing at the timing calculated by the following formula for the edge set with CCR4.AET.

$$\text{The adjustment edge timing} = \text{base clock} \times \text{CCR4.ATT}[2:0]$$

In addition, the upper limit of the adjustment edge timing is limited by setting the base clock cycles. For details, see **Table 7.3-28**.



A transmission movement image figure of the communication through a photo coupler with this function is shown in **Figure 7.3-28** and **Figure 7.3-29**, the movement explanation of this function is shown in **Figure 7.3-30** and **Figure 7.3-31**.

Do not use this function when there is not the difference between the rising transfer time and the falling transfer time, there is a possibility of deteriorating the reception margin of a communication partner.

Table 7.3-28 The Acceptable Value of CCR4.AET and CCR4.ATT (Asynchronous Mode Using Internal Clock)

ABCSE	ABCS	The Number of Base Clock Cycles/1 Bit	The Acceptable Value	
			AET	ATT[2:0]
1	x	6	0	000b to 101b
			1	
0	1	8	0	000b to 111b
			1	
0	0	16	0	000b to 111b
			1	

Note: When the value of CCR4.AET/ATT is out of the acceptable value, this module does not adjust transmit timing.

Note 1. The dull period by a photo coupler

Note 2. When CCR4.AET is 0b, the rising edge of transmit waveform timing is shifted to back by the setting value of CCR4.ATT[2:0]. It can transmit waveform bringing forward the falling edge relatively.

Note 3. When CCR4.AET is 1b, the falling edge of transmit waveform timing is shifted to back by the setting value of CCR4.ATT[2:0]. It can transmit waveform bringing forward the rising edge relatively.

Note: This waveform shows the operation image of adjustment transmit waveform.

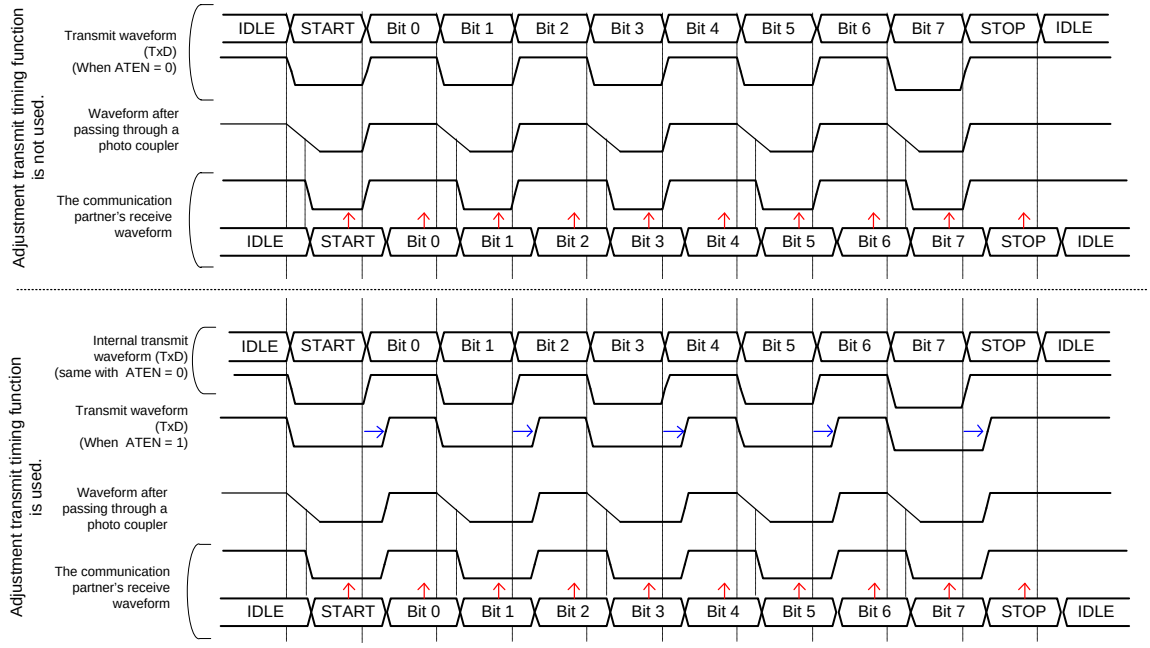


Figure 7.3-28 The Transmission Movement Image Figure of the Communication through a Photo Coupler

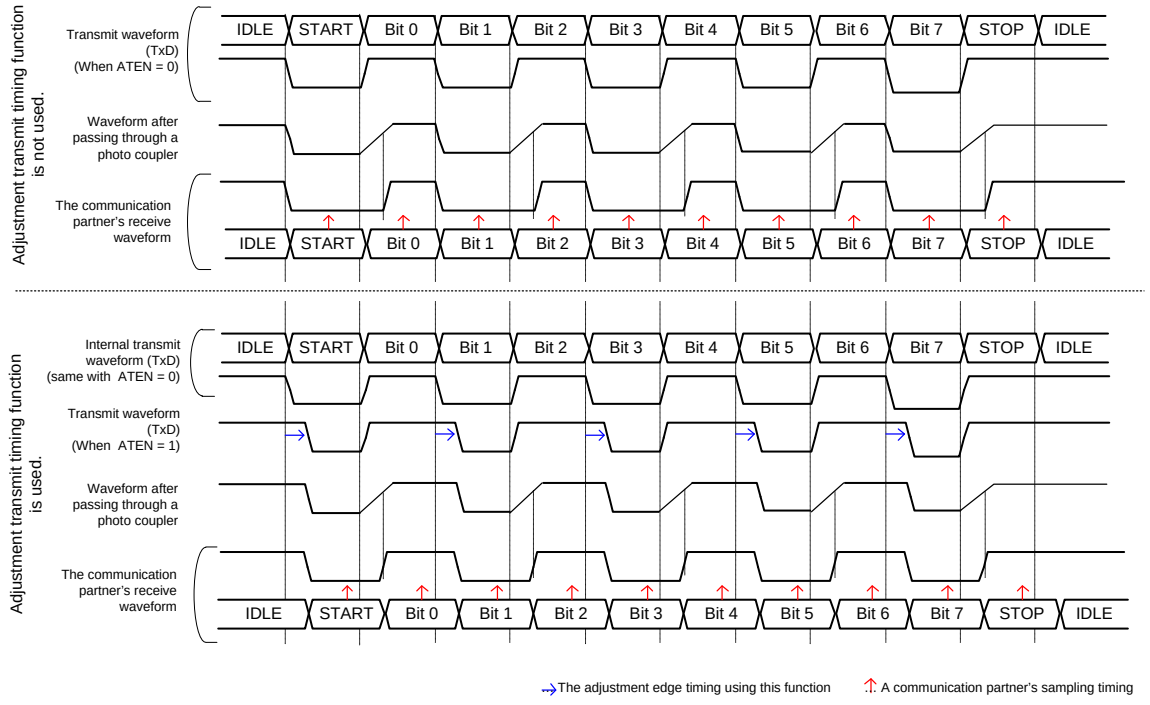
The explanation of transmit waveforms of the communication through a photo coupler using adjust transmit timing function

When using the transmission timing adjustment function, adjust the edge timing of the transmission waveform and correct the reception waveform of the communication partner

The following example is 8 bit long data.

(a) In the case of the falling edge transfer time >> the rising transfer time

(b) In the case of the falling edge transfer time << the rising transfer time



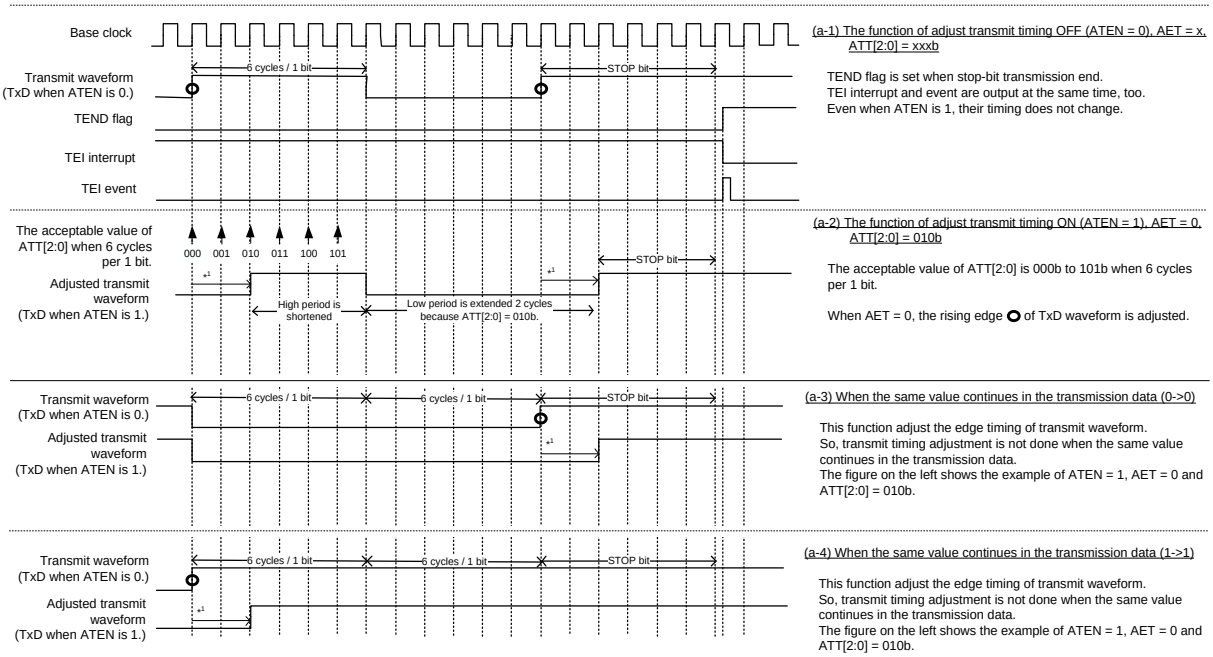


Figure 7.3-29 The Explanation for the Transmit Waveform through a Photo Coupler

The operation explanation of adjustment the transmit timing

(a) In the case of the falling transfer time >> rising transfer time

In this case, the high period of a communication partner's reception waveform is made long, and the low period is made short.
Therefore, the LSI transmits the waveform with the falling edge relatively brought forward by adjusting the rising edge timing.
Then adjust value (ATT[2:0]) should be set to make equal the low-period/1 bit and high-period/1 bit for a communication partner.

This function's operation is explained as an example of 6 cycles/1 bit.

Note 1. The rising edge of transmit timing is shifted to back by the setting value of CCR4.ATT[2:0].

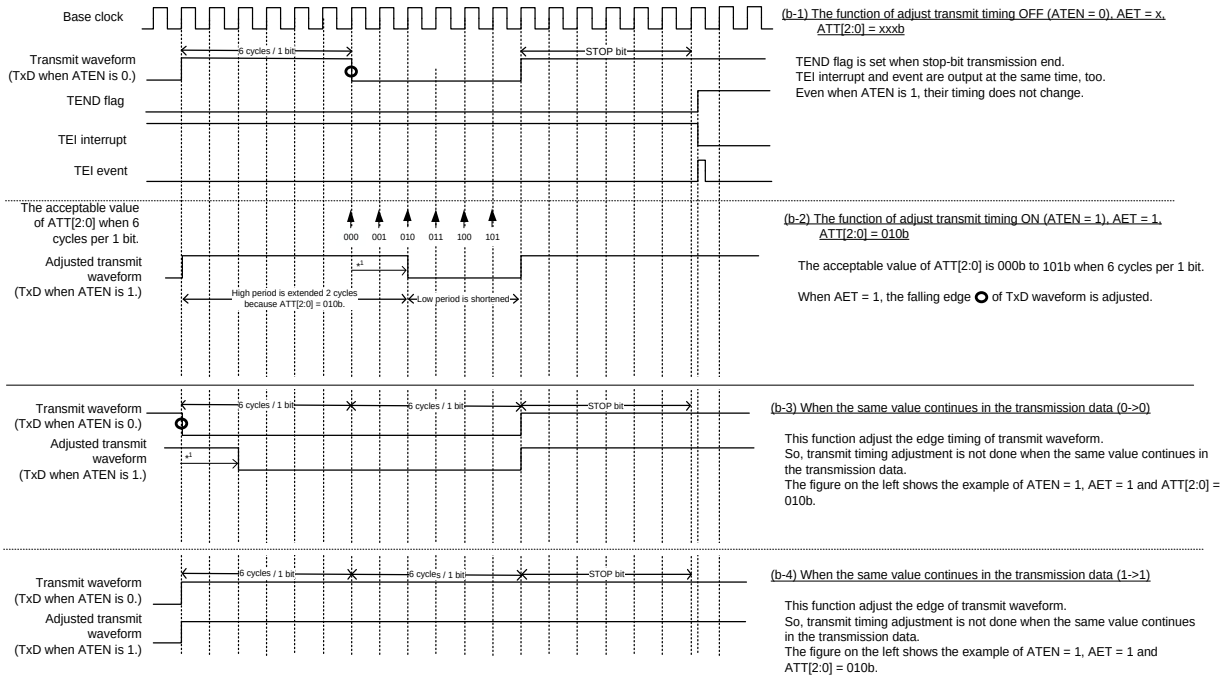

Figure 7.3-30 The Adjustment Operation Explanation for the Transmit Timing when AET is 0b

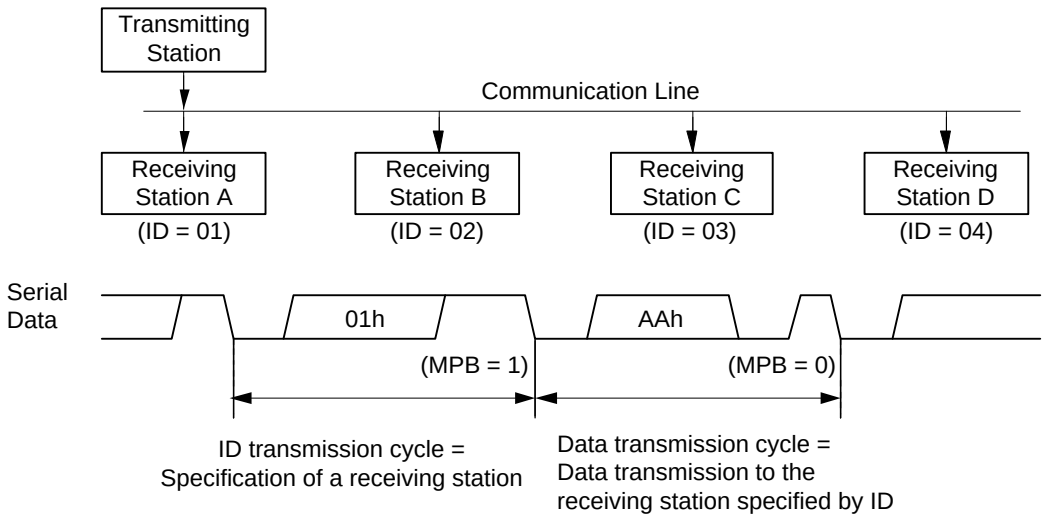
The operation explanation of adjustment the transmit timing

(b) In the case of the falling transfer time << rising transfer time

In this case, the low period of a communication partner's reception waveform is made long, and the high period is made short.
Therefore, the LSI transmits the waveform with the rising edge relatively brought forward by adjusting the falling edge timing.
The adjust value (ATT[2:0]) should be set to make equal the low-period/1 bit and high-period/1 bit for a communication partner.

This function's operation is explained as an example of 6 cycles/1 bit.



Note 1. The falling edge of transmit timing is shifted to back by the setting value of CCR4.ATT[2:0].

Figure 7.3-31 The Adjustment Operation Explanation for the Transmit Timing when AET is 1b

7.3.4 Multi-Processor Communication Function

Using the multi-processor communication functions enables to transmit and receive data by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle. When the multi-processor bit is set to 1b, it indicates the ID transmission cycle and when the multiprocessor bit is set to 0b, it indicates the data transmission cycle. **Figure 7.3-32** shows an example of communication between processors by using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1b is added to the ID code of the receiving station. Next, the transmitting station transmits the communication data in which the multi-processor bit set to 0b is added to the transmit data. On receiving the communication data in which the multi-processor bit is set to 1b, the receiving station compares the received ID with the ID of the receiving station itself and if the two matches, receives the communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until again receiving the communication data in which the multi-processor bit is set to 1b.

RTS control cannot be used at the time of multi-processor communication function use, because this is a function corresponding to one-to-many communications.

Note: MPB: Multi-processor bit

Figure 7.3-32 An Example of Communication Using the Multi-Processor Format (Example of Transmission of Data AAh to Receiving Station A)

(1) Non-FIFO selected

For supporting this function, the SCI provides the MPIE bit in CCR0. When the MPIE bit is set to 1b, transfer of receive data from the RSR to the RDR, detection of a receive error, and setting the respective status flags RDRF, ORER, and FER in CSR are disabled until reception of data in which the multi-processor bit is set to 1b.

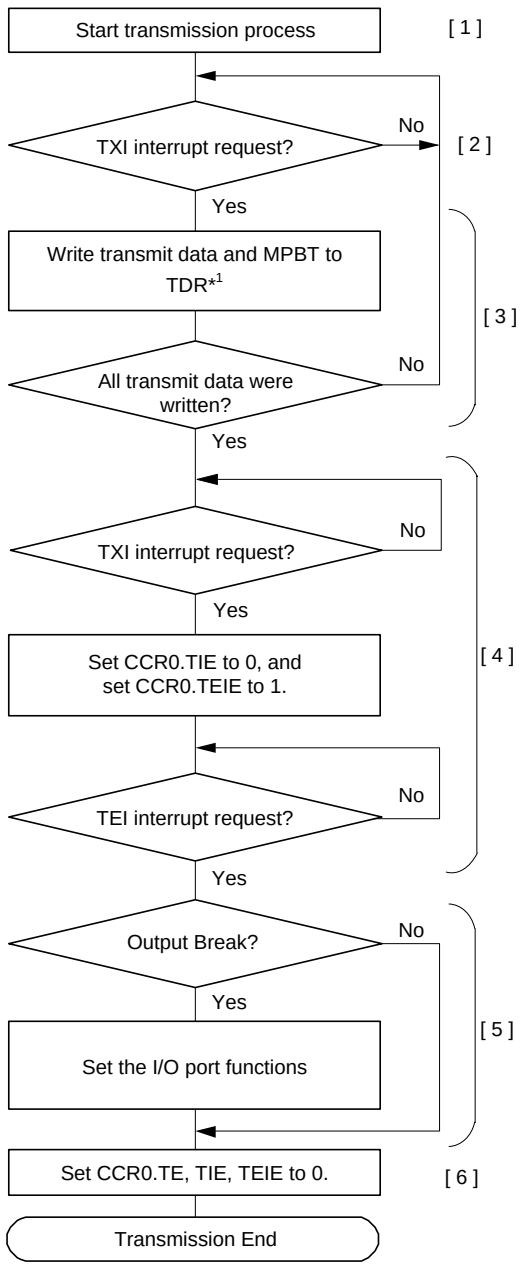
On receiving a reception character in which the multi-processor bit is set to 1b, the MPB bit in RDR is set to 1b and the MPIE bit in CCR0 is automatically cleared, thus returning to a non-multi-processor reception operation. At this time, an RXI interrupt is generated if the RIE bit in CCR0 is set.

When the multi-processor format is specified, specification of the parity bit is disabled.

Apart from this, there is no difference from the operation in the non-multi-processor asynchronous mode. A clock which is used for the multi-processor communication is also the same as the clock used in the non-multi-processor asynchronous mode.

(2) FIFO selected

For transmission, it should write to TDR.MPBT (Multi-Processor Bit Transfer) which corresponds to transmit data in TDR.TDAT. For reception, Multi-processor bit that is a part of receive data, is stored to RDR.MPB, and receive data is stored to RDR.RDAT. When the MPIE bit is set to 1b, transfer of receive data from the RSR to the RDR.RDAT, detection of a receive error, and detection of DR, and setting the respective status flags RDRF, ORER, and FER in CSR are disabled until reception of data in which the multi-processor bit is set to 1b.



On receiving a reception character in which the multi-processor bit is set to 1b, the MPB bit in RDR is set to 1b, and receive data is stored to receive FIFO (RDR.RDAT), and the MPIE bit in CCR0 is automatically cleared, thus returning to a non- multi-processor reception operation. At this time, an RXI interrupt is generated if the RIE bit in CCR0 is set.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the non-multi-processor asynchronous mode and non-FIFO selected.

7.3.4.1 Multi-Processor Serial Data Transmission

(1) Non-FIFO selected

Figure 7.3-33 shows a sample flowchart of multi-processor data transmission. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in TDR set to 1b. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0b. The other operations are the same as the operations in asynchronous mode.

[1] Start transmission process:
To enable TXI interrupt at the start of transmission, set TE and TIE to 1 with one instruction at the same time. And set CCR3.MP to 1.

[2] TXI interrupt request:
The transmit-data-empty-interrupt (TXI) is generated at following conditions:
When set TE and TIE to 1 at same time.
When transmission-data forwards to TSR from TDR.

[3] Serial transmission continuation procedure:
To continue serial transmission write transmit data and MPBT setting value to TDR*1 once by using a TXI. Transmit data and MPBT setting value can also be written by activating the DMAC.

[4] If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR*1 and transmission is started.

[5] Break output at the end of serial transmission:
To output a break, it is necessary to set SPB2IO and SPB2DT, for output status setting when TE is 0. (If you set these bits at initialization, you can skip this step.)

[6] Set CCR0.TE, TIE, TEIE to 0.

Note 1. In case of byte access with data length 9 bits, write transmit data in order of TDR[15:8] and TDR[7:0].

Figure 7.3-33 Example of Multi-Processor Serial Transmission Flowchart (Non-FIFO Selected)

(2) FIFO selected

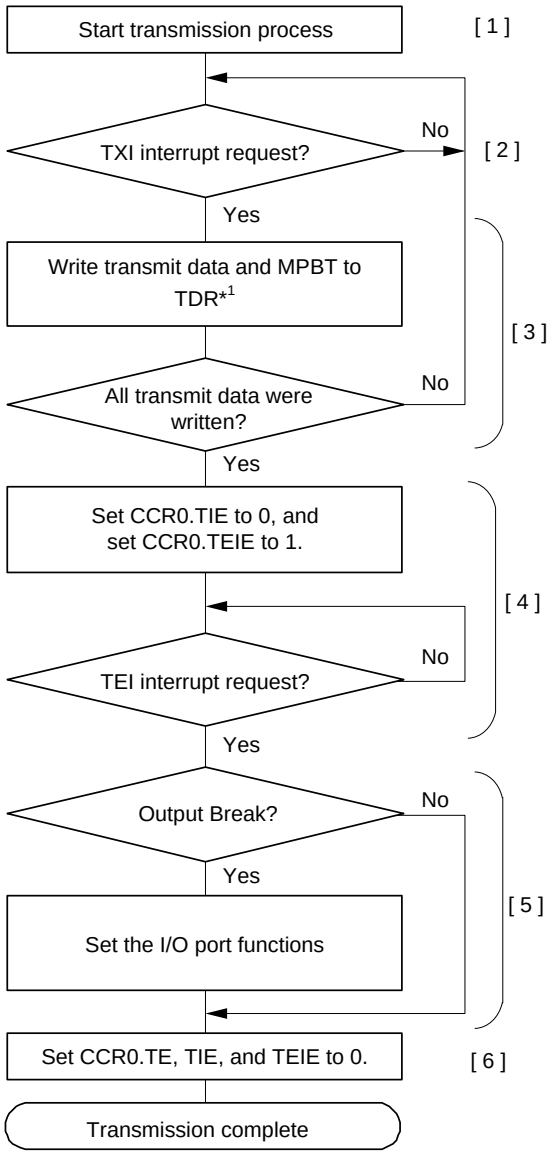


Figure 7.3-34 shows an example of data format that is written to transmit FIFO (TDR.TDAT) in multi-processor mode. Write MPBT in bit 9 of TDR. And write data to transmit FIFO (TDR.TDAT) corresponded to data length. It should write to 0b for unused bits.

Data Length	Register Setting CCR3.CHR[1:0]		Transmit data in TDR[15:0]															
			b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	1	—	—	—	—	—	—	MPBT	—	—	TDAT[6:0]						
8 bits	1	0	—	—	—	—	—	—	MPBT	—	TDAT[7:0]							
9 bits	0	x	—	—	—	—	—	—	MPBT	TDAT[8:0]								

Note: The bits Indicated by "—" are not used. Therefore, those bits should be set to 0b.

Figure 7.3-34 Data Format in Multi-Processor Mode that is Written to Transmit FIFO (TDR.TDAT)

Figure 7.3-35 shows a sample flowchart for multi-processor data transmission with FIFO selected. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in TDR set to 1b. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0b. The other operations are the same as the operations in asynchronous mode with FIFO selected.

[1] Start transmission process.
To enable TXI interrupt at he start of transmission, set TE and TIE to 1 with one instructions at the same time. And set CCR3.FM and MP to 1.

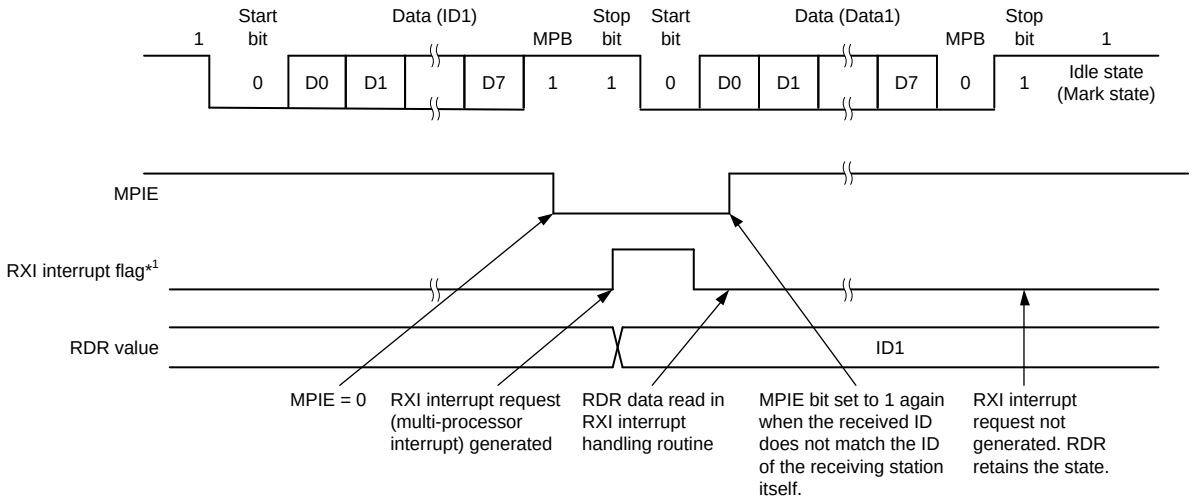
[2] TXI interrupt request:
The transmit-data-empty-interrupt (TXI) is generated when transmission-data forwards to TSR from the transmit FIFO (TDR) and the number of transmit-data written in the transmit FIFO is equal to or less than the transmit FIFO threshold.

[3] Serial transmission continuation procedure:
To continue serial transmission, write all transmit data and MPBT setting value to the transmit FIFO (TDR) by using a TXI interrupt. Transmit data and MPBT setting value can also be written to the transmit FIFO (TDR) by activating the DMAC.

[4] If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR*1.

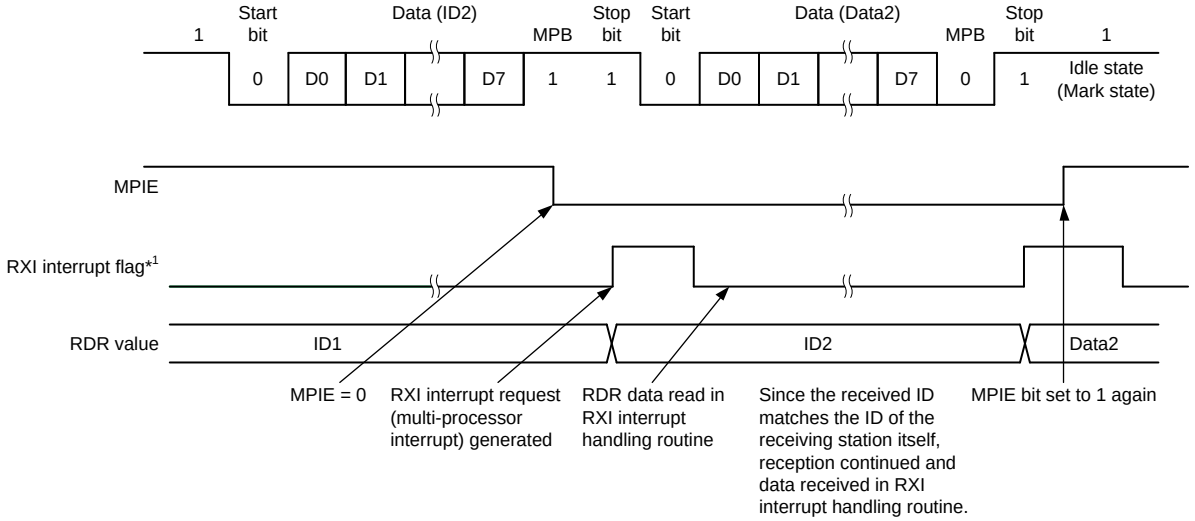
[5] Break output at the end of serial transmission:
To output a break, it is necessary to set SPB2IO and SPB2DT, for output status setting when TE is 0.
(If you set these bits at initialization, you can skip this step.)

[6] Set CCR0.TE, TIE, and TEIE to 0.



Note 1. In case of byte access with data length 9 bits, write transmit data in order of TDR[15:8] and TDR[7:0].

Figure 7.3-35 Example of Serial Transmission Flowchart in Multi-Processor Mode (FIFO Selected)



7.3.4.2 Multi-Processor Serial Data Reception

(1) Non-FIFO selected

Figure 7.3-37 and **Figure 7.3-38** are sample flowcharts of multi-processor data reception. When the MPIE bit in CCR0 is set to 1b, reading the communication data is skipped until reception of the communication data in which the multi-processor bit is set to 1b. When the communication data in which the multi-processor bit is set to 1b is received, the received data is transferred to RDR. At this time, the RXI interrupt request is generated. The other operations are the same as the operations in asynchronous mode. **Figure 7.3-36** is the example of operation for reception.

(a) When the received ID does not match the ID of the receiving station itself

(b) When the received ID matches the ID of the receiving station itself

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-36 Example of SCI Reception (8-Bit Data/Multi-Processor Bit/1 Stop Bit)

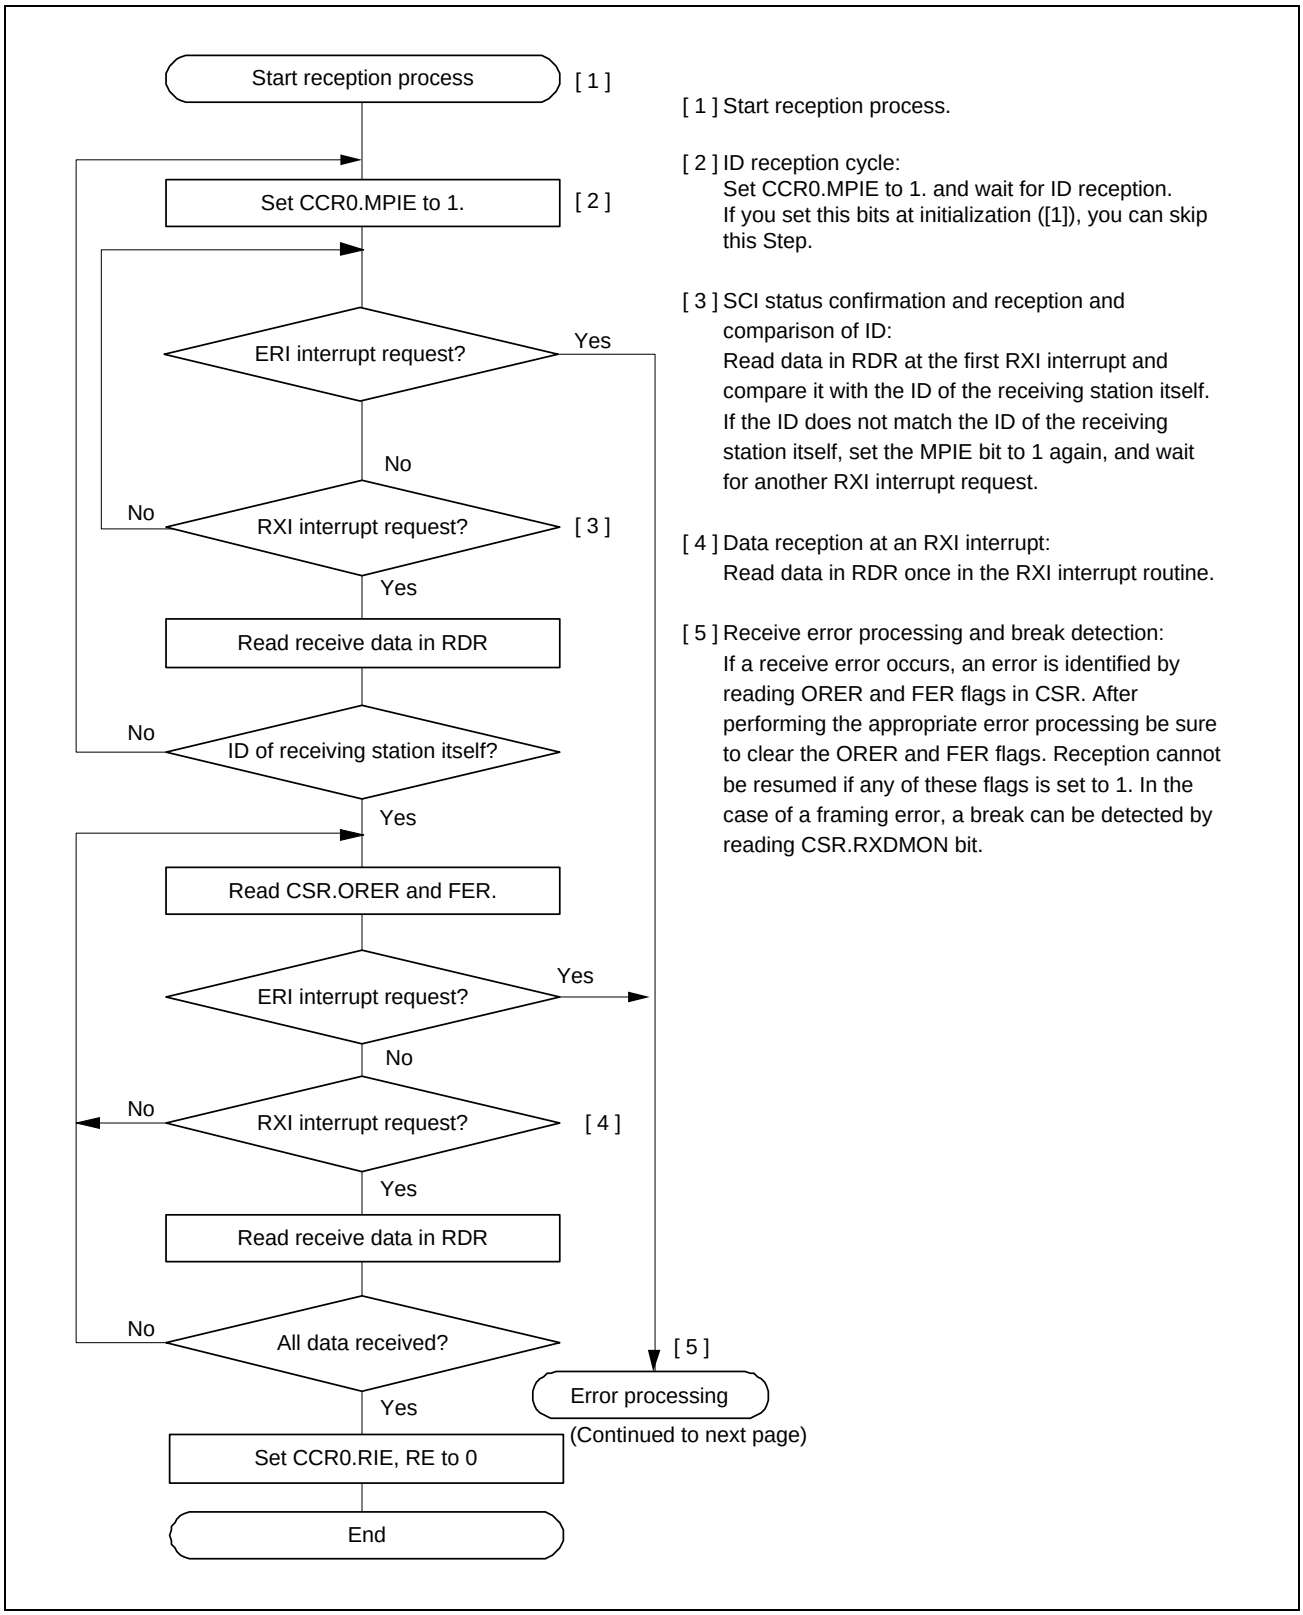


Figure 7.3-37 Example of Multi-Processor Serial Reception Flowchart (1) (Non-FIFO Selected)

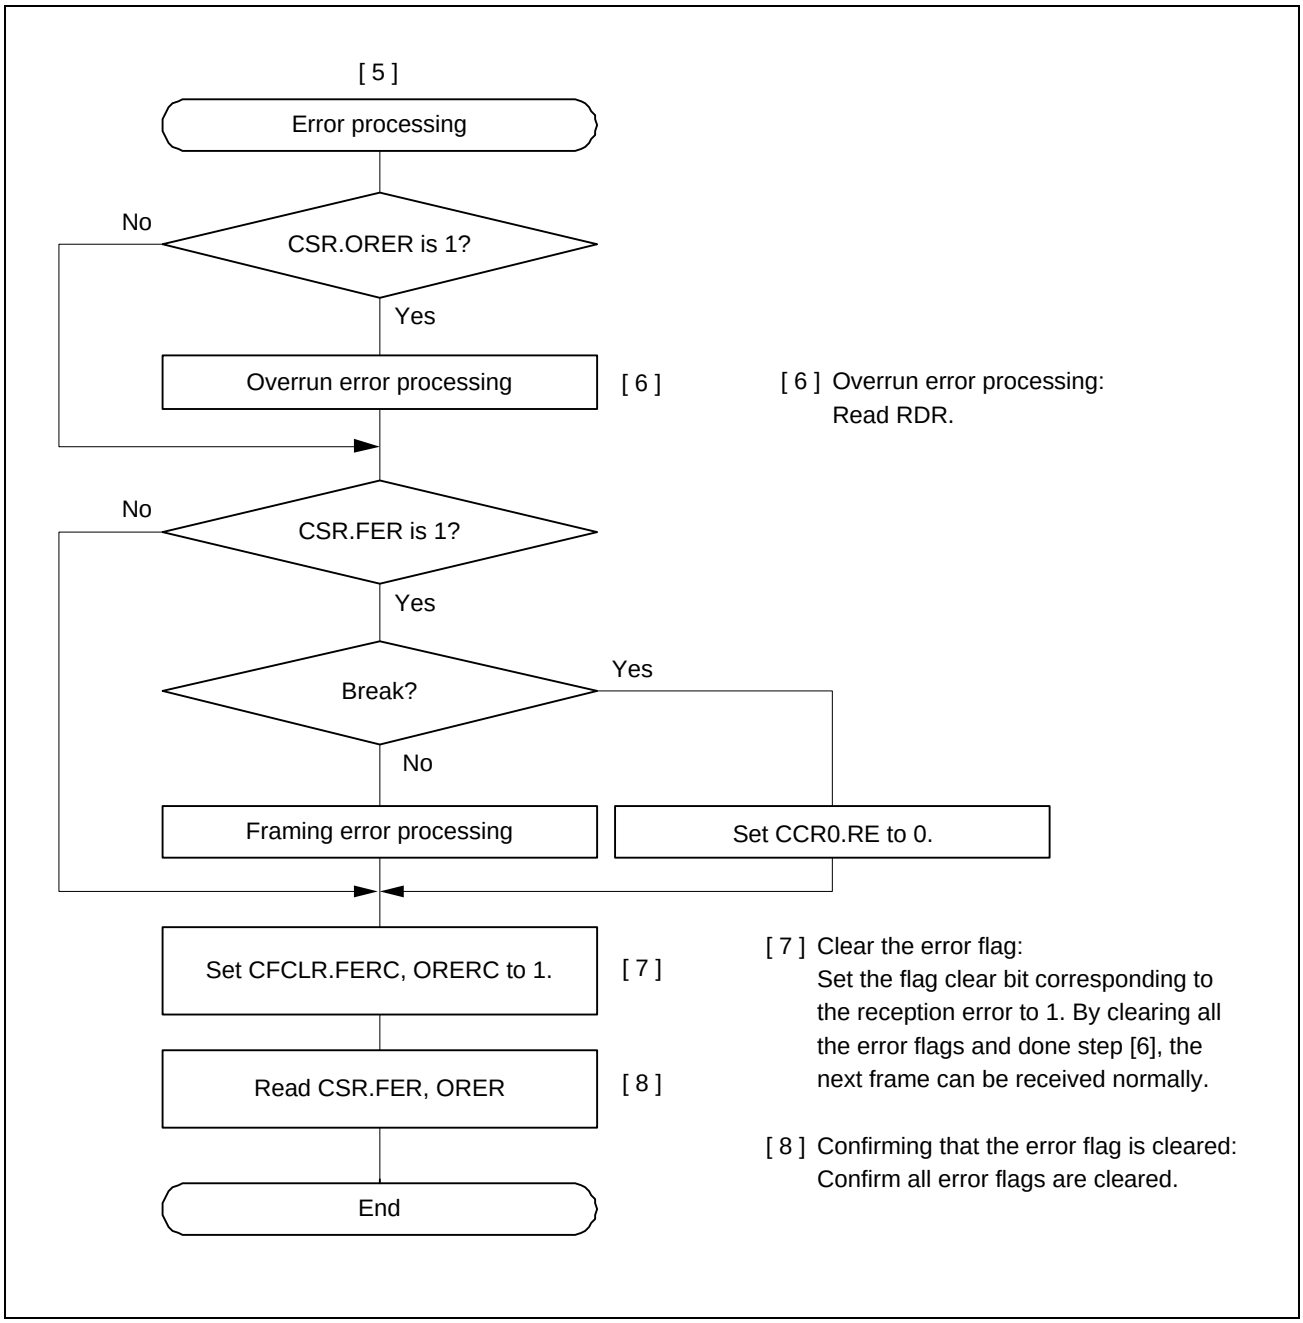

Figure 7.3-38 Example of Multi-Processor Serial Reception Flowchart (2) (Non-FIFO Selected)

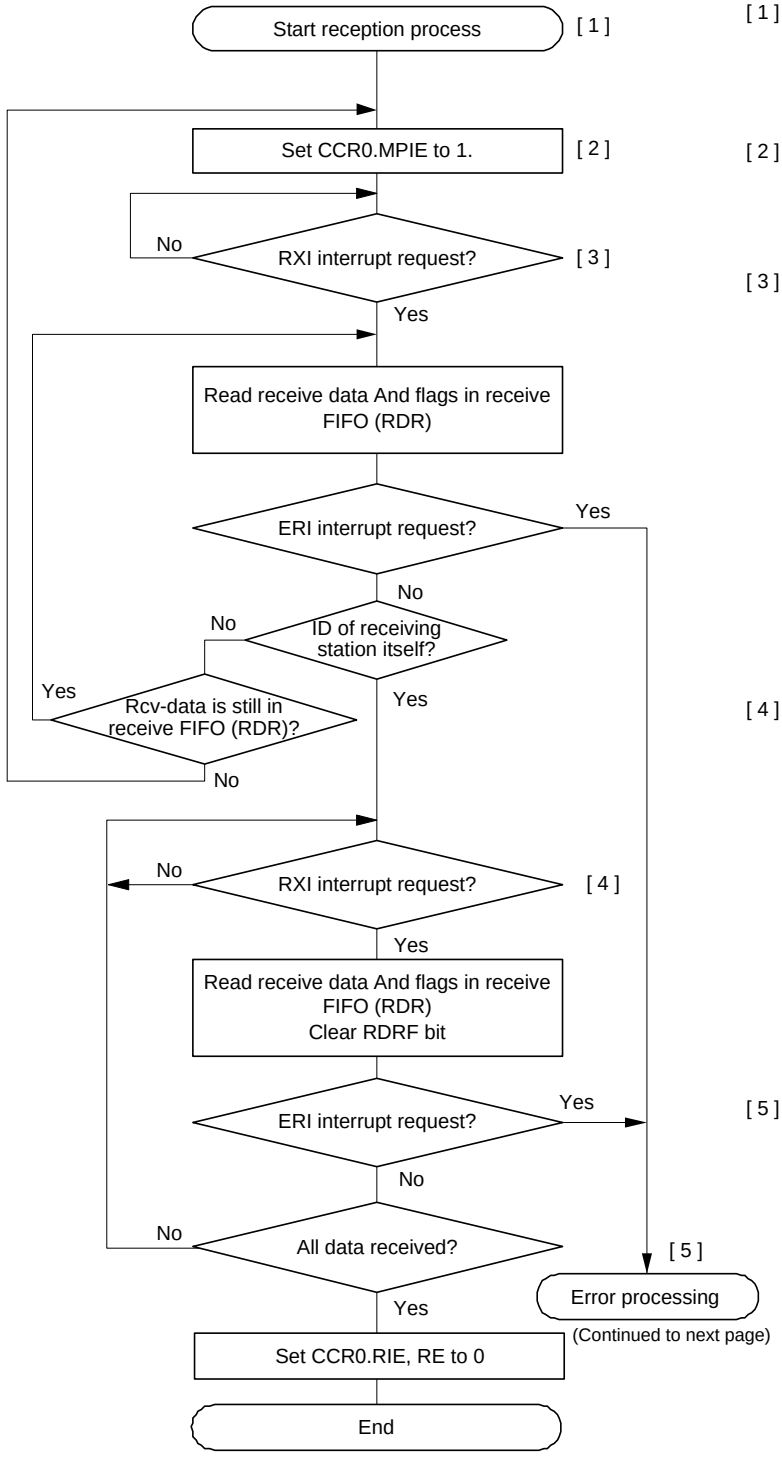
(2) FIFO selected

Figure 7.3-39 shows an example of data format that is stored to receive FIFO (RDR) in multi-processor mode. MPB is stored in bit 9 of RDR. 0b is stored to FPER and PER flag bit. Data is stored to receive FIFO (RDR) corresponded to data length. It is stored to 0b for unused bits. Reading the receive FIFO (RDR register) updates the FFER, FPER, MPB flags and receive data (RDAT[8:0]) in the receive FIFO (RDR register) with the next received data. The FER, PER, and ORER flags in the receive FIFO (RDR register) always reflect the status of the corresponding flags in the CSR and FRSR registers.



Data Length	Register Setting CCR3.CHR[1:0]		Receive data in RDR[31:0] b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	1	0	0	0	FFER	FPER	DR	MPB	0	0	RDAT[6:0]						
8 bits	1	0	0	0	0	FFER	FPER	DR	MPB	0	RDAT[7:0]							
9 bits	0	x	0	0	0	FFER	FPER	DR	MPB	RDAT[8:0]								
Data Length	Register Setting CCR3.CHR[1:0]		b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
7 bits	1	1	0	0	0	FER	PER	0	0	ORER	0	0	0	0	0	0	0	0
8 bits	1	0	0	0	0	FER	PER	0	0	ORER	0	0	0	0	0	0	0	0
9 bits	0	x	0	0	0	FER	PER	0	0	ORER	0	0	0	0	0	0	0	0

Note: When a 7-bit data length is selected, the RDAT[8:7] bits are always read as 00b.
When an 8-bit data length is selected, the RDAT[8] bit is always read as 0b.

Figure 7.3-39 Data Format in Multi-Processor Mode that is Stored to Receive FIFO (FIFO Selected)

Figure 7.3-40 shows a sample flowchart for multi-processor data reception at FIFO selected. When the MPIE bit in CCR0 is set to 1b, reading the communication data is skipped until reception of the communication data in which the multiprocessor bit is set to 1b. When the communication data in which the multi-processor bit is set to 1b is received, the received data, MPB, and each errors are transferred to receive FIFO (RDR), and the MPIE bit in CCR0 is automatically cleared, thus returning to a normal reception operation. After a framing error occurred and CSR.FER flag is set to 1b, but SCI continues data reception.

The other operations are the same as the operations in asynchronous mode at non-FIFO selected.

[1] Start reception process
To generate an RXI interrupt request with MP detection, please set FCR.RTRG=1 and FCR.DRES=0.

[2] ID reception cycle:
Set CCR0.MPIE to 1. and wait for ID reception. If you set this bits at Initialization ([1]), you can skip this Step.

[3] SCI status confirmation and reception and comparison of ID:
Skip the communication data until the MPB bit receives data "1".
When the MPB bit receives data "1", an RXI interrupt request is generated.
When an RXI interrupt request is received, read the data in the receiving FIFO (RDR register) and compare it to the ID of my station.
If it is not my station's ID, set the MPIE bit to "1" again and wait for the RXI interrupt request. For my station's ID, set the received FIFO threshold to the necessary value.

[4] Data reception at an RXI interrupt:
When the number of received data stored in the received FIFO (RDR register) exceeds the received FIFO threshold, the CSR.RDRF bit becomes "1" and an RXI interrupt request is generated. In addition, if the number of received data stored in the received FIFO (RDR register) is "1" or more and less than the received FIFO threshold, the FRSR.DR bit becomes "1" after 15 ETU, and an RXI interrupt request is generated. The RXI interrupt routine reads the data from the received FIFO (RDR register).

[5] Receive error processing and break detection:
If a receive error occurs, an error is identified by reading ORER and FER flags in CSR. After performing the appropriate error processing be sure to clear the ORER and FER flags. In the case of a framing error, a break can be detected by reading the CSR.RXDMON bit.

Figure 7.3-40 Example Flowchart of Serial Reception in Multi-Processor Mode (1) (FIFO Selected)

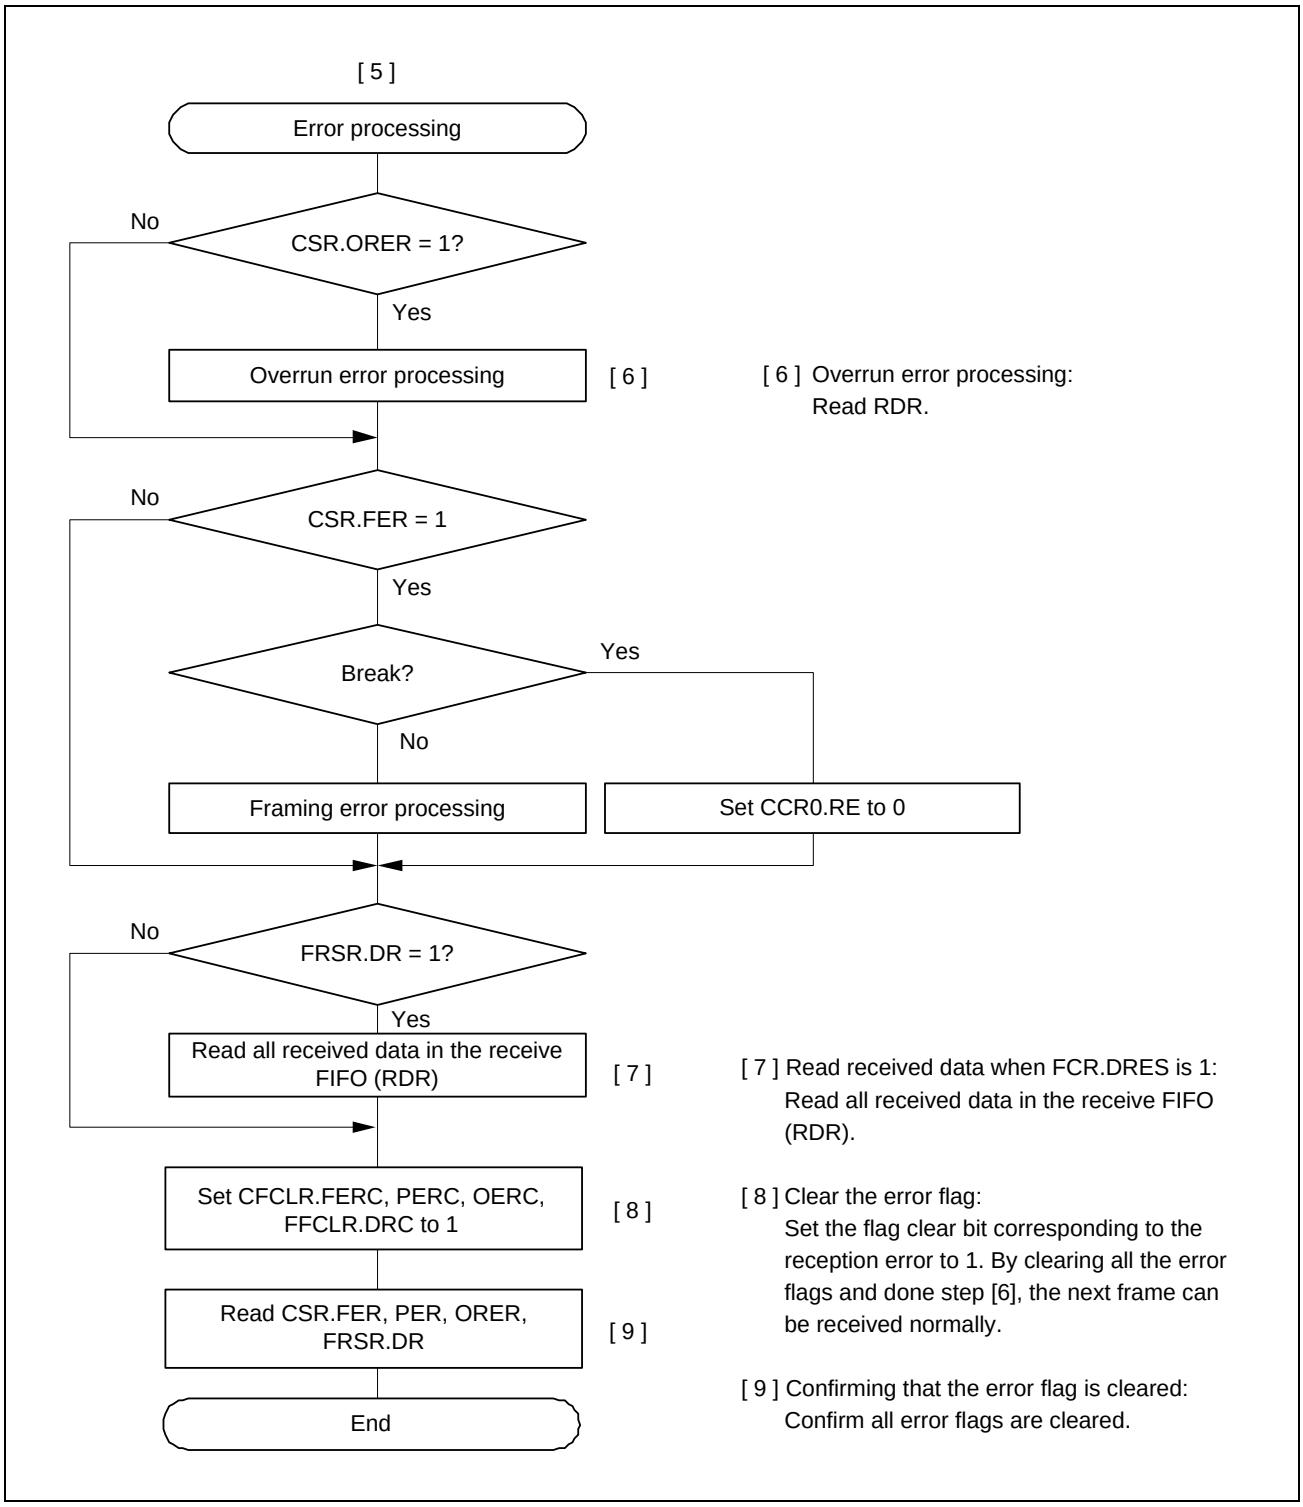


Figure 7.3-41 Example Flowchart of Serial Reception in Multi-Processor Mode (2) (FIFO Selected)

7.3.5 Smart Card Interface Mode

The SCI supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards), as an extended function.

Smart card interface mode can be selected using the appropriate register.

7.3.5.1 Sample Connection

Figure 7.3-42 shows a sample connection between a smart card (IC card) and this LSI.

As in the figure, since this LSI communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to VCC using a resistor. Setting the TE and RE bits in CCR0 to 1b with an IC card disconnected enables closed transmission/reception allowing self-diagnosis.

To supply an IC card with the clock pulses generated by the SCI, input the SCKm pin output to the CLK pin of an IC card.

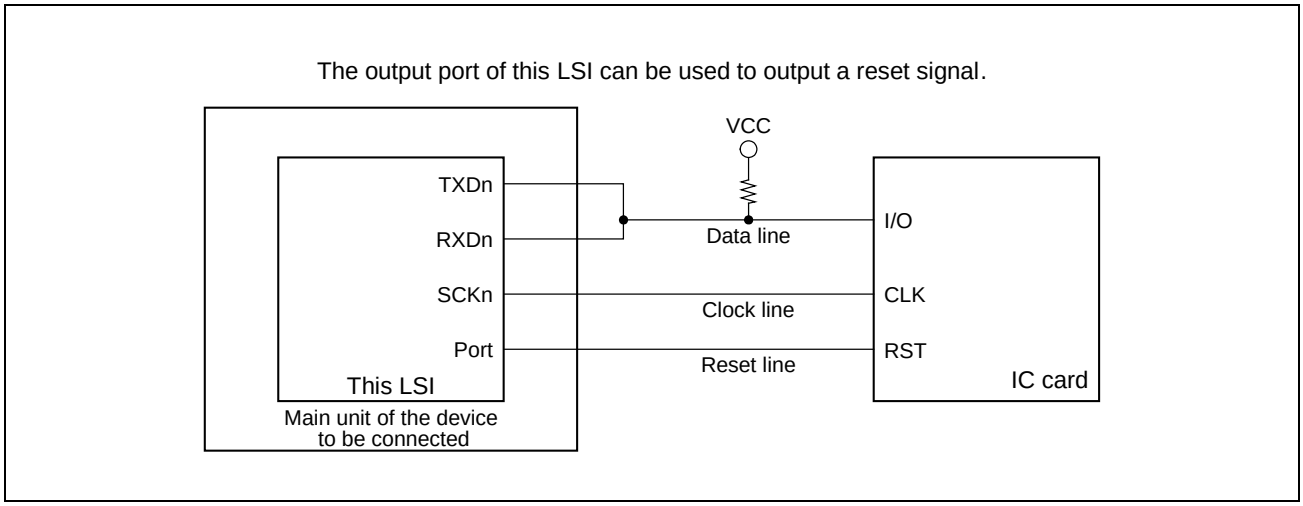

Figure 7.3-42 Sample Connection with a Smart Card (IC Card)

7.3.5.2 Data Format (Except in Block Transfer Mode)

Figure 7.3-43 shows the data transfer formats in smart card interface mode.

- One frame consists of 8-bit data and a parity bit in asynchronous mode.
- During transmission, at least 2 etu (elementary time unit: time required for transferring 1 bit) is secured as a guard time from the end of the parity bit until the start of the next frame.
- If a parity error is detected during reception, a low-level error signal is output for 1 etu after 10.5 etu has passed from the start bit.
- If an error signal is sampled during transmission, the same data is automatically retransmitted after at least 2 etu.

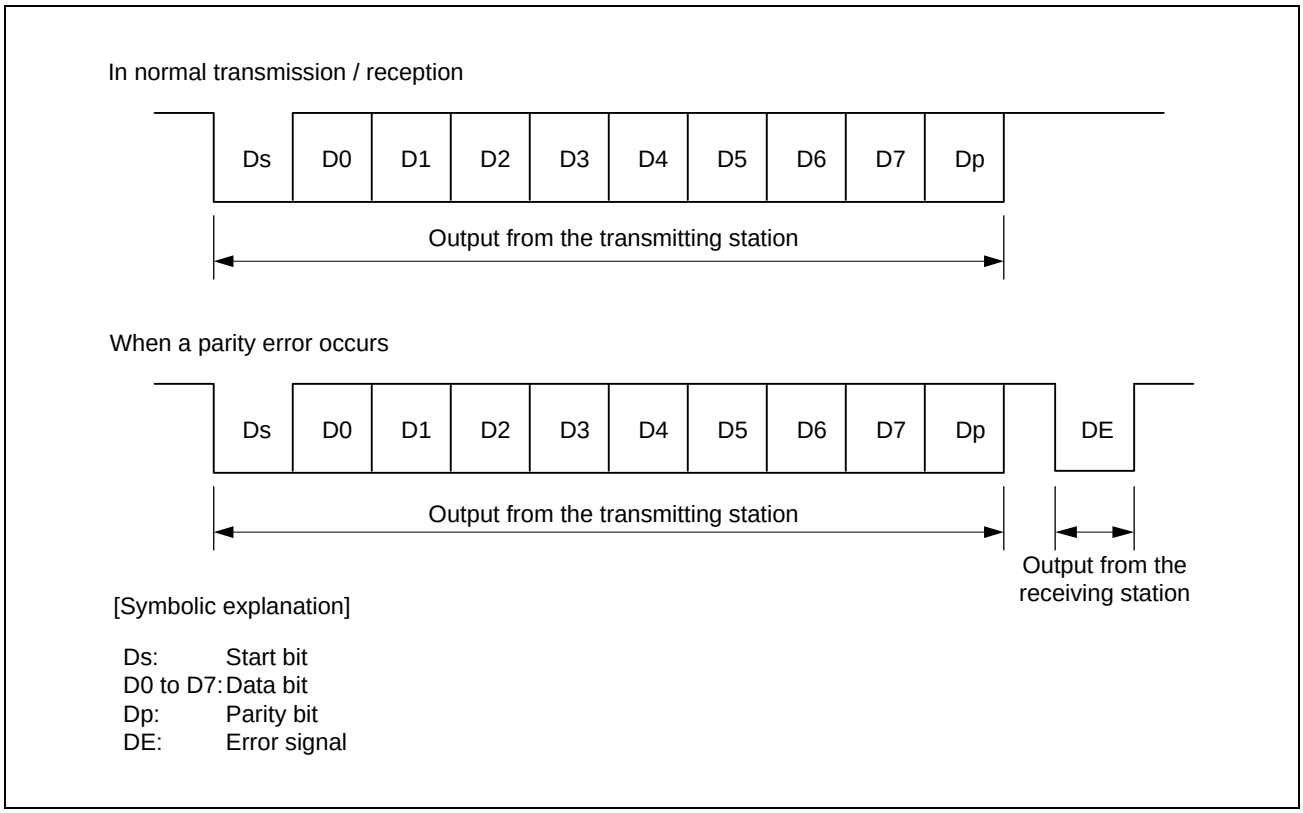

Figure 7.3-43 Data Formats in Smart Card Interface Mode

For communications with IC cards of the direct convention type and inverse convention type, follow the procedure below.

(1) Direct Convention Type

For the direct convention type, logic levels 1 and 0 correspond to states Z and A, respectively, and data is transferred with LSB first as the start character, as shown in **Figure 7.3-44**. Therefore, data in the start character in the figure is 3Bh.

When using the direct convention type, write 0b to the CCR3.SINV bit and write 1b to the CCR3.LSBF bit. Write 0b to CCR1.PM in order to use even parity, which is prescribed by the smart card standard.

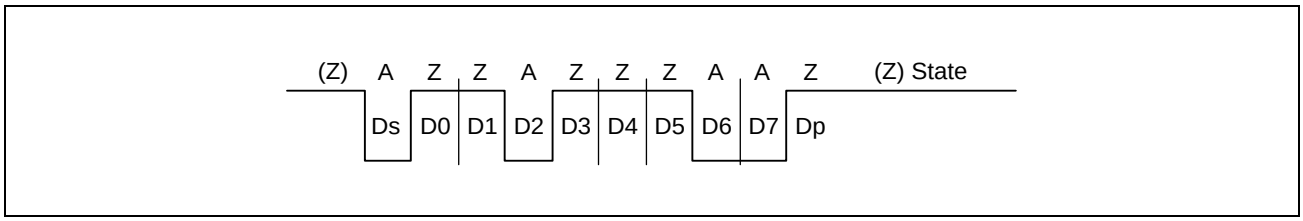

Figure 7.3-44 Direct Convention Type (CCR3.LSBF = 1b, CCR3.SINV = 0b, CCR1.PM = 0b)

(2) Inverse Convention Type

For the inverse convention type, logic levels 1 and 0 correspond to states A and Z, respectively and data is transferred with MSB first as the start character, as shown in **Figure 7.3-45**. Therefore, data in the start character in the figure is 3Fh.

When using the inverse convention type, write 1b to the CCR3.SINV bit and write 0b to the CCR3.LSBF bit. The parity bit is logic level 0 to produce even parity, which is prescribed by the smart card standard, and corresponds to state Z. Since the SINV bit of this LSI only inverts data bits D7 to D0, write 1b to CCR1.PM to invert the parity bit for both transmission and reception.

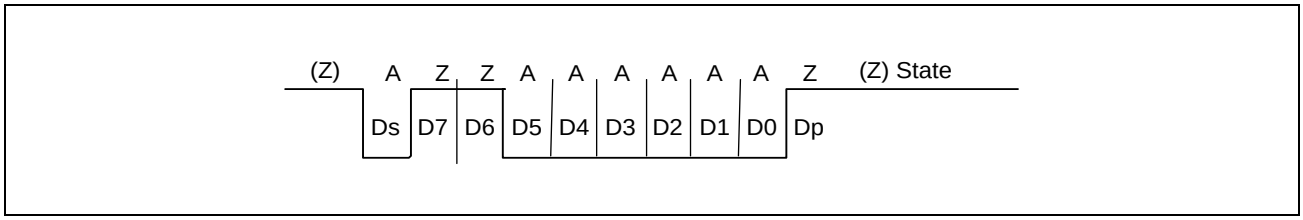

Figure 7.3-45 Inverse Convention Type (CCR3.LSBF = 0b, CCR3.SINV = 1b, CCR1.PM = 1b)

7.3.5.3 Block Transfer Mode

Block transfer mode is different from non-block-transfer-mode of smart card interface mode in the following respects.

- Even if a parity error is detected during reception, no error signal is output. Since CSR.PER is set by error detection, clear the PER bit before receiving the parity bit of the next frame.
- During transmission, at least 1 etu is secured as a guard time from the end of the parity bit until the start of the next frame.
- Since the same data is not retransmitted during transmission, CSR.TEND is set for 11.5 etu after transmission start.
- In block transfer mode, CSR.ERS flag indicates the error signal status as in non-block-transfer-mode of smart card interface mode, but the flag is always read as 0b because no error signal is transferred.

7.3.5.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the baud rate generator can be used as a transfer clock in smart card interface mode. In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate according to the settings of CCR2.BCP[2:0]. For data reception, the falling edge of the start bit is sampled with the base clock to perform synchronization. Receive data is sampled on the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, and 256th rising edges of the base clock so that it can be latched at the middle of each bit as shown in **Figure 7.3-46**. The reception margin here is determined by the following formula.

$$M = \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\%$$

M: Reception margin (%)
N: Ratio of bit rate to clock (N = 32, 64, 372, 256)
D: Duty cycle of clock (D = 0 to 1.0)

L: Frame length (L = 10)
F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5, and N = 372 in the above formula, the reception margin is determined by the formula below.

$$M = \left\{\frac{0.5 - 1}{2 \times 372}\right\} \times 100\% = 49.866\%$$

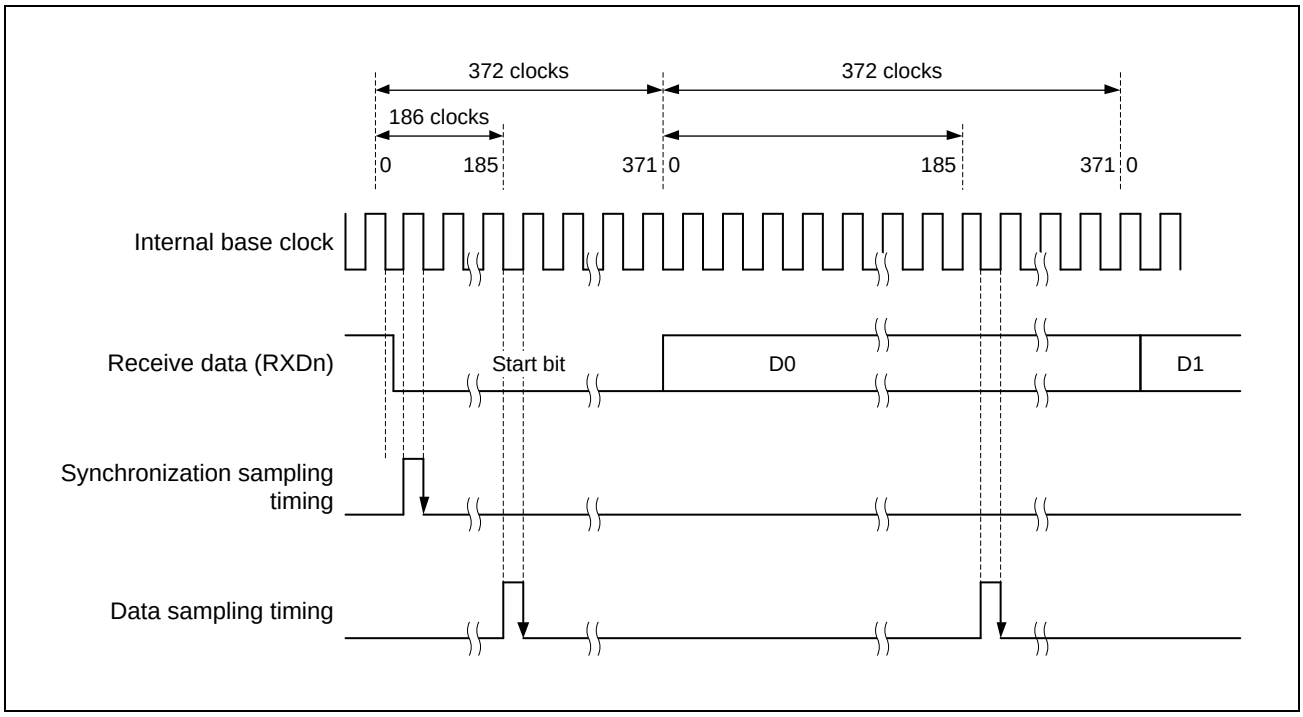

Figure 7.3-46 Receive Data Sampling Timing in Smart Card Interface Mode (when Clock Frequency is 372 Times the Bit Rate)

7.3.5.5 Initialization of SCI (Smart Card Interface Mode)

Before transmitting and receiving data, write 0b to CCR0.TE and CCR0.RE (Or write the initial value to CCR0). And initialize SCI following example flowchart in **Figure 7.3-47**.

Be sure to set the initial value in the TIE, RIE, TE, RE, and TEIE bits in CCR0 register before switching from transmission mode to reception mode and vice versa. Even if the RE bit is set to 0b, the RDR register is not initialized. In transmission mode, set 1b to the TE bit and TIE bit simultaneously, then the TXI interrupt request is generated. To change reception mode to transmission mode, first check that reception has completed, and then initialize SCI. At the end of initialization, set TE = 1b and RE = 0b. Reception completion can be verified by RXI request, CSR.ORER, or CSR.PER. To change transmission mode to reception mode, first check that transmission has completed, and then initialize SCI. At the end of initialization, set TE = 0b and RE = 1b. Transmission completion can be verified by reading CSR.TEND.

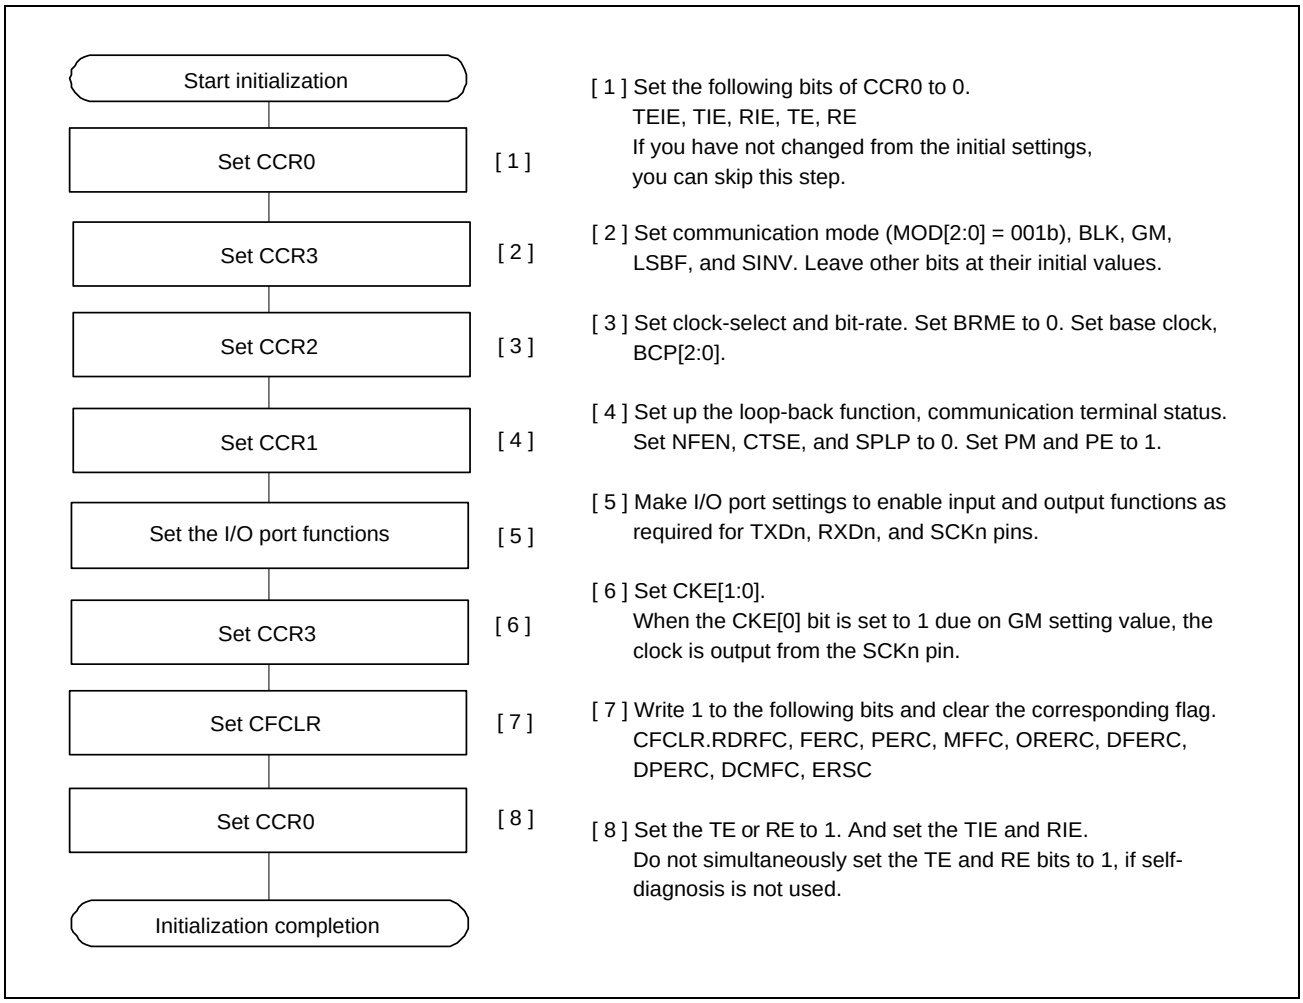

Figure 7.3-47 Example of SCI Initialization Flowchart (Smart Card Interface Mode)

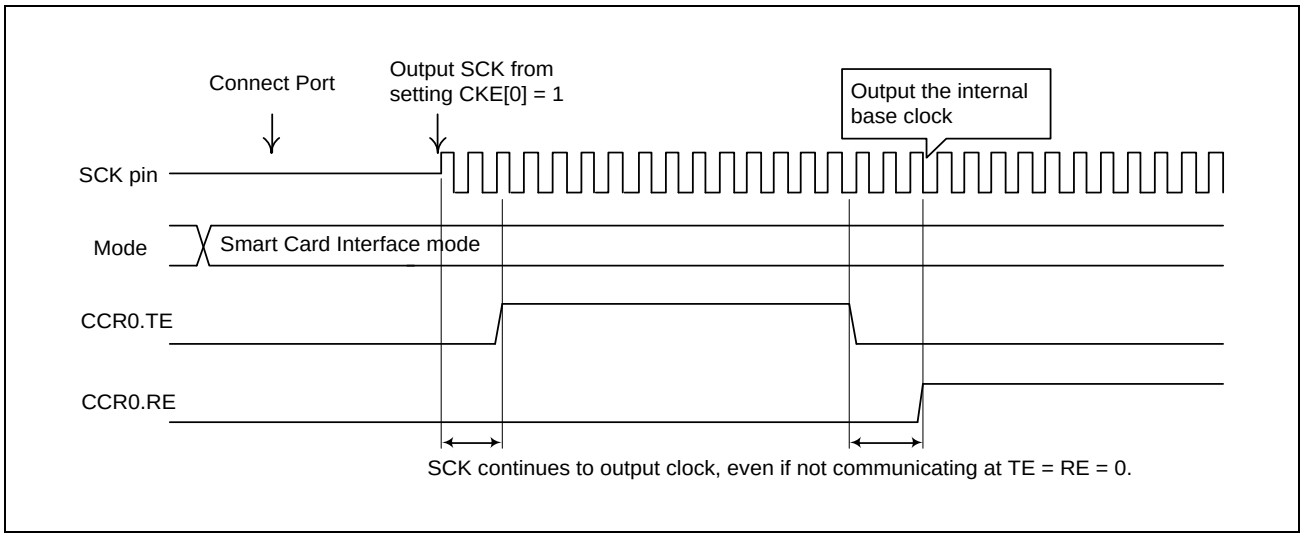
Figure 7.3-48 is a timing chart when data transmission is performed by making transition to the Smart Card Interface mode according to the above flow chart. The figure shows the case when CCR3.GM bit is 0b. As shown in the figure, when the pin function is set to the SCK pin, the SCK pin is high impedance because the CCR3.CKE[0] bit is 0b. When the TXD pin is set, the TXD pin is high impedance because the CCR0.TE bit is 0b. Start clock output to the SCK pin with the clock output setting CCR3.CKE[0] to 1b, start data transmission by writing transmit data after setting CCR0.TE to 1b.

In the smart card interface mode, even if not communicating at CCR0.TE = 0b and CCR0.RE = 0b, the clock is continuously output if the clock output setting is used.



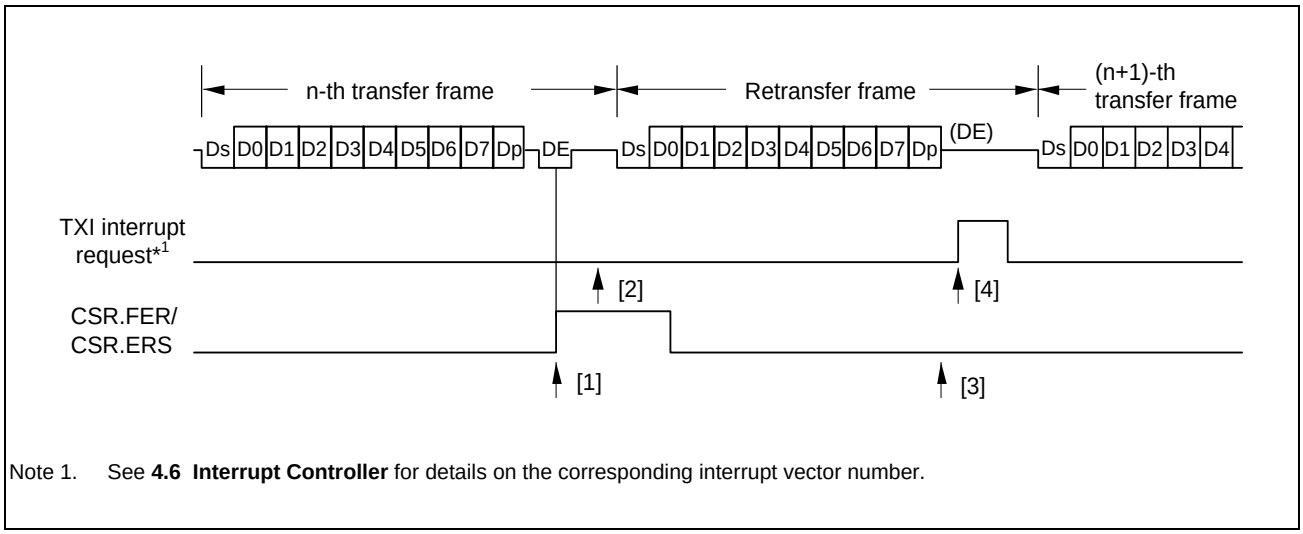


Figure 7.3-48 Example of Timing Chart of Data Transmission (Smart Card Interface Mode)

7.3.5.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode), in that an error signal is sampled and data can be retransmitted, is different from that in non-smart card interface mode. **Figure 7.3-49** shows the data retransfer operation during transmission.

1. When an error signal from the receiver end is sampled after one-frame data has been transmitted, CSR.ERS is set to 1b. If CCR0.RIE is 1b at this time, an ERI interrupt request is generated. Clear the ERS flag to 0b before the next parity bit is sampled.
2. For a frame in which an error signal is received, CSR.TEND is not set. Data is retransferred from TDR to TSR allowing data retransmission automatically.
3. If no error signal is returned from the receiver, the ERS flag is not set to 1b.
4. In this case, the SCI judges that transmission of one-frame data (including retransfer) has been completed, and the TEND flag is set. If CCR0.TIE is 1b at this time, a TXI interrupt request is generated. Writing transmit data to TDR starts transmission of the next data.

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-49 Data Retransfer Operation in SCI Transmission Mode

Figure 7.3-51 shows a sample flowchart of serial transmission. All the processing steps are automatically performed by using a TXI interrupt request to activate the DMAC. When CSR.TEND is set to 1b in transmission, if the CCR0.TIE is 1b, a TXI interrupt request is generated. The DMAC is activated by a TXI interrupt request if the TXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of transmit data. The TEND flag is automatically set to 0b when the DMAC transfers the data. If an error occurs, the SCI automatically retransmits the same data. During this retransmission, the TEND flag is kept to 0b and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, since the ERS flag is not automatically cleared, set the RIE bit to 1b beforehand to enable an ERI interrupt request to be generated at error occurrence, and clear the ERS flag to 0b.

When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings. For DMAC settings, see **4.7 DMA Controller (DMAC)**.

Note that CSR.TEND flag is set in different timings depending on the CCR3.GM bit setting. **Figure 7.3-50** shows the TEND flag generation timing.

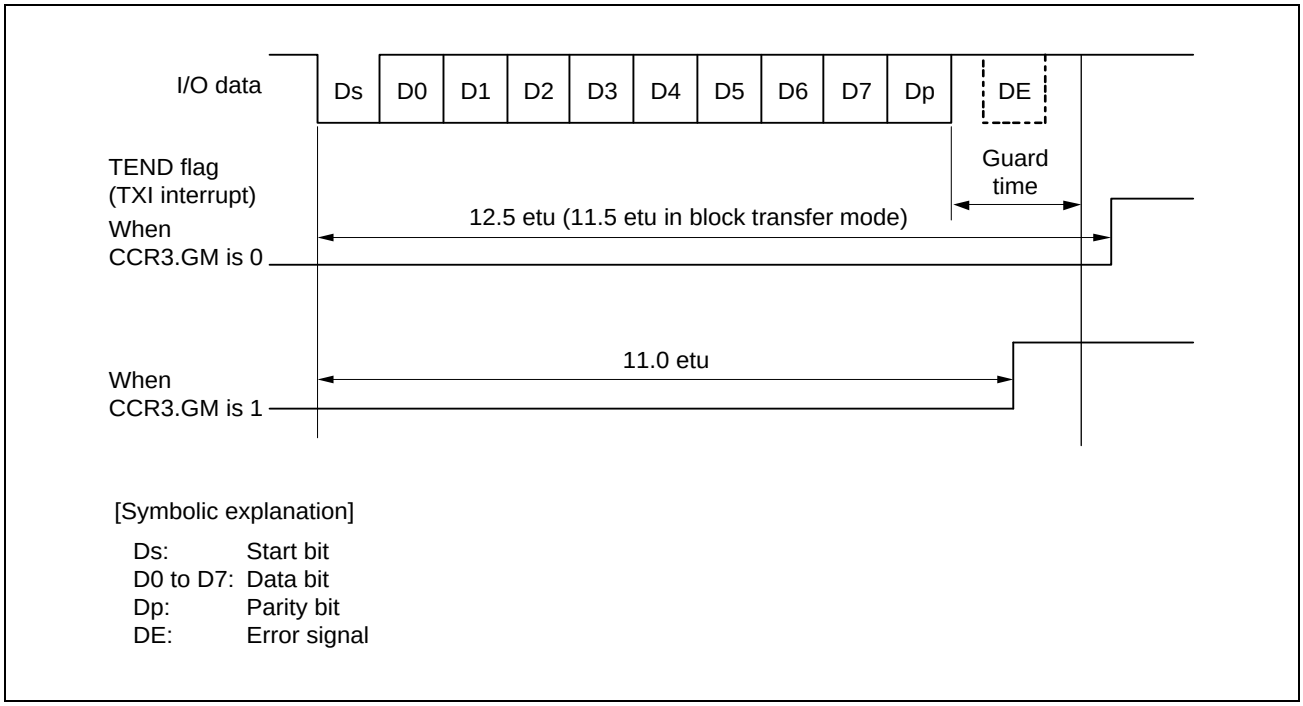

Figure 7.3-50 CSR.TEND Flag Generation Timing during Transmission

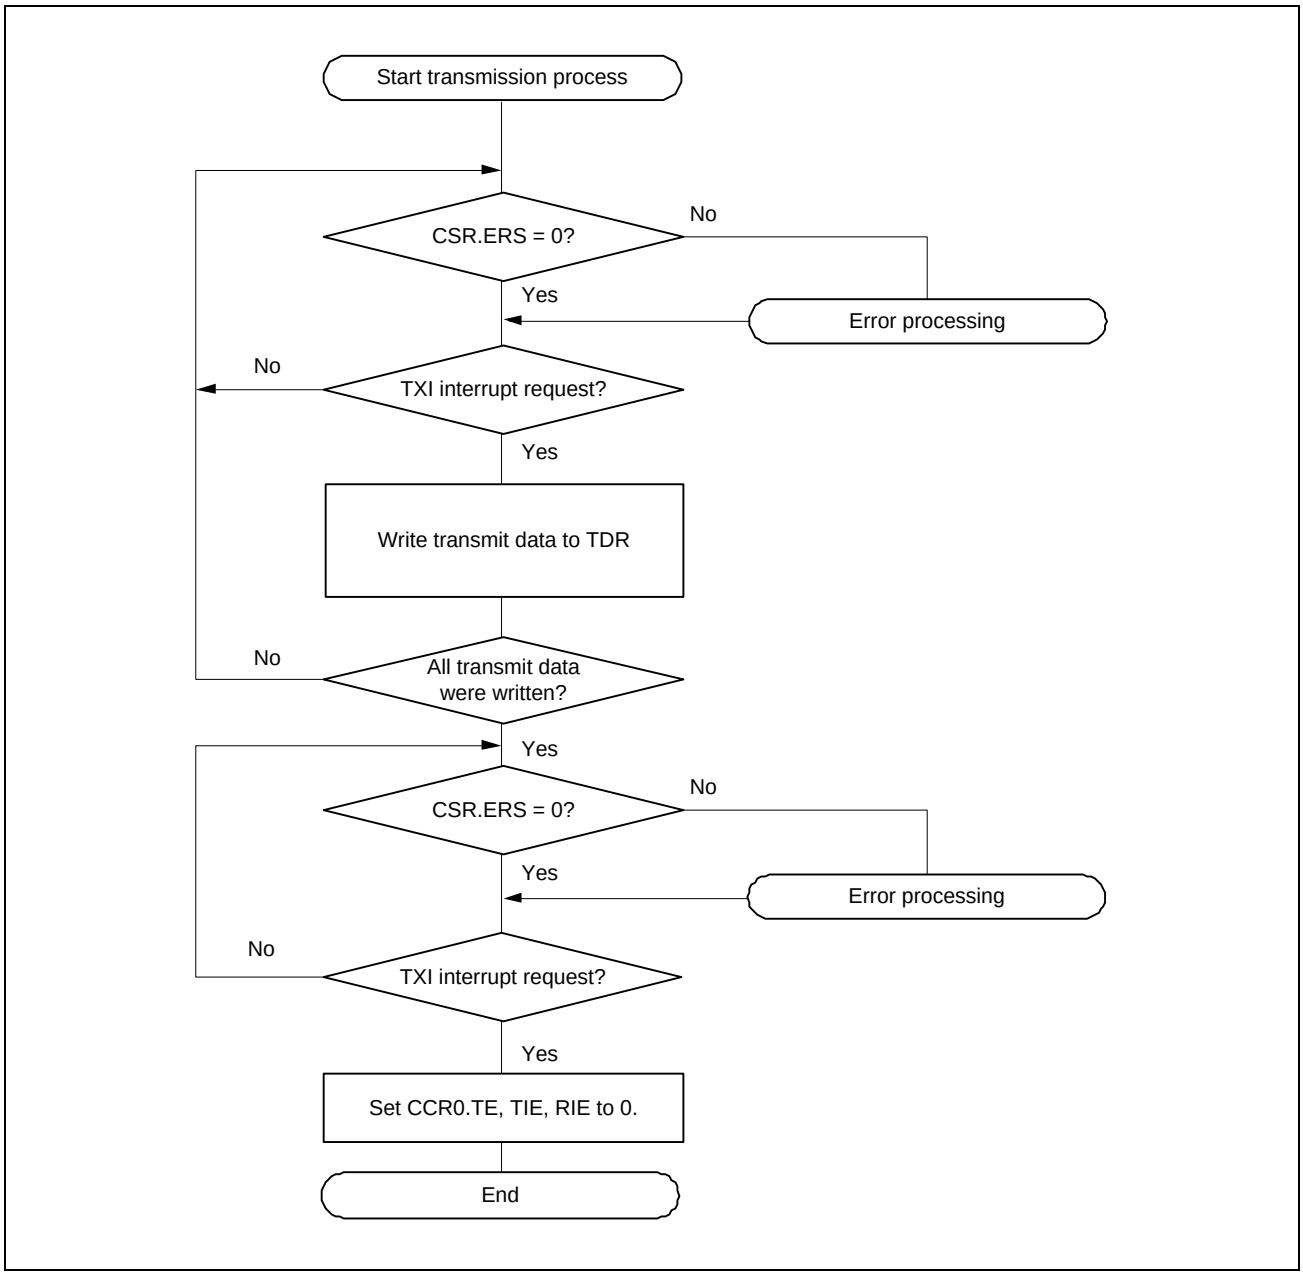

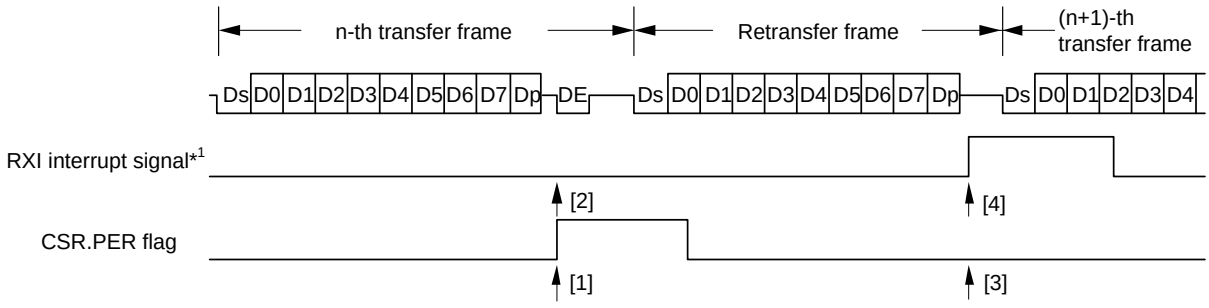

Figure 7.3-51 Sample Smart Card Interface Transmission Flowchart

7.3.5.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is like that in non-smart card interface mode. **Figure 7.3-52** shows the data retransfer operation in reception mode.

1. If a parity error is detected in receive data, the CSR.PER flag is set to 1b. When the CCR0.RIE is 1b at this time, an ERI interrupt request is generated. Clear the PER flag to 0b before the next parity bit is sampled.
2. For a frame in which a parity error is detected, no RXI interrupt is generated.
3. When no parity error is detected, the CSR.PER flag is not set to 1b.
4. In this case, data is determined to have been received successfully. When the CCR0.RIE is 1b, an RXI interrupt request is generated.

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-52 Data Retransfer Operation in SCI Reception Mode (Data Retransfer Operation during Reception)

Figure 7.3-53 shows a sample flowchart for serial data reception. All the processing steps are automatically performed using an RXI interrupt request to activate the DMAC. In reception, setting the RIE bit to 1b allows an RXI interrupt request to be generated. The DMAC is activated by an RXI interrupt request if the RXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of receive data. If an error occurs during reception and either the CSR.ORER or PER flag is set to 1b, a receive error interrupt (ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DMAC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DMAC is transferred.

Even if a parity error occurs and the PER flag is set to 1b during reception, receive data is transferred to RDR, thus allowing the data to be read. When a reception is forcibly terminated by setting the CCR0.RE to 0b during operation, read the RDR register because the received data which has not yet been read may be left in RDR.

NOTE

For operations in block transfer mode, see **7.3.3 Asynchronous Mode**.

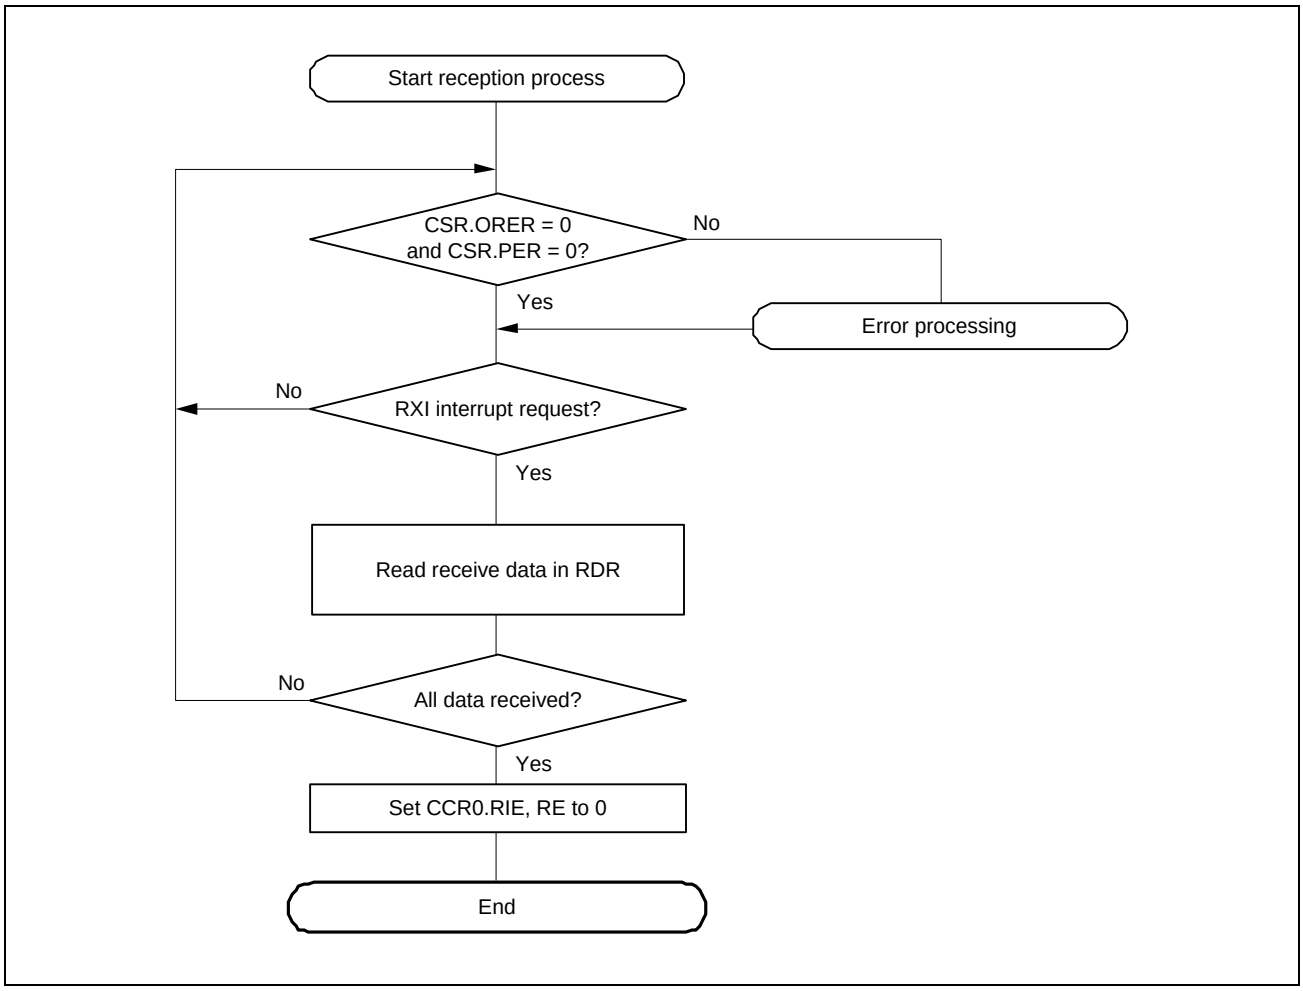

Figure 7.3-53 Sample Smart Card Interface Reception Flowchart

7.3.5.8 Clock Output Control

When the CCR3.GM is set to 1b, the clock output can be controlled by the CCR3.CKE[1:0]. Refer to the description of the CKE in **7.3.2.2.8 Common Control Register 3 (RSCIm_CCR3)**. When setting the clock output, the base clock described in **7.3.3.3 Clock** is output, so the width of the clock pulse can be kept to the width specified by setting the bit rate. It is described in **7.3.2.2.7 Common Control Register 2 (RSCIm_CCR2)**, the bit rate is set by CCR2.CKS[1:0], CCR2.BCP[2:0], and BRR[7:0].

Figure 7.3-54 shows the timing chart for explaining clock output control. This is an example when the CCR3.CKE[1] is set to 0b and the CCR3.CKE[0] is controlled.

When the CCR3.GM is 0b, output control by the CCR3.CKE[0] is immediately reflected on the SCK pin, so there is a possibility that pulses with an unintended width may be output from the SCK pin.

When the CCR3.GM is 1b, the output pulse control by the CCR3.CKE[0] controls the pulse width set to be based on the state of the base clock.

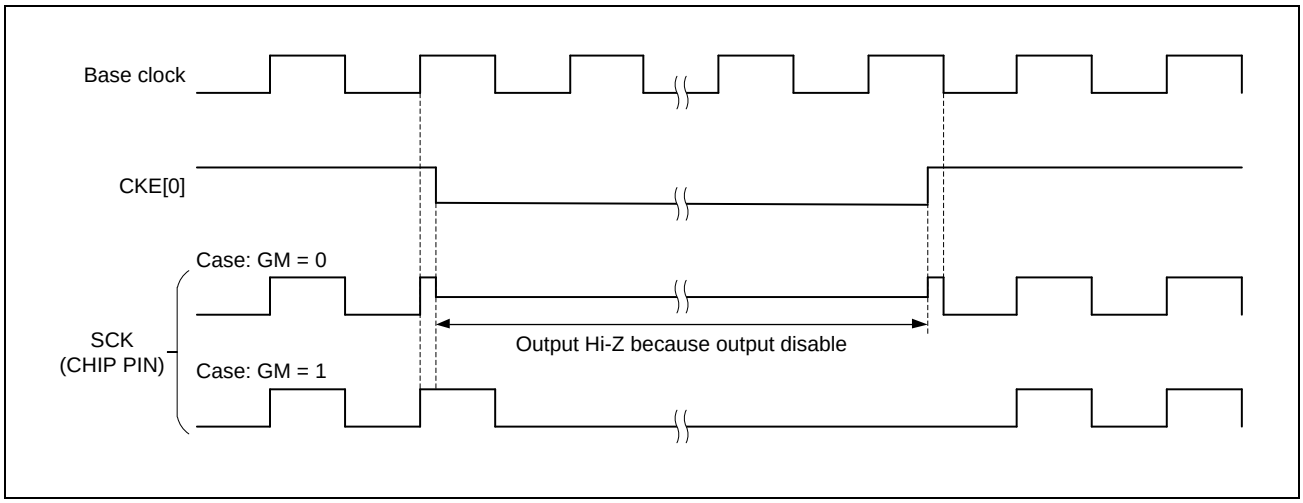

Figure 7.3-54 Clock Control Timing Chart by CCR3.GM

7.3.6 Simple-LIN Mode

As an extended function of the RSCI, the RSCI supports the serial communication protocol (**Figure 7.3-55**) consisting of a Start Frame and an Information Frame as Simple-LIN. Simple-LIN mode is enabled by setting the CCR3.MOD[2:0] = 110b. Since the simple-LIN mode uses the same circuit as the asynchronous mode for transmission/reception control other than Break Field, the basic communication settings required for the asynchronous mode are also required for simple-LIN mode. (For the setting value when using Simple-LIN mode, see the explanation of **7.3.2 SCI Registers**. In particular, note that CCR3.RXDESEL needs to be changed from the initial value and set to 1b.) The Start Frame consists of a Break Field, Control Field 0, and Control Field 1. The Information Frame can be configured with some Data Fields, a CRC16 Upper Field, and a CRC16 Lower Field.

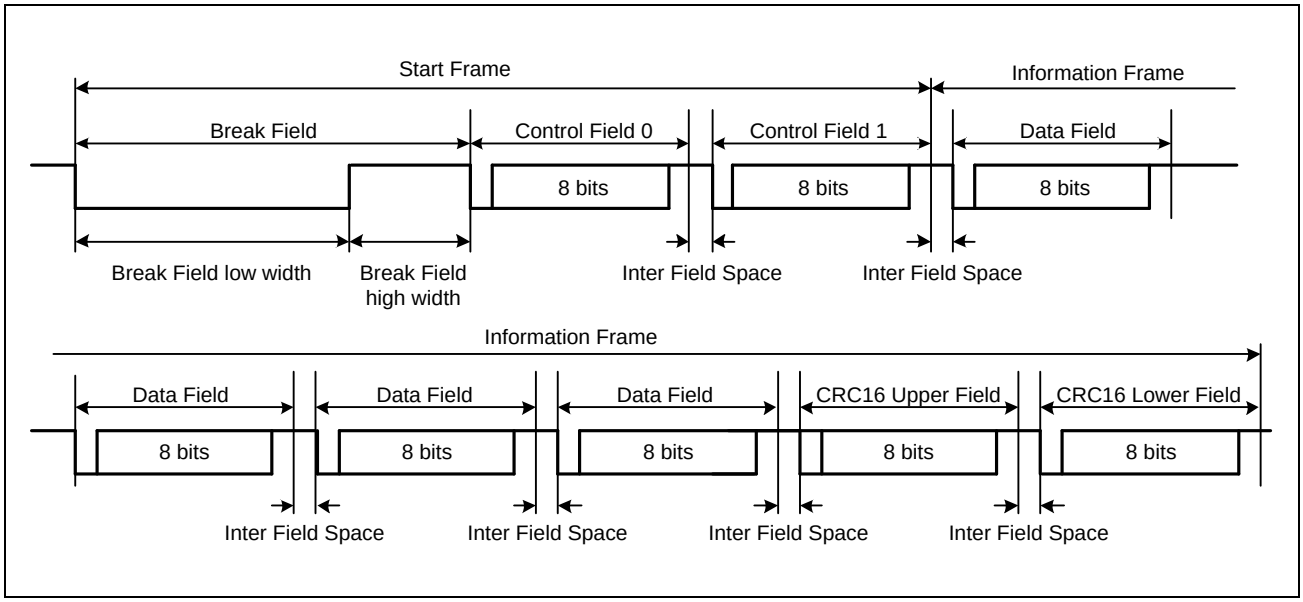

Figure 7.3-55 Clock Control Timing Chart by CCR3.GM

The following describes operations when the simple-LIN is used. In this section, operations are described with the following conditions: Communication pin (RXD/TXD) level inversion function: OFF (RINV = TINV = 0b). When using the simple LIN with the communication pin (RXD/TXD) level inversion function enabled, replace the RXD and TXD signal levels with their inverted levels.

7.3.6.1 Simple-LIN Start Frame Transmission

Figure 7.3-56 shows an example of transmission of the Start Frame consisting of a Break Field, Control Field 0, and Control Filed 1. (Omit Break Field and Control Field 0 according to the Start Frame configuration.)

Figure 7.3-57 shows a flowchart for Start Frame transmission.

The RSCI operates as follows during Start Frame transmission.

1. Make the initial settings for the RSCI according to the RSCI initialization flow (**Figure 7.3-8**) in asynchronous mode. In simple-LIN mode, do not set CCR0.TE and TIE to 1b at the same time to avoid TXI output before the Break Field. Therefore, perform the following two steps sequentially to set the SCI initialization flow (asynchronous mode) procedure [9].
   - Set the bits except CCR0.TIE. (CCR0.TIE = 0b, CCR0.TE = 1b, and CCR0.RE = 0b)
   - Set CCR0.TIE to 1b.
2. When 1b is written to TCST, the SCIX timer starts counting and outputs a low level (Break Field) from the TXD pin for the period set in XCR2.BFLW[15:0]. A timer count clock source can be selected by XCR0.TCSS[1:0]. Writing 0b to XCR1.TCST suspends output of the Break Field. After the suspension, set CCR0.TE = 0b and turn off the transmission.
3. When the simple-LIN module timer count value matches the set XCR2.BFLW[15:0] value, the timer stops counting and inverts the TXD pin output level, and the XSR0.BFOF flag is set to 1b*[1]. Furthermore, if XCR0.BFOIE has been set to 1b at this time, a TXI interrupt is generated.
4. After confirming XSR0.BFOF=1b after TXI interrupt, write transmission data and transmit Control Field 0 data.

Remark LIN communication requires a Break delimiter (IDLE period) of 1 bit or more from the end of Break Field output until the next data transmission starts. For this reason, the Break delimiter length is counted upon completion of Break Field output. If transmit data is written while the Break delimiter length is being counted, transmission does not start until the Break delimiter length counting is completed. When transmit data is written after the Break delimiter length has been counted, transmission starts at the same timing as normal data transmission (bit boundary).
Break delimiter length count time after Break Field output:
- 1-bit to 2-bit length (CCR3.STP = 0b)
- 2-bit to 3-bit length (CCR3.STP = 1b)

5. After the Control Field 0 data has been transmitted, write the Control Field 1 data to TDR. And it is transmitted.
6. After the Control Field 1 data has been transmitted, the Information Frame data is transmitted.

Note 1. After XSR0.BFOF is set to 1b, if 1b is written to XCR1.TCST without clearing it, no TXI interrupt is output at the end of Break Field transmission. Clear XSR0.BFOF before writing 1b to XCR1.TCST.

7.3.6.2.1 Simple-LIN Normal Reception of Start Frame (PIB Not Used)

Figure 7.3-58 shows an example of normal reception of the Start Frame consisting of a Break Field, Control Field 0, and Control Field 1. **Figure 7.3-59** shows an example of reception to detect the Break Field during Control Field 1. **Figure 7.3-60** shows a flowchart to receive the Start Frame, and **Figure 7.3-61** shows a state transition diagram.

When receiving the Start Frame, the RSCI operates as follows. Omit the processing of Break Field and Control Field 0 according to the Start Frame configuration.

(1) Writing 1b to XCR1.SDST makes it possible to detect the Start Frame. When XCR0.BFE = 1b, RXD input to the SCI core is disabled until the Break Field is detected (because XSR0.RXDSF is set to 1b). Once the Break Field is detected, RXD input can be received by the SCI core (XSR0.RXDSF = 0b).

(2) When a low level is input from the RXD pin, the Break Field detection count starts. A timer count clock source can be selected by XCR0.TCSS[1:0].

(3) When a low level that is equal to or longer than the period set in XCR2.BFLW[15:0] is input from the RXD pin, it is determined as Break Field. At this time, XSR0.BFDF is set to 1b. If XCR0.BFDIE has been set to 1b at this time, a BFD interrupt is generated.
The timer continues counting until the RXD rising edge or counter overflow.

(4) After the Break Field is detected, when the input level from the RXD pin becomes high, the count value is captured to XSR1.TCNT[15:0] when BMEN = 0b. At this time, XSR0.RXDSF is cleared to 0b and the SCI core starts receiving the RXD input.

(5) The SCI core starts receiving Control Field 0. Because the simple LIN continuously counts the edge interval, it determines a low level that is equal to or longer than the period set in XCR2.BFLW[15:0] as detection of the Break Field. When the Break Field is detected in the Control Field 0 phase, the SCI core waits for reception of Control Field 0 again (**Figure 7.3-59**).

(6) When Control Field 0 has been received, an RXI interrupt is generated and the Control Field 0 data is stored in XSR0.CF0RD[7:0]. When the received data matches the set XCR2.CF0D[7:0] value, XSR0.CF0MF is set to 1b. If

the received data differs from the set XCR2.CF0D[7:0] value, the SCI transitions to the state before the Break Field is detected.

(7) The SCI core starts receiving Control Field 1. When BFE = 1b, the Break Field detection function is continuously enabled while SDST = 1b as in the case of Control Field 0. When the Break Field is detected in the Control Field 1 phase, the SCI core waits for reception of Control Field 0 again.

(8) When Control Field 1 has been received, an RXI interrupt is generated and the Control Field 1 data is stored in XSR0.CF1RD[7:0]. When the received data matches the set XCR1.PCF1D[7:0] value or the set XCR1.SCF1D[7:0] value, XSR0.CF1MF is set to 1b. If the received Control Field 1 data matches neither the set XCR1.PCF1D[7:0] value nor the set XCR1.SCF1D[7:0] value, the SCI transitions to the state before the Break Field is detected.

(9) The RSCI core performs Information Frame communication.

(10) When communication is completed, write 0b to XCR1.SDST and 0b to CCR0.RE to stop reception.

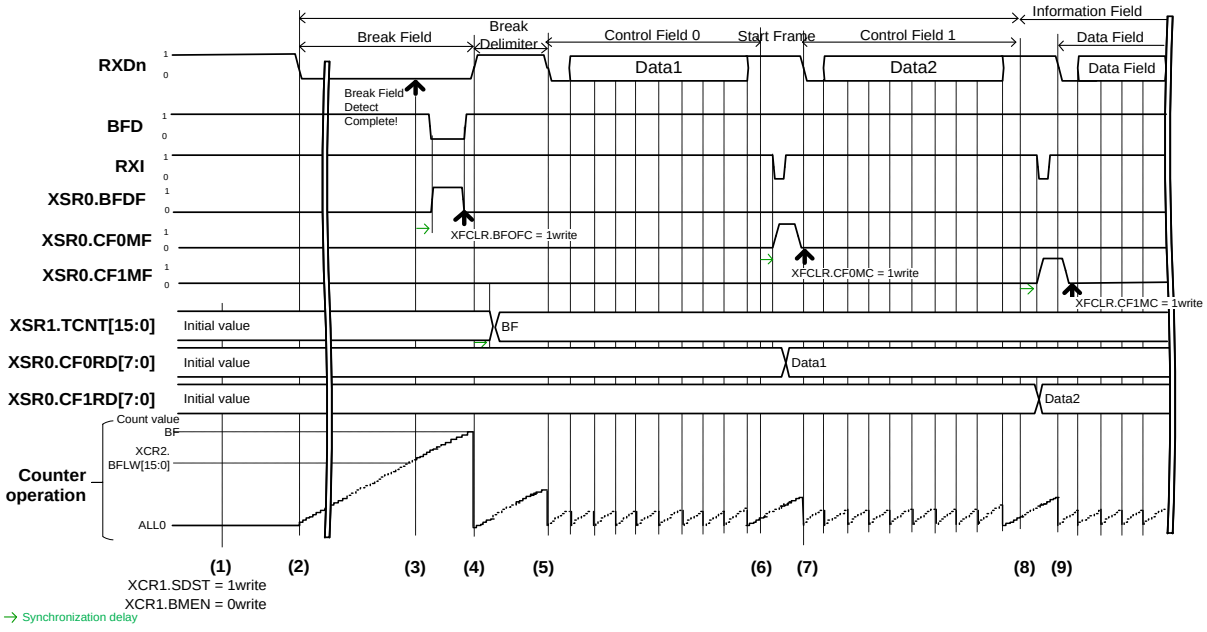

Figure 7.3-58 Normal Reception Example of Start Frame (PIB Not Used)

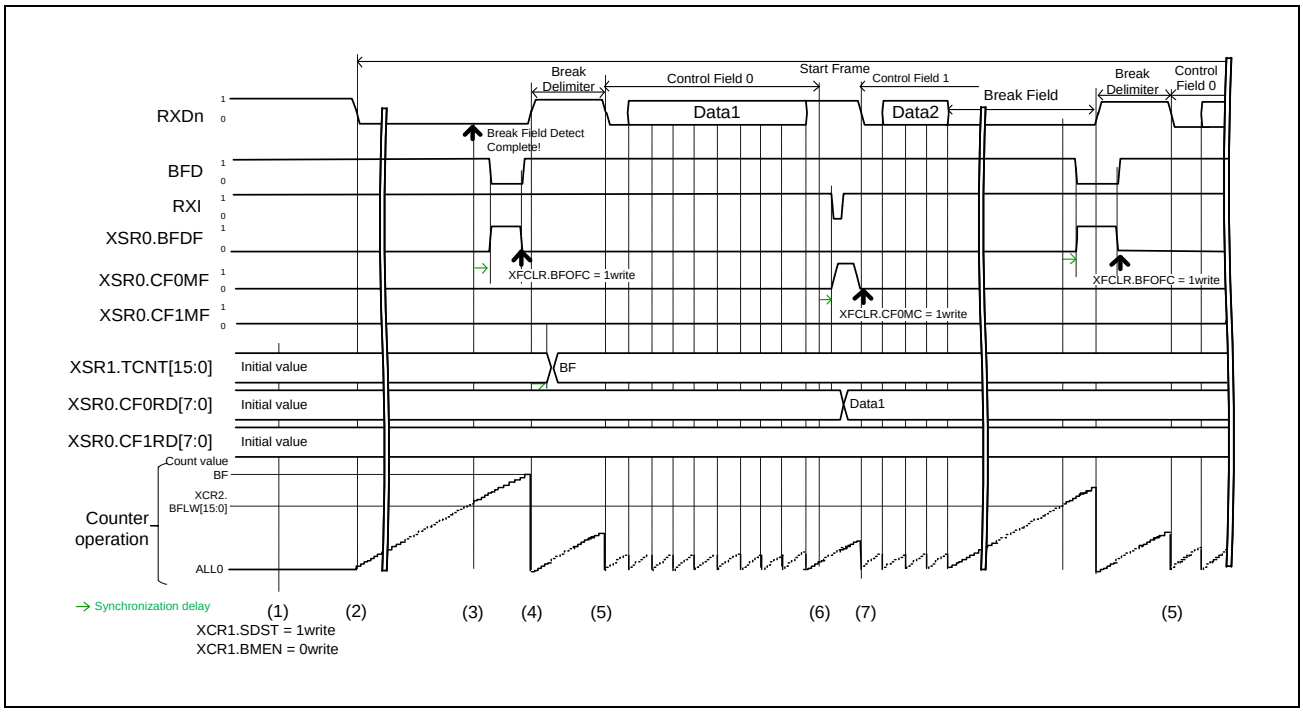

Figure 7.3-59 Start Frame Reception Example (PIB Not Used) Break Field Detected during Control Field 1

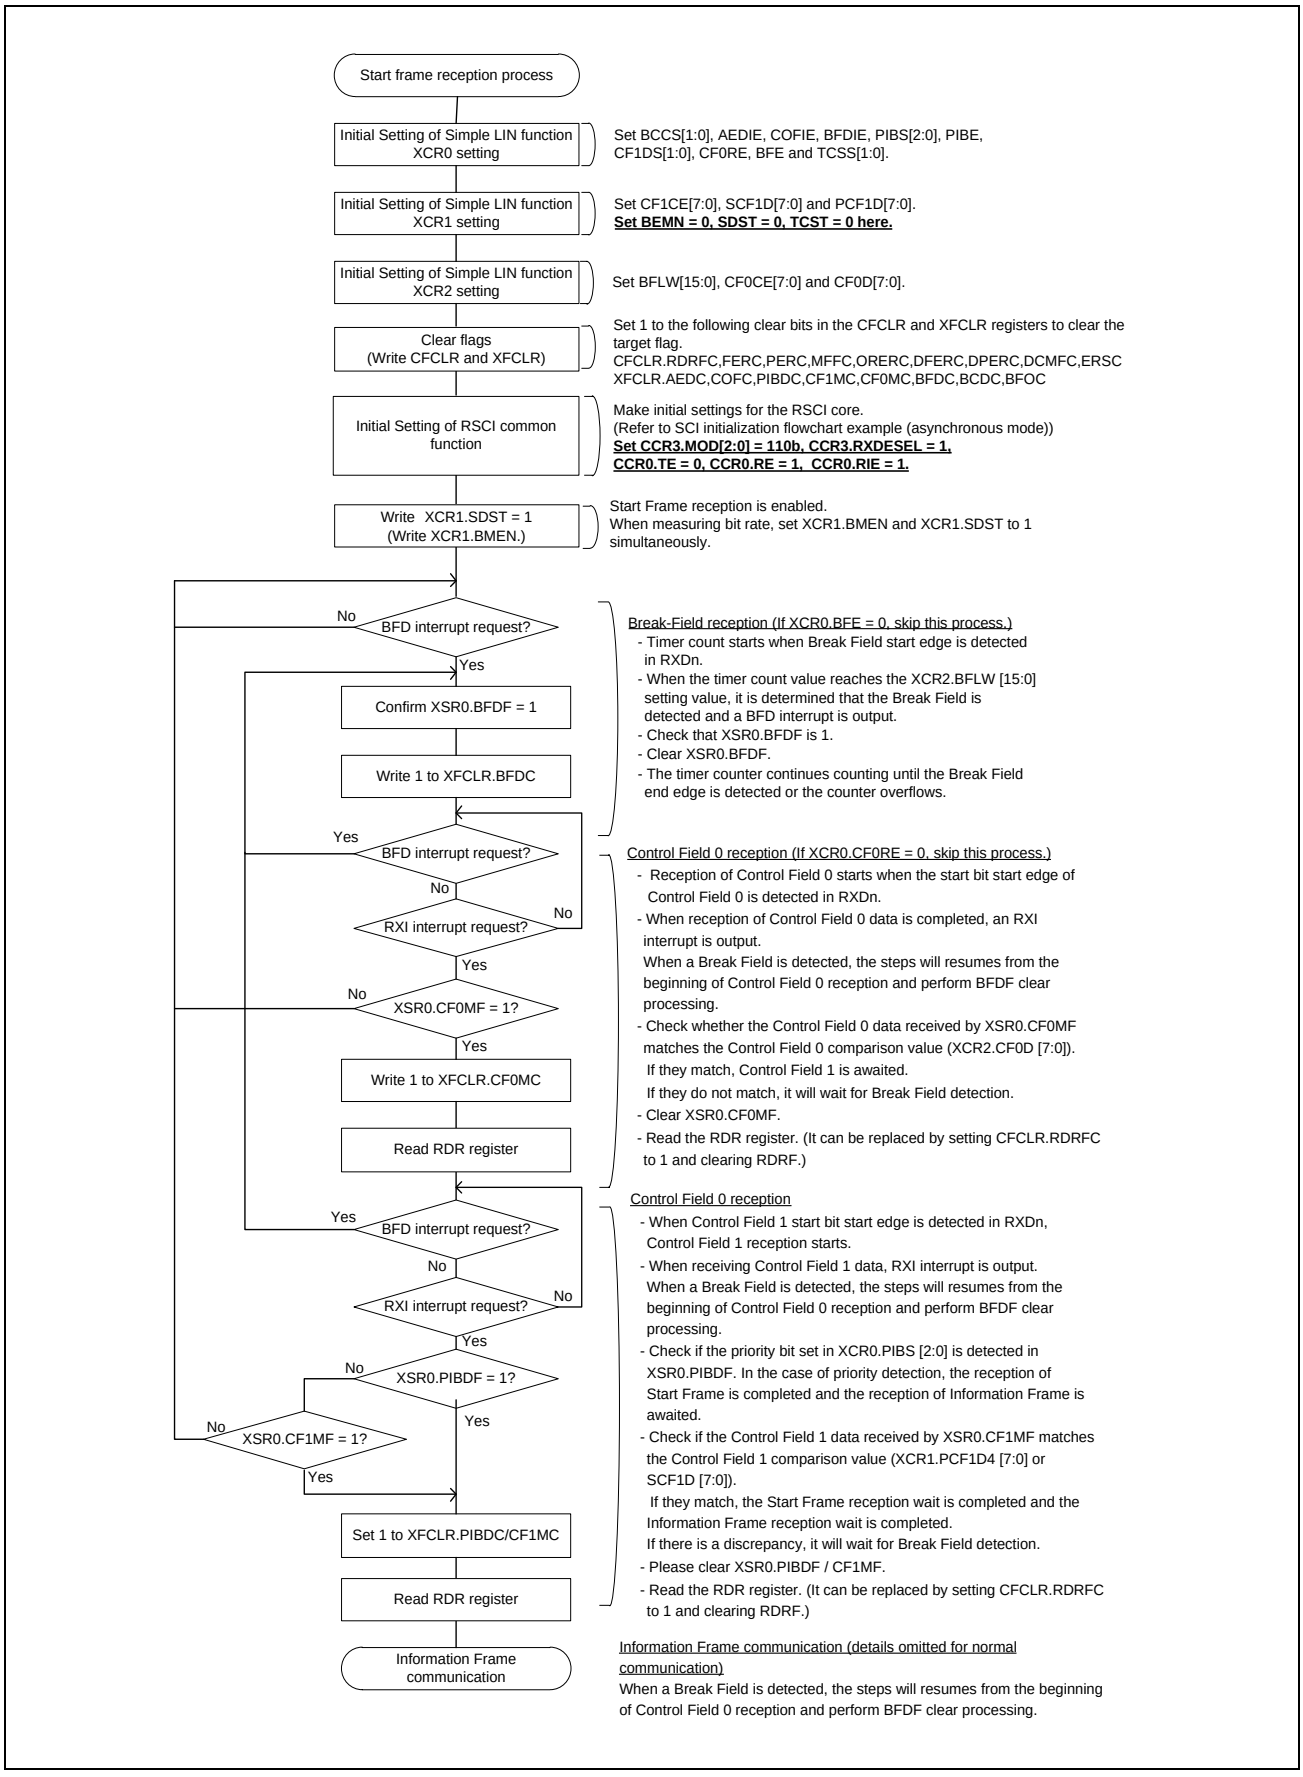

Figure 7.3-60 Example of Start Frame Reception Flowchart

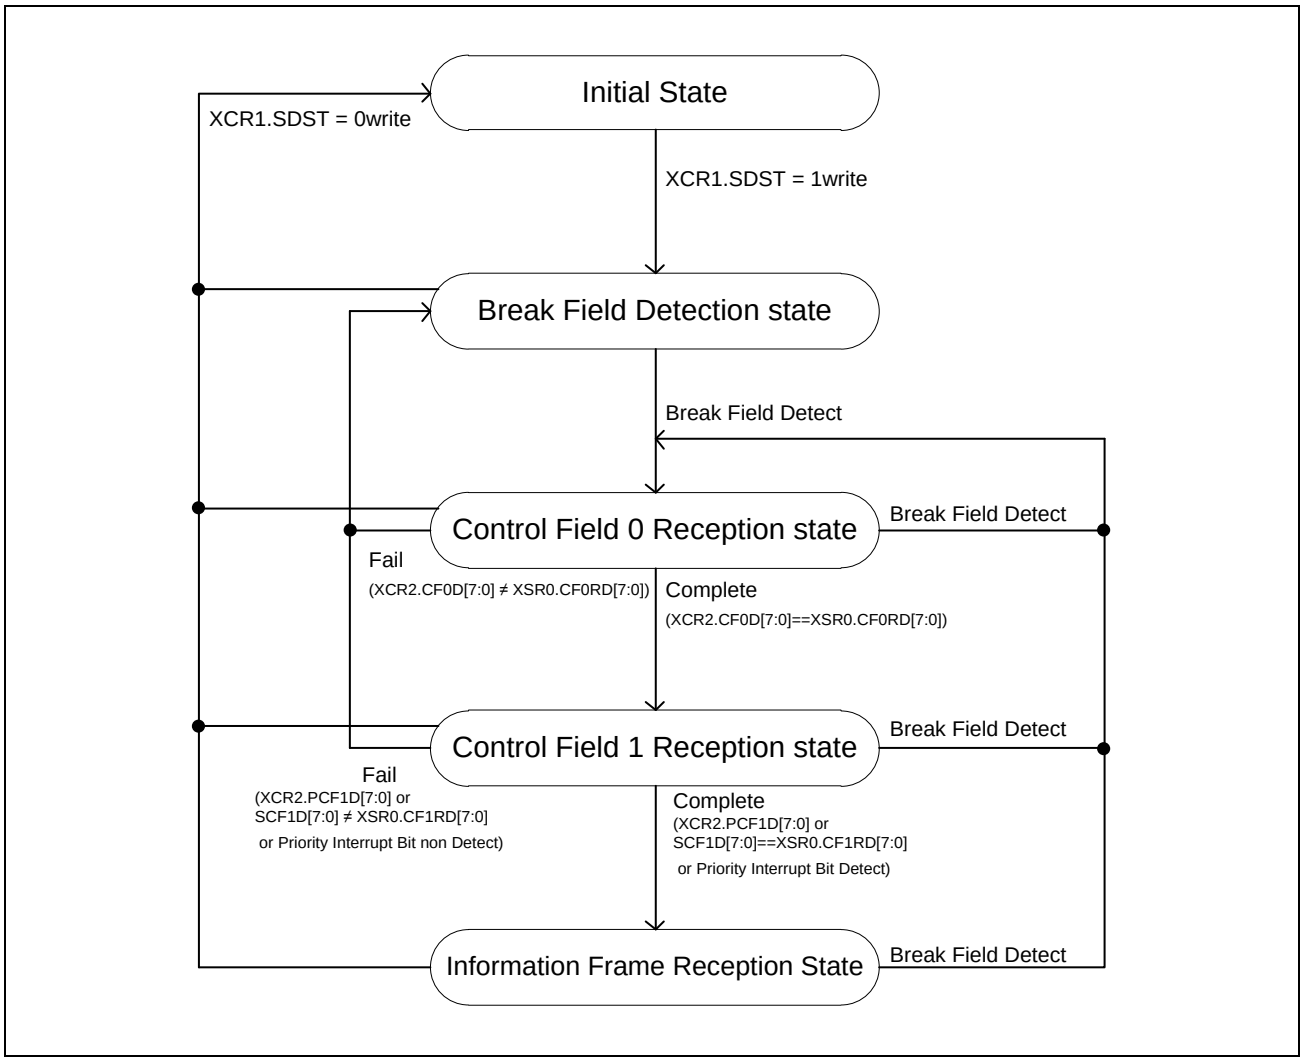

Figure 7.3-61 State Transition Diagram of Start Frame Reception

7.3.6.2.2 Simple-LIN Start Frame reception (using the priority interrupt bit)

Figure 7.3-62 shows an example of Start Frame reception using the priority interrupt bit. The priority interrupt bit is enabled by setting XCR0.PIBE to 1b.

The RSCI operates as follows during Start Frame reception using the priority interrupt bit.

Steps (1) to (7) are the same as steps (1) to (7) in the Start Frame reception example in **Figure 7.3-59**.

(8) When the value specified in the XCR0.PIBS[2:0] bits matches the set XCR1.PCF1D[7:0] value, XSR0.PIBDF is set to 1b and the RSCI core performs communication of the Information Frame. If the data received in Control Field 1 matches neither the set XCR1.PCF1D[7:0] value nor the set XCR1.SCF1D[7:0] value and the priority interrupt bit is not detected, the RSCI transitions to the state before the Break Field is detected.

(9) Communicate information frame at the RSCI core.

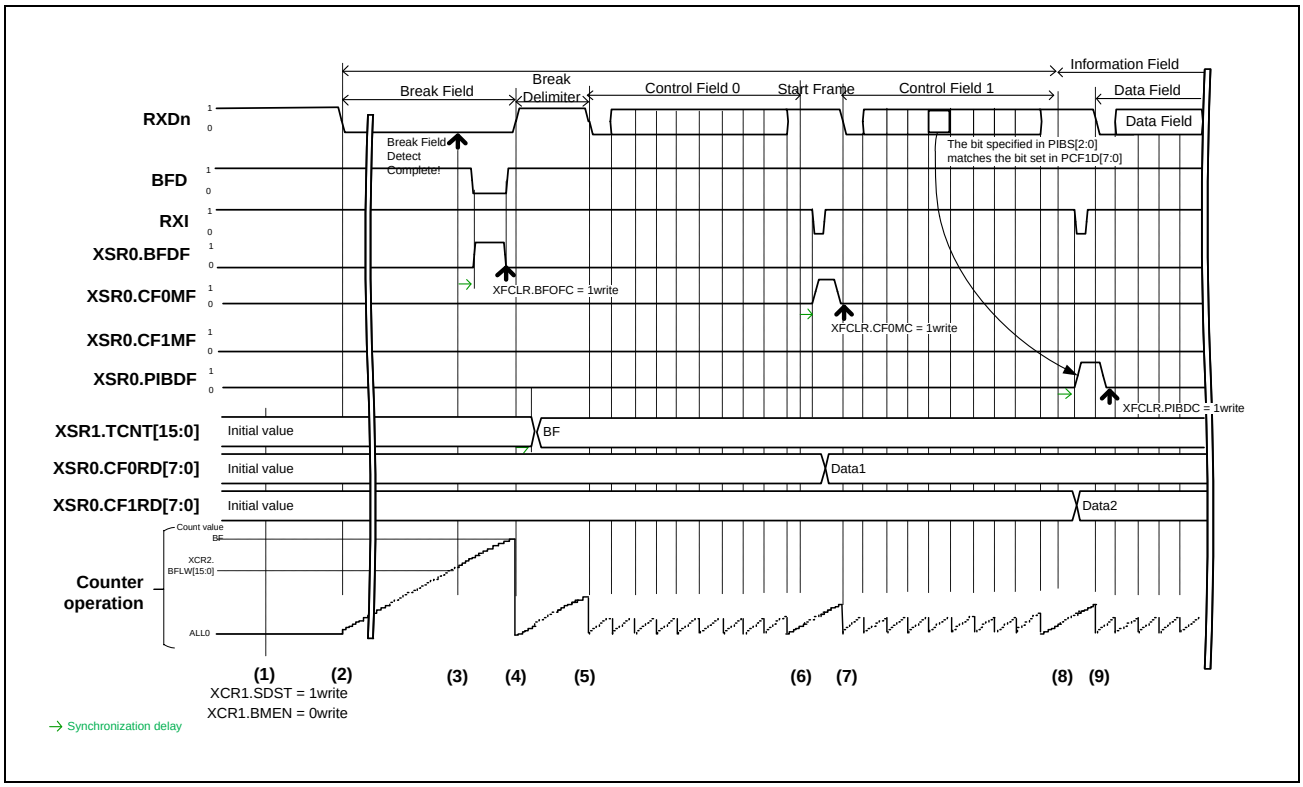

Figure 7.3-62 Start Frame Reception Example (Priority Interrupt Bit Used)

7.3.6.3 Simple-LIN Bus Conflict Detection Function

In simple-LIN mode (CCR3MOD[2:0] = 110b) when TE = 1b, the bus conflict detection function works during Break Field output and during data transmission.

Figure 7.3-63 shows an operation example of the bus conflict detection function. The TXD pin output and the RXD pin input are sampled by the bus conflict detection clock set in XCR0.BCCS[1:0]. When a mismatch occurs three times in a row, XSR0.BCDF is set to 1b, and if XCR0.BCDIE has been set to 1b at this time, an ERI interrupt is generated.

When an ERI interrupt is generated, stop transmission according to **Figure 7.3-64**. Check the bus state to decide whether to resume transmission.

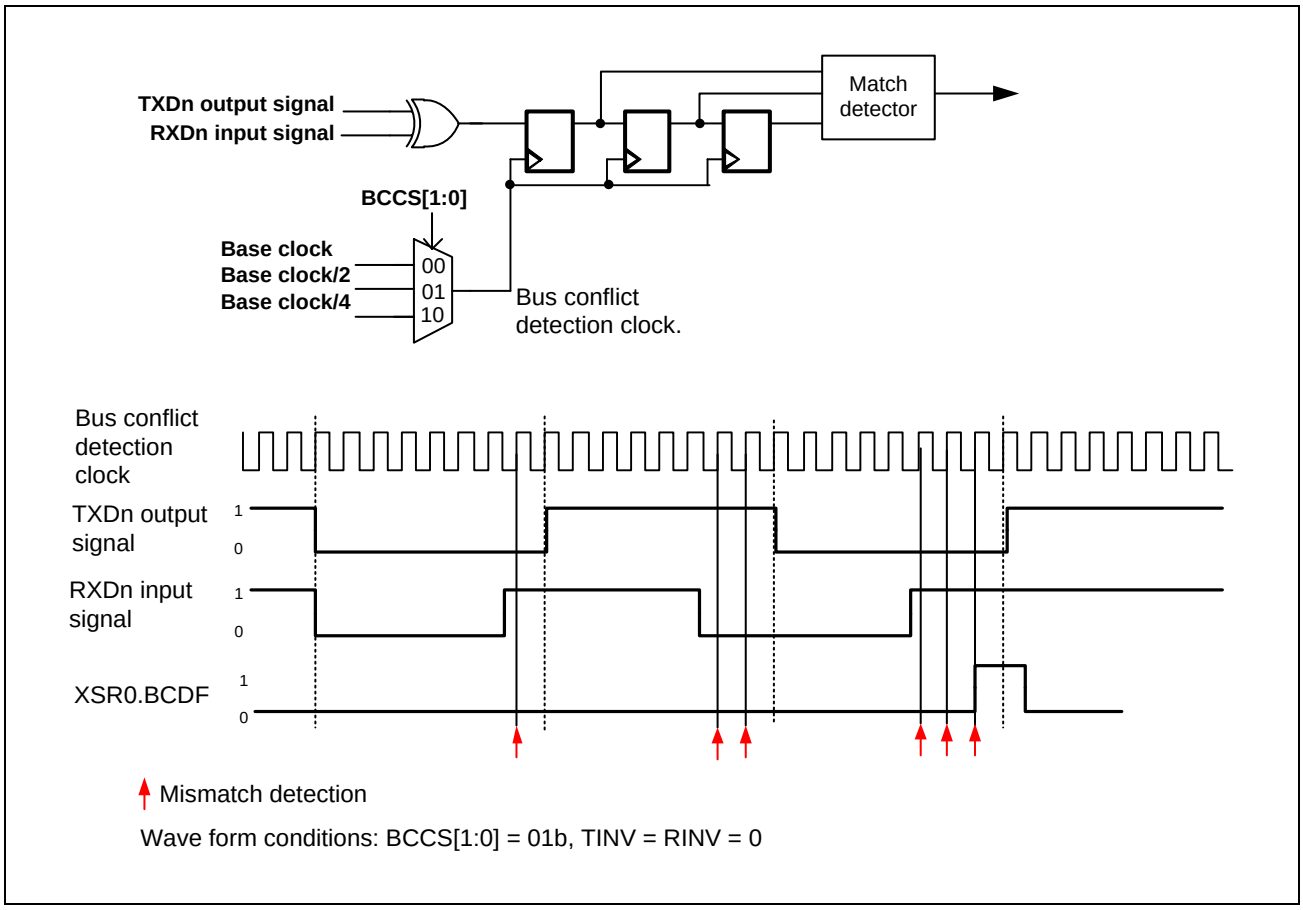

Figure 7.3-63 Operation Example of the Bus Conflict Detection Function

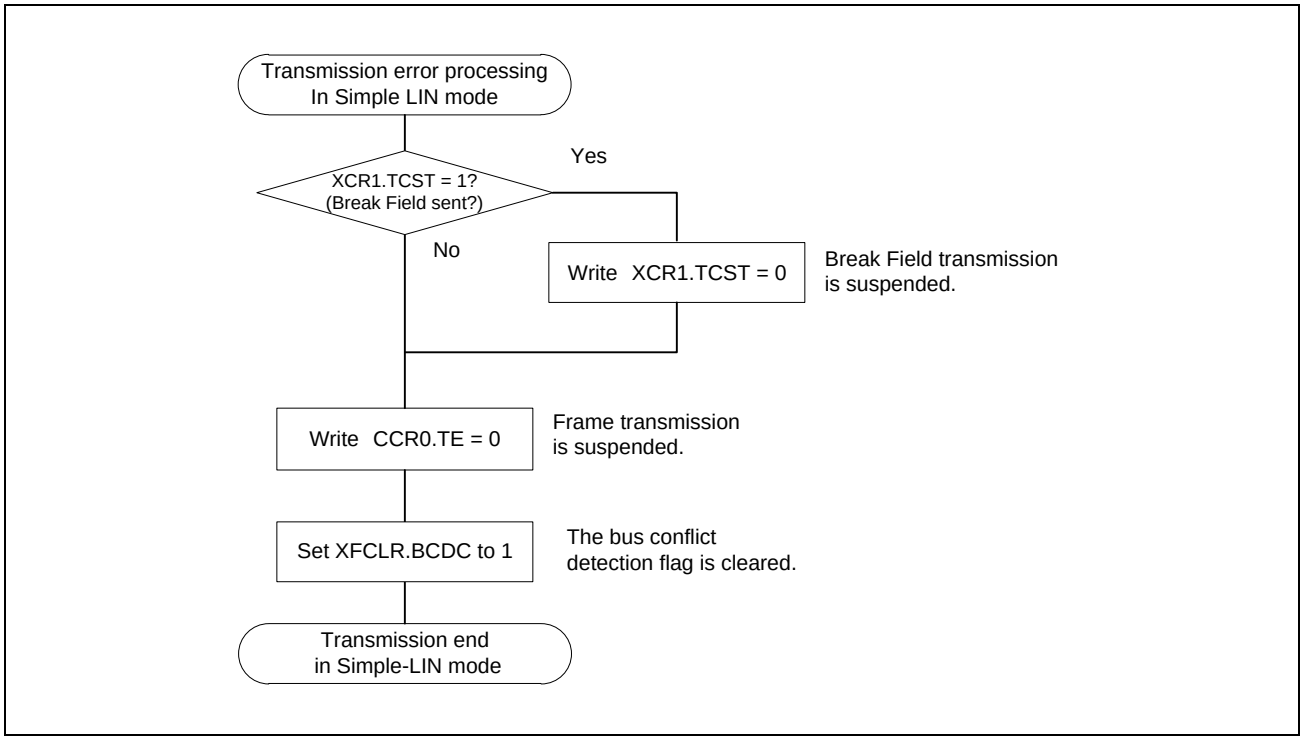

Figure 7.3-64 ERI Interrupt Handling Flow at Transmission in Simple-LIN Mode

7.3.6.4 Simple-LIN Bit Rate Measurement Function

This function measures a bit rate between the effective edges of the input signal from the RXD pin. **Figure 7.3-65** shows an operation example of the bit rate measurement function.

(1) Writing 1b to XCR1.SDST and XCR1.BMEN enables bit rate measurement. When this bit is set to 1b, the valid edge interval of Control Field 0 and Control Field 1 data is measured. However, the bit rate is not measured between the Break Field and the Break Delimiter. Set XCR1.BMEN and XCR1.SDST to 1b simultaneously only when measuring the bit rate.

(2) Because the bit rate is not measured in the Break Field, the effective edge detection flag is not set to 1b at the rising edge at the end of the Break Field, and the counter capture value is not stored in XSR1.TCNT[15:0].

(3) The counter starts counting from the falling edge of the start bit in Control Field 0. The Break Delimiter count value is not captured in XSR1.TCNT[15:0].

(4) The rising edge of the start bit is detected as an effective edge, and then the XSR0.AEDF flag is set to 1b. If XCR0.AEDIE has been set to 1b at this time, an AED interrupt is output. The start bit count value is stored in XSR1.TCNT[15:0]. The XSR1.TCNT[15:0] value is retained until the effective capture value is read.

(5) Even if an effective edge is input from the RXD input pin, the count value of this effective edge timing is not captured because the XRS1.TCNT[15:0] value has not been read and retention has not been released. In this case, an AED interrupt is not output.

(6) The XSR1.TCNT[15:0] value is read. Then the retention of XSR1.TCNT[15:0] is released and the XSR0.AEDF flag is cleared by hardware.

(7) Because the retention of XSR1.TCNT[15:0] has been released, the count value is captured at the effective edge and is retained. At the same time, the XSR0.AEDF flag is set to 1b, and if XCR0.AEDIE has been set to 1b, an AED interrupt is output. The bit rate can be adjusted by calculating it from the count value between effective edges by software and by changing the RSCI settings.

(8) To disable bit rate measurement, write 0b to XCR1.BMEN.

(9) The XSR0.AEDF value and the XSR1.TCNT[15:0] value remain unchanged at the effective edge timing because the bit rate measurement function is disabled.

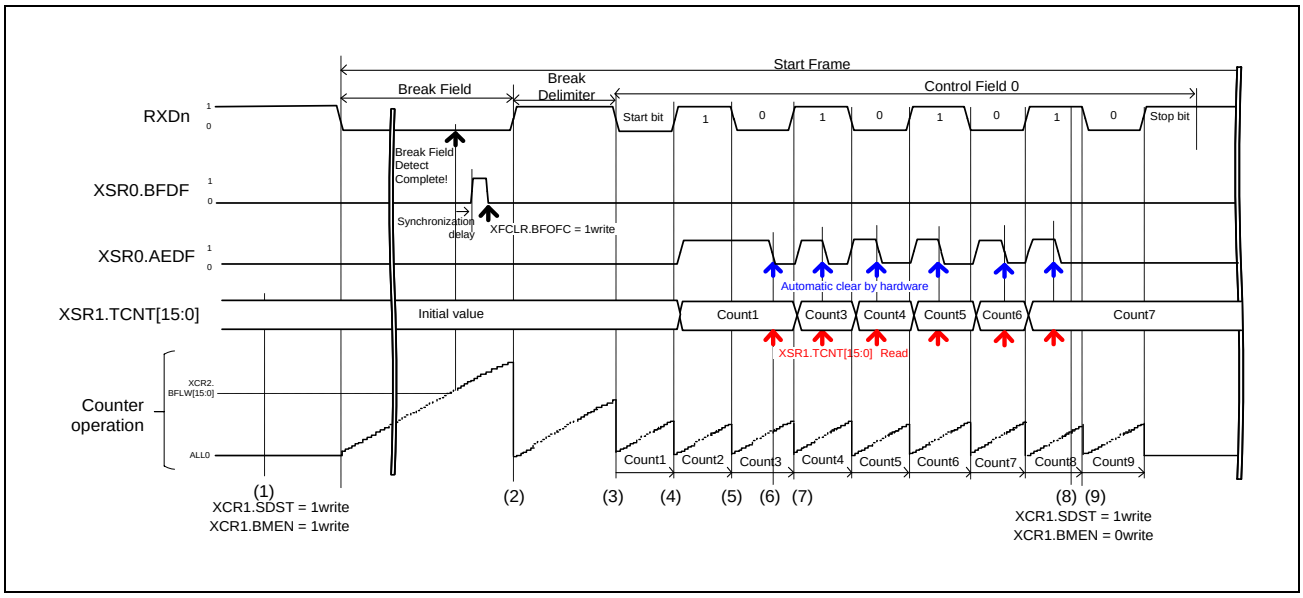

Figure 7.3-65 Operation Example of the Bit Rate Measurement Function

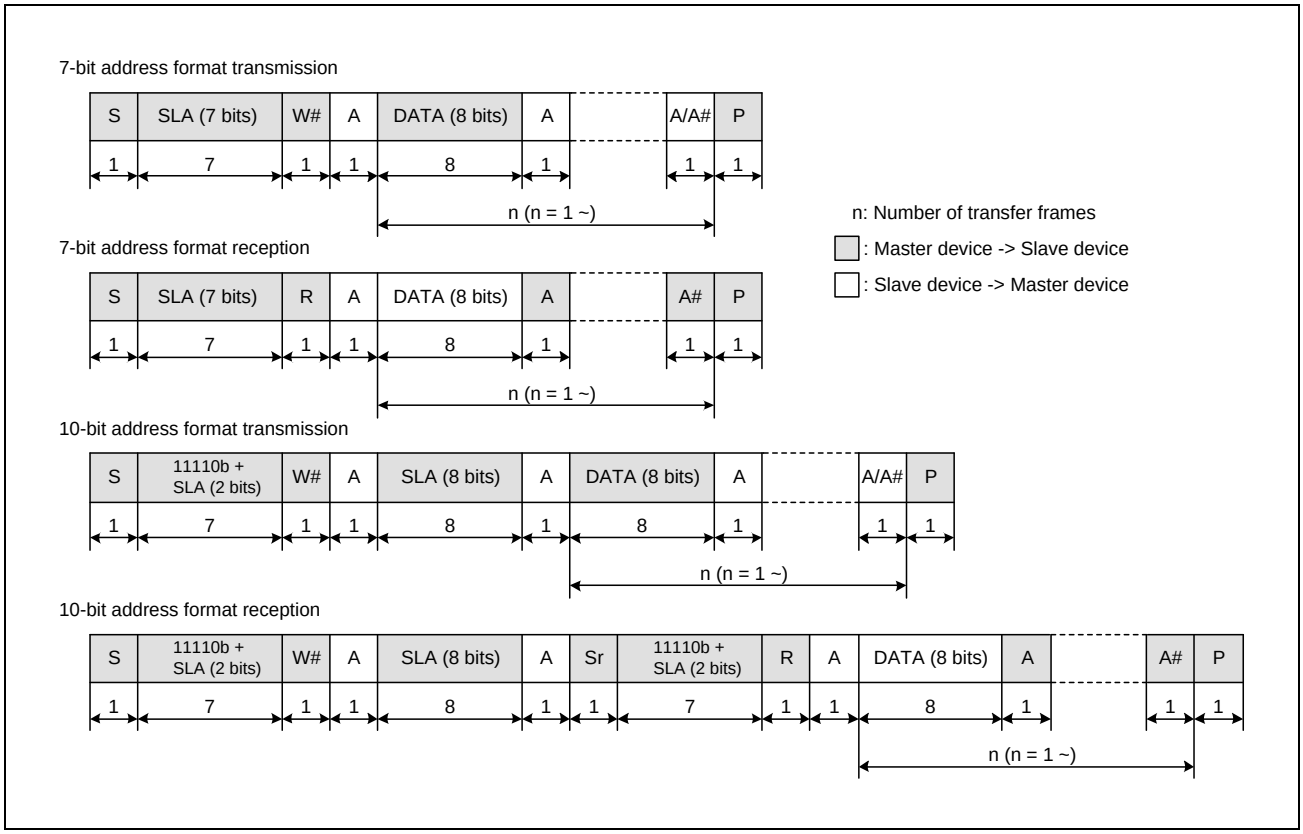
7.3.7 Simple I2C Mode

Simple I2C mode supports master operation only. Simple I2C bus format is composed of 8 data bits and an acknowledge bit. A slave-address frame follows start condition or restart condition. And the slave-address frame is used to specify a slave device as the partner by master device. The currently specified slave device remains valid until a new slave device is specified or a stop condition is satisfied. The 8-bit data of each frame is transmitted from MSB.

Figure 7.3-66 shows I2C bus format, and **Figure 7.3-67** shows the timing of I2C.



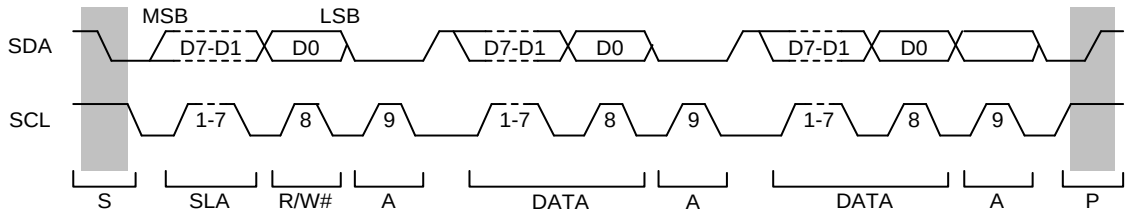


Figure 7.3-66 I2C Bus Format

[Symbol explanation]

S: Indicates a start condition. The master device changing the level on the SDAn line from the high to the low level when the SCLn line is at the high level.

SLA: Indicates a slave address. The master device selects a slave device.

R/W#: Indicates the direction of transfer (reception or transmission). When R/W# is high, the transfer direction is from the slave device to the master device. When R/W# is low, the transfer direction is from the master device to the slave device.

A/A#: Indicates an acknowledge. This is returned by the slave device for master transmission and by the master device for master reception. The low level indicates ACK and the high level indicates NACK.

Sr: Indicates a restart condition. The master device changing the level on the SDAn line from the high to the low level when the SCLn line is at the high level.

DATA: Indicates the received or transmitted data.

P: Indicates a stop condition. The master device changing the level on the SDAn line from the low to the high level when the SCLn line is at the high level.

Figure 7.3-67 I2C Bus Timing (SLA = 7 Bit)

7.3.7.1 Generation of Start, Restart, and Stop Conditions

Writing 1b to ICR.IICSTAREQ causes the generation of a start condition. The following operations are done at the generation of a start condition.

- The level on the SDAn line falls (from the high level to the low level) and the SCLn line is kept in the released state.
- The hold time for the start condition is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The level on the SCLn line falls (from the high level to the low level), the ICR.IICSTAREQ is set (to 0b), and a start condition generated STI interrupt (TEI) is output.

Writing 1b to ICR.IICRSTAREQ causes the generation of a restart condition. The following operations are done at the generation of a restart condition.

- The SDAn line is released and the SCLn line is kept at the low level.
- The period at low level for the SCLn line is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The SCLn line is released (transition from the low to the high level).
- Once the high level on the SCLn line is detected, the setup time for the restart condition is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The level on the SDAn line falls (from the high level to the low level).
- The hold time for the restart condition is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.

- The level on the SCLn line falls (from the high level to the low level), the ICR.IICRSTAREQ is set (to 0b), and a restart condition generated STI interrupt (TEI) is output.

Writing 1b to ICR.IICSTPREQ causes the generation of a stop condition. The following operations are done at the generation of a stop condition.

- The level on the SDAn line falls (from the high level to the low level) and the SCLn line is kept at the low level.
- The period at low level for the SCLn line is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The SCLn line is released (transition from the low to the high level).
- Once the high level on the SCLn line is detected, the setup time for the stop condition is secured as half of a bit period at the bit rate determined by the setting of the CCR2.BRR.
- The SDAn is released (transition from the low to the high level), the ICR.IICSTPREQ is set (to 0b), and a stop condition generated STI interrupt (TEI) is output.

Figure 7.3-68 shows the timing of operations in the generation of start, restart and stop conditions.

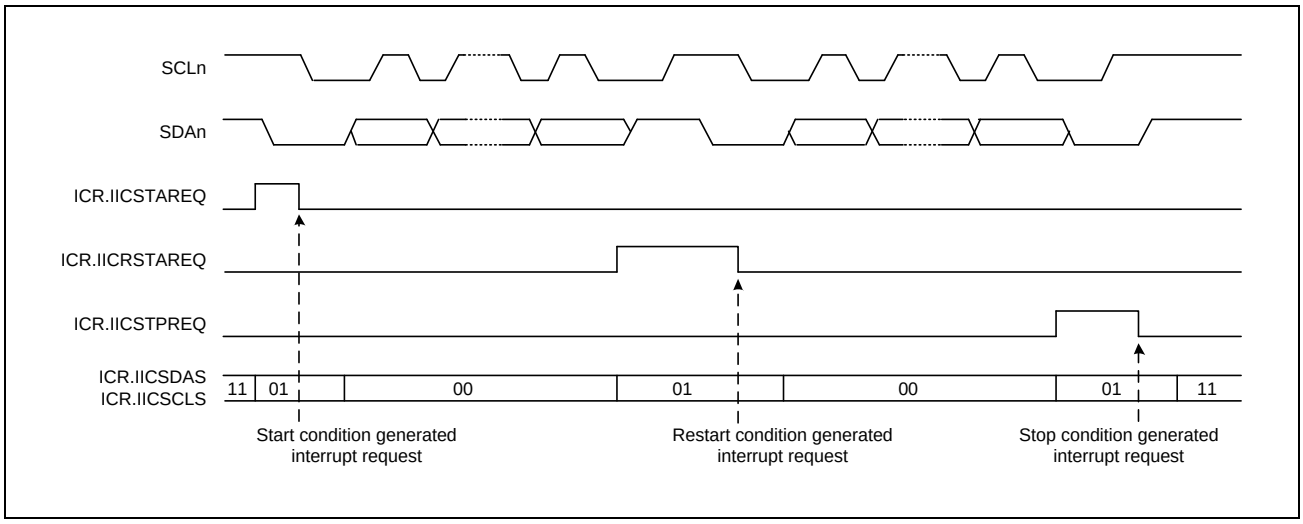

Figure 7.3-68 The Timing of Operations in the Generation of Start, Restart and Stop Conditions

7.3.7.2 Clock Synchronization

The slave device of the communication partner may make SCLn line Low-level with a view to insert a wait. Setting the ICR.IICCSC to 1b, applies control to obtain synchronization when the levels of the internal SCLn clock signal and the level being input on the SCLn pin differ.

When the ICR.IICCSC is set to 1b, the level of the internal SCLn clock signal changes from low to high, counting to determine the period at high level is stopped while the low level is being input on the SCLn pin, and counting to determine the period at high level starts after the transition of the input on the SCLn pin to the high level. The interval until counting to determine the period at high level starts on the transition of the SCLn pin to the high level is the total time which contains the SCLn input delay, the noise filtering delay of the SCLn pin (2 or 3 cycles of the filtering clock), and the internal processing delay (1 or 2 cycles of RSCI_m_TCLK). The period at high level of the internal SCLn clock is extended even if other devices are not placing the low level on the SCLn line.

If the ICR.IICCSC is 1b, synchronization is obtained for the transmission and reception of data by taking the logical AND of the input on the SCLn pin and the internal SCLn clock. If the ICR.IICCSC is 0b, synchronization with the internal SCLn clock is obtained for the transmission and reception of data.

If a slave device inserts a period of waiting into the interval until the transition of the internal SCLn clock signal from the low to the high level after a request for the generation of a start, restart, or stop condition is issued, the time until generation is prolonged by that period.

If a slave device inserts a period of waiting after the transition of the internal SCLn clock signal from the low to the high level, although the generation-completed interrupt is issued without stopping the period of waiting, generation of the condition itself is not guaranteed.

Figure 7.3-69 shows an example of operations to synchronize the clocks.

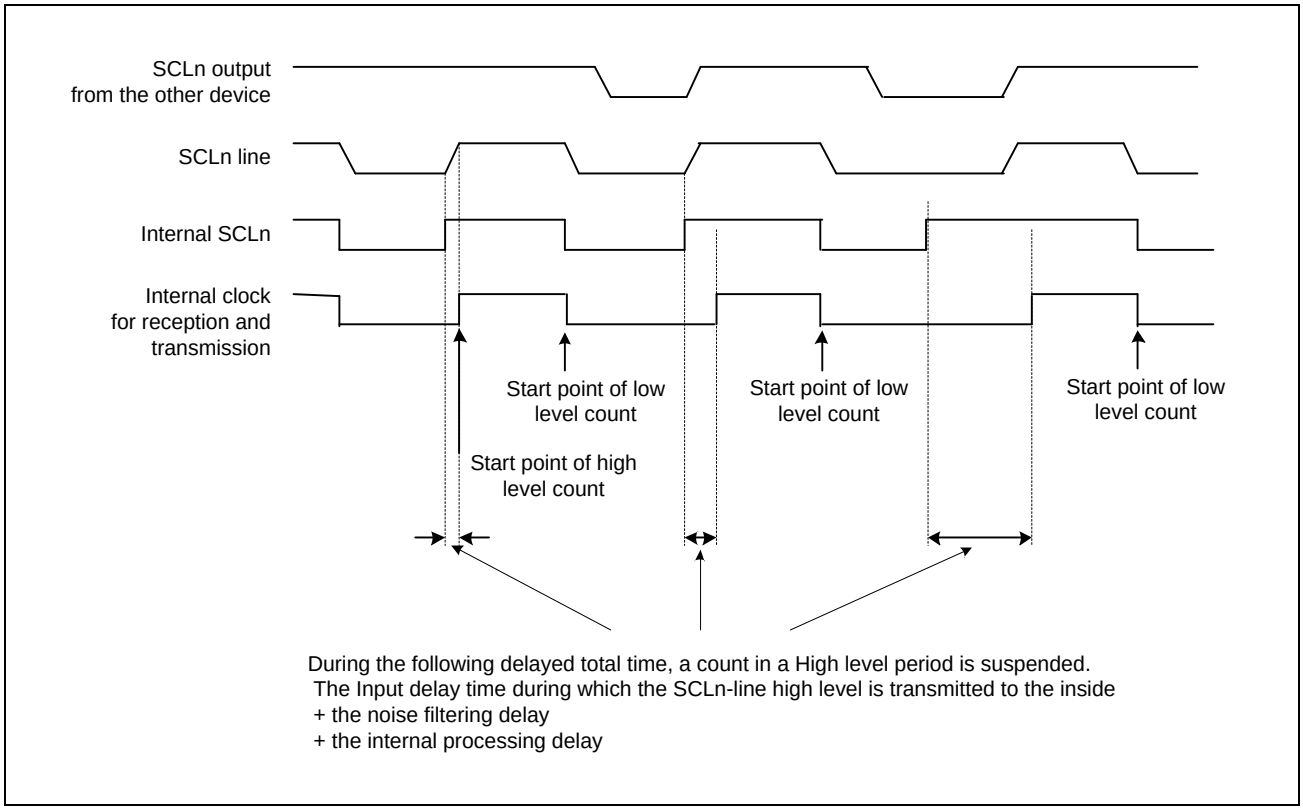

Figure 7.3-69 Example of Operations for Clock Synchronization

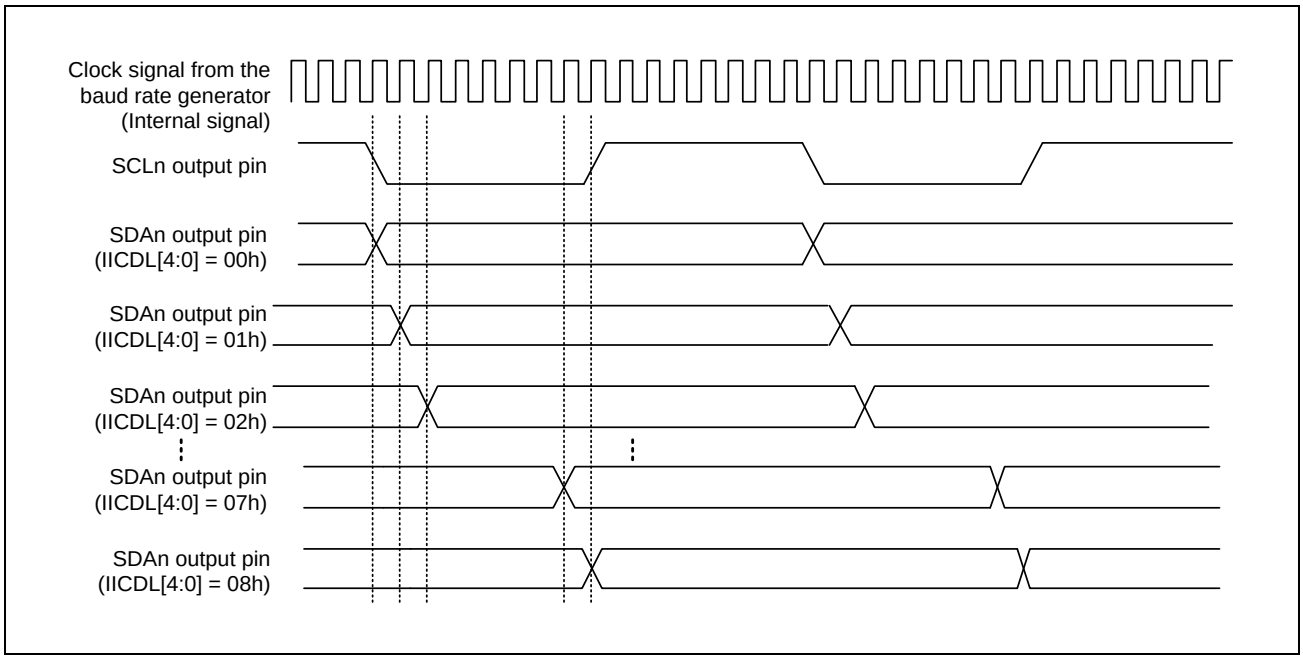
7.3.7.3 SDA Output Delay

The ICR.IICDL[4:0] can be used to set a delay for output on the SDAn pin relative to falling edges of output on the SCLn pin. The delay-time settings are selectable from 0 to 31 cycles of the clock signal from the baud rate generator (The base is RSCI_m_TCLK and selected the divided clock by the CCR2.CKS[1:0]). About Start/Restart/Stop conditions, 8-bit transmission data and acknowledge, the SDAn pin output can be delayed.

If the SDA output delay is shorter than the falling time of the SCLn output pin, the change of the SDAn output pin will start while the SCLn output pin level is falling, then there is a possibility of erroneous operation for slave devices. Ensure setting the SDA output delay greater than the SCLn maximum falling time (300 ns for I2C normal/fast mode).

Figure 7.3-70 shows the timing of SDA output delay.



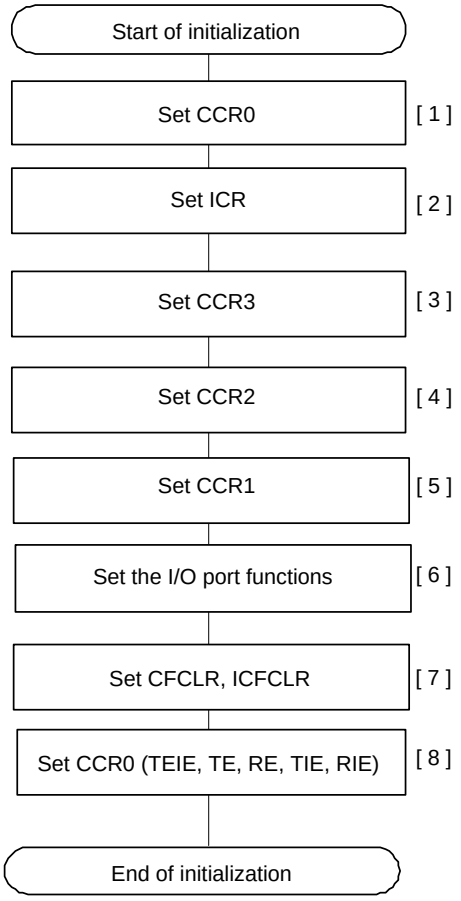


Figure 7.3-70 Timing of SDA Output Delay

7.3.7.4 SCI Initialization (Simple I2C Mode)

Write initial value (all 0) to CCR0, then initialize SCI according to **Figure 7.3-71**.

When changing the operating mode, transfer format, and so on, be sure to set 0b to CCR0.TE and CCR0.RE before proceeding with the changes. (Or write initial value to CCR0 again.)

[1] Set the following bits of CCR0 to 0.
TEIE, TIE, RIE, TE, RE
If you have not changed from the initial settings, you can skip this step.

[2] Set the IICSDAS[1:0] and IICSCLS[1:0] to 11b.
Set the IICDL[4:0] and IICINTM as required.
Set the IICACKT and the IICCSC bits to 1.

[3] Set the transmission/reception format as the communication mode (MOD[2:0] = 100b) and CCR3.LSBF = 0.

[4] Set the bit rate modulation function*1, the clock selection, and the bit rate.

[5] Set up the Noise-filter function.

[6] Set I/O port settings that allow use of the SCLn and SDAn pin functions.

[7] Write 1 to the following bits and clear the corresponding flag.
CFCLR.RDRFC, FERC, PERC, MFFC, ORERC, DFERC, DPERC, DCMFC, ERSC
ICFCLR.IICSTIFC

[8] Set the TE and RE to 1.
To enable interrupts, set the TE bit, TIE bit, TEIE bit, RE bit, and RIE bit to 1 with one instruction at the same time.
(for transmission and when the IICINTM bit is 1, clear the RIE bit.)
Setting the TE and RE bits to 1 makes the SCLn and SDAn pin functions available.

Note: Set the CCR0.TE and RE bits to 0b or 1b at the same time.

Note 1. If you do not use the bit rate modulation function, you do not need to set it.

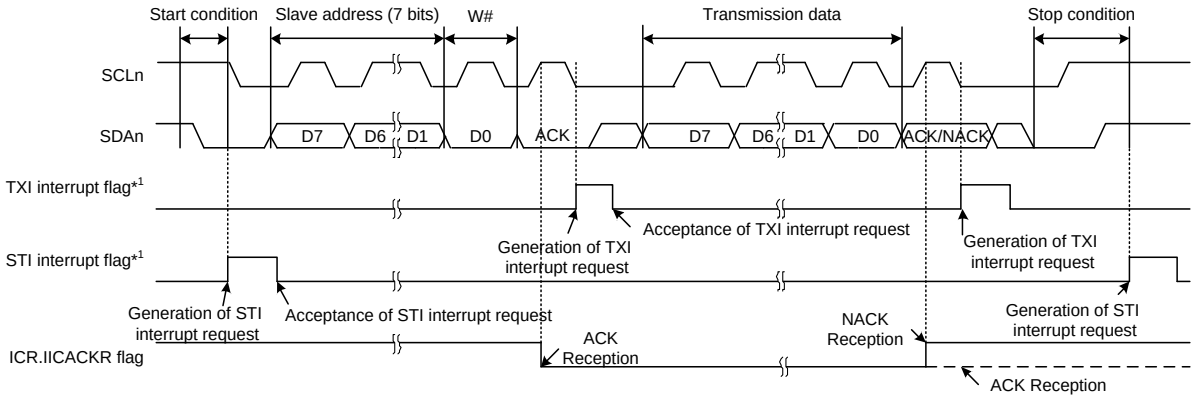

Figure 7.3-71 Example of the Flow of SCI Initialization (for Simple I2C Mode)

7.3.7.5 Operation in Master Transmission (Simple I2C Mode)

Figure 7.3-72 and **Figure 7.3-73** show examples of operations in master transmission, **Figure 7.3-74**, **Figure 7.3-75**, and **Figure 7.3-76** show the example flowcharts. See **Table 7.3-37** about the STI interrupt.

Figure 7.3-72 shows the operation example when ICR.IICINTM is 1b (reception/transmission interrupts are in use). In this case, you can start the DMAC by using the TXI interrupt. However, if the DMAC is used, ACK/NACK cannot be confirmed. If you need to confirm ACK/NACK, use the CPU to prepare transmit data. In simple I2C mode, the TXI interrupt is generated when communication of one frame is completed. In master transmission, the RXI interrupt is not used, so set the CCR0.RIE bit to 0b.

Figure 7.3-74 shows a flow chart in the case of ICR.IICINTM is 1b and address transmission by CPU and data transmission by DMAC. **Figure 7.3-75** shows a flow chart of address and data transmission by CPU. When 10-bit slave addresses are in use, steps [3] and [4] are repeated twice.

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

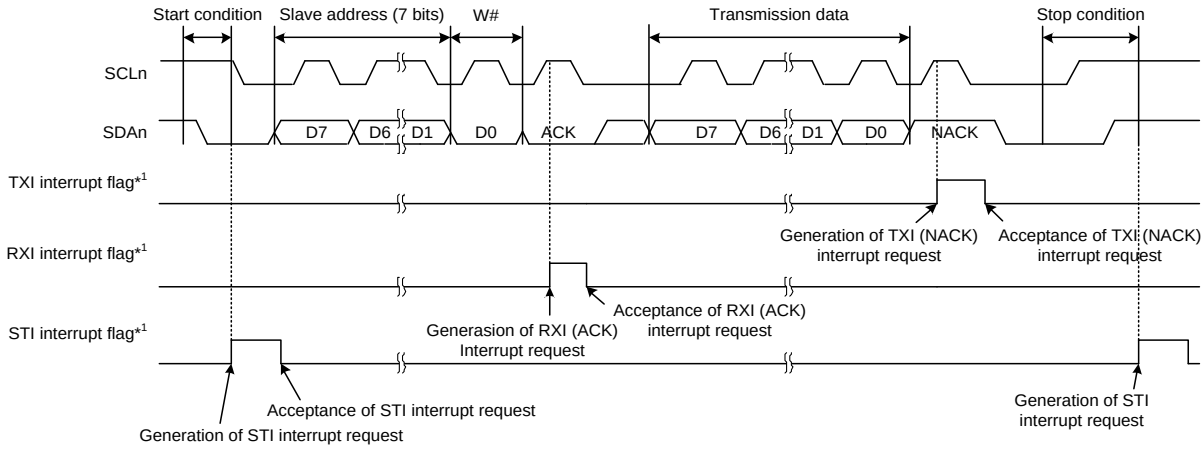

Figure 7.3-72 Example 1 of Operations for Master Transmission in Simple I2C Bus Mode (7-Bit Slave Address, Transmission and Reception Interrupt in Use (ICR.IICINTM = 1b))

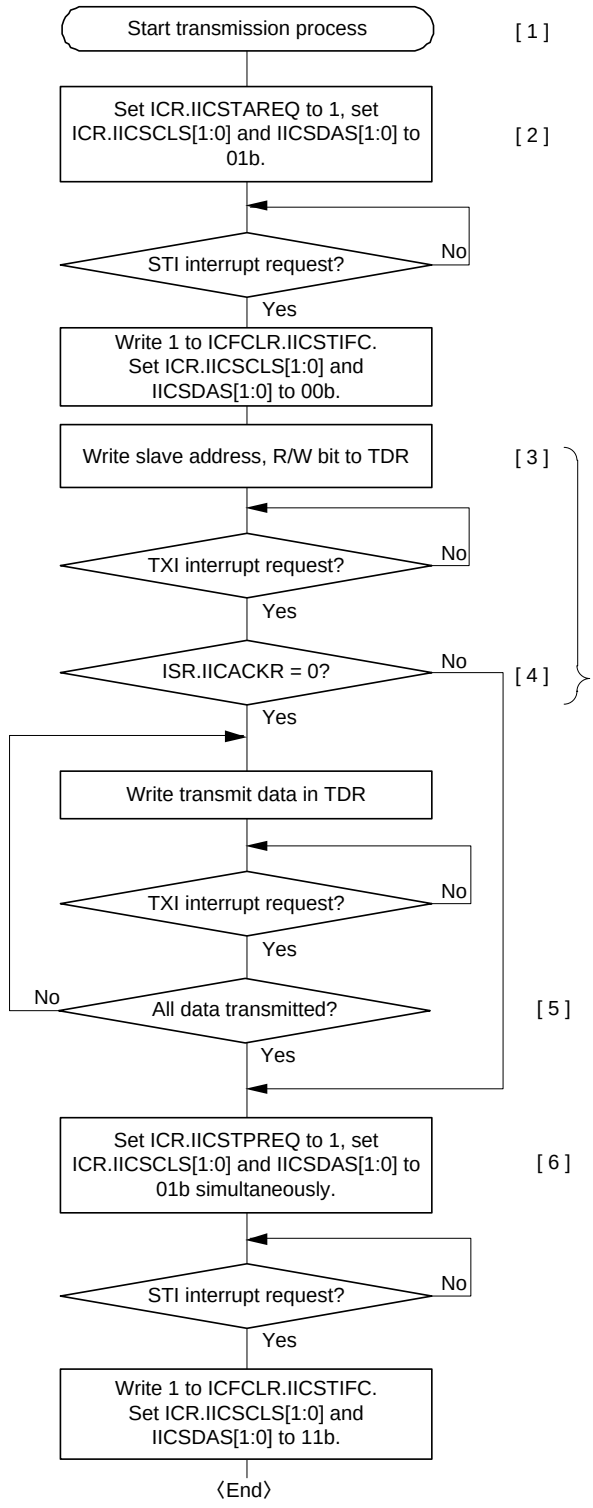
Figure 7.3-73 shows an example of operations when ICR.IICINTM is 0b (ACK and NACK interrupt in use). In this case, DMAC is activated by the ACK (RXI) interrupt, and necessary number of data bytes are transmitted. When the NACK is received, error processing, such as transmission stop and retransmission, is performed by the NACK (TXI) interrupt as the trigger.

Figure 7.3-76 shows a flow chart of ICR.IICINTM is 0b.



To resume communication after interrupting communication for some reason after writing transmit data to TDR, follow the procedure below.

1. Set the CCR0.TE and CCR0.RE bits to 0b to stop communication.
2. Set ICR.IICSCLS[1:0] and ICR.IICSDAS[1:0] to 11b, release the I2C bus, and clear various condition generation requests.
3. When CSR.RDRF = 1b, the RDR register is read by dummy and the RDRF bit is set to 0b.
4. Set the CCR0.TE and CCR0.RE bits to 1b and restart communication.

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

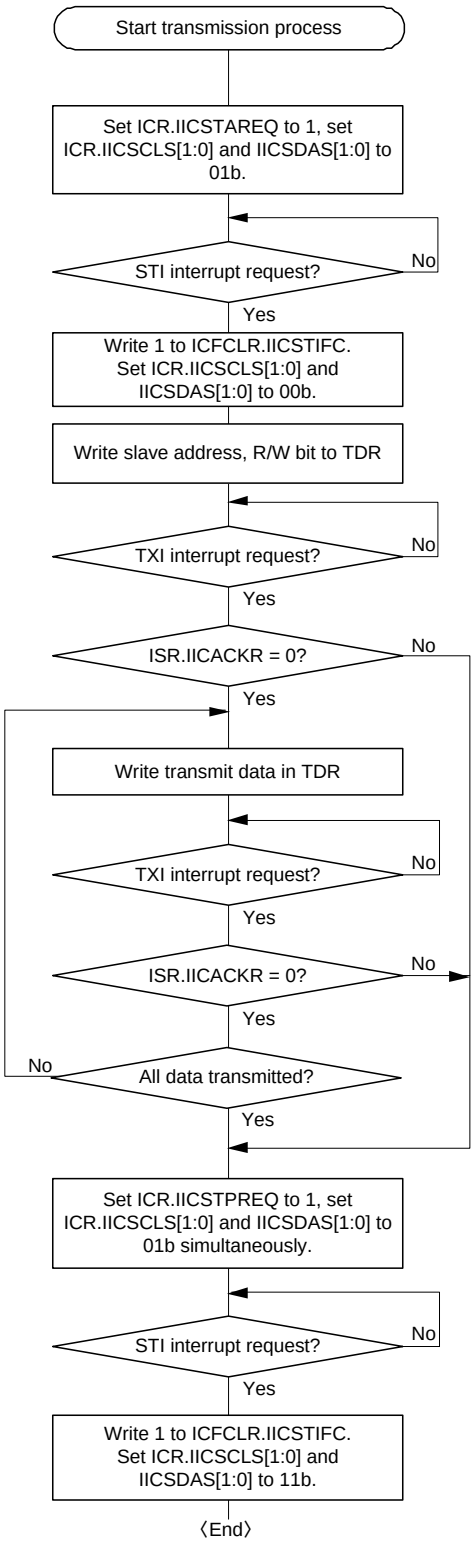
Figure 7.3-73 Example 2 of Operations for Master Transmission in Simple I2C Bus Mode (7-Bit Slave Address, ACK and NACK Interrupt in Use (ICR.IICINTM = 0b))

[1] Start transmission process
For transmission, set the CCR0.RIE to 0.
(RXI and ERI interrupts requests are disabled)

[2] Generate a start condition.

[3] Writing to TDR:
Writing the slave address and value for the R/W bit to TDR.

[4] Confirm ACK response from the slave device:
Check the ISR.IICACKR bit. If its value is 0, it is indicated that the slave device responded with ACK and operations proceed. If its value is 1, it is indicated that there was no response from a slave device so the next transition is to generation of the stop condition.



[5] Steps for continuing with serial transmission:
When transmission is to continue, write further transmit data to TDR. Except for the first data to be transmitted, a TXI interrupt request can activate the DMAC to handle writing of data to TDR.
But it cannot be confirmed status of ACK or NACK in this case.

[6] Generation of a stop condition.

If 10-bits slave address are in use, processing from [3] to [4] is repeated twice.

Note: In simple I2C mode, the TXI interrupt request is generated when communication is completed.

Figure 7.3-74 Example of the Procedure for Master Transmission Operations in Simple I2C Mode (when ICR.IICINTM is 1b, and when Confirming ACK/NACK by Address Transmission Only.)

[1] [1] Start transmission process
For transmission, set the CCR0.RIE to 0.
(RXI and ERI interrupts requests are disabled)

[2] Generate a start condition.

[2] [3] Writing to TDR:
Writing the slave address and value for the R/W bit to TDR.

[4] Confirm ACK response from the slave device:
Check the ISR.IICACKR bit. If its value is 0, it is indicated that the slave device responded with ACK and operations proceed. If its value is 1, it is indicated that there was no response from a slave device so the next transition is to generation of the stop condition.

[3] [5] Steps for continuing with serial transmission:
When transmission is to continue, write further transmit data to TDR. If ACK or NACK is checked in every transmission, DMAC cannot be used.

[6] Generation of a stop condition.

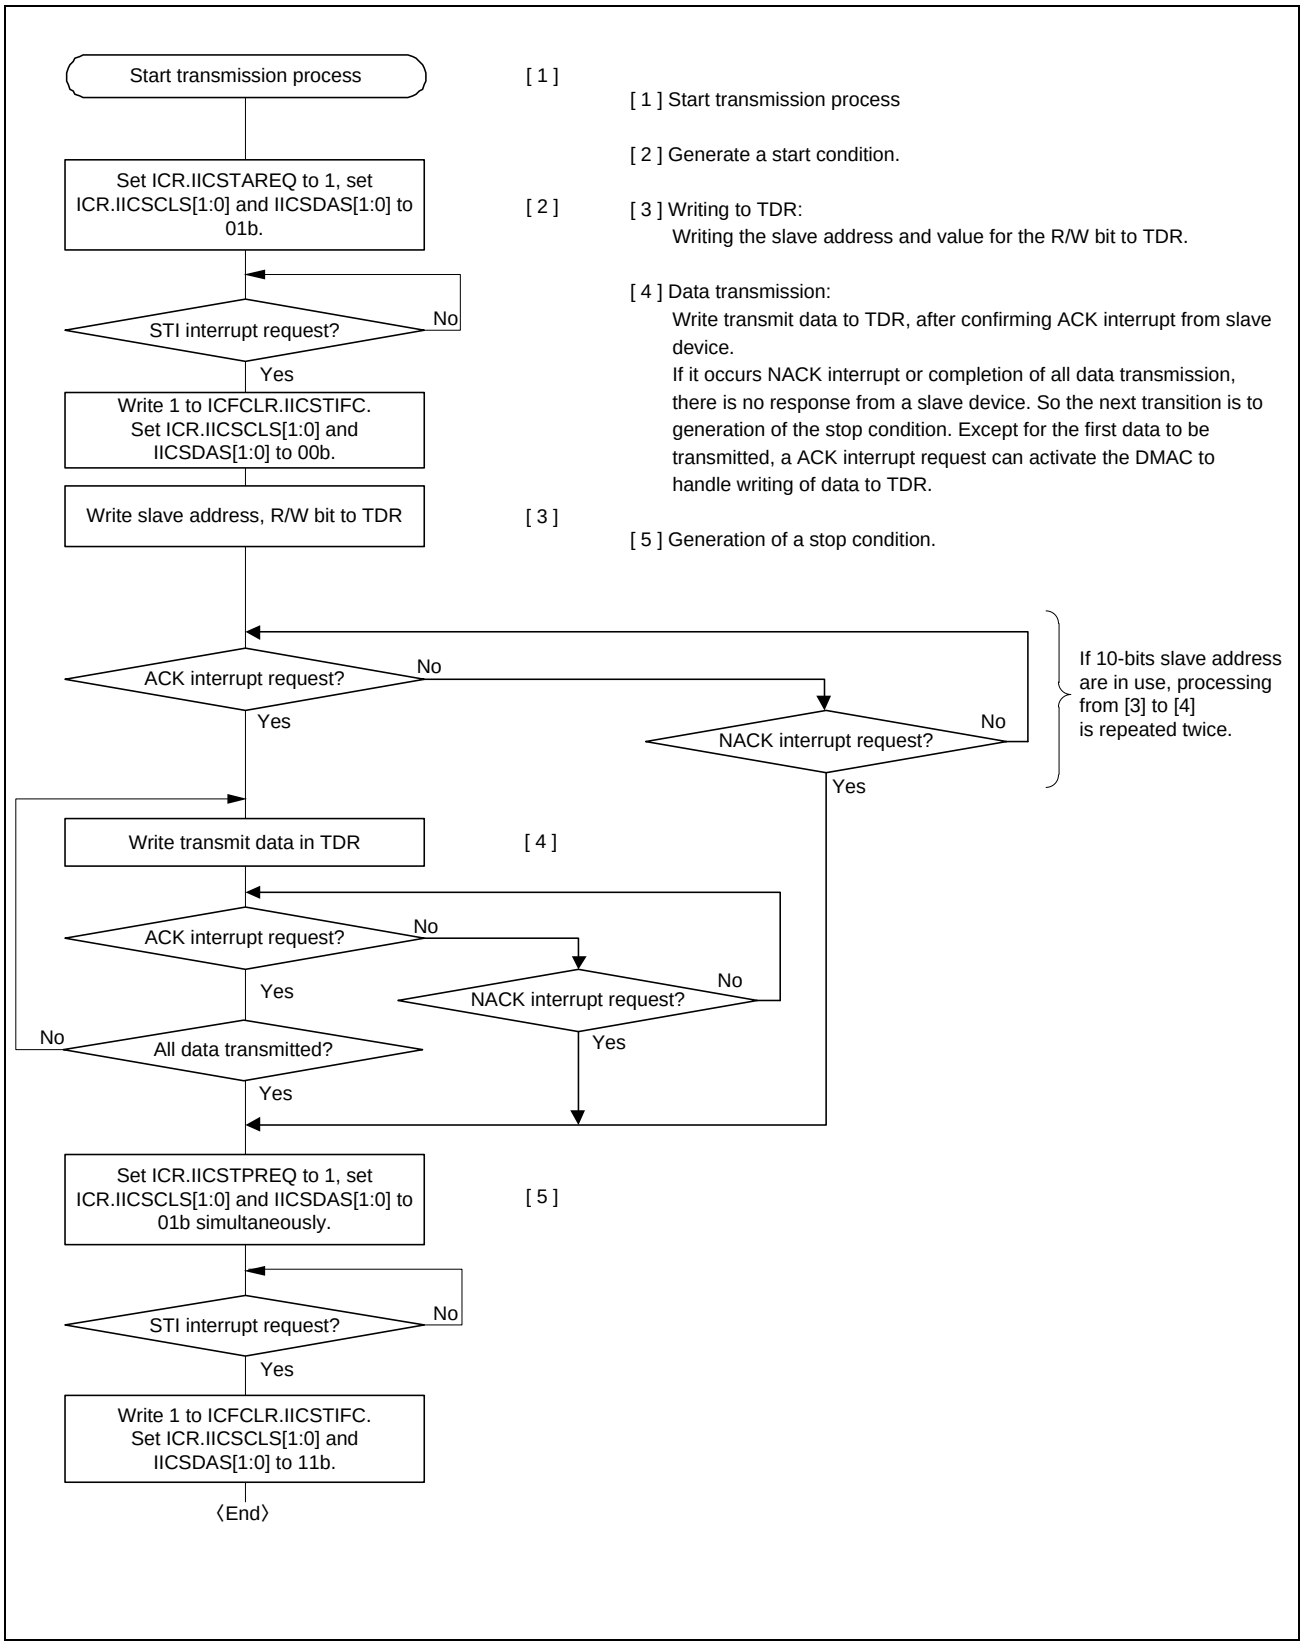
[4] If 10-bits slave address are in use, processing from [3] to [4] is repeated twice.

[5]

[6]

Note: In simple I2C mode, the TXI interrupt request is generated when communication is completed.

Figure 7.3-75 Example of the Procedure for Master Transmission Operations in Simple I2C Mode (when ICR.IICINTM is 1b, and when Confirming ACK/NACK in All Transmissions.)



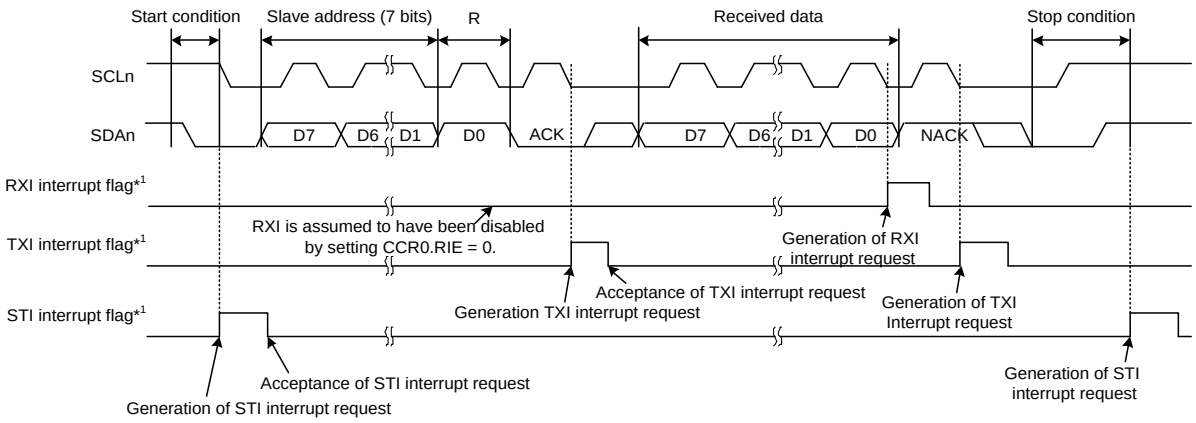


Figure 7.3-76 Example of the Procedure for Master Transmission Operations in Simple I2C Mode (when ICR.IICINTM is 0b.)

7.3.7.6 Master Reception (Simple I2C Mode)

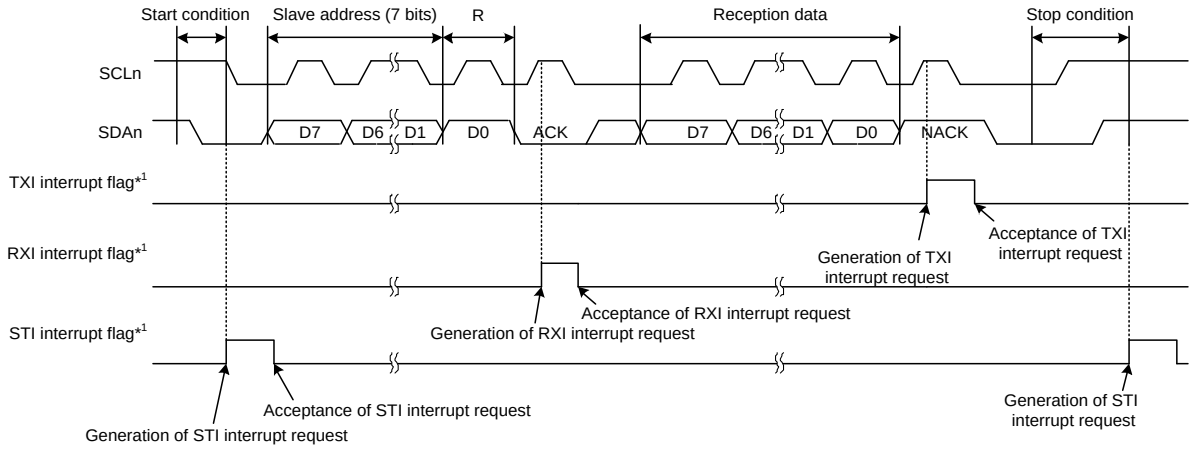

Figure 7.3-77 and **Figure 7.3-78** show example of operations in simple I2C mode master reception. **Figure 7.3-79** and **Figure 7.3-80** show flowchart of the master reception. The value of the ICR.IICINTM bit is assumed to be 1b (use reception and transmission interrupts) and 0b (use ACK and NACK interrupts).

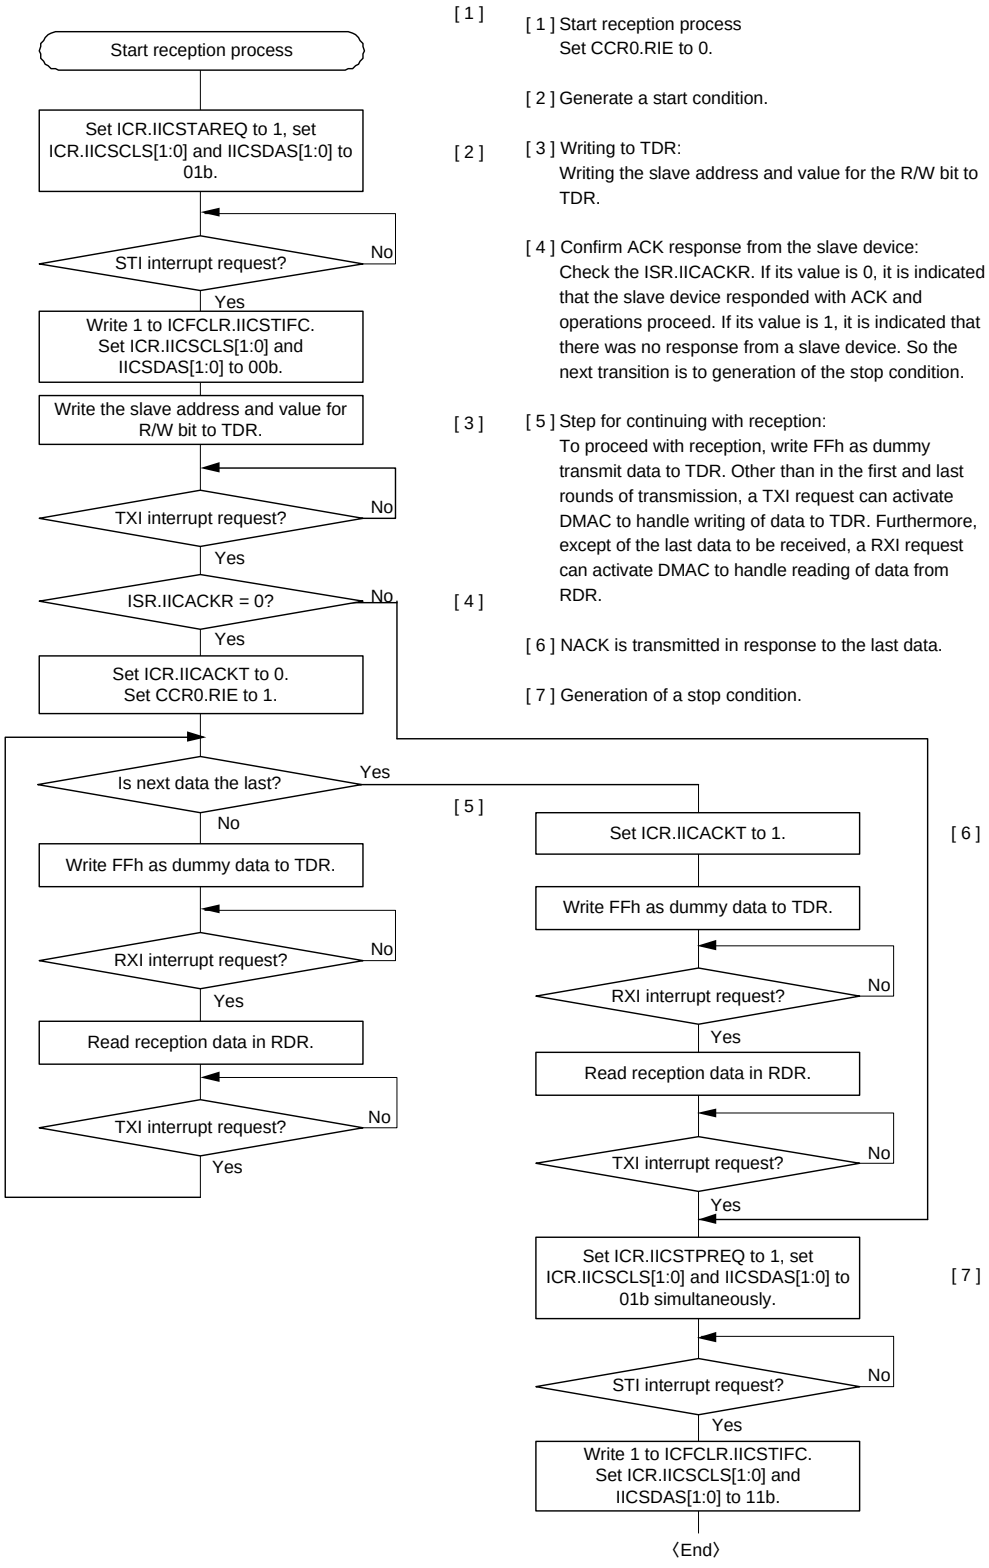
In simple I2C mode, the transmit data empty interrupt (TXI) is generated when communication of one frame is completed.



Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-77 Example of Operations for Master Reception in Simple I2C Bus Mode (7-Bit Slave Address, Transmission and Reception Interrupt in Use (ICR.IICINTM = 1b))

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-78 Example of Operations for Master Reception in Simple I2C Bus Mode (7-Bit Slave Address, ACK and NACK Interrupt in Use (ICR.IICINTM = 0b))

[1] Start reception process
Set CCR0.RIE to 0.

[2] Generate a start condition.

[3] Writing to TDR:
Writing the slave address and value for the R/W bit to TDR.

[4] Confirm ACK response from the slave device:
Check the ISR.IICACKR. If its value is 0, it is indicated that the slave device responded with ACK and operations proceed. If its value is 1, it is indicated that there was no response from a slave device. So the next transition is to generation of the stop condition.

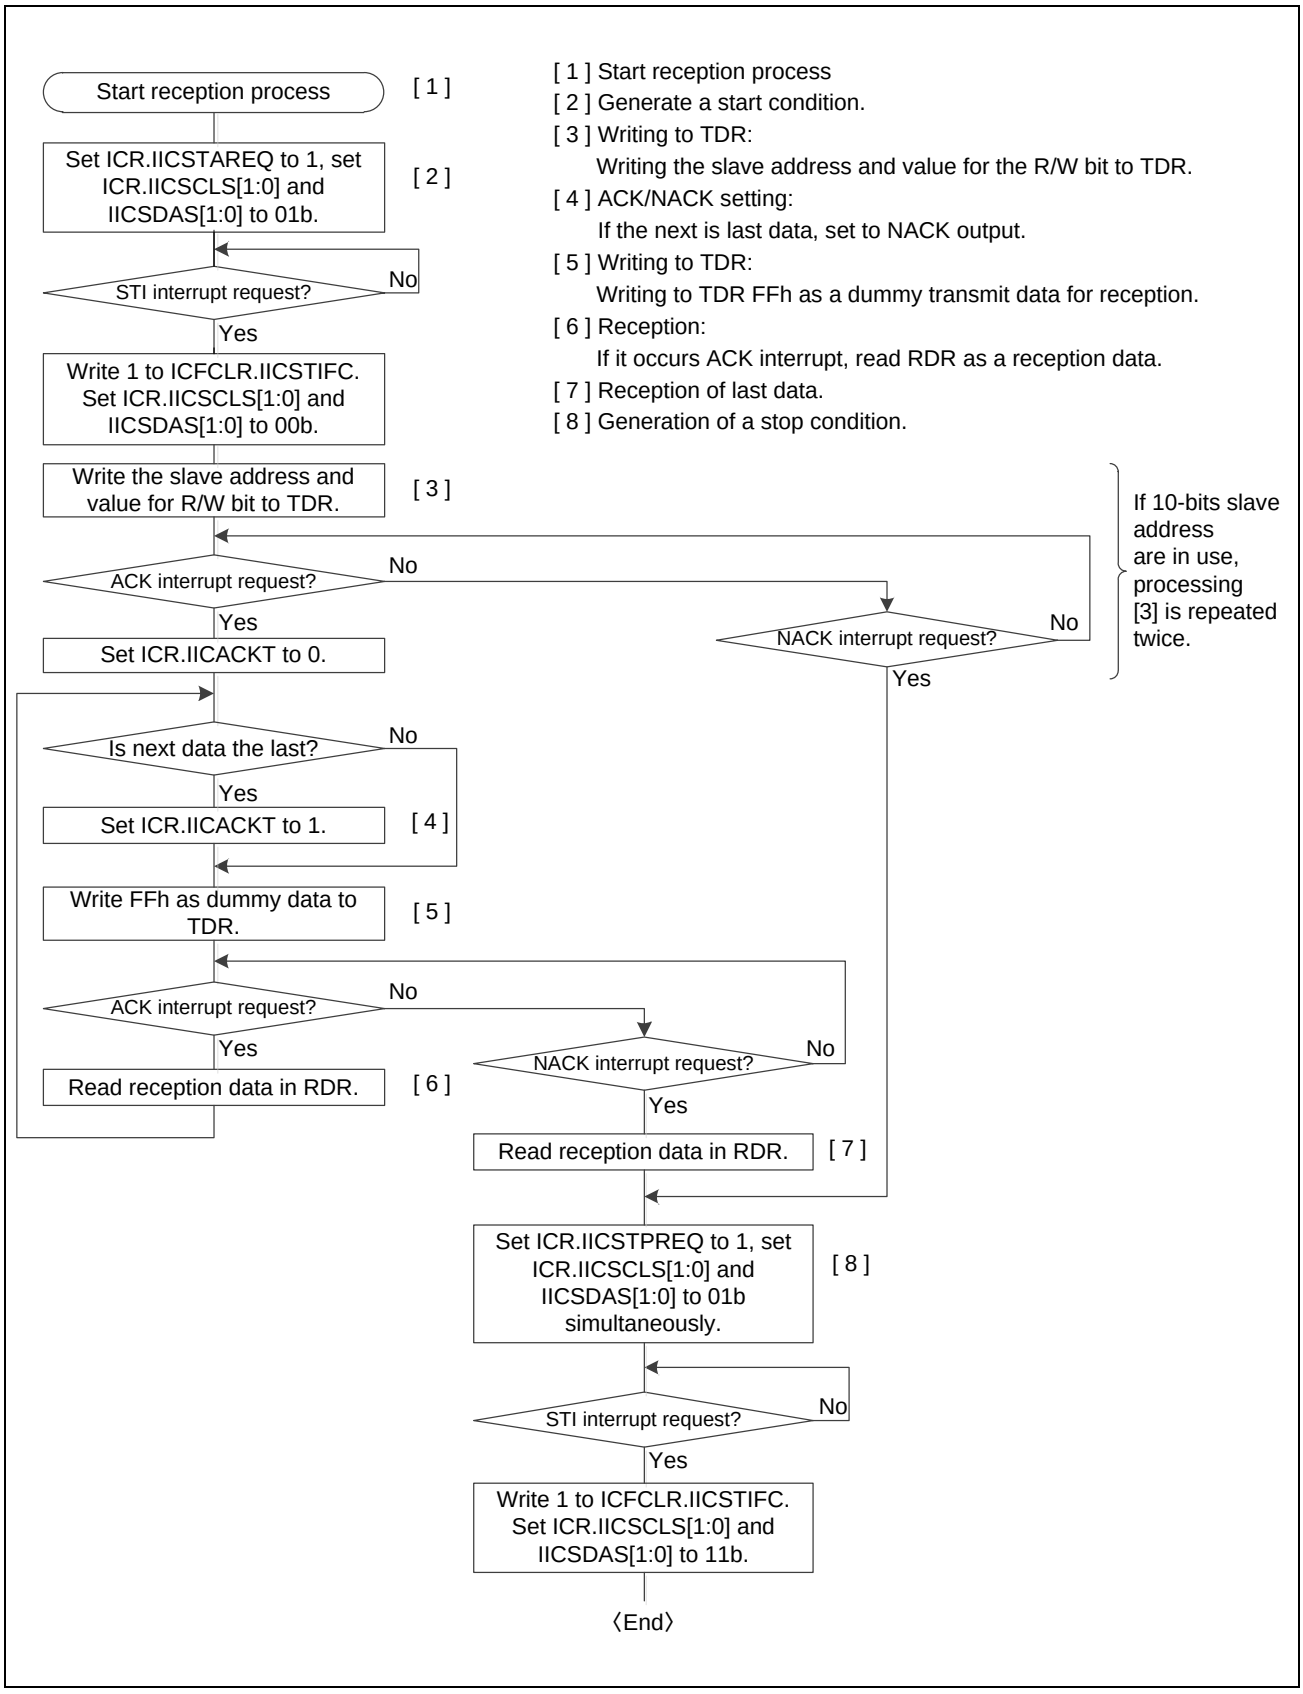
[5] Step for continuing with reception:
To proceed with reception, write FFh as dummy transmit data to TDR. Other than in the first and last rounds of transmission, a TXI request can activate DMAC to handle writing of data to TDR. Furthermore, except of the last data to be received, a RXI request can activate DMAC to handle reading of data from RDR.

[6] NACK is transmitted in response to the last data.

[7] Generation of a stop condition.

Note: In simple I2C mode, the TXI interrupt request is generated when communication is completed.

Figure 7.3-79 Example of the Procedure for Master Reception Operations in Simple I2C Mode (when ICR.IICINTM is 1b, and Transmission Interrupts and Reception Interrupts are in Use.)



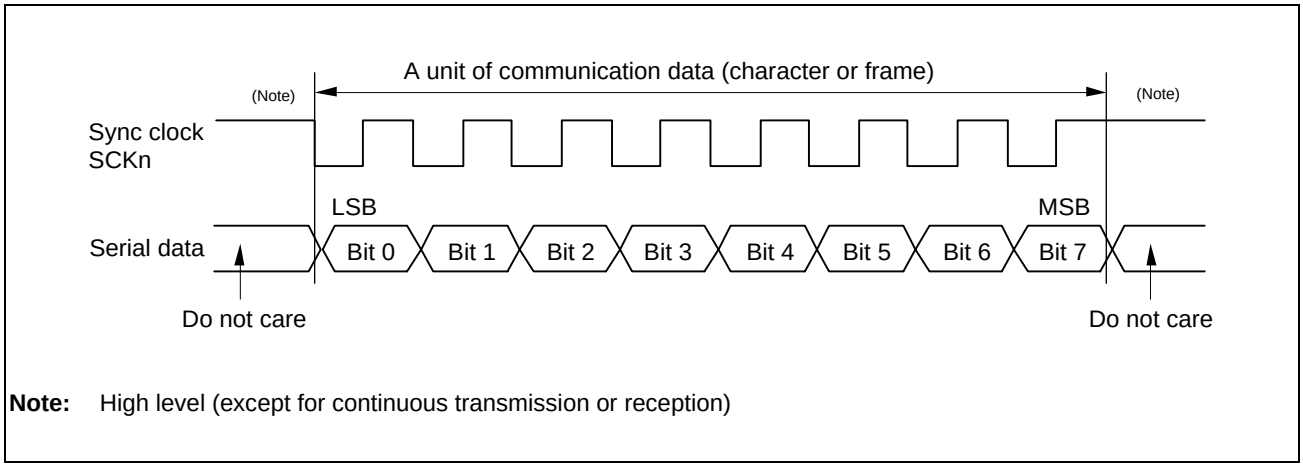


Figure 7.3-80 Example of the Procedure for Master Reception Operations in Simple I2C Mode (when ICR.IICINTM is 0b, and ACK Interrupts and NACK Interrupts are in Use.)

7.3.8 Clock Synchronous Mode

Figure 7.3-81 shows the communication data format of clock synchronous serial communication.

In clock synchronous mode, data is transmitted and received in synchronization with clock pulses. A communication data character consists of 8-bit data. In clock synchronous mode, no parity bit can be added. In data transmission when CPHA = 1b and CPOL = 1b, the SCI outputs data from the falling edge of the sync clock until the next falling edge. In data reception, data is read at the rising edges of the sync clock. After 8-bit data is output, the communication line holds the final-bit output state. In slave communication when CPHA = 0b, however, the communication line holds the first-bit output state.

Because the SCI has an internal transmitter and a receiver independently, SCI enable full-duplex communication by sharing a communication clock of the transmitter and the receiver. Furthermore, because both the transmitter and the receiver have a double- buffer structure, continuous transmission and reception are possible by writing the next transmit data during transmission and reading the previous receive data during reception.

Note: High level (except for continuous transmission or reception)

Figure 7.3-81 Data Format of Clock Synchronous Serial Communication (LSB First, CPHA = 1b, CPOL = 1b)

7.3.8.1 Clock

(1) When the internal clock is selected

When the CCR3.CKE[1:0] bits are set to 00b or 01b (master mode), the internal clock generated by the baud rate generator can be selected and the sync clock is output from the SCKm pin. Eight pulses of the sync clock are output during single- character transmission/reception. The sync clock remains at a high level*[1] while no transmission or reception is performed. In transmission-only or transmission/reception, the sync clock is not output unless transmit data is prepared.

When the internal clock is selected, the clock with a delay from the SCKm signal is used for the master reception sampling clock. This ensures the data setup time and hold time for high-speed communication.

Note 1. When CCR3.CPOL = 1b, the sync clock stops at a high level. When CCR3.CPOL = 0b, the sync clock stops at a low level.

(2) When the external clock is selected

When the CCR3.CKE[1:0] bits are set to 10b or 11b (slave mode), data is transmitted and received using the external clock that is input from the SCKm pin.

7.3.8.2 CTS and RTS Functions

The CTS function performs transmission/reception and controls transmission start using the CTSn# pin input when the internal clock is selected. Setting the CCR1.CTSE bit to 1b enables the CTS function. Two settings are possible for the CTS/RTS pin: dual setting for using either function with a single pin, and dedicated setting for using each function simultaneously with two pins. The CCR1.CTSPEN register is used for these settings.

When the CTS function is enabled, transmission/reception and transmission start only when the CTSn# pin input level is low. Even if the CTSn# pin input becomes high level during transmission/reception or transmission operation, frames that are being transmitted/received or being transmitted are not affected and transmission/reception or transmission operation continues.

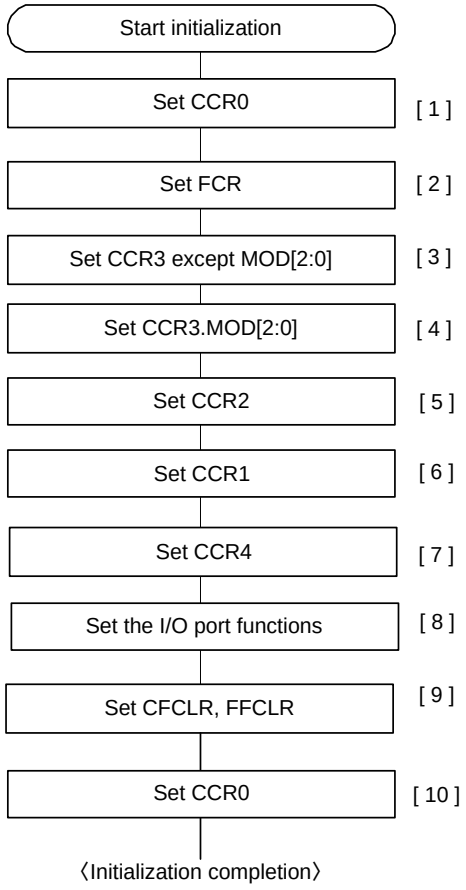
The RTS function makes a serial communication start request using the RTSn# pin output when the external sync clock is selected. When serial communication is enabled, the RTSn# pin outputs a low level. A low level and a high level are output under the following conditions.

[Conditions for low level]

1. When a non-FIFO buffer is selected, all the following conditions are met.
   - CCR0.RE bit or TE bit = 1b
   - Serial communication is enabled.
   - No receive data is present before reading. (when CCR0.RE bit = 1b)
   - Data before transmission start is remaining in the TSR register. (when CCR0.TE bit = 1b)
   - CSR.ORER flag = 0b
2. When a FIFO buffer is selected, all the following conditions are met.
   - CCR0.RE bit or TE bit = 1b
   - Serial communication is enabled
   - The number of receive data stored in the receive FIFO (RDR register) is less than the value set in FCR.RSTRG[4:0]. (when CCR0.RE bit = 1b)
   - Unsent data is remaining in the transmit FIFO (TDR register). (when CCR0.TE bit = 1b and CCR3.CKE[1] bit = 0b)
   - Data before transmission start is remaining in the TSR register. (when CCR0.TE bit = 1b and CCR3.CKE[1] bit = 1b)
   - ORER (RDR.ORER) flag = 0b

[Conditions for high level]

1. When a non-FIFO buffer is selected If conditions for low level are not met:
   When CCR0.RE is set to 0b without reading the RDR register to terminate reception after reception is complete, the RTSn# pin output level remains high. At this time, write 0b to CCR0.RE.
2. When a FIFO buffer is selected
   If conditions for low level are not met:



7.3.8.3 Initializing the SCI (Clock Synchronous Mode)

Before starting data transmission/reception, write 0b to CCR0.TE and CCR0.RE (or write initial values to the CCR0 register) and initialize the SCI according to the flowchart example in **Figure 7.3-82**.

Before changing operating mode or communication format, also be sure to write 0b to CCR0.TE and CCR0.RE.

Note that writing 0b to the RE bit does not initialize the ORER, FER, PER, and RDRF flags in CSR and the RDR register. Also note that writing 0b to the TE bit does not initialize the TEND flag when a FIFO buffer is selected. Attention is also needed for changing operating mode.

When CCR0.TIE = 1b, note that setting the TE bit to 1b from 0b generates a TXI interrupt.

[1] Set the following bits of CCR0 to 0*1.
TEIE, TIE, RIE, TE, RE
If you have not changed from the initial settings, you can skip this step.

[2] Set the TFRST and RFRST to 1 to empty FIFO.
Set the TTRG[4:0], RTRG[4:0], and RSTRG[4:0] bits.

[3] Set CCR3 except of communication mode.
FIFO use / no-use
Transmission / reception format
Clock setting
Leave unused bits (CHR[1:0], STP, RXDESEL, MP, DE, ACS0,GM,BLK) at their initial values.

[4] Set communication mode (MOD[2:0] = 010b)*2.

[5] Select clock, set bit rate*3. Leave unused bits (BCP[2:0], ABCS, ABCSE) at their initial values.

[6] Set up the loop-back function, communication terminal status, and the CTS/RTS function.

[7] Set up the adjust sampling timing function.
Leave unused bits (CMPD[8:0], ATEN, ATT[2:0], AET) at their initial values.

[8] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, SCKn, CTS#, and RTSn# pins.

[9] Write 1 to the following bits and clear the corresponding flag.
CFCLR.RDRFC, FERC, PERC, MFFC, ORERC, DFERC, DPERC, DCMFC, ERSC
FFCLR.DRC

[10] Set the TE or RE bit to 1.*1,*4 To enable interrupts, set the TE bit and TIE bit, and the RE bit and RIE bit to 1 with one instruction at the same time.
Setting the TE and RE bits allows TXDn and RXDn to be used.

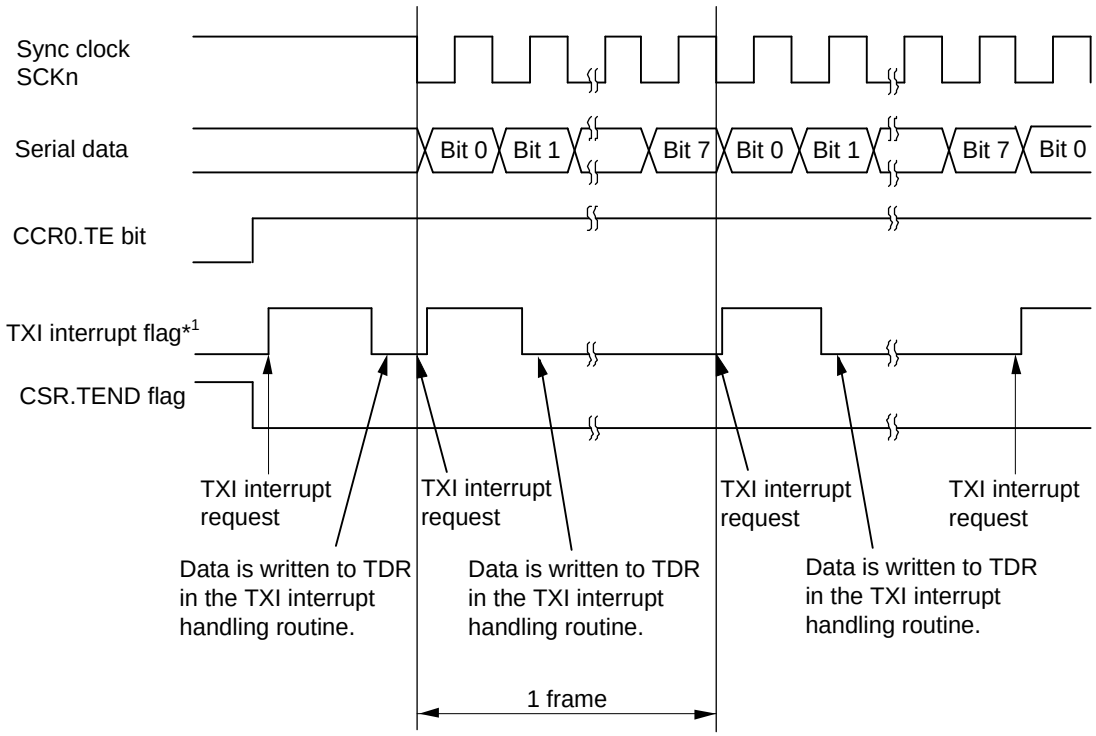
Note 1. In simultaneous transmit and receive operations, the TE and RE bits in CCR0 should both be to 0b or set to 1b simultaneously.

Note 2. Set CPOL and CPHA before setting the Communication mode.

Note 3. If you use an external clock, you do not need to set it.

Note 4. When using the internal clock (master), the setting of reception only is prohibited.

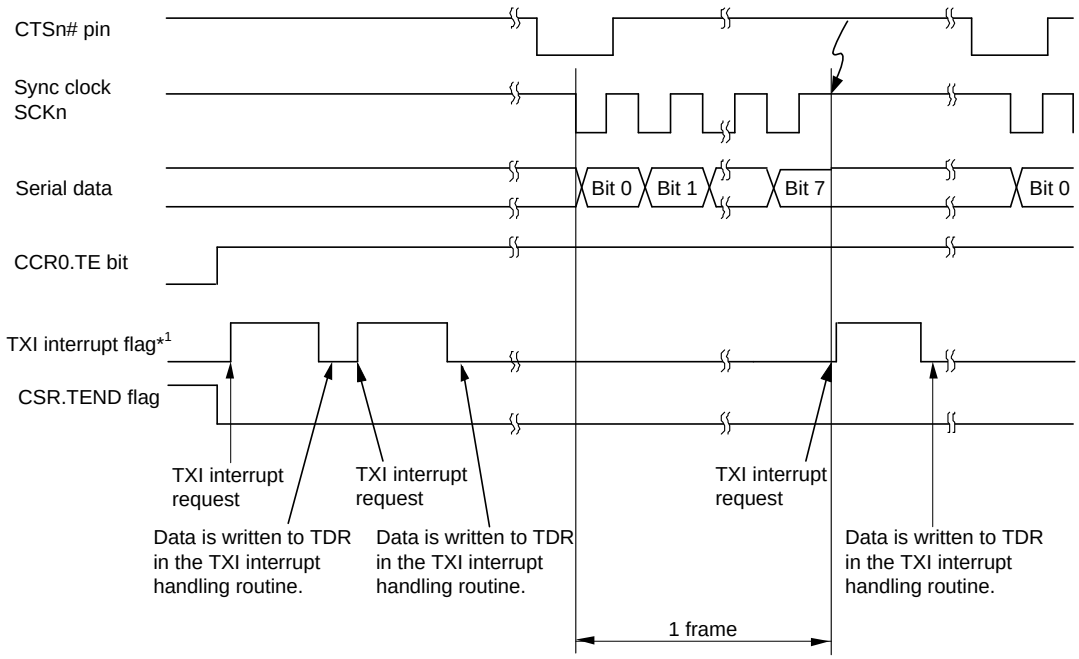
Figure 7.3-82 SCI Initialization Flowchart Example (Clock Synchronous Mode)



7.3.8.4 Serial Data Transmission (Clock Synchronous Mode)

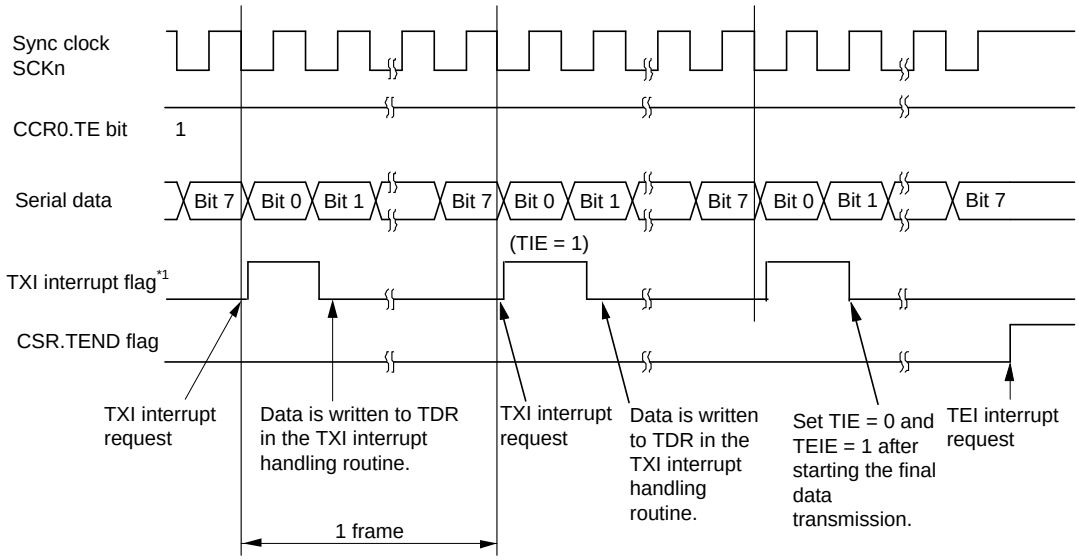
(1) Non-FIFO selected

Figure 7.3-83, **Figure 7.3-84**, and **Figure 7.3-85** show operation examples of serial transmission in clock synchronous mode. The SCI operates as follows during serial data transmission.



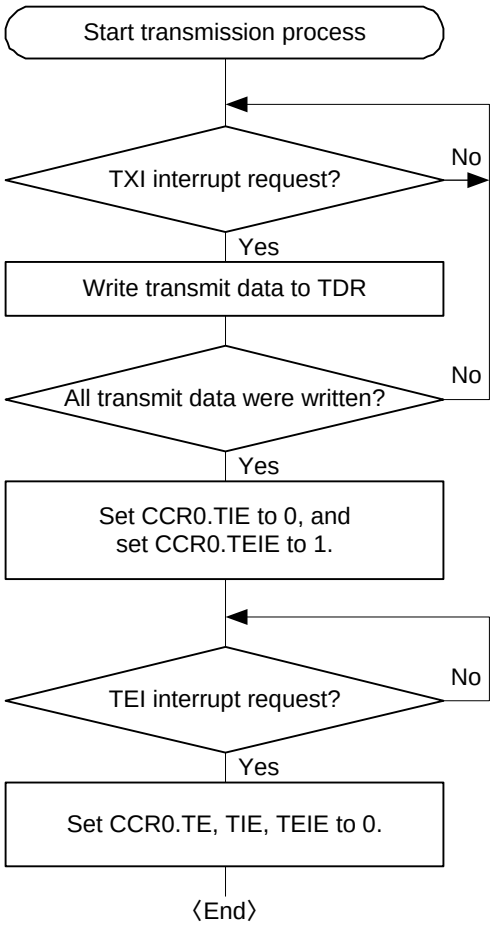
1. When data is written to the TDR register in the TXI interrupt routine, the SCI transfers the data from the TDR register to the TSR register. When starting data transmission, set the CCR0.TIE bit and the CCR0.TE bit to 1b simultaneously by a single instruction. Then a TXI interrupt request is generated.
2. The written data is transferred from the TDR register to the TSR register, which starts transmission. When the CCR0.TIE bit is set to 1b at this time, a TXI interrupt request is generated. Writing the next transmit data to the TDR register before transmission of data transferred previously in the TXI interrupt routine is complete enables continuous transmission. When a TEI interrupt request is used, after the final transmit data is written to the TDR register in the TXI interrupt request processing routine and the final data's transmission is started, set 0b to the CCR0.TIE bit and set 1b to the TEIE bit.
3. The TXDn pin outputs 8-bit data in synchronization with the output clock (in clock output mode) or with the input clock (when external clock is selected). When the CCR1.CTSE bit = 1b (CTS function enabled), the output clock starts after the CTS signal input becomes low level.
4. Update (data write) of the TDR register is checked at the final-bit transmission timing.
5. When the TDR register has been updated, data is transferred from the TDR register to the TSR register to start sending the next frame.
6. If the TDR register has not been updated, the CSR.TEND flag is set to 1b and the final-bit output state is retained. When the CCR0.TEIE bit is set to 1b at this time, a TEI interrupt request is generated. The SCKm pin is held high.

Figure 7.3-86 shows an example of data transmission flowchart.



Note 1. For corresponding interrupt source numbers, see **4.6 Interrupt Controller**.

Figure 7.3-83 Serial Transmission Example in Clock Synchronous Mode (1) (CTS Function Not Used/Transmission Start/CPHA = 1b, CPOL = 1b)



Note 1. For corresponding interrupt source numbers, see **4.6 Interrupt Controller**.

Figure 7.3-84 Serial Transmission Example in Clock Synchronous Mode (2) (CTS Function Used/Transmission Start/CPHA = 1b, CPOL = 1b)

Note 1. For corresponding interrupt source numbers, see **4.6 Interrupt Controller**.

Figure 7.3-85 Serial Transmission Example in Clock Synchronous Mode (3) (during Transmission to Transmission End/CPHA = 1b, CPOL = 1b)

[1] Start transmission process

[2] Write transmit data to TDR by using TXI:
The transmit-data-empty-interrupt (TXI) is generated when transmission-data forwards to TSR from TDR.
Write transmit data to TDR once by using a TXI.

[3] Serial transmission continuation procedure:
To continue serial transmission write transmit data to TDR by using a TXI.
Transmit data can also be written by activating the DMAC.
If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR.

Note: When the external clock is in use (the value of the CKE[1:0] is 10b or 11b), the rising edge on the SCK pin for the last bit sets the TEND flag to 1b. Setting TE to 0b immediately after this, then it may lead to insufficient received data hold time on the receiver side.

Figure 7.3-86 Serial Transmission Flowchart Example in Clock Synchronous Mode (Non-FIFO Selected)

(2) FIFO selected

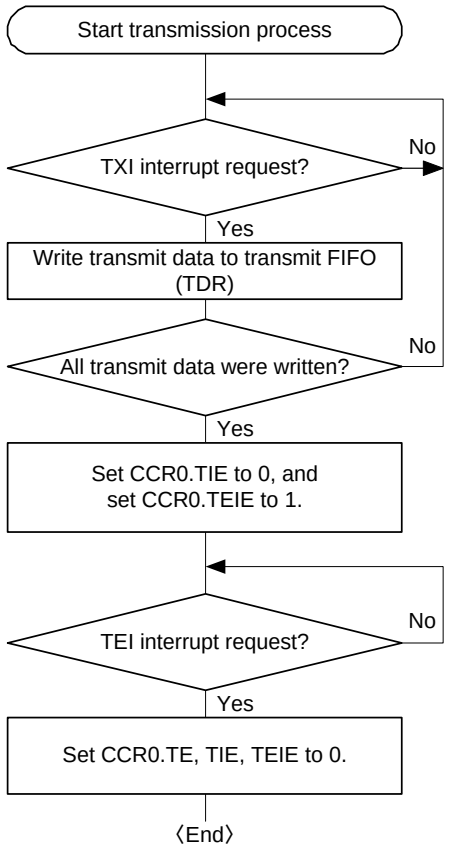


Figure 7.3-87 shows an example of flowchart of serial transmission (a FIFO buffer selected) in clock synchronous mode. The SCI operates as follows when serial data transmission.

1. When data is written to the transmit FIFO (TDR register) in the TXI interrupt routine, the SCI transfers the data from the transmit FIFO (TDR register) to the TSR register. The number of writable transmit data is [NFIFO (= 32) - number of unsent transmit data stored in the transmit FIFO (TDR register)]. In addition, when starting data transmission, set the CCR0.TIE bit and the CCR0.TE bit to 1b simultaneously by a single instruction. Then a TXI interrupt request is generated.
2. Data is transferred from the transmit FIFO (TDR register) to the TSR register and transmission starts. When the number of data stored in the transmit FIFO (TDR register) is equal to or less than the threshold value of the transmit FIFO, the CSR.TDRE flag is set to 1b. When the CCR0.TIE bit is set to 1b at this time, a TXI interrupt request is generated. Writing the next transmit data to the transmit FIFO (TDR register) in the TXI interrupt routine before transmission of data written to the transmit FIFO (TDR register) is complete enables continuous

transmission. When a TEI interrupt request is used, after the final transmit data is written to the transmit FIFO (TDR register) in the TXI interrupt request processing routine, set 0b to the CCR0.TIE bit and set 1b to the TEIE bit.

3. The TXDn pin outputs 8-bit data in synchronization with the output clock (in clock output mode) or with the input clock (when external clock is selected). When CCR1.CTSE = 1b (CTS function enabled), the output clock starts after the CTS signal input becomes low level.
4. The SCI checks whether unsent transmit data is remaining in the transmit FIFO (TDR register)*1 at the final-bit transmission timing.
5. When data is remaining in the transmit FIFO (TDR register), the data is transferred from the transmit FIFO (TDR register) to the TSR register to start sending the next frame.
6. If no data is remaining in the transmit FIFO (TDR register), the CSR.TEND flag is set to 1b and the final-bit output state is retained. When the CCR0.TEIE bit is set to 1b at this time, a TEI interrupt request is generated. The SCKm pin is held high.

Note 1. The number of unsent transmit data stored in the TDR register (transmit FIFO) can be monitored by reading the FTSR.T[5:0] bits.

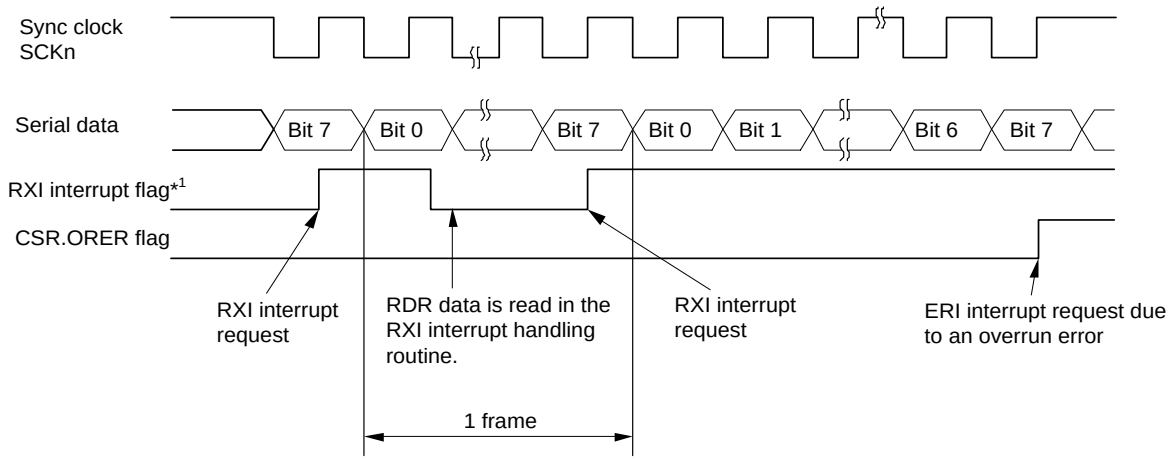
[1] Start transmission process

[2] Write transmit data to transmit FIFO (TDR) by using TXI:
The transmit-data-empty-interrupt (TXI) is generated when transmission-data forwards to TSR from the transmit FIFO (TDR) and the number of transmit-data written in the transmit FIFO is equal to or less than the transmit FIFO threshold.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to the transmit FIFO (TDR) by using a TXI interrupt and clear TDRE flag to 0.
The number of transmission data it's possible to write in is N_{FIFO} (= 32) - (the number of stored transmit FIFO data).
Transmit data can also be written to the transmit FIFO (TDR) by activating the DMAC. In this case, the TDRE flag is cleared automatically, so please do not operate the TDRE flag.
If you use TEI, set TIE = 0 and TEIE = 1 after writing the last-transmit-data to TDR.

Note: When the external clock is in use (the value of the CKE[1:0] is 10b or 11b), the rising edge on the SCK pin for the last bit sets the TEND flag to 1b. Setting TE to 0b immediately after this, then it may lead to insufficient received data hold time on the receiver side.

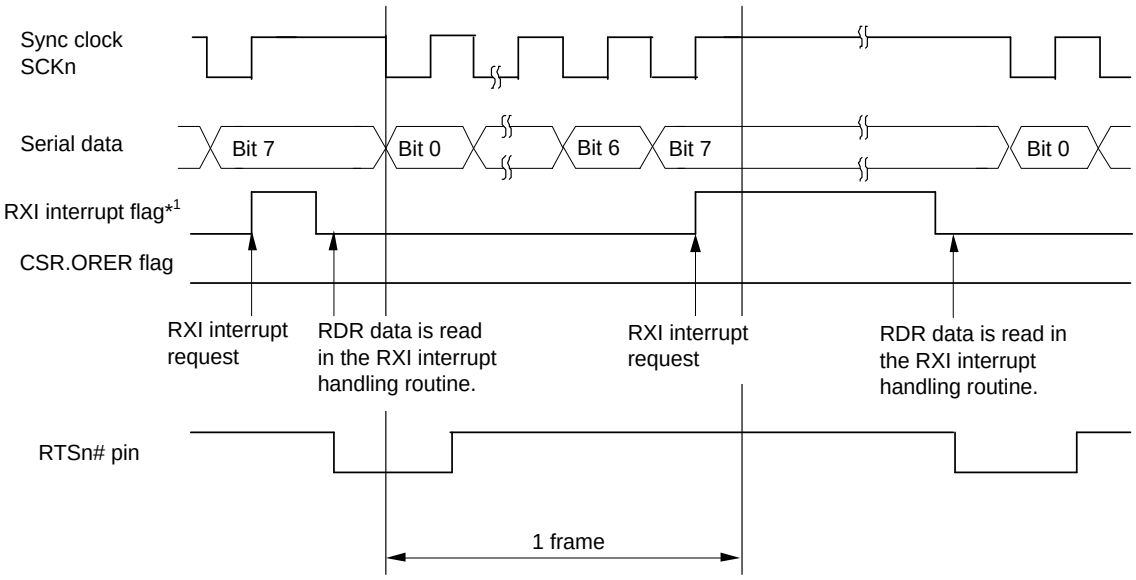
Figure 7.3-87 Serial Transmission Flowchart Example in Clock Synchronous Mode (FIFO Buffer Selected)



7.3.8.5 Serial Data Reception (Clock Synchronous Mode)

(1) Non-FIFO selected

Figure 7.3-88 and **Figure 7.3-89** show operation examples of serial data reception in clock synchronous mode.

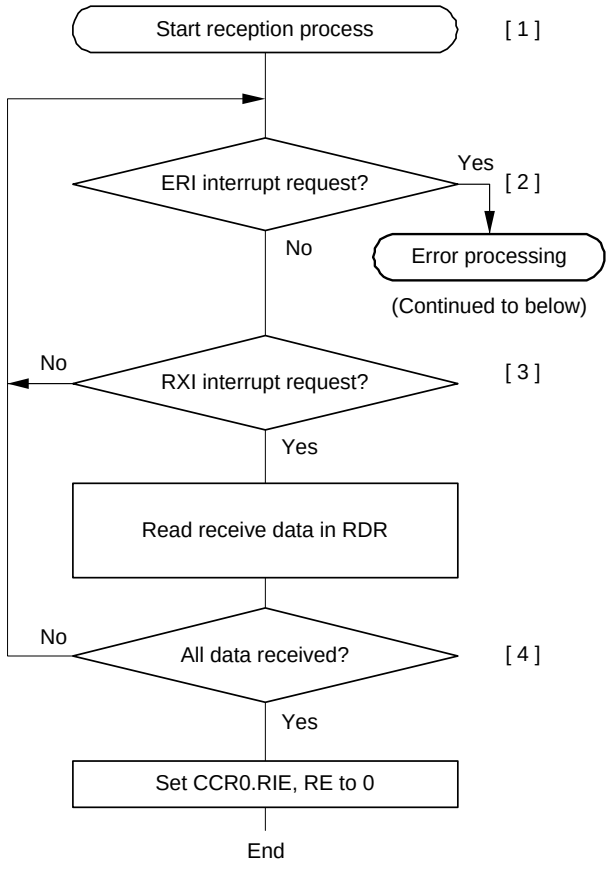


The SCI operates as follows during serial data reception. Reception-only operation is possible only in slave mode. (In master mode, reception-only operation is prohibited.)

1. When the CCR0.RE bit is set to 1b, the RTSn# pin output becomes low level (when the RTS function is used).
2. The SCI starts data reception in synchronization with input or output of the sync clock, and transfers receive data to the RSR register.
3. When an overrun error occurs, the CSR.ORER flag is set to 1b. When the CCR0.RIE bit = 1b at this time, an ERI interrupt request is generated and the received data is not transferred to the RDR register.
4. When data is normally received, the received data is transferred to the RDR register. When the RIE bit = 1b at this time, an RXI interrupt request is generated. Reading the received data transferred to the RDR register in the RXI interrupt handling routine before the next data is completely received enables continuous reception. When the received data transferred to the RDR register is read, the RTSn# pin output becomes low level (when the RTS function is used).
   If you want to prevent the RTSn# pin output from turning low level after the final data is received, clear the CCR0.RE bit to 0b and then read the RDR register.

Note 1. For corresponding interrupt source numbers, see **4.6 Interrupt Controller**.

Figure 7.3-88 Serial Data Reception Example in Clock Synchronous Mode (1) (RTS Function Not Used/CPHA = 1b, CPOL = 1b)

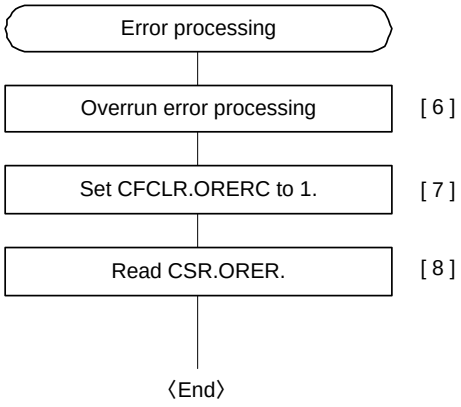


Note 1. For corresponding interrupt source numbers, see **4.6 Interrupt Controller**.

Figure 7.3-89 Serial Data Reception Example in Clock Synchronous Mode (2) (RTS Function Used/CPHA = 1b, CPOL = 1b)

While the reception error flag is set to 1b, subsequent reception is disabled. Therefore, before continuing reception, be sure to clear the ORER flag in CSR to 0b. Also be sure to read the RDR register in the overrun error processing. If the CCR0.RE bit is set to 0b during reception to forcibly terminate the reception operation, unread receive data may be remaining in the RDR register. In this case, read the RDR register.

Figure 7.3-90 shows an example of serial data reception flowchart.



[1] Start reception process

[2] Receive error processing:
If a receive error occurs, after performing the appropriate error processing, be sure to ORER is 0. Reception cannot be resumed if ORER is 1.

[3] Read the receive data in RDR once in the RXI interrupt handling routine.

[4] Serial reception continuation procedure:
To continue serial reception, before the MSB bit (bit 7) of the current frame is received, read data from RDR in the RXI interrupt handling routine. The RDR data can also be read by activating the DMAC.

[6] Overrun error processing:
Read RDR.

[7] Clear the error flag:
Set the flag clear bit corresponding to the reception error to 1. Done this step and step [6], the next frame can be received normally.

[8] Confirming that the error flag is cleared:
Confirm all error flags are cleared.

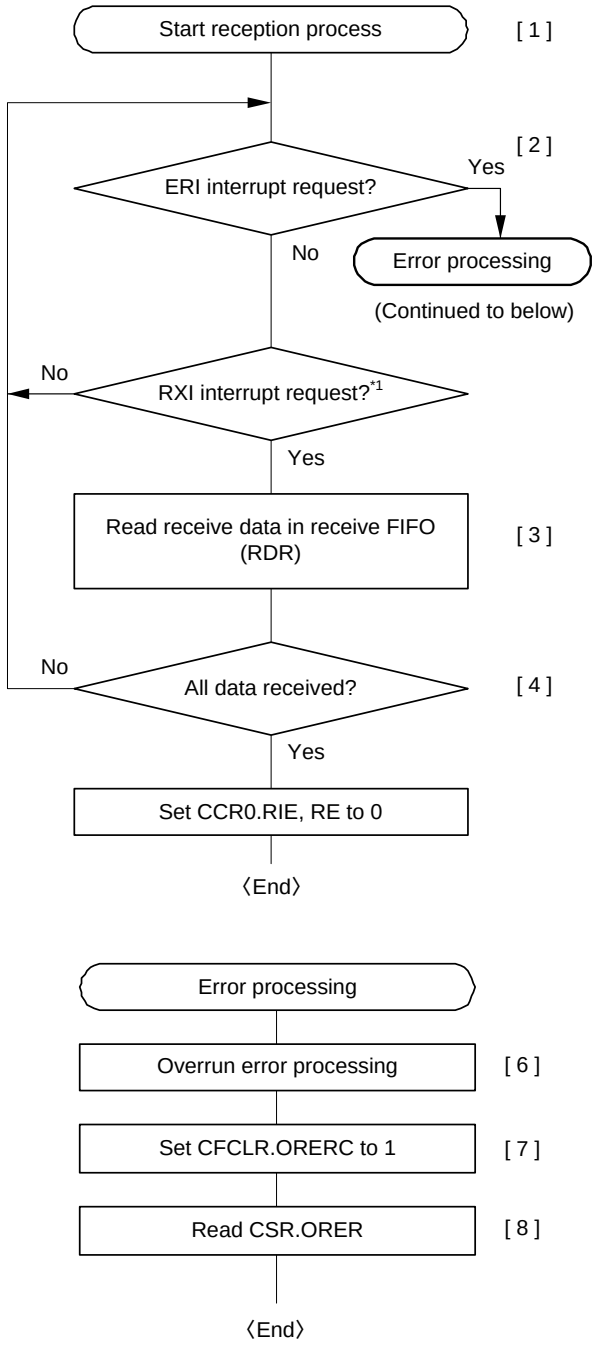


Figure 7.3-90 Sample Flowchart for Serial Reception in Clock Synchronous Mode (Non-FIFO Selected)

(2) FIFO selected

Figure 7.3-91 shows an example of serial data reception flowchart (a FIFO buffer selected) in clock synchronous mode. The SCI operates as follows during serial data reception. Reception-only operation is possible only in slave mode. (In master mode, reception-only operation is prohibited.)

1. When the CCR0.RE bit is set to 1b, the RTSn# pin output turns low level (when the RTS function is used).
2. The SCI starts receiving data in synchronization with input or output of the sync clock and transfers the received data to the receive FIFO (RDR register).
3. When an overrun error occurs, the CSR.ORER flag is set to 1b. When the CCR0.RIE bit = 1b at this time, an ERI interrupt request is generated and the received data is not transferred to the receive FIFO (RDR register)*1.
4. When data is normally received, the received data is transferred to the receive FIFO (RDR register)*1. When the number of receive data stored in the receive FIFO (RDR register) is equal to or more than the threshold value of the receive FIFO, the CSR.RDRF flag is set to 1b. When the RIE bit = 1b at this time, an RXI interrupt request is generated. Reading the received data transferred to the receive FIFO (RDR register) in the RXI interrupt handling routine before an overrun error occurs enables continuous reception. When the received data transferred to the receive FIFO (RDR register) is read and the number of data becomes lower than the RTS# output threshold value, the RTSn# pin output becomes low level (when the RTS function is used).

Note 1. The RDR.RDAT[8] bit is not used.

[1] Start reception process

[2] Receive error processing:
If a receive error occurs, after performing the appropriate error processing, be sure to ORER is 0. Reception cannot be resumed if ORER is 1.

[3] Read the receive data in the receive FIFO (RDR) in the RXI interrupt handling routine. The reception data stored in the receive FIFO (RDR) is read until the number of stored data will be below the FCR.RTRG value at least. You can confirm the number of the reception data in the FIFO by FRSR.R[5:0].

[4] Serial reception continuation procedure:
To continue serial reception, before the overrun error occurs, read data from RDR and clear RDRF flag to 0. The RDR data can also be read by activating the DMAC. In this case, the RDRF flag is cleared automatically, so please do not operate the RDRF flag.

Note 1. Set all received data to an integer multiple of the receive FIFO threshold. If it is not an integral multiple, return to step [2] and it will become an infinite loop, so set a timeout time separately using a timer etc.

[6] Overrun error processing:
Read RDR.

[7] Clear the error flag:
Set the flag clear bit corresponding to the reception error to 1. Done this step and step [6], the next frame can be received normally.

[8] Confirming that the error flag is cleared:
Confirm all error flags are cleared.

Figure 7.3-91 Example of Serial Reception in Clock Synchronous Mode (FIFO Selected)

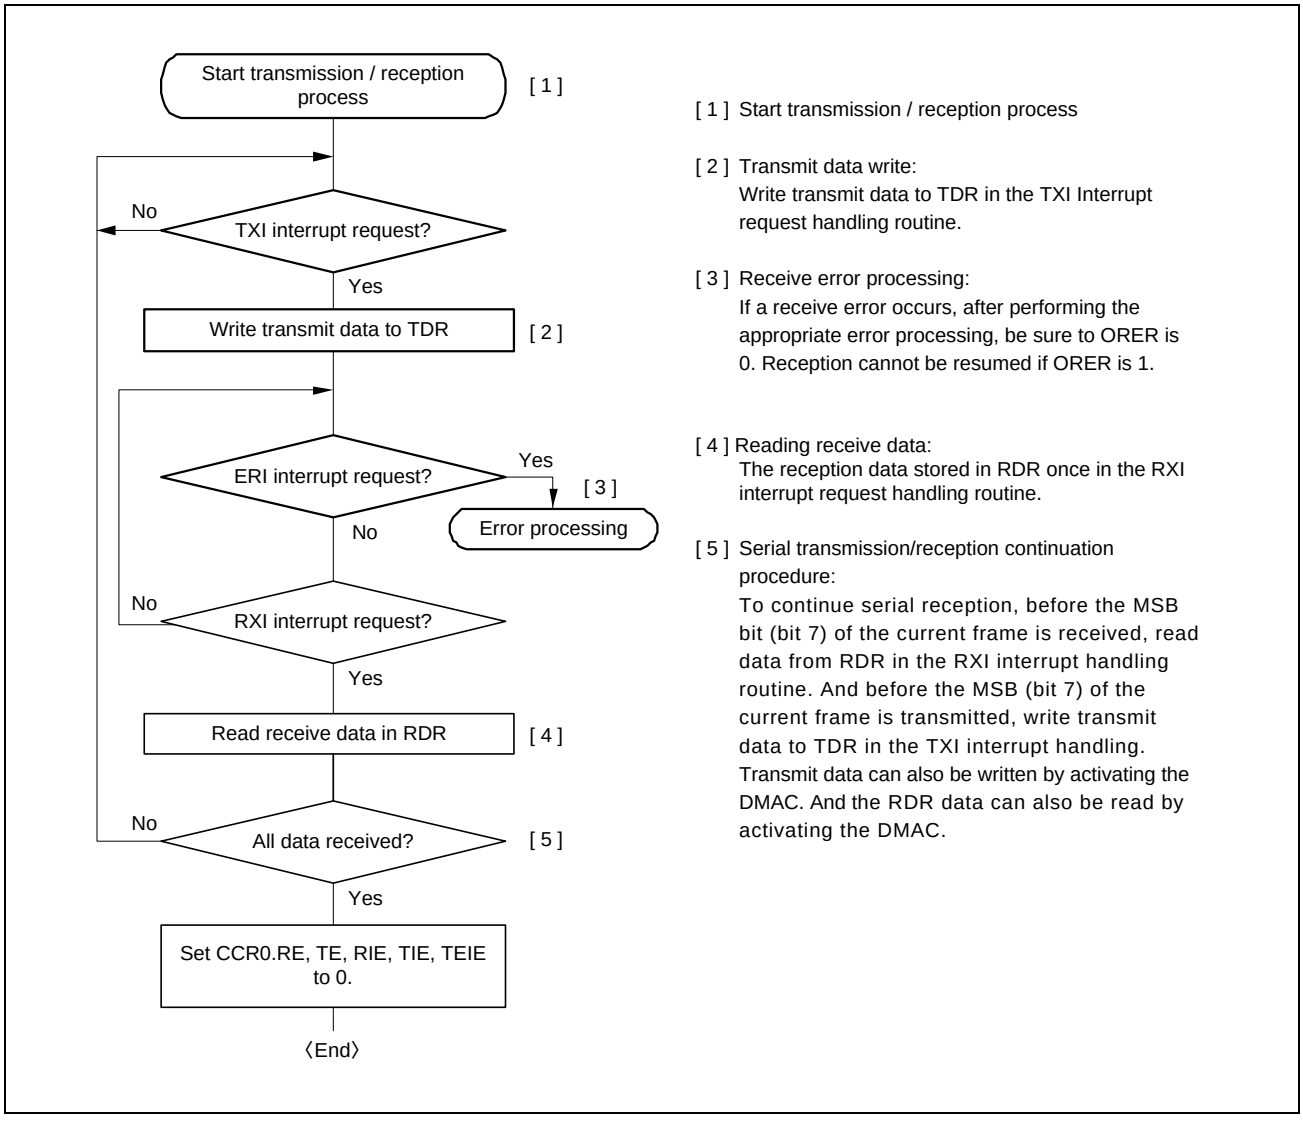
7.3.8.6 Serial Data Transmission and Reception (Clock Synchronous Mode)

(1) Non-FIFO selected

Figure 7.3-92 shows an example of serial data concurrent transmission/reception flowchart in clock synchronous mode. After the SCI is initialized, perform the following procedure for serial data concurrent transmission/reception. When switching mode from transmission to concurrent transmission/reception, check that the CSR.TEND flag is set to 1b to ensure that the SCI is in the transmission complete state. Then set CCR0.TE = 0b and RE = 0b and then set the TE, RE, TIE, and RIE bits in CCR0 to 1b simultaneously by a single instruction.

When switching mode from reception to concurrent transmission/reception, check that the SCI is in the reception complete state, and then set CCR0.TE = 0b and RE = 0b. After that, check that the error flags (ORER, FER, and PER) in CSR are cleared to 0b, and then set the TE, RE, TIE, and RIE bits in CCR0 to 1b simultaneously by a single instruction.

When the RTS function is used in the concurrent transmission/reception operation, if you want to prevent the RTSn# pin output from turning to low after the final data is received as in the reception operation, clear the RE and TE bits in CCR0 to 0b simultaneously, and then read the RDR register.



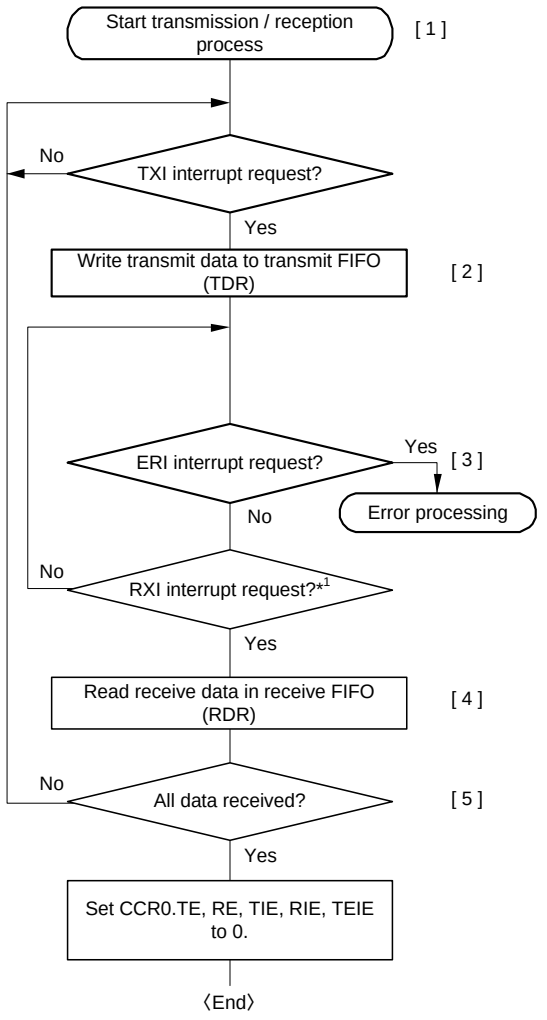


Figure 7.3-92 Serial Data Concurrent Transmission/Reception Flowchart Example in Clock Synchronous Mode (Non-FIFO Selected)

(2) FIFO selected

Figure 7.3-93 shows an example of serial data concurrent transmission/reception flowchart (a FIFO buffer selected) in clock synchronous mode.

After the SCI is initialized, perform the following procedure for serial data concurrent transmission/reception. When switching mode from transmission to concurrent transmission/reception, check that the CSR.TEND flag is set to 1b to ensure that the SCI is in the transmission complete state. Then set CCR0.TE = 0b and RE = 0b and then set the TE, RE, TIE, and RIE bits in CCR0 to 1b simultaneously by a single instruction.

When switching mode from reception to concurrent transmission/reception, check that the SCI is in the reception complete state, and then set CCR0.TE = 0b and RE = 0b. After that, check that the error flags (ORER, FER, and PER) in CSR are cleared to 0b, and then set the TE, RE, TIE, and RIE bits in CCR0 to 1b simultaneously by a single instruction.

[1] Start transmission / reception process

[2] Transmit data write:
Write transmit data to transmit FIFO (TDR) in the TXI Interrupt request handling routine.
The number of transmission data it's possible to write in is N_{FIFO} (= 32) - (the number of stored transmit FIFO data).

[3] Receive error processing:
If a receive error occurs, after performing the appropriate error processing, be sure to ORER is 0. Reception cannot be resumed if ORER is 1.

[4] Read receive data:
Read the receive data in the receive FIFO (RDR) in the RXI interrupt handling routine. The reception data stored in the receive FIFO (RDR) is read until the number of stored data will be below the FCR.RTRG value at least. You can confirm the number of the reception data in the FIFO by FRSR.R[5:0].

[5] Serial transmission/reception continuation procedure:
To continue serial reception, before the overrun error occurs, read data from RDR and clear CSR.RDRF.
To continue serial transmission, write transmit data to the transmit FIFO (TDR) by using a TXI interrupt and clear TDRE flag to 0.
Transmit data can also be written to the transmit FIFO (TDR) by activating the DMAC. And The RDR data can also be read by activating the DMAC. In this case, the TDRE and RDRF are cleared automatically, so please do not operate the TDRE and RDRF.

Note 1. Set all received data to an integer multiple of the receive FIFO threshold. If it is not an integral multiple, return to step [2] and it will become an infinite loop, so set a timeout time separately using a timer etc.

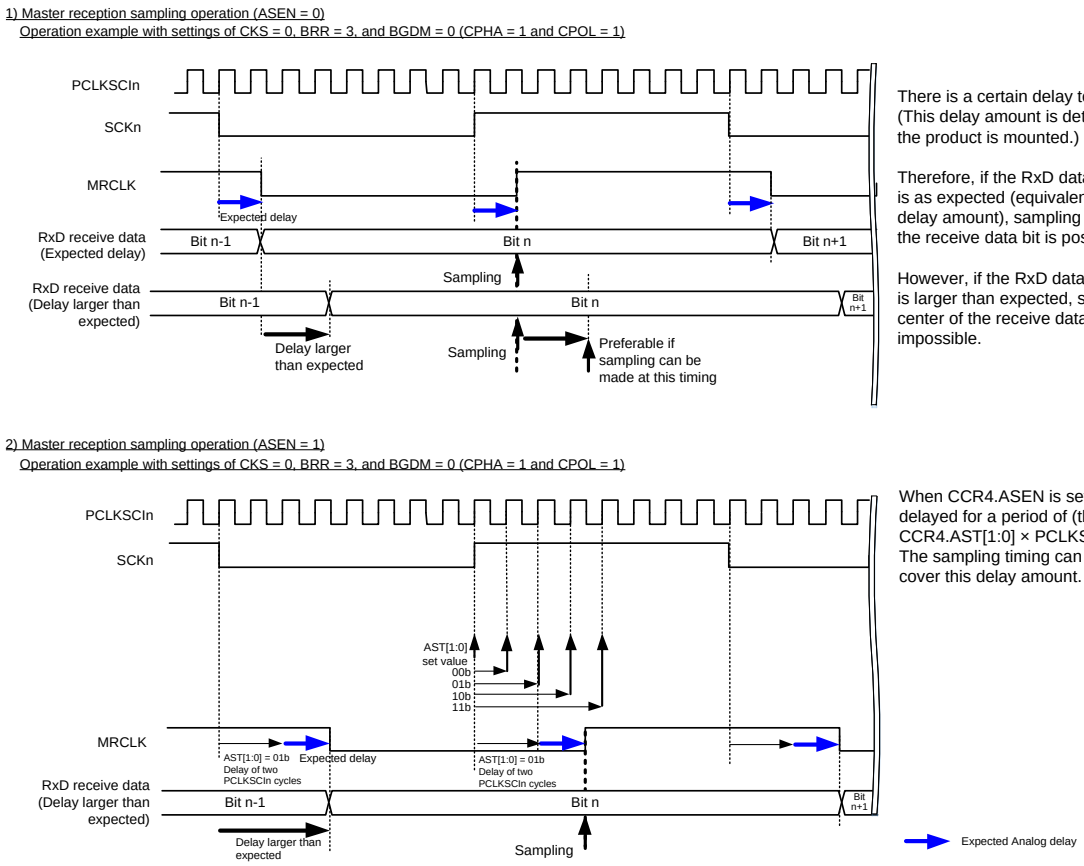

Figure 7.3-93 Serial Data Concurrent Transmission/Reception Flowchart Example in Clock Synchronous Mode (FIFO Selected)

7.3.8.7 Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with Internal Clock Used

When the clock synchronous internal clock is used (master mode), MRCLK is used as a reception sampling clock.

This function adjusts the reception sampling timing by delaying MRCLK by 1 to 4 RSCI_m_TCLK and adding a digital delay.

Setting the CCR4.ASEN bit to 1b enables this function. The delay value is set in CCR4.AST[1:0].

Note: This timing chart illustrates the reception sampling timing adjustment function.

Figure 7.3-94 Reception Sampling Timing Adjustment Operation in Clock Synchronous Mode (Master)

7.3.9 Simple-SPI Mode

As an extended function of the SCI, the SCI supports Simple-SPI (4-wire serial bus) mode that allows communication from one or more master devices to multiple slave devices.

Simple-SPI mode is enabled by the Simple-SPI mode setting (CCR3.MOD[2:0] = 011b) and by setting the CCR0.SSE bit to 1b. When using the 4-wire serial bus in master mode with a single master, the SS pin function on the master side is not required. Therefore, the CCR0.SSE bit is set to 0b.

Figure 7.3-95 shows an example of Simple-SPI connection.

In simple-SPI mode, data is transmitted and received in synchronization with clock pulses in the same way as clock synchronous mode. A character of communication data consists of 8-bit data. No parity bit can be attached.

Because the SCI has an internal transmitter and a receiver independently, the transmitter and the receiver can share a clock to enable full-duplex communication. Furthermore, because both the transmitter and the receiver have a double-buffer structure, continuous transmission and reception are possible by writing the next transmit data during transmission and reading the previous receive data during reception.

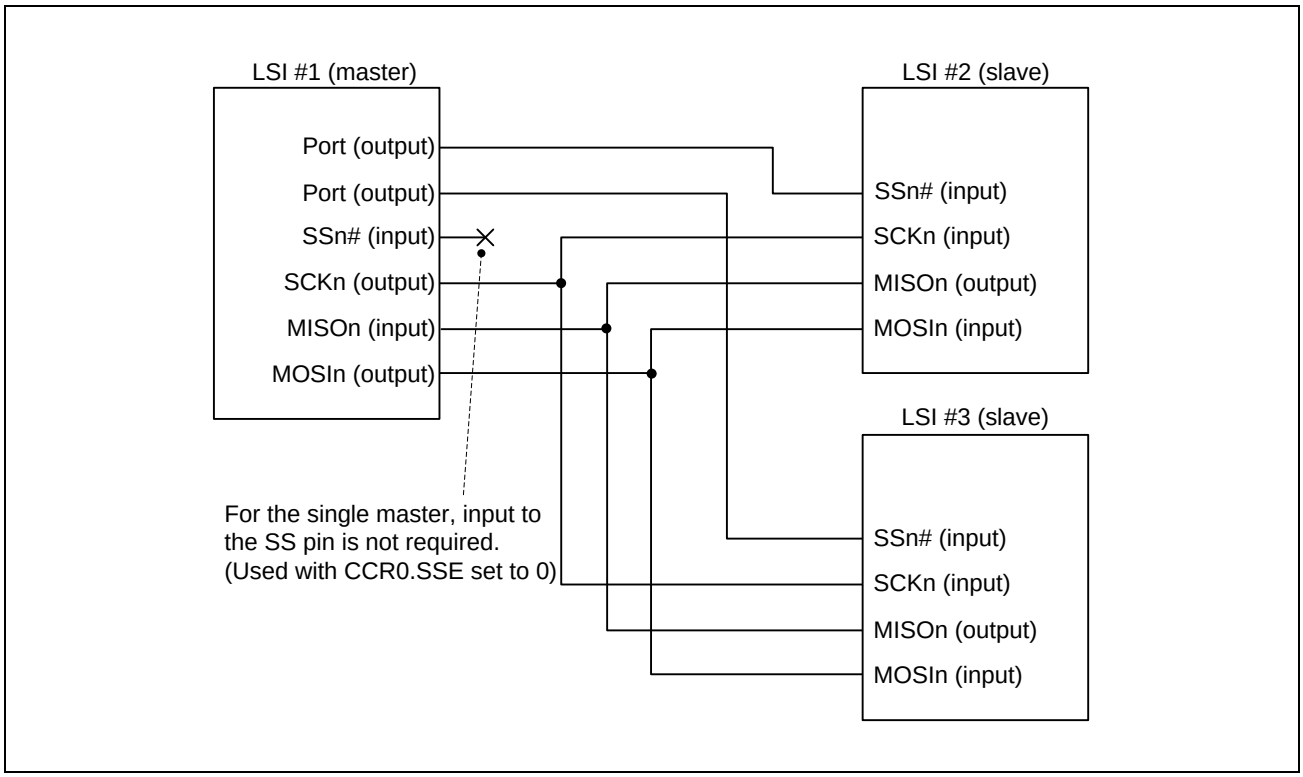

Figure 7.3-95 Simple-SPI Connection Example

7.3.9.1 Pin Status in Master and Slave Mode

In simple-SPI mode, input and output directions of each pin vary depending on master mode (CCR3.CKE[1:0] = 00b or 01b) and slave mode (CCR3.CKE[1:0] = 10b or 11b).

Table 7.3-30 shows the relationship among mode, SSn# pin input, and each pin state.

Table 7.3-30 Relationship among Mode, SSn# Pin Input, and Each Pin State

Mode	SSn# Pin Input	TXDn (MOSIn) Pin State	RXDn (MISOn) Pin State	SCKm Pin State
Master mode*1	High level (Communication enabled)	Transmit data output*2	Receive data input	Clock output*3
	Low level (Communication disabled)	High impedance	Receive data input (disabled)	High impedance
Slave mode	High level (Communication disabled)	Receive data input (disabled)	High impedance	Clock input (disabled)
	Low level (Communication enabled)	Receive data input	Transmit data output*2	Clock input

Note 1. When single master is selected (SSE bit = 0b), communication is enabled (equivalent to the state when the SSn# pin input is high level) regardless of the SSn# pin input level. The SSn# pin is not used and is available for other purposes.

Note 2. High impedance when transmission is disabled (CCR0.TE bit = 0b)

Note 3. High impedance when multi-master (SSE bit = 1b) is selected and transmission/reception is disabled (CCR0.TE, RE bits = 00b)

7.3.9.2 SS Function in Master Mode

Setting the CCR3.CKE[1:0] bits to 00b or 01b enables master mode.

In single master mode (SSE bit = 0b), the SSn# pin is not used and data transmission and reception are enabled regardless of the SSn# pin input level. The SSn# pin is available for other purposes.

When in multi-master mode (SSE bit = 1b) and the SSn# pin input is high, the master outputs a clock from the SCKm pin and performs transmission and reception operations. And outputting clock indicates “There are no other masters” or “Another master is not performing reception or transmission”. When the SSn# pin input level is low in multi-master mode (SSE bit = 1b), this means that another master exists and it is performing data transmission/reception. At this time, the SCI makes the TXDn pin output and the SCKm pin output high impedance and does not start data transmission/reception. In addition, the CSR.MFF bit is set to 1b as a mode fault error. In multi-master mode, read this flag bit to perform the error processing. If a mode fault error occurs during the transmission/reception operation, the SCKm pin and the TXDn pin output are made high impedance while the SSn# pin input level is low. When the SSn# pin input becomes high level, the SCKm pin outputs a clock signal and the TXDn pin outputs data. Even if the SCKm pin and the TXDn pin are in the high impedance state, internal transmission/reception operation continues, but it stops after transmission/reception of a single character is complete. In this case, any of TXI, RXI, and TEI interrupts occurs.

Control the SSn# pin output in master mode with a general-purpose port.

7.3.9.3 SS Function in Slave Mode

Setting the CCR3.CKE[1:0] bits to 10b or 11b enables slave mode.

When the SSn# pin input level is high, the RXDn pin output becomes high impedance and the clock input from the SCKm pin is ignored. When the SSn# pin input level is low, the clock input from the SCKm pin becomes effective, enabling data transmission and reception.

When the SSn# pin input changes from low to high level during the transmission/reception operation, the RXDn pin output is made high impedance and the transmission/reception operation is immediately suspended. If the transmission is in progress, the CSR.TEND flag will not be set, a transmit end interrupt will not be output, and an abnormal stop status will occur. So, do not negate the SSn# pin during slave transmission/reception. If an abnormal stop occurs, set CCR0.RE and CCR0.TE to 0b to stop transmission / reception. To resume transmission/reception, set CCR0.RE and CCR0.TE to 1b after at least RSCI_m_TCLK × 3 cycles + RSCI_m_PCLK × 3 cycles.

7.3.9.4 Relationship between Clock and Transmit/Receive Data

The clock to be used for data transmission/reception is selectable from four types using the CCR3.CPOL and CPHA bits. **Figure 7.3-96** shows the relationship between clock and transmit data/receive data. The same relationship applies to master mode and slave mode.

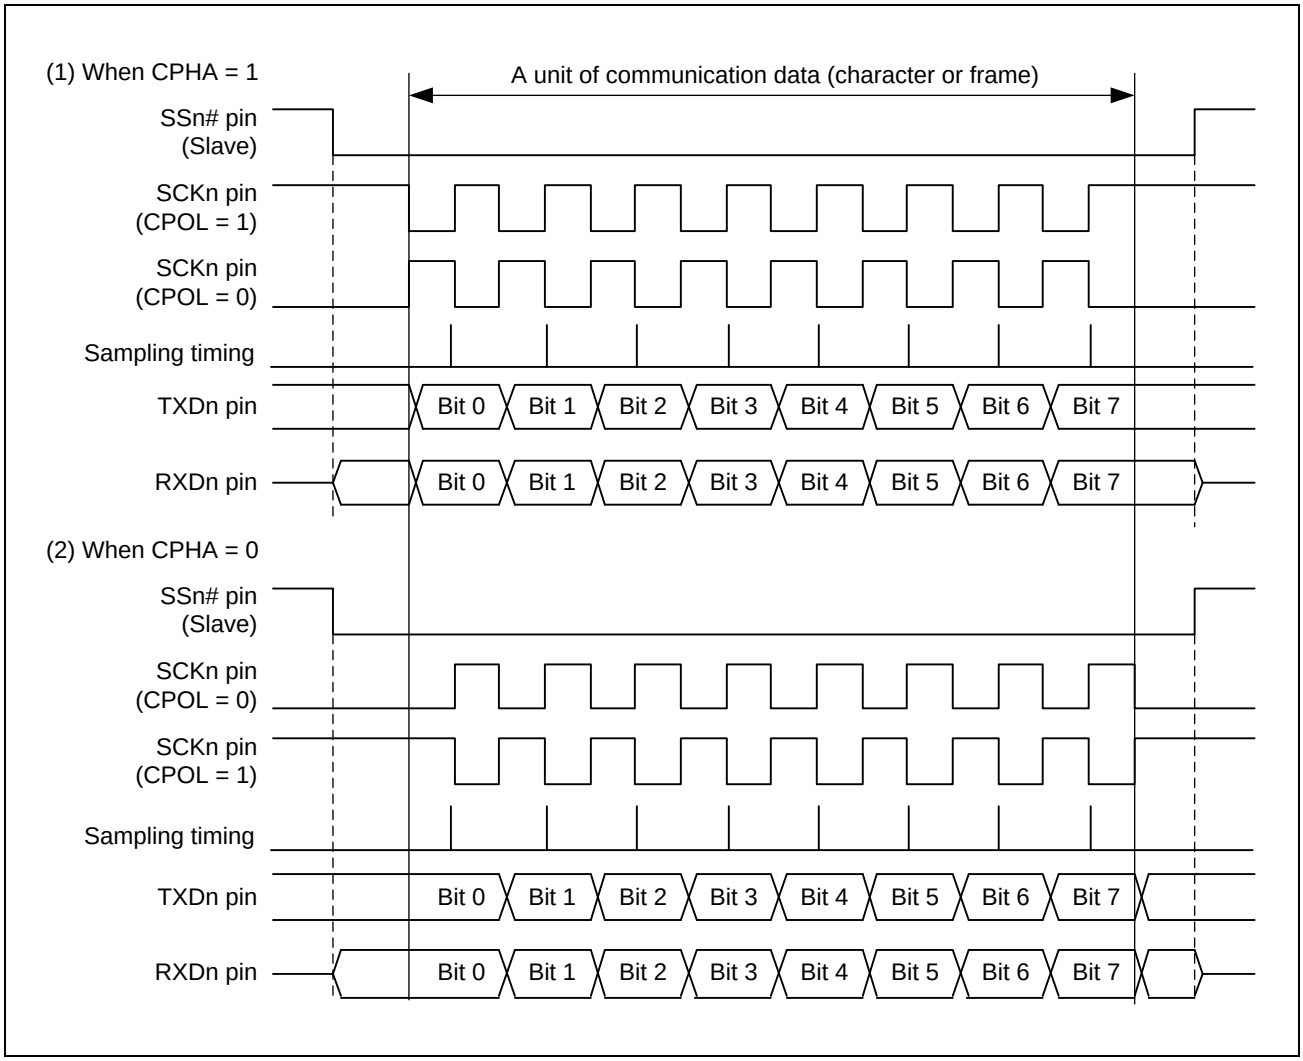

Figure 7.3-96 Relationship between Clock and Transmit Data/Receive Data in Simple-SPI Mode

7.3.9.5 SCI Initialization in Simple-SPI Mode

The SCI can be initialized using the same initialization procedure as for clock synchronous mode (**Figure 7.3-82**). The master devices and slave devices use the same clock type selected by the CCR3.CPOL and CPHA bits.

Before performing initialization or changing operating mode or communication format, be sure to stop communication (CCR0.RE = 0b and CCR0.TE = 0b).

Note that setting the RE bit to 0b does not initialize the ORER, FER, and PER flags in CSR and the RDR register.

Note that, when CCR0.TIE = 1b, setting the TE bit to 1b from 0b generates a TXI interrupt.

7.3.9.6 Serial Data Transmission and Reception in Simple-SPI Mode

In master mode, set the SSn# pin of the destination slave device to low level before starting data transmission/reception and set to high level after the end of data transmission/reception. In multiple master operation with CCR0.SSE = 1b even in master mode, a mode fault error will occur if the SSn# pin goes low. Therefore, make sure that no mode fault error has occurred before starting communication, and start communication, and make sure that no mode fault error has occurred even after communication ends. If a mode fault error has occurred, communication may be incomplete, so measures such as retransmission are required. The other procedures are the same as in clock synchronous mode.

In slave mode, it operates according to the SSn# pin input level. Other steps are the same as those of clock synchronous mode.

7.3.9.7 Reception Sampling Timing Adjustment Function in Simple-SPI Mode with Internal Clock Used

The reception sampling timing adjustment function in simple SPI mode is the same as the reception sampling timing adjustment function in clock synchronous mode. For the description of operation, see **7.3.8.7 Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with Internal Clock Used**.

7.3.10 Bit Rate Modulation Function

Using the bit rate modulation function, the bit rate can be corrected by evenly enabling the clocks of the number specified in the CCR2.MDDR[7:0] bits among 256 clock cycles of internal clocks which is selected by the CKS[1:0] bits in CCR2.

Figure 7.3-97 shows an example where the RSCI_m_TCLK is selected by the CKS[1:0] bits in CCR2 and the BRR and MDDR are set to 0 and 160 respectively in asynchronous mode. In this example, the cycle of the base clock is evenly corrected (256/160) and the bit rate is also corrected (160/256). The enable of internal clock has non-balanced. So, notice the pulse width of the internal base clock is caused bias.

Do not use this function in Clock Synchronous mode, Simple-SPI mode, Smart Card Interface mode and Simple-LIN mode.

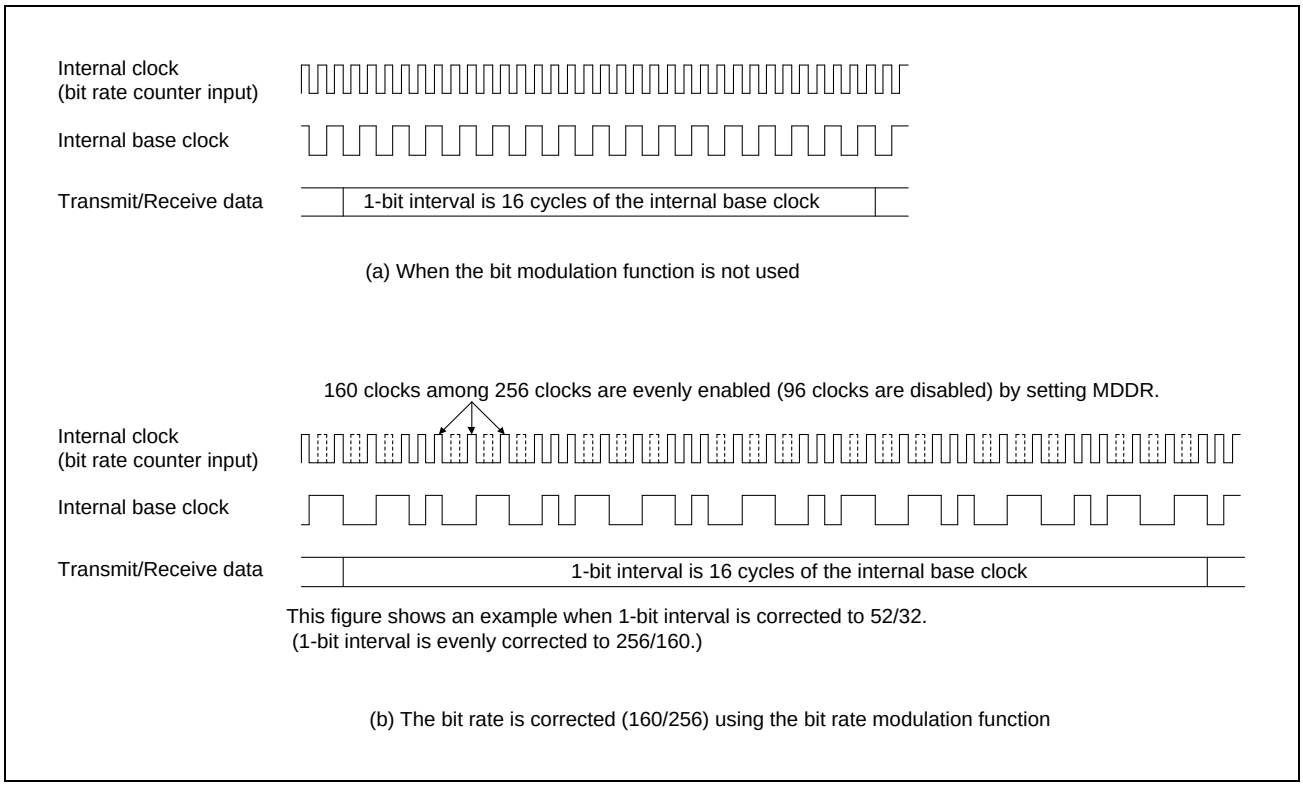

Figure 7.3-97 Example of Internal Base Clock when Bit Rate Modulation Function is Used

7.3.11 Noise Cancellation Function

Figure 7.3-98 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of a two-stage flip-flop circuits and a match detection circuit. When the input signals of the noise filter and the output signals of the two- stage flip-flop circuits completely match, the matched level is conveyed as an internal signal. Unless otherwise matched, the previous value is retained. (When the same level is retained for three cycles or longer on the sampling clock of the noise filter, it is considered as a valid receive signal. A change in pulse for three cycles or shorter is considered as a noise, not as a receive signal.)

In asynchronous mode and simple-LIN mode, the noise cancellation function can be applied to the receive signal input to the RXDn pin. The sampling period of the noise filter can be selected from the base clock period and the divided clock of the baud rate generator clock source by CCR1.NFCS[2:0].

(When CCR1.NFCS[2:0] = 000b, CCR2.ABCS = 0b and CCR2.ABCSE = 0b, the cycle is 1/16 of a period 1 transfer bit.
When CCR1.NFCS[2:0] = 000b, CCR2.ABCS = 1b and CCR2.ABCSE = 0b, the cycle is 1/8 of a period 1 transfer bit.
When CCR1.NFCS[2:0] = 000b, CCR2.ABCSE = 1b, the cycle is 1/6 of a period 1 transfer bit.)

In simple I2C mode, the noise elimination function can be used for the input pins of SDAn and SCLn. The sampling period of the noise filter can be selected from the divided clock of the baud rate generator clock source by CCR1.NFCS[2:0].

If the base clock is stopped once with the noise filter enabled and then the base clock input is restarted again, the noise filter operation resumes from the state where the clock was stopped. When CCR0.TE and CCR0.RE are set to 0b during base clock input, all of the noise filter flip-flop values are initialized to 1. Accordingly, if the input data is 1 when reception operation resumes, it is determined that a level match is detected and is conveyed as an internal signal. When the level being input corresponds to 0b, the initial output of the noise filter is retained until the level matches in three consecutive sampling cycles.

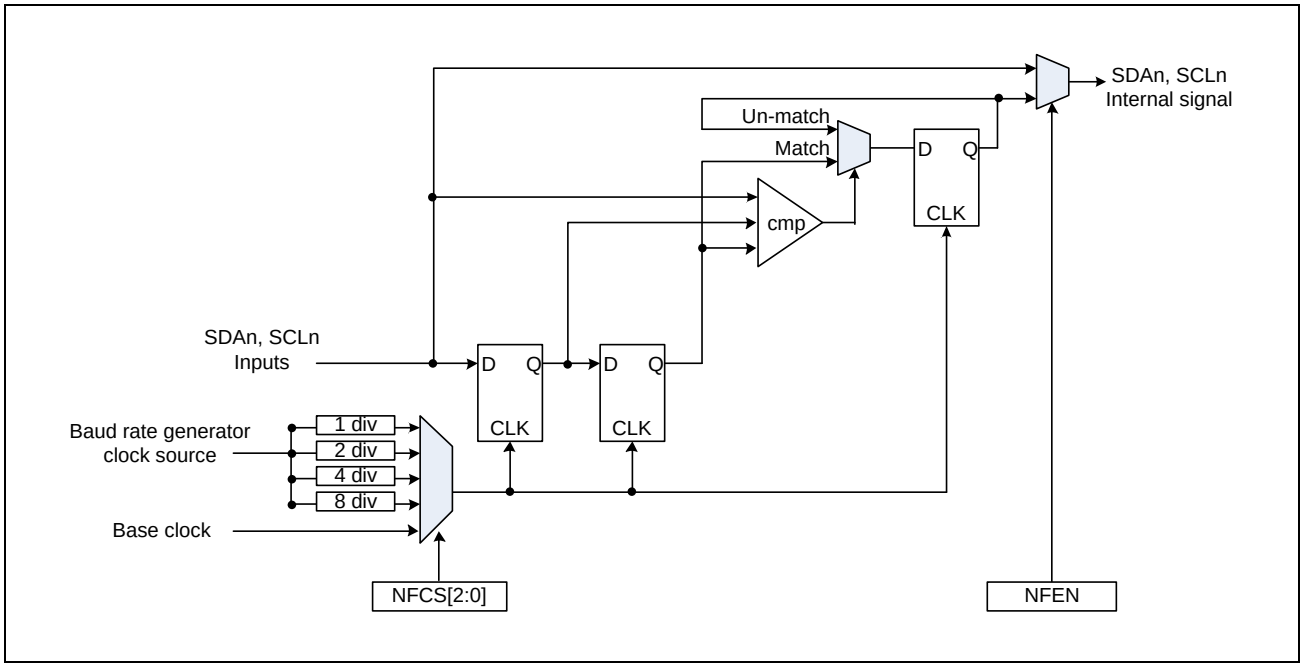

Figure 7.3-98 Block Diagram of Digital Noise Filter Circuit

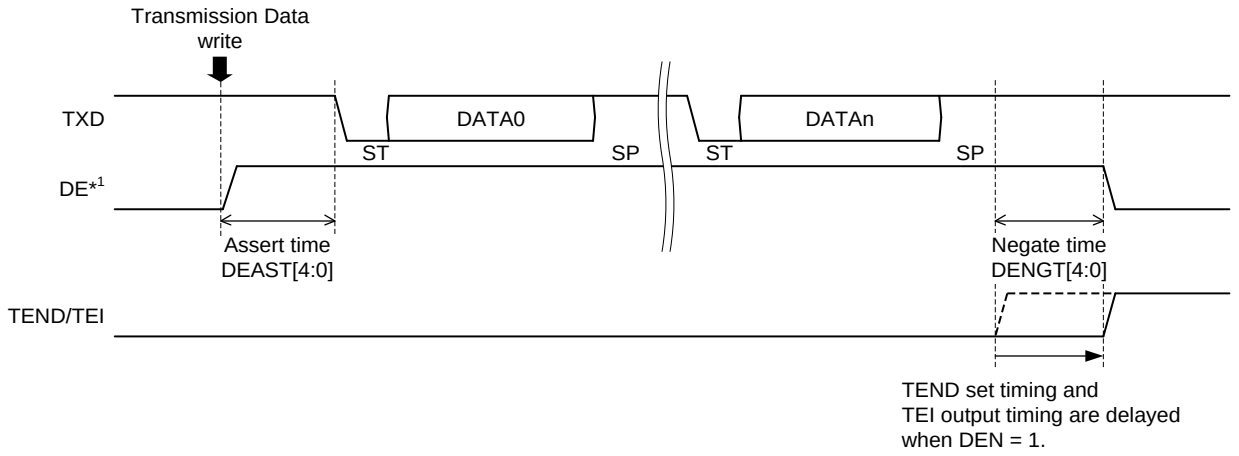
7.3.12 RS-485 Driver Control Function

Setting the DEN bit in the SCI Common Control Register 3 (CCR3) to 1b enables the RS-485 driver control function and generates a DE (Driver Enable) signal that enables the external transceiver transmission mode. The DE signal outputs a valid level for the period with Driver assertion time and Driver negation time added before and after data transmission. The DE signal valid level is set by the DEPOL bit in the driver control register (DCR).



The Driver assertion time is the time from when the DE signal is valid until the start bit starts. Set by DEAST[4:0] of driver control register (DCR).

The Driver negation time is the time from the end of the last stop bit of the transmitted message to the invalidation of the DE signal. Set with DENGT[4:0] of the driver control register (DCR).

DEAST and DENGT are expressed in base clock units. For details, see **7.3.2.2.14 Driver Control Register (RSCIm_DCR)**.

When this function is used (DEN = 1b), the TEND set timing and TEI interrupt output timing are at the end of the driver negation time.

When transmission is completed and the next transmission data is not written before the DE signal is negated, the DE signal is negated once. If the timing for writing the next transmit data is not in time, assert the DE signal after negating it again, insert the Driver assertion time, and transmit the next data. If you want to perform the next transmission with the DE signal asserted, write the next transmission data to the TDR quickly enough in consideration of the synchronization delay time of the register.

Note: ST = Start bit
SP = Stop bit

Note 1. When DCR.DEPOL = 0b

Figure 7.3-99 The Image Waveform for RS-485 Driver Control DE Signal Output

7.3.13 Loopback Function

The loopback function can be used in asynchronous mode with the internal clock, and clock synchronous mode with the internal clock.

When 1b is written to the SPLP bit in the CCR1 register, SCI blocks the external input (RXD) path and connects the output path of the transmit data register and the input path of the receive data register.

When this function is used with TINV = 1b, inversion of transmission data becomes reception data. However, this function can be used with TINV = 1b only when operating in clock synchronous mode internal clock.

Table 7.3-31 shows the relationship between the TINV and SPLP bit settings and the received data.

Table 7.3-31 TINV and SPLP Bit Settings and Received Data

			Communication Mode	
TINV	SPLP	Receive Data	Async Internal Clock	Clock Sync Internal Clock
x	0	Receive Data from RXD pin	Possible	Possible
0	1	Transmit Data	Possible	Possible
1	1	Inverted transmit data	Impossible	Possible

Figure 7.3-100 shows the configuration of the shift register input/output path in loopback mode.

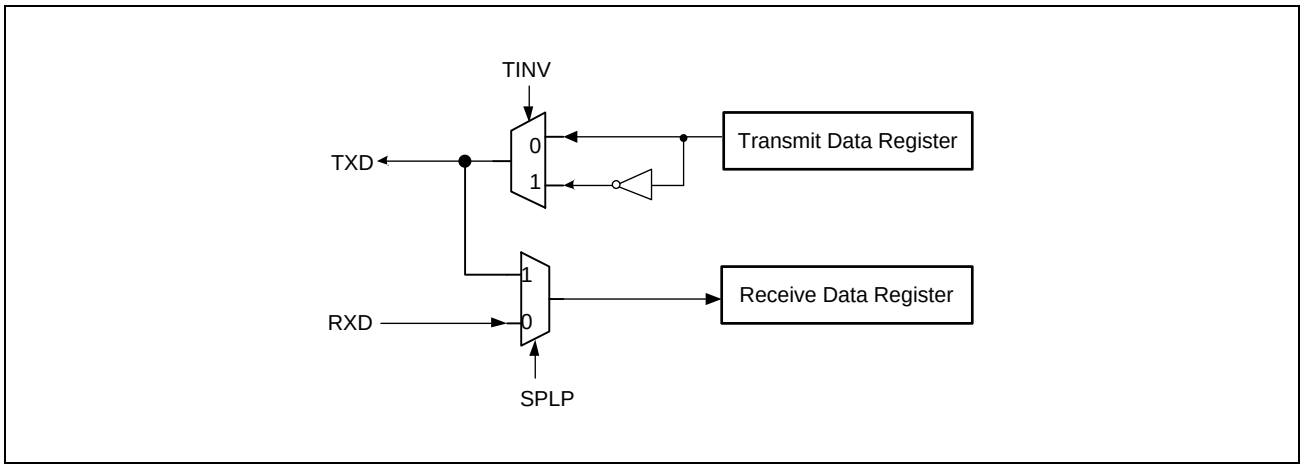


Figure 7.3-100 Shift Register Input/Output Configuration Image in Loopback Mode

7.3.14 Half-Duplex Communication Function

Do not use the half-duplex communication function in Simple-I2C mode, Simple-SPI mode, and Smart Card Interface mode.

In other communication modes, if the CCR1.SHARPS bit is set to 1b, half-duplex communication using the TXD pin is possible. When half-duplex communication is used, transmission and reception must be performed exclusively. Transmission and reception settings (CCR0.TE = 1b and CCR0.RE = 1b) is prohibited.

However, if half-duplex communication is performed as the master in clock synchronous mode, perform transmission/reception settings (CCR0.TE = 1b and CCR0.RE = 1b) and perform dummy transmission. By dummy transmission (arbitrary transmission data is written to TDR), SCKm is output and reception is enabled. The dummy transmission data is discarded inside the module and is not actually transmitted.

During half-duplex communication, the only communication port terminal used is the TXD pin. Output when CCR0.TE = 1b, input when CCR0.TE = 0b.

7.3.15 Synchronizer Bypass Function

This module has a bus clock (RSCI_m_PCLK) and the operation clock (RSCI_m_TCLK). And these have each operating circuit. Therefore, there is a synchronization circuit for signal transfer between different clocks, and synchronization delay time is required for signal propagation between different clocks.

However, the synchronization circuit can be bypassed by the CCR3.BPEN bit only when the same clock is input to the bus clock and the operation clock. In this case, eliminates synchronization delay time and improves responsiveness. **Figure 7.3-101** shows the image waveform of the bypass function.

This module also has a synchronization circuit between the communication clock (SCK) and the operation clock (RSCI_m_TCLK), but this synchronization circuit cannot be bypassed.

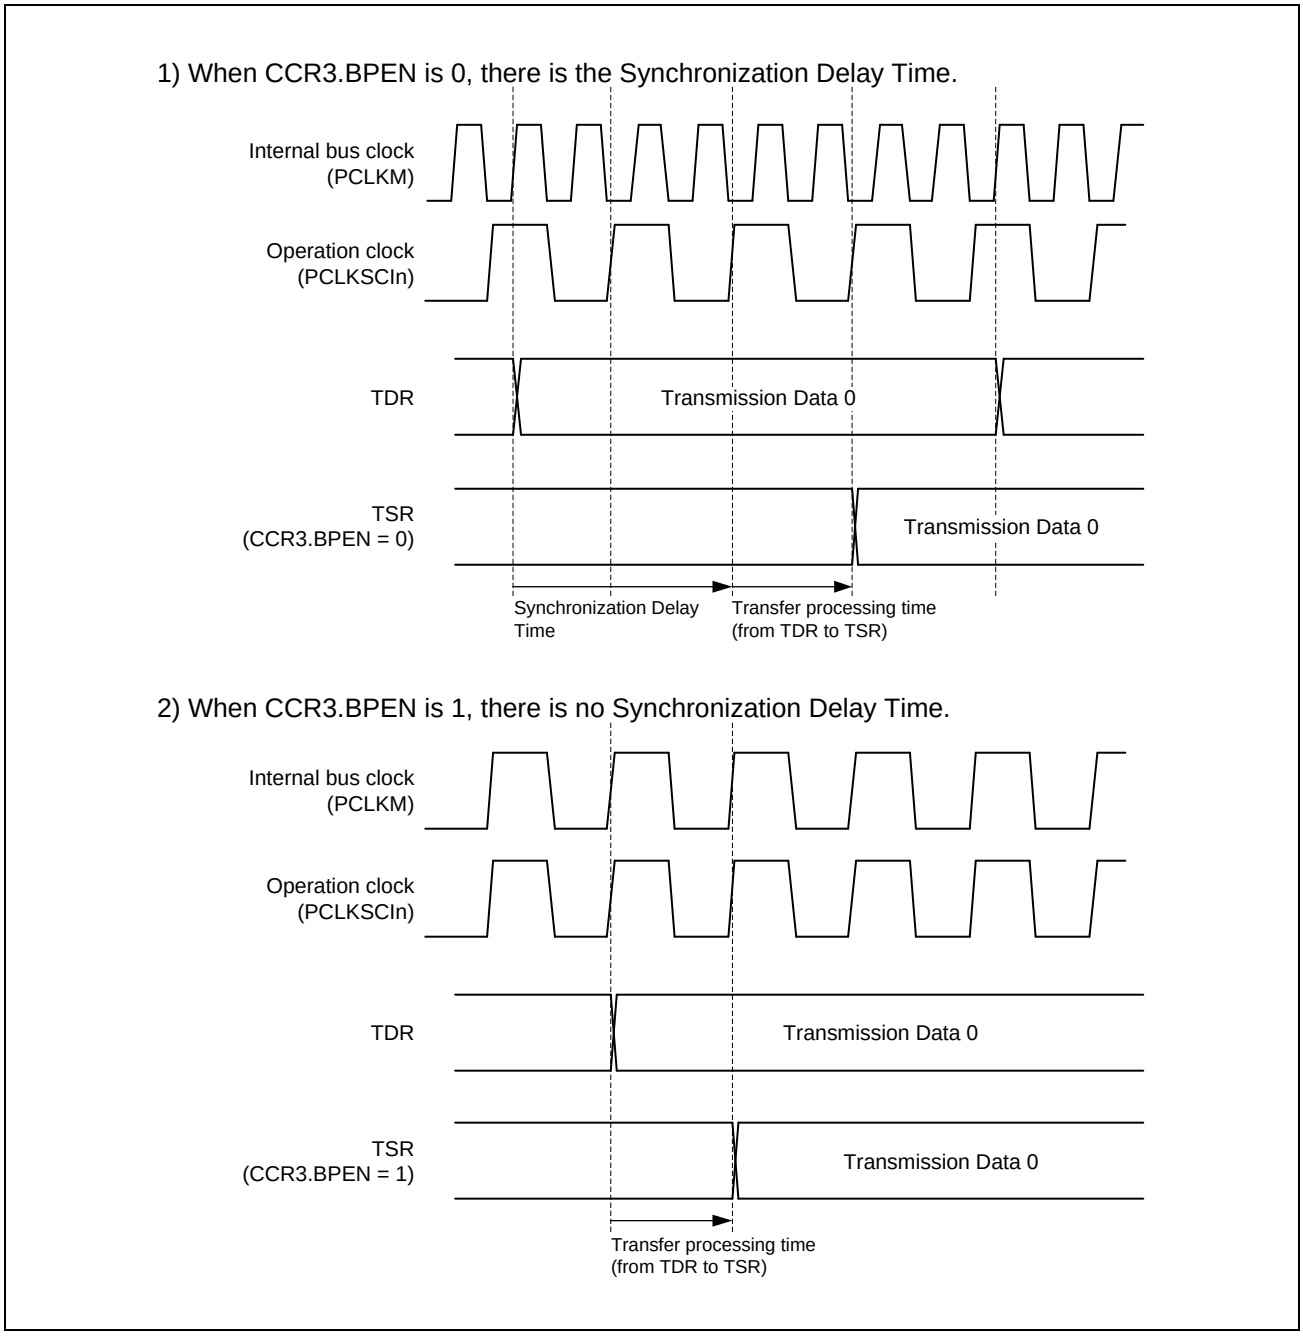

Figure 7.3-101 Image Waveform of Synchronizer Bypass Function

7.3.16 Half Data Communication Function

Setting the HCR.HDEN bit to 1b supports half data communication in which data 0 is pulsed low for the first half of a 1-bit period. Since this function operates only in the asynchronous mode, see the asynchronous mode for the setting, transmission, and reception flow.

7.3.16.1 Reception in Half Data Communication

When receiving during half data communication, the falling edge of the input from the RXDm_MISOm_SCLm pin is detected and the signal after the start bit is recognized is received. One frame is sampled according to the set bit rate, and if the stop bit is correctly received without error, the data value is stored in the receive data register RDR.

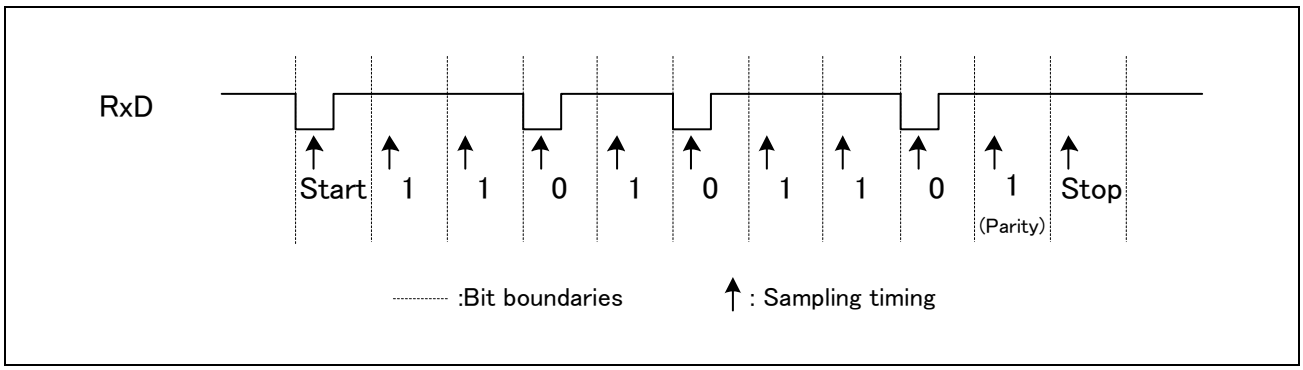

Figure 7.3-102 Half Data Communication Reception Timing Chart

For reception in half data communication, it is necessary to sample at the timing of 1/4 of 1 bit in order to capture the pulse in the first half of the 1 bit period. Sampling operates with a frequency 16 times the bit rate*1 as the base clock as in the asynchronous mode. The start bit is detected by detecting the Low level from the falling edge of RxD four times continuously with the base clock. When High is detected during communication, it is regarded as noise and waits for the next falling edge.

To set the sampling timing to 1/4 of the 1-bit period, enable the reception sampling timing adjustment function with the CCR4.ASEN bit, set the CCR4.AJD bit to 1b and the CCR4.AST bit to 100b, and adjust from the center of the bit, which is the previous sampling timing, four clocks ahead of the base clock.

Since the sampling timing can be adjusted backward and forward using the reception sampling timing adjustment function, this timing can be adjusted according to the reception status. Increasing the CCR4.AST bit value from 100b will move the sampling timing forward, and decreasing it will move it backward. See **7.3.3.10 The Function of Adjust Receive Sampling Timing (Asynchronous Mode)** for the details of adjustment.

After recognizing the start bit, sampling is performed at the timing according to the set bit rate, but the low width and high width of the waveform are not checked. Therefore, it is possible to receive even a normal asynchronous waveform.

Note 1. Half data communication function is supported only when CCR2.ABCS = 0b and CCR2.ABCSE = 0b.

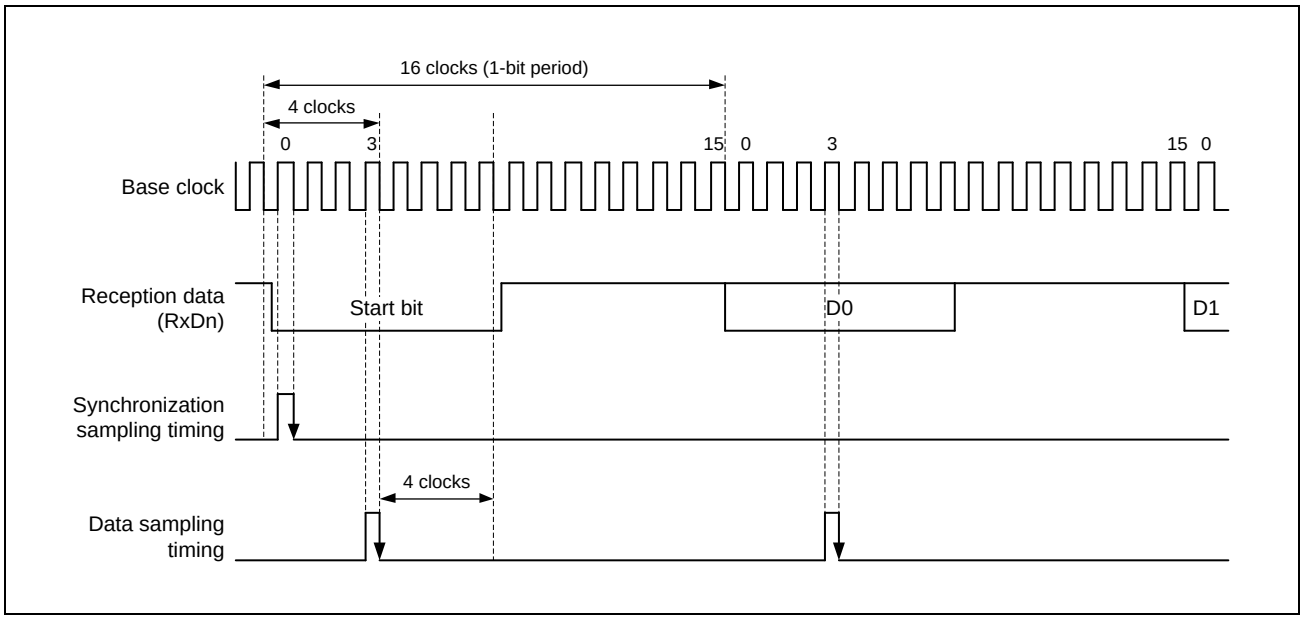

Figure 7.3-103 Details of Reception Sampling Timing during Half Data Communication

7.3.16.2 Transmission in Half Data Communication

In transmission during half data communication, data 0 is output as a low pulse for the first half of the 1-bit period.

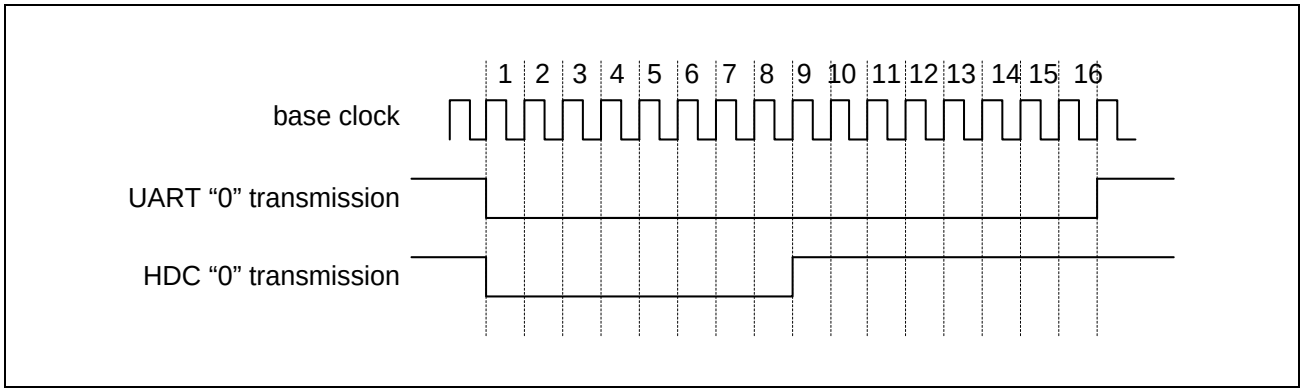

Figure 7.3-104 Transmission Waveform in Half Data Communication

Figure 7.3-105 shows an example of the transmission waveform.

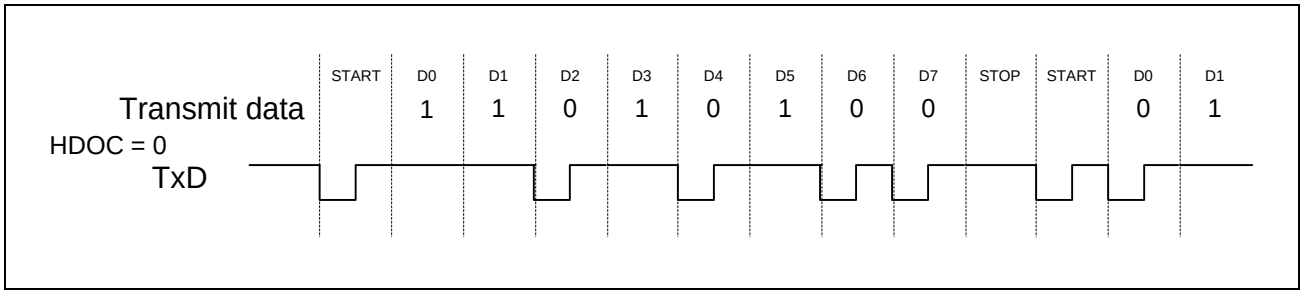

Figure 7.3-105 Difference in Half Data Transmission Waveform (when HDST = 0b, HDOC = 0b)

When CCR0.TE bit = 0b, TxD pins become Hi-Z, but can be controlled by the CCR1.SPB2IO bit and CCR1.SPB2DT bit. At this time, output is applied to the TxD pins.

7.3.16.3 Register Settings for Half Data Communication

The half data communication function is a part of asynchronous mode function, but some settings are not supported when using this function. Set each bit of the common control register as shown in **Table 7.3-32** before use. Register bits not listed can be set in the same way as in the asynchronous mode.

Table 7.3-32 Common Control Register Setting Values for Half Data Communication

Register.Bit Name	Value	Remarks
CCR0.DCME	0b	Use this setting when the address match function is to be disabled.
CCR1.NFCS[2:0]	000b	Use this setting when using the noise filter.
CCR1.SHARPS	0b	Half-duplex communication with the TxD terminal cannot be used.
CCR1.CTSE	0b	Use this setting to disable the CTS function.
CCR2.BRME	0b	Bit rate modulation function cannot be used.
CCR2.ABCSE	0b	Only 1 bit can be set for 16 cycles of base clock.
CCR2.ABCS	0b	Only 1 bit can be set for 16 cycles of base clock.
CCR3.CKE[1:0]	00b	Use this setting to enable internal clock and disable clock output.
CCR3.DEN	0b	Use this setting to disable the RS-485 driver function.
CCR3.FM	0b	Use this setting to disable the FIFO function.
CCR3.MOD[2:0]	000b	Set to asynchronous mode.
CCR3.RxDESEL	1b	Detect the start bit at the falling edge of the RxD pin input.
CCR3.STP	0b	Use this setting to select 1 stop bit.
CCR3.SINV	0b	Use this setting to disable data inversion.
CCR3.LSBF	1b	Use this setting for LSB first.
CCR3.CHR[1:0]	10b	Use this setting for the 8 bit length.
CCR4.AJD	1b	Use this setting when receiving half data communication.
CCR4.AST[2:0]	100b	Use this setting when receiving half data communication.*1
CCR4.ATEN	0b	Use this setting to disable the adjust transmit timing function.
CCR4.ASEN	1b	Use this setting when receiving half data communication.

Note 1. This is the central timing setting for half data. It can be adjusted if needed.

7.3.17 Interrupt Signal

Table 7.3-33 lists SCI interrupt signals.

When performing transmission and reception using DMAC, be sure to set DMAC first, and then set SCI. See **4.7 DMA Controller (DMAC)** for how to set DMAC.

Table 7.3-33 SCI Interrupt Sources

Name	ICU Input Name	Interrupt Sources	CA55 GIC Request	CM33 GIC Request	DMAC Activation
ERI	RSCI_CHm_INT_sc_eri_n	Error interrupt	Possible	Possible	Not possible
RXI	RSCI_CHm_INT_sc_rxi_n	Simple-I2C: Reception end interrupt Other mode: Receive data full interrupt	Possible	Possible	Possible*1
TXI	RSCI_CHm_INT_sc_txi_n	Simple-I2C and Smart Card Interface: Transmit end interrupt Other mode: Transmit data empty interrupt	Possible	Possible	Possible*1
TEI	RSCI_CHm_INT_sc_tei_n	Simple-I2C: Completion of generation of a start, restart, or stop condition (STI) Other mode: Transmit end interrupt	Possible	Possible	Not possible
AED	RSCI_CHm_INT_sc_aed_n	Active edge detection interrupt	Possible	Possible	Possible
BFD	RSCI_CHm_INT_sc_bfd_n	Break Field detection interrupt	Possible	Possible	Not possible

Note: m = 0 to 3

Note 1. Available interrupt sources change dependent on operation mode.

7.3.17.1 Buffer Operations for TXI and RXI Interrupts

The TXI and RXI interrupts have an interrupt buffer function. When the first interrupt request is generated during interrupt handling and the next interrupt request is generated (when the status flag of the Interrupt Controller Unit (ICU) is 1), the module does not output the interrupt request, and the SCI holds it internally. The interrupt that can be held is up to one.

7.3.17.2 Interrupt in Asynchronous Mode, Clock Synchronous Mode, and Simple-SPI Mode

A different interrupt vector is assigned to each interrupt source, and individual interrupt sources can be enabled or disabled with the enable bits in CCR0 register.

(1) Non-FIFO selected

Table 7.3-34 lists interrupt sources in Asynchronous Mode, Clock Synchronous Mode, and Simple-SPI Mode with Non-FIFO selected.

If the CCR0.TIE bit is 1b, a TXI interrupt request is generated when transmit data is transferred from the TDR to the TSR. At the start of transmission, a TXI interrupt request can also be generated by using a single instruction to set the CCR0.TE and CCR0.TIE bit to 1b at the same time. A TXI interrupt request can activate the DMAC to handle data transfer.

A TXI interrupt request is not generated by setting the CCR0.TIE bit to 1b while the setting of the CCR0.TE bit is 1b.*1

When the CCR0.TEIE bit is 1b, the CSR.TEND flag becomes 1b and the TEI interrupt request is generated if the next data is not written to the TDR register by the timing to transmit the last bit of transmission data. In addition, the TEND flag holds 1b during the period from setting the CCR0.TE bit to 1b until writing transmit data to the TDR register, and if the TEIE bit is set to 1b, a TEI interrupt request is generated.

Writing data to the TDR register clears the TEND flag and cancels the TEI interrupt request, but it takes time to cancel it.

If the CCR0.RIE bit is 1b, an RXI interrupt request is generated when received data is stored in the RDR. An RXI interrupt request can activate the DMAC to handle data transfer.

Setting of any from among the ORER, FER, PER flags in the CSR to 1b while the CCR0.RIE bit is 1b leads to the generation of an ERI interrupt request.

An RXI interrupt request is not generated at this time. Clearing all three flags (ORER, FER, PER) leads to discarding of the ERI interrupt request.

Note 1. To temporarily prohibit TXI interrupts at the time of transmission of the last of the data and so on when you wish a new round of transmission to start after handling of the transmit end interrupt, control prohibiting and permitting of the interrupt by using the interrupt request enable bit in the interrupt controller rather than using the TIE bit. This can prevent the suppression of TXI interrupt requests in the transfer of new data.

Table 7.3-34 SCI Interrupt Sources with Non-FIFO Selected

Name	Interrupt Source	Interrupt Flag	Level/Pulse Output	Interrupt Enable	DMAC Activation
ERI	Receive error	ORER, FER, PER, DFER, DPER	Level	RIE	Not possible
RXI	Receive data full	RDRF	Pulse	RIE	Possible
	Address match	DCMF			
TXI	Transmit data empty	TDRE	Pulse	TIE	Possible
	TE = 0 -> 1 detection				
TEI	Transmit end	TEND	Level	TEIE	Not possible

(2) FIFO selected

Table 7.3-35 lists interrupt sources in Asynchronous Mode, Clock Synchronous Mode, and Simple-SPI Mode with FIFO selected.

If the CCR0.TIE bit is 1b, a TXI interrupt request is generated when the stored number of data in transmit FIFO becomes the threshold value indicated in FCR.TTRG or below. A TXI interrupt request can also be generated by using a single instruction to set the CCR0.TE and CCR0.TIE bit to 1b at the same time. A TXI interrupt request is not generated by setting the CCR0.TIE bit to 1b while the setting of the CCR0.TE bit is 1b. If CCR0.TEIE bit is 1b, when the next data is not being written in transmit FIFO by the timing to which the last bit of the transmission data is sent, CSR.TEND flag will be 1b and TEI interrupt request is generated.

If the CCR0.RIE bit is 1b, RXI interrupt request is generated when the stored number of data in receive FIFO becomes the threshold value indicated in FCR.RTRG or above. When FCR.RTRG is set to 0b, RXI interrupt request is occurred if the quantity of data in receive FIFO is greater than or equal to 1.

If the CCR0.RIE bit is 1b, when CSR.ORER flag is set to 1b or the data a framing error or a parity error generated is stored in receive FIFO, ERI interrupt request is generated.

When the number of data stored in a receive FIFO at this time is a threshold value or above, RXI interrupt request is also generated. The ERI interrupt request can be canceled by clearing all flags (CSR.ORER, FER, and PER).

Table 7.3-35 SCI Interrupt Sources with FIFO Selected

Name	Interrupt Source	Interrupt Flag	Level/Pulse Output	Interrupt Enable	DMAC Activation
ERI	Receive error	ORER, FER, PER, DFER, DPER	Level	RIE	Not possible
		DR (FCR.DRES = 1b)			
RXI	Receive FIFO data full	RDRF	Pulse	RIE	Possible
	Receive data ready	DR (FCR.DRES = 0b)			
	Address match	DCMF			
TXI	Transmit FIFO data empty	TDRE	Pulse	TIE	Possible
	TE = 0 -> 1 detection				
TEI	Transmit end	TEND	Level	TEIE	Not possible

7.3.17.3 Interrupt in Smart Card Interface Mode

Table 7.3-36 lists interrupt sources in smart card interface mode. A transmit end interrupt (TEI) request cannot be used in this mode.

Table 7.3-36 SCI Interrupt Sources in Smart Card Interface Mode

Name	Interrupt Source	Interrupt Flag	Level/Pulse Output	Interrupt Enable	DMAC Activation
ERI	Receive error or error signal detection	ORER, PER, ERS	Level	RIE	Not possible
RXI	Receive data full	RDRF	Pulse	RIE	Possible
TXI	Transmit end	TEND	Pulse	TIE	Possible
	When set TE = 0 -> 1				

Data transmission/reception using the DMAC is also possible in smart card interface mode. In transmission operation, when the TEND flag in CSR is set to 1b, a TXI interrupt request is generated. This TXI interrupt request activates the DMAC allowing transfer of transmit data if the TXI request is specified beforehand as a source of DMAC activation. The TEND flag is automatically set to 0b when the DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During the retransmission, the TEND flag is kept to 0b and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, the ERS flag in CSR is not automatically cleared to 0b at error occurrence. Therefore, the ERS flag must be cleared by previously setting the RIE bit in CCR0 to 1b to enable an ERI interrupt request to be generated at error occurrence.

In reception operation, an RXI interrupt request is generated when receive data is set to RDR. This RXI interrupt request activates the DMAC allowing transfer of receive data if the RXI request is specified beforehand as a source of DMAC activation. If an error occurs, the error flag is set. Therefore, the DMAC is not activated and an ERI interrupt request is issued to the CPU instead; the error flag must be cleared.

When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings. For DMAC settings, see **4.7 DMA Controller (DMAC)**.

7.3.17.4 Interrupts in Simple-I2C Mode

Table 7.3-37 lists SCI interrupts in simple-I2C mode.

The STI interrupt is allocated to the transmit end interrupt (TEI) request. The receive error interrupt (ERI) request cannot be used.

The DMAC can also be used to handle transfer in simple I2C mode.

When the value of the IICINTM bit in ICR is 1b, a RXI request will be generated on the falling edge of the SCLn signal for the eighth bit. If the RXI has been set up as an activating request for the DMAC beforehand, the RXI request will activate the DMAC to handle transfer of the received data. Furthermore, a TXI request is generated on the falling edge of the SCLn signal for the ninth bit (acknowledge bit). If the TXI has been set up as an activating request for the DMAC beforehand, the TXI request will activate the DMAC to handle transfer of the transmit data. (In this case, ACK/NACK judging are impossible.)

When the value of the IICINTM bit in ICR is 0b, SCI operates as follows.

RXI request (ACK detection) is generated if the input on the SDAn pin is at the low level on the rising edge of the SCLn signal for the ninth bit (acknowledge bit).

TXI request (NACK detection) is generated if the input on the SDAn pin is at the high level on the rising edge of the SCLn signal for the ninth bit (acknowledge bit).

If the RXI has been set up as an activating request for the DMAC beforehand, the RXI request will activate the DMAC to handle transfer of the received data. Also, if the DMAC is used for data transfer in reception or transmission, be sure to set up and enable the DMAC before setting up the SCI.

When the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits in ICR are used to generate a start condition, restart condition, or stop condition, the STI request is issued when generation is complete.

Table 7.3-37 SCI Interrupt Sources in Simple-I2C Mode

Name	Interrupt Source		Interrupt Flag	Level/Pulse Output	Interrupt Enable	DMAC Activation
	IICINTM = 1	IICINTM = 0				
RXI	Reception end	—	—	Pulse	RIE	Possible*1
	—	ACK detection	—			Possible
TXI	Transmit end	—	—	Pulse	TIE	Possible*1
	—	NACK detection	—			Possible
STI	Completion of generation of a start, restart, or stop condition		IICSTIF	Level	TEIE	Not Possible

Note 1. If the DMAC is being used, you cannot confirm whether ACK or NACK.

7.3.17.5 Interrupts in Simple-LIN Mode

Table 7.3-38 lists RSCI interrupts in simple-LIN mode.

Table 7.3-38 RSCI Interrupt Sources in Simple-LIN Mode

Name	Interrupt Sources	Interrupt Flag	Flag that Needs to be Confirmed	Level/Pulse Output	Interrupt Enable	DMAC Activation
ERR	Error	ORER,FER,PER	—	Level	RIE	Not Possible
		BCDF,COF	—		BCDIE,RIE, COFIE	
RXI	Reception Data full flag	RDRF	CF0MF, CF1MF, PIBDF	Pulse	RIE	XSR0.SFSF = 0b :Possible XSR0.SFSF = 1b: Not Possible
AED	Active edge detection	AEDF	—	Pulse	AEDIE	Possible
TXI	Transmit data empty interrupt	TDRE	—	Pulse	TIE	Possible
	When set TE = 0->1					
	Break Field output completion	BFOF	—		TIE, BFOIE	
TEI	Transmit end	TEND	—	Level	TEIE	Not Possible
BFD	Break Field Detection	BFDF	—	Level	BFDIE	Not Possible

In Simple-LIN mode, in addition to reception errors (ORER, FER, PER), an ERI interrupt request is output when a bus conflict is detected during transmission, or when a counter overflow of the Simple-LIN module occurs. At this time, a RXI interrupt request is not output. The ERI interrupt request can be canceled by clearing all the flags.

When transmitting Start Frame, if CCR0.TIE = 1b and XCR0.BFOIE = 1b, a TXI interrupt request is output when Break Field transmission is completed. When Control Field 0 data is written to the TDR register, data transmission starts. Therefore, transmission using DMAC is possible.

Set CCR0.TEIE = 1b after writing the last transmit data to the TDR register and transmission starts.

During Start Frame reception (XSR0.SFSF = 1b), reception using DMAC by RXI interrupt is not possible. Check the CSR register and XSR0 register, check the reception status (see **Figure 7.3-61**), and then clear the flag. Also read the RDR register (if you do not need to check the received data value, clear the RDRF flag without reading the RDR register). When reception of Control Field 1 is completed (XSR0.CF1MF = 1b), Start Frame detection is disabled (XSR0.SFSF = 0b) and reception using DMAC is possible. Be sure to read the RDR register.

When Start Frame / Break Field detection is enabled (XCR1.SDST = 1b), if a Break Field longer than the period set in XCR2.BFLW [15: 0] is received, the BFDF flag is set and a BFD interrupt request is output. Then RSCI becomes the Start Frame reception state. Clear the BFDF flag.

When Start Frame / Break Field detection is enabled (XCR1.SDST = 1b) and the bit rate measurement function is enabled (XCR1.BMEN = 1b), an AED interrupt factor is output when an active edge is detected. Read the timer count capture value (XSR1.TCNT [15: 0]).

7.3.18 Usage Notes

7.3.18.1 Notes on Module Standby Mode

(1) Transmission

Before using the power consumption reduction function to reduce SCI's power consumption, please do the following to confirming transmission end (CSR.TEND = 1b):

- Set the output pin state after transmission operation is stopped by CCR1.SPB2DT, SPB2IO.
- Stop the transmission (CCR0.TIE = 0b, TE = 0b, TEIE = 0b).

When transitions to these states are made during transmission, the data being transmitted become indeterminate.

To transmit data in the same transmission mode after cancellation of the low power consumption state, set the TE bit to 1b, read CSR, and write data to TDR sequentially to start data transmission. To transmit data with a different transmission mode, initialize the SCI first.

To start transmission using the DMAC after cancellation of the low power consumption state, set the TE and TIE bit to 1b. The TXI interrupt flag is set to 1b and transmission starts using the DMAC.

Figure 7.3-106 shows a sample flowchart for transition to the low power consumption state during transmission. **Figure 7.3-107** and **Figure 7.3-108** show the port pin states during transition to the low power consumption state.

(2) Reception

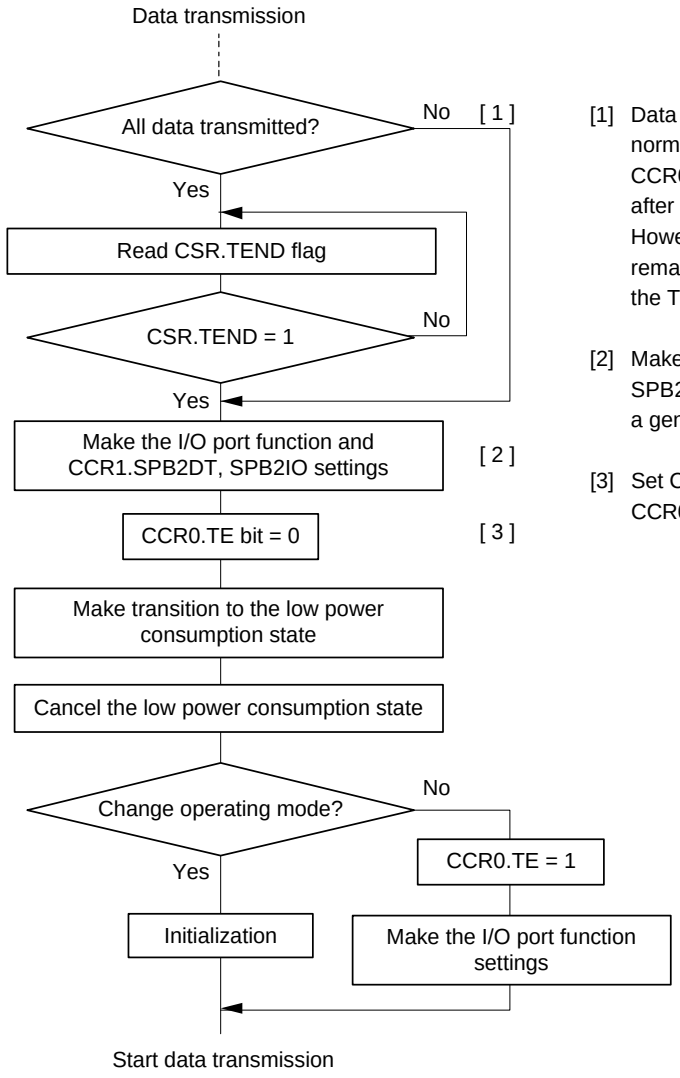
(a) When Address match function is non used as condition of resumption (wake-up)

Before specifying the module stop state or making a transition to the low power consumption state, stop the receive operations (CCR0.RE = 0b). If transition is made during data reception, the data being received will be invalid.

Figure 7.3-109 shows a sample flowchart for reception to software standby mode during reception.

(b) When Address match function is used as condition of resumption (wake-up)

When using the power consumption reduction function to reduce SCI's power consumption, please do the following:



- Set the operation mode of after released.
- Set the compare data to CCR4.CMPD and set 1b to CCR0.DCME.
- Set the receive operation (CCR0.RE = 1b).

Please set CCR3.RXDESEL= 0b. Because there is a possibility that a start bit (falling edge of RXDn pin) cannot be detected at the time of low power consumption mode release.

After detecting the falling edge of the RxD terminal and transitioning from standby mode to snooze mode, the operating clock is supplied to SCI and data is received by RSCI. The address match function determines the received data, and if it matches, it transitions from snooze mode to normal mode, and if it does not match, it transitions to standby mode again. This operation behaves as if the standby mode is continued until the communication data matching the CMPD is received, and after the standby mode is released, the normal reception operation is continued.

When using this function, the reception speed must be slow enough because it is necessary to perform the transition from the falling-edge detection of the RxD terminal to the snooze mode, and from the clock supply to the RSCI to the reception.

Figure 7.3-110 shows a sample flowchart for reception to the low power consumption state during reception.

[1] Data being transmitted is lost halfway. Data can be normally transmitted from the CPU by setting the CCR0.TE to 1, reading CSR, and writing data to TDR after canceling the low power consumption state. However, if the DMAC has been activated, the data remaining in the DMAC will be transmitted when both the TE and TIE bits in CCR0 are set to 1.

[2] Make the I/O port function and CCR1.SPB2DT, SPB2IO settings to switch the TXDn pin to operate as a general I/O port.

[3] Set CCR0.TE bit to 0. Set also 0 to CCR0.TIE and CCR0.TEIE if these bits were 1.

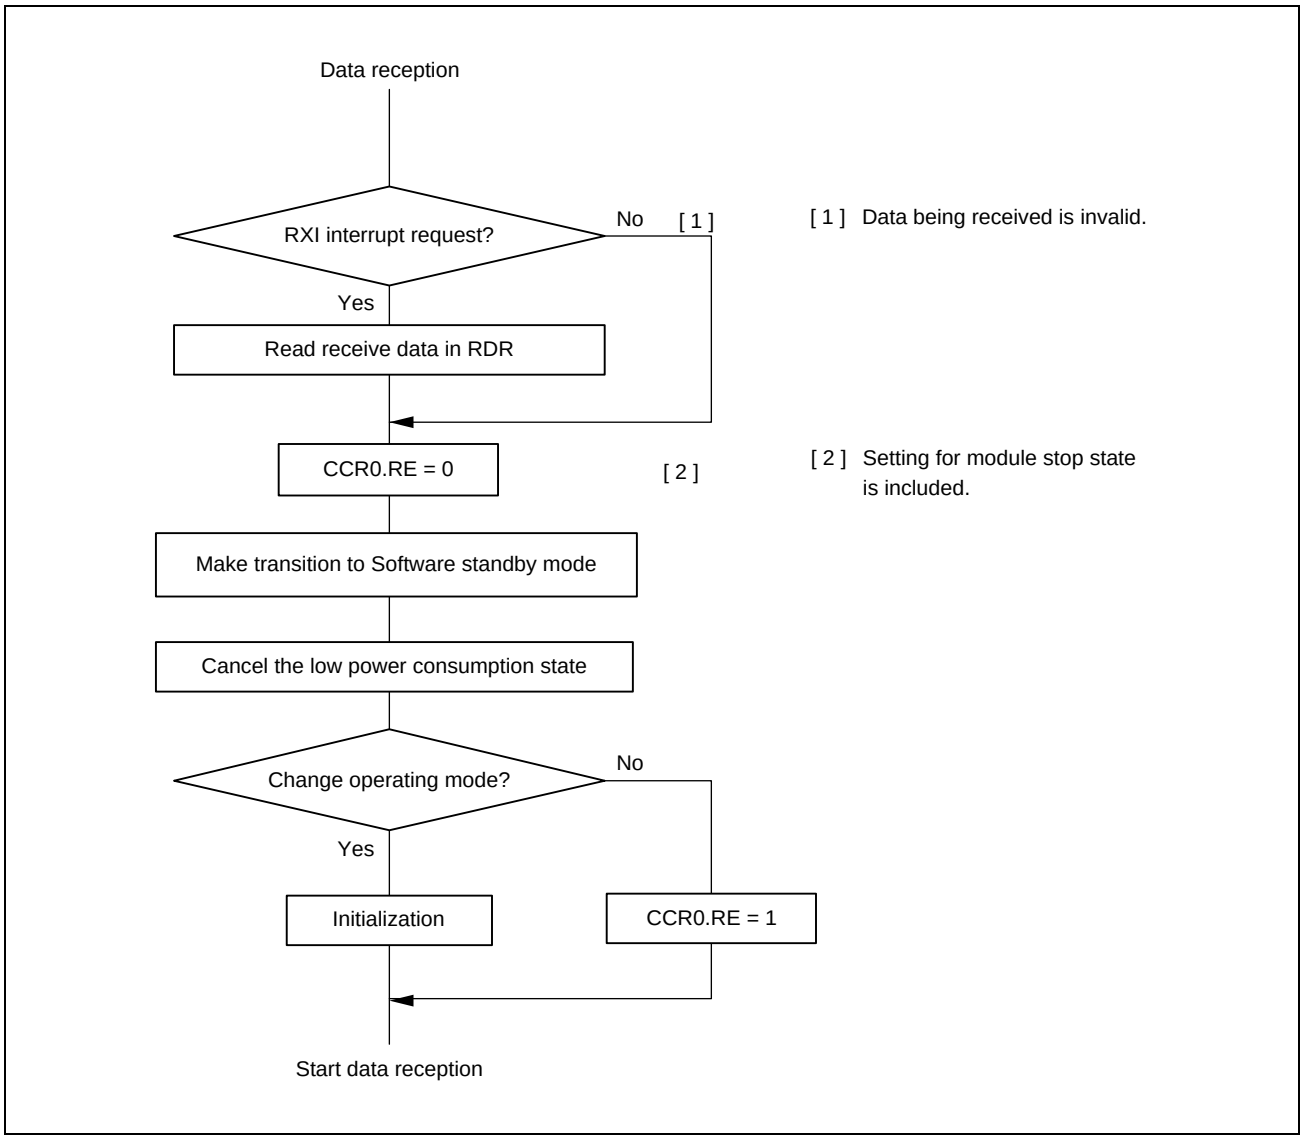

Figure 7.3-109 Example of Flowchart for Reception to Module Standby Mode during Reception

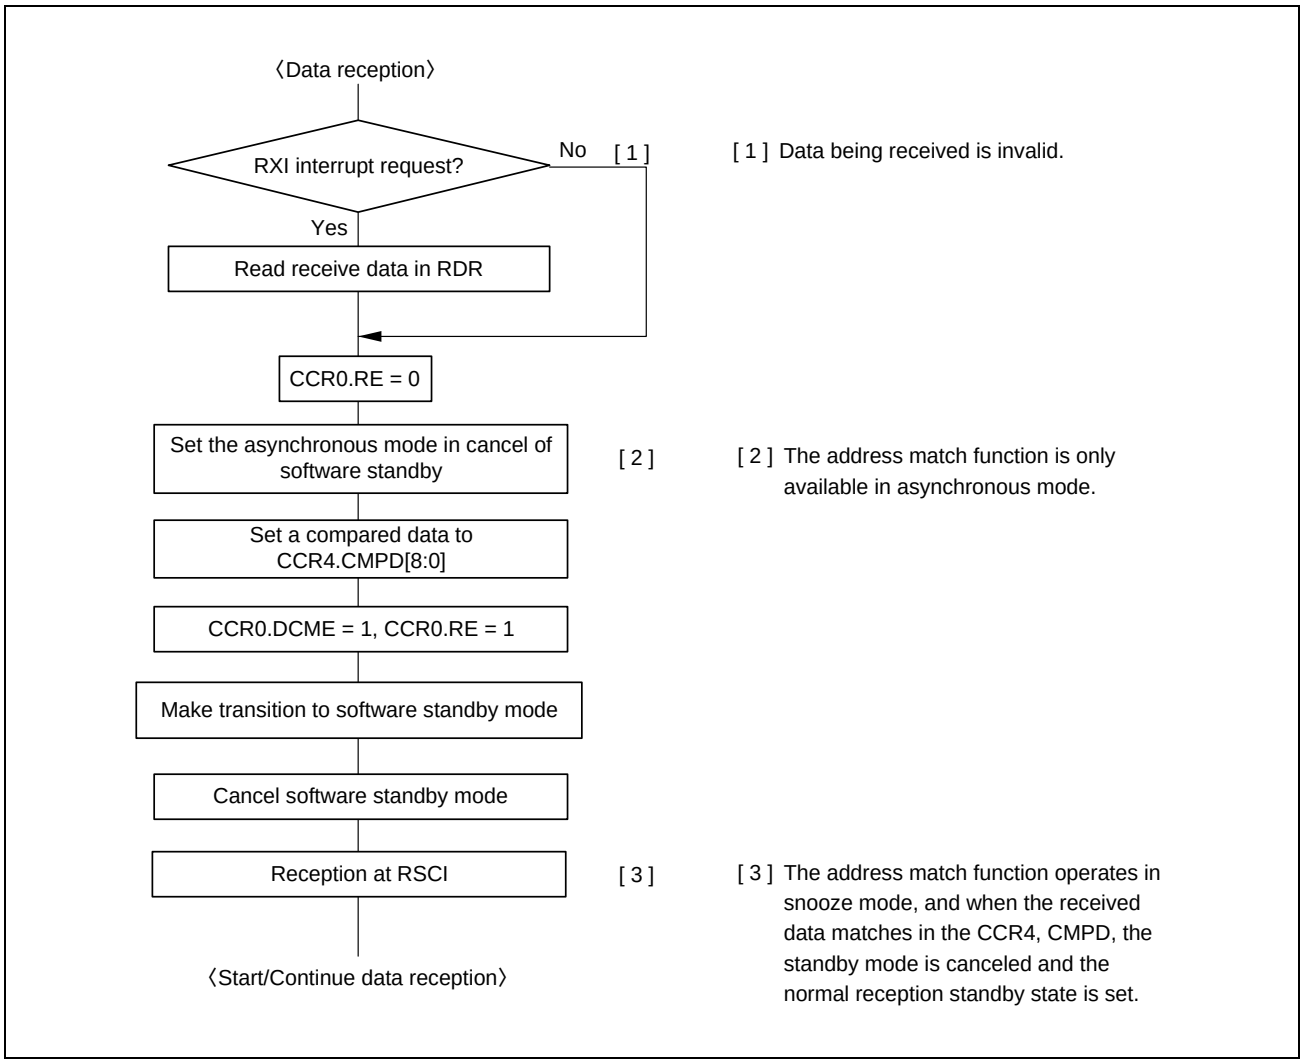

Figure 7.3-110 Example of Flowchart for Reception to Module Standby Mode during Reception With Address Match

7.3.18.2 Break Detection and Processing

(1) Non-FIFO selected

When a framing error is detected, a break can be detected by reading CSR.RXDMON bit value. In a break, the input from the RXDn pin becomes all 0s, and so the CSR.FER flag is set to 1b (framing error has occurred), and the CSR.PER flag may also be set to 1b (parity error has occurred). When the CCR3.RXDESEL bit is 0b, the SCI continues the receive operation even after a break is received. Therefore, note that even if the FER flag is set to 0b (no framing error occurred), it will be set to 1b again. When the CCR3.RXDESEL bit is 1b, the SCI sets the CSR.FER flag to 1b and stops receiving operation until a start bit of the next data frame is detected. If the CSR.FER flag is set to 0b at this time, the CSR.FER flag retains 0b during the break. When the RXDn pin is set to 1b and the break ends, detecting the beginning of the start bit at the first falling edge of the RXDn pin allows the SCI to start the receiving operation.

(2) FIFO selected

After a framing error is detected, when SCI detects that continuous receive data is 0b for 1 frame, the data stored into the receive FIFO (RDR) and reception stops. When a framing error is detected, a break can be detected by reading CSR.RXDMON bit value. After the RxD signal is in the mark state and it has finished the break, a stock of reception data to the receive FIFO (RDR) resumes.

7.3.18.3 Mark State and Production of Breaks

When CCR0.TE = 0b (serial transmission is disabled), the state of the TXDn pin can be set by CCR1.SPB2IO bit and CCR1.SPB2DT bit. Using this, it's possible to do a TXDn pin in the mark state and send a breakout. When you want to make a communication-line in the mark state (the state of 1) until the CCR0.TE bit is set to 1b (serial transmission is enabled), execute the following operations. First, set output level High by the CCR1.SPB2IO and CCR1.SPB2DT bits. Next, it's changed to a TXDn pin by I/O port function. On the other hand, if you want to send a break when sending data, set the CCR0.TE bit to 0b after setting the SPB2IO and SPB2DT bits in the CCR1 register to low level output. Setting the TE bit to 0b initializes the transmitter regardless of the current transmission status.

7.3.18.4 Receive Error Flags and Transmit Operations (Clock Synchronous Mode and Simple SPI Mode)

Transmission can be started by writing transmit-data to TDR even if CSR.ORER is 1b. However, reception cannot be started. Note also that the receive error flags cannot be set to 0 even if the CCR0.RE is set to 0b (serial reception is disabled).

7.3.18.5 Writing Data to TDR

(1) Non-FIFO selected

Data can be written to TDR anytime when CCR0.TE = 1b. However, if new data is written to TDR when transmit data is remaining in TDR, the previous data in TDR is lost because it has not been transferred to TSR yet. If you use DMAC, be sure to write transmit data to TDR in the TXI interrupt request handling routine.

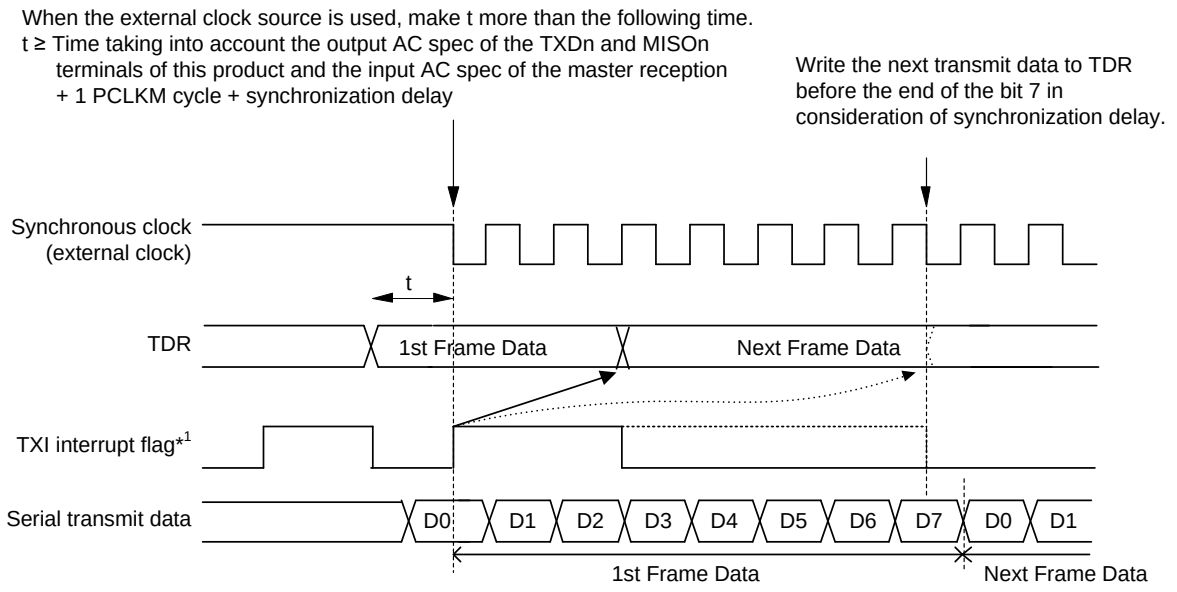
(2) FIFO selected

Data can be written to transmit FIFO (TDR) when TE is 1b. Check the number of writable data with the FTSR.T[5:0] bits.

7.3.18.6 Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode and Simple SPI Mode)

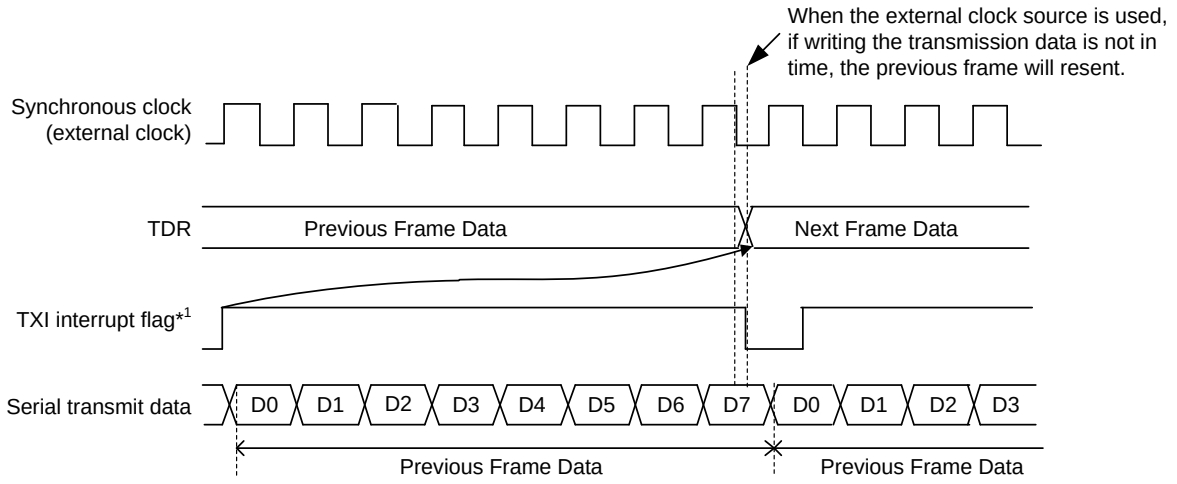
When the external clock source is used as a synchronization clock, the following restrictions apply.

(1) Start of transmission



Update TDR by the CPU or DMAC and wait at least the following time until the start of the external clock input: (See **Figure 7.3-111**.)

Time taking into account the output AC specification of the TXDn and MISOn pins of this product and the input AC specification of the master reception + 1 RSCI_m_PCLK cycle + synchronization delay (2 to 3 RSCI_m_TCLK).



(2) Continuous transmission

Write the next transmit data to TDR before the falling edge*[1] of the transmit clock for bit 7. Please write the transmit data to TDR in consideration of synchronization delay [2 to 3 RSCI_m_TCLK]. If the transmit data cannot be written in time, the previous frame data is resent. (See **Figure 7.3-111**.)

Note 1. When CCR3.CPOL = 1b and CCR3.CPHA = 0b, or CCR3.CPOL = 0b and CCR3.CPHA = 1b. In the case of CCR3.CPOL = 0b and CCR3.CPHA = 0b, or CCR3.CPOL = 1b and CCR3.CPHA = 1b, it is the rising edge.

(1) Start of transmission and (2) Continuous transmission (When transmission data is in time)

(2) Continuous transmission (When transmission data is not in time)

Note 1. See **4.6 Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 7.3-111 Restrictions on Use of External Clock in Clock Synchronous Transmission

7.3.18.7 Notes on Starting Transfer

At the point where transfer starts, when the interrupt status flag in the interrupt controller is 1, follow the procedure below to clear interrupt requests before permitting operations (by setting the CCR0.TE or CCR0.RE bit to 1b).

For details on the interrupt status flag, see section XX, Interrupt Controller (ICU).

- Confirm that transfer has stopped (the setting of the CCR0.TE or CCR0.RE bits is 0b).
- Set the corresponding interrupt enable bit (CCR0.TIE, CCR0.TEIE, or CCR0.RIE) to 0b.
- Read the corresponding interrupt enable bit (CCR0.TIE, CCR0.TEIE, or CCR0.RIE bit) to check that it has actually become 0b.
- Set the interrupt status flag in the interrupt controller to 0b.

7.3.18.8 Limitations on Simple SPI Mode

(1) Master Mode

- Use a resistor to pull up or pull down the clock line matching the initial settings for the transfer clock set by the CCR3.CPHA and CPOL bits when CCR0.SSE = 1b. This prevents the clock line from being placed in the high-impedance state when the CCR0.TE bit is set to 0b or unexpected edges from being generated on the clock line when the CCR0.TE bit is changed from 0b to 1b.
  In a single-master mode, pull up or pull down the clock line is not necessary because the clock line does not become high-impedance state when CCR0.SSE = 0b and CCR0.TE = 0b.
- In the case of the setting for clock delay (CCR3.CPHA = 0b), the receive data full interrupt (RXI) is generated before the final clock edge on the SCKm pin as indicated in **Figure 7.3-112**. If the TE and RE bits become 0b at this time before the final edge of the clock signal on the SCKm pin, the SCKm pin is placed in the high-impedance state, so the width of the last clock pulse of the transfer clock is shortened. Furthermore, an RXI interrupt may lead to the input signal on the SSn# pin of a connected slave going to the high level before the final edge of the clock signal on the SCKm pin, leading to incorrect operation of the slave.
- In a multi-master mode, take care because the SCKm pin output becomes high-impedance while the input on the SSn# pin is at the low level if a mode fault error occurs as the current character is being transferred. And stopping supply of the clock signal to the connected slave. Remake the settings for the connected slave to avoid misaligned bits when transfer is restarted.

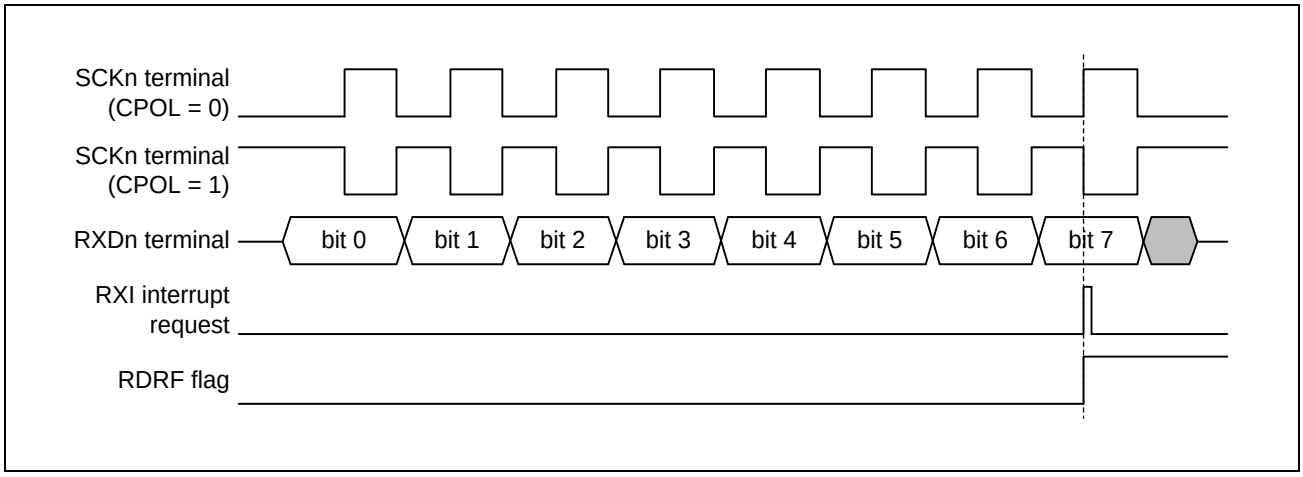


Figure 7.3-112 Timing of the RXI Interrupt in Simple SPI Mode (with Clock Delay)

(2) Slave Mode

- It takes “1 RSCI_m_PCLK + synchronization delay time + data output delay time (AC spec)” from writing the transmit data to the TDR register until the data is output to the MSIOn pin. Take these into account when starting external clock input.
- Provide an external clock signal to the master the same as the data length for transfer.
- Secure the SS input setup time (AC spec) from the SS# low-level input to the start of external clock input.
- Control the input on the SSn# pin before the start and after the end of data transfer.
- When the level being input on the SSn# pin is to be changed from low to high while the current character is being transferred, the transmission and reception are stopped immediately. Set the TE and RE bits in the CCR0 to 0b and, after remaking the settings, restart transfer of the first byte.

7.3.18.9 Notes on Transmit Enable Bit (TE)

In initial register value, when CCR0.TE = 0b, and the terminal function is TXDn, the pin outputs high impedance. So please make sure that the TXDn line will not be high impedance by the following one of ways.

1. The pull-up resistance is connected to the TXDn line.
2. Before CCR0.TE bit is 0b, the function of the terminal is changed to general-purpose input port or output port. And after CCR0.TE bit is 1b, the function of the pin is changed to TXDn.
3. In asynchronous mode, you can set CCR1 and decided level of TXDn pin during TE is 0b.

In the simple SPI mode slave operation, the MSIOn pin operates in the same way as the above TXDn pin, so please deal with 1 or 2 in the same way. (3 cannot be used.)

7.3.18.10 Notes on Simple-LIN mode

In Simple-LIN mode (CCR3.MOD[2:0] = 110b), the following functions cannot be used.

- Multi-processor communication function
- Bit Rate Modulation function
- Loopback function
- FIFO buffer

7.3.18.11 Notes on RS-485 Driver Control Function

- RS-485 Driver control function is valid only in asynchronous mode.
- When RS-485 Driver control function is active (CCR3.DEN = 1b), the TEND set timing/TEI output timing changes as follows. Wait for the TEI interrupt and set the TE bit in CCR0 to 0b.
  When RS-485 Driver control function is inactive: When STOP bit output is completed. When RS-485 Driver control function is active: At the end of DE negation time.

7.3.18.12 Notes on Loopback Function

The Loopback function is valid in asynchronous mode with internal clock and clock synchronous mode with internal clock.

7.3.18.13 Notes Regarding Register Access when Operation Clock (RSCI_m_TCLK) is Slower than Bus Clock (RSCI_m_PCLK)

If the operating clock (RSCI_m_TCLK) is slower than the bus clock (RSCI_m_PCLK), the interval for writing access to the same register should be at least RSCI_m_TCLK × 3 cycles + RSCI_m_PCLK × 3 cycles. Synchronization delay time and signal processing time are required to ensure that the setting value of the first write access is propagated to the subsequent logic circuit and the circuit is controlled correctly.

7.3.18.14 Notes on Interrupting Operation

If 0b is written to CCR0.RE during data reception and the reception operation is interrupted, there is a possibility of an invalid state, so please do not use the received data (RDR register stored value) and the flag value of each status register. To interrupt the reception operation, stop the interrupt or event link reception side and then write 0b to the CCR0.RE bit.

In addition, when 0b is written to each operation enable bit (CCR0.RE, CCR0.TE) and the operation is interrupted, the following time is required to safely stop the internal circuit. During this time, access to this register is prohibited.

RSCI_m_TCLK × 3 cycles + RSCI_m_PCLK × 3 cycles

7.3.18.15 Notes on Communication Mode Transition

When changing the communication mode setting bits CCR3.MOD[2:0] and switching the communication mode, set CCR0.RE = 0b and CCR0.TE = 0b to stop the communication operation. In order to transition the internal circuit state safely, the register access interval should be at least RSCI_m_TCLK × 3 cycles + RSCI_m_PCLK × 3 cycles. During this time, write access to this register is prohibited. As an example, the following describes the transition from Asynchronous mode to Clock- synchronous mode.

1. Confirm stop of reception and transmission at asynchronous mode (CCR3.MOD[2:0] = 000b).
2. Write 0b to CCR0.TE and CCR0.RE, stop communication.
3. Wait “RSCI_m_TCLK × 3 cycles + RSCI_m_PCLK × 3 cycles”. During this time, access to this register is prohibited.
4. Write 010b to CCR3.MOD[2:0].
5. Wait “RSCI_m_TCLK × 3 cycles + RSCI_m_PCLK × 3 cycles”. During this time, access to this register is prohibited.

SECTION 7 LOW-SPEED INTERFACE

7.4 Serial Communications Interface with FIFO (SCIFA)

This LSI has six channels of serial communication interface (SCIFA) with FIFO that support both asynchronous and clock synchronous serial communication. The SCIFA has 16-stage FIFO buffers for transmission and reception, respectively, for each channel that enable this LSI to perform efficient high-speed continuous communication.

NOTE

This LSI does not support CTS# and RTS# function.

Related descriptions of the CTS# and RTS# in this section should be ignored.

7.4.1 Overview

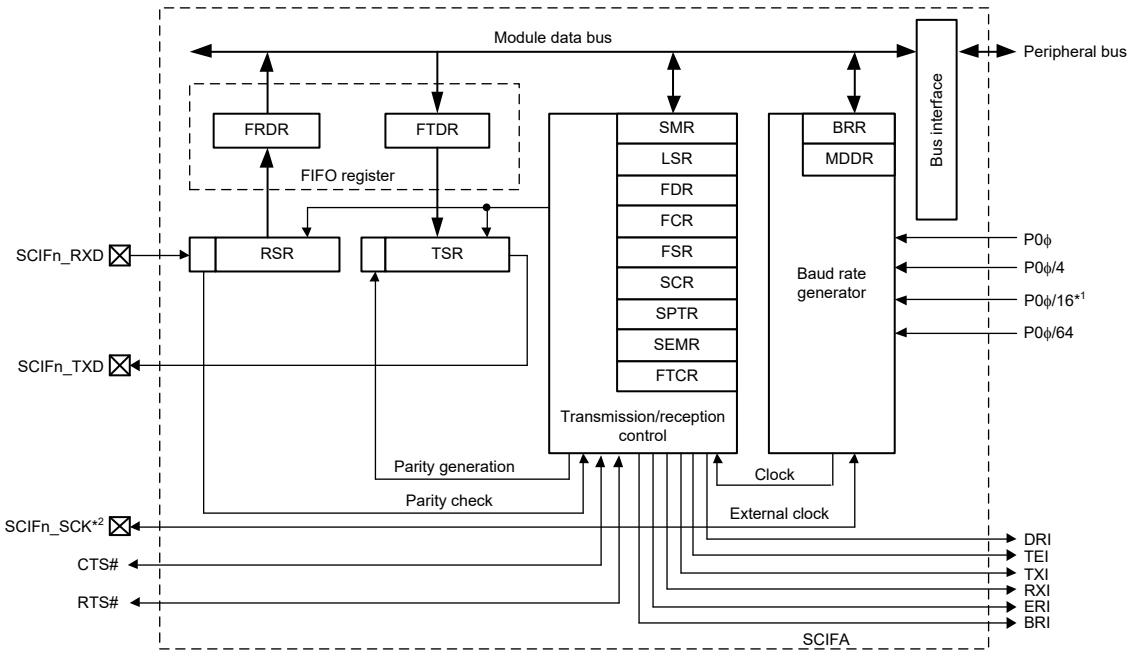

Table 7.4-1 lists the specifications of the SCIFA.

Table 7.4-1 Specifications of SCIFA

Item		Description
Channel		6 channels (ch 0, 1, 2, 3, 4, 5)
Serial communication method		Asynchronous communication mode and clock synchronous communication mode
Transfer speed		Selectable bit rate with an on-chip baud rate generator
Full duplex communication		Transmitting section: realizes continuous data transmission using 16-stage FIFO buffer Receiving section: realizes continuous data reception using 16-stage FIFO buffer
Data transmission		Selectable either LSB-first or MSB-first transfer
Interrupt source		The following six sources: • Transmit-end (TEIF) • Transmit-FIFO-data-empty (TXIF) • Receive-FIFO-data-full (RXIF) • Receive-data-ready (DRIF)*1 • Receive-error (ERIF) • Break detection or overrun (BRIF)
Asynchronous communication mode	Character length	7 or 8 bits
	Transmission stop bit length	1 or 2 bits
	Parity	Even, odd, or none
	Receive error detection	Parity, overrun, and framing errors
	Break detection	Break signal detection function by hardware.
	Clock source	Selectable from internal or external clock
	Noise cancellation	Incorporates a digital noise filter in the RXD pin input path.
Clock synchronous communication mode	Character length	8 bits
	Receive error detection	Detects an overrun error as a receive error.
	Clock source	Selectable either internal or external clock
Bit rate modulation		Enables errors to be decreased by correcting the output of the on-chip baud rate generator.

Note 1. Effective only for asynchronous communication mode

Figure 7.4-1 shows a block diagram of the SCIFA.

RSR: Receive shift register
FRDR: Receive FIFO data register
TSR: Transmit shift register
FTDR: Transmit FIFO data register
SMR: Serial mode register
SCR: Serial control register
FSR: Serial status register
MDDR: Modulation duty register
BRR: Bit rate register
SPTR: Serial port register
FCR: FIFO control register
FDR: FIFO data count register
LSR: Line status register
SEMR: Serial extended mode register
FTCR: FIFO trigger control register

Note 1. The Pϕ/16 clock is not input in the case of the channel 0 interface.

Note 2. Ch0 is not supported for SCK pin

Figure 7.4-1 Block Diagram of SCIFA

Table 7.4-2 lists the input/output pins of the SCIFA.

Table 7.4-2 Pin Configuration of the SCIFA

Channel	Pin Name	Signal Name in This Section	Input/Output	Functional Description
0	SCIF0_RXD	RXD	Input	Receive data input
	SCIF0_TXD	TXD	Output	Transmit data output
1 to 5	SCIFn_SCK	SCK	I/O	Transmission/reception clock input/output, general output
	SCIFn_RXD	RXD	Input	Receive data input
	SCIFn_TXD	TXD	Output	Transmit data output

Note: n = 1 to 5; Only ch0 don't have SCK.

7.4.2 Register Descriptions

Table 7.4-3 Base Address Table

Address Space	Channel 0	Channel 1	Channel 2	Channel 3	Channel 4	Channel 5
Cortex-A55 Address Space	H'0_100A_C000	H'0_100A_C400	H'0_1004_C000	H'0_1004_C400	H'0_1004_C800	H'0_1004_E000
Cortex-M33 Address Space Secure	H'400A_C000	H'400A_C400	H'4004_C000	H'4004_C400	H'4004_C800	H'4004_E000
Cortex-M33 Address Space Non-Secure	H'500A_C000	H'500A_C400	H'5004_C000	H'5004_C400	H'5004_C800	H'5004_E000

Table 7.4-4 List of Registers

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
Serial mode register	SMR	R/W	H'0000	H'00	16
Bit rate register	BRR	R/W	H'FF	H'02	8
Modulation duty register	MDDR	R/W	H'FF	H'02	8
Serial control register	SCR	R/W	H'0000	H'04	16
Transmit FIFO data register	FTDR	W	Undefined	H'06	8
Serial status register	FSR	R/W	H'0020	H'08	16
Receive FIFO data register	FRDR	R	Undefined	H'0A	8
FIFO control register	FCR	R/W	H'0000	H'0C	16
FIFO data count register	FDR	R	H'0000	H'0E	16
Serial port register	SPTR	R/W	H'00xx	H'10	16
Line status register	LSR	R/W	H'0000	H'12	16
Serial extended mode register	SEMR	R/W	H'00	H'14	8
FIFO trigger control register	FTCR	R/W	H'1F1F	H'16	16

Note: BRR and MDDR are located in the same address. Setting the MDDRS bit of the SEMR register switches these registers.

7.4.2.1 Receive Shift Register (RSR)

The RSR register receives serial data and temporally stores the data. The SCIFA stores the serial data input via the RXD pin into the RSR register and converts the data to the parallel form. When one byte of data has been received, it is automatically transferred to the receive FIFO data register (FRDR).

The CPU cannot read from or write to the RSR register directly.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0

7.4.2.2 Receive FIFO Data Register (FRDR)

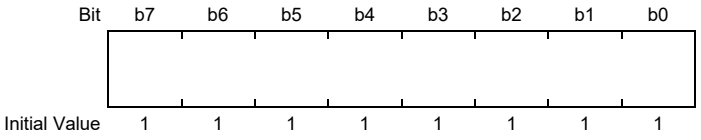
The FRDR register is a 8-bit, 16-stage FIFO register that stores the received serial data. When the SCIFA receives one byte of serial data, it transfers the received data from the receive shift register (RSR) to the FRDR register and completes the receive operation. Continuous reception is possible until the received 16 bytes of data are stored. If the FRDR register is read when there is no received data in the FRDR register, an undefined value is read.

When the FRDR register is full of received data, subsequently received serial data is lost.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0

7.4.2.3 Transmit Shift Register (TSR)

The SCIFA transfers the transmit data from the transmit FIFO data register (FTDR) to the TSR register, and then transmits the data serially to the TXD pin. After transmitting one byte of data, the SCIFA automatically transfers the next transmit data from the FTDR register into the TSR register and starts transmission.



The CPU cannot read from or write to the TSR register directly.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1

7.4.2.4 Transmit FIFO Data Register (FTDR)

The FTDR register is a 8-bit, 16-stage FIFO register that stores serial transmission data. When the SCIFA detects that the transmit shift register (TSR) is empty, it transmits data written in the FTDR register to the TSR register and starts serial transmission. Continuous serial transmission is executed until there is no transmit data left in the FTDR register. Writing the transmit data to the FTDR register should be done when a transmit data empty interrupt (TXI) request is generated. When the FTDR register becomes full of transmit data (16 bytes), no more data can be written. Even if new data is written, the data is ignored.

CPU can read from the FTDR register but cannot write to it.

7.4.2.5 Serial Mode Register (SMR)

The SMR register specifies the SCIFA serial communication format and selects the clock source for the baud rate generator.

The CPU can always read and write to the SMR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CM	CHR	PE	PM	STOP	—	CKS[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKS[1:0]	All 0	R/W	Clock Select b1 b0 0 0: 1 × Pϕ*1 0 1: 1/4 × Pϕ*1 1 0: 1/16 × Pϕ*1,*2 1 1: 1/64 × Pϕ*1
b2	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.
b3	STOP	0	R/W	Stop Bit Length 0: One stop bit 1: Two stop bits
b4	PM	0	R/W	Parity Mode 0: Even parity 1: Odd parity
b5	PE	0	R/W	Parity Enable 0: Parity bit addition or check is disabled. 1: Parity bit addition or check is enabled.
b6	CHR	0	R/W	Character Length 0: 8-bit data 1: 7-bit data*3
b7	CM	0	R/W	Communication Mode 0: Asynchronous mode 1: Clock synchronous mode
b15 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Pϕ: SCIFn_CLK_PCK (n = 0 to 5)

Note 2. This setting is not applicable to channel 0. It is only applicable to channels 1 to 5.

Note 3. When 7-bit data is selected, the MSB (bit 7) of the transmit FIFO data register is not transmitted.

CKS[1:0] Bits (Clock Select)

Select an internal clock source for the on-chip baud rate generator. For further information on the clock source, bit rate register settings, and baud rates, see **7.4.2.8 Bit Rate Register (BRR)**.

STOP Bit (Stop Bit Length)

Selects one bit or two bits as the stop bit length in asynchronous mode. This setting is used only in asynchronous mode. It is ignored in clock synchronous mode because no stop bits are added. When receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit, but if the second stop bit is 0, it is treated as the start bit of the next incoming character.

Note: When transmitting with one stop bit, a single 1 bit (stop bit) is added at the end of each transmission character.

Note: When transmitting with two stop bits, two 1 bits (stop bits) are added at the end of each transmission character.

PM Bit (Parity Mode)

Selects either the even or odd parity check. The setting of this bit is effective only when the parity enable (PE) bit of this register is set to 1 in asynchronous mode. The setting of this bit is ignored in clock synchronous mode, or when parity addition/check is disabled in asynchronous mode.

Note: If even parity is selected, the parity bit is added to data to be transmitted to make the total number of 1s even in the transmission character and parity bit combined. When receiving, the SCIFA verifies that the total number of 1s in the received character and parity bit combined is even.

Note: If odd parity is selected, the parity bit is added to data to be transmitted to make the total number of 1s odd in the transmission character and parity bit combined. When receiving, the SCIFA verifies that the total number of 1s in the received character and parity bit combined is odd.

PE Bit (Parity Enable)

Selects whether to add a parity bit on data transmission and whether to enable/disable the parity check on data reception in asynchronous mode. In clock synchronous mode, a parity bit is neither added nor checked, regardless of the setting of this bit.

Note: When this bit is set to 1, an even or odd parity bit specified in the PM bit is added to data to be transmitted. The SCIFA verifies whether the parity bit of the received data is even or odd as specified in the PM bit when receiving.

CHR Bit (Character Length)

Selects 7- or 8-bit data length in asynchronous mode. In clock synchronous mode, the data length is always 8 bits, regardless of the CHR setting.

CM Bit (Communication Mode)

Selects whether the SCIFA operates in asynchronous or clock synchronous mode.

7.4.2.6 Serial Control Register (SCR)

The SCR register enables or disables the SCIFA transmission/reception and interrupt requests, and selects the transmit/receive clock source. The CPU can always read from and write to the SCR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TIE	RIE	TE	RE	REIE	TEIE	CKE[1:0]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKE[1:0]	All 0	R/W	Clock Enable In asynchronous mode: b1 b0 0 0: Internal clock or SCK pin is used for input pin (input signal is ignored). The SCK pin state depends on the SCKIO and SCKDT bits in SPTR. 0 1: Internal clock or SCK pin is used for clock output (The output clock frequency is 16 or 8 times of the bit rate). 1 0: External clock or SCK pin is used for clock input (The input clock frequency is 16 or 8 times of the bit rate). 1 1: Setting prohibited In clock synchronous mode: b1 b0 0 0: Internal clock or SCK pin is used for synchronous clock output. 0 1: Internal clock or SCK pin is used for synchronous clock output. 1 0: External clock or SCK pin is used for synchronous clock input. 1 1: Setting prohibited
b2	TEIE*1	0	R/W	Transmit End Interrupt Enable 0: Transmit end interrupt (TEI) request is disabled. 1: Transmit end interrupt (TEI) request is enabled.
b3	REIE	0	R/W	Receive Error Interrupt Enable 0: Receive-error interrupt (ERI) and break interrupt (BRI) requests are disabled. 1: Receive-error interrupt (ERI) and break interrupt (BRI) requests are enabled.
b4	RE	0	R/W	Receive Enable 0: Data reception is disabled. 1: Data reception is enabled.
b5	TE	0	R/W	Transmit Enable 0: Data transmission is disabled. 1: Data transmission is enabled.
b6	RIE	0	R/W	Receive Interrupt Enable 0: Receive-FIFO-data-full interrupt (RXI), receive-data ready interrupt (DRI), receive-error interrupt (ERI), and break interrupt (BRI) requests are disabled. 1: Receive-FIFO-data-full interrupt (RXI), receive-data ready interrupt (DRI), receive-error interrupt (ERI), and break interrupt (BRI) requests are enabled.
b7	TIE	0	R/W	Transmit Interrupt Enable 0: Transmit-FIFO-data-empty interrupt request (TXI) is disabled. 1: Transmit-FIFO-data-empty interrupt request (TXI) is enabled.
b15 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. TEI interrupt requests can be cleared by reading 1 from TEND flag, and then clearing the setting to 0, or by setting the TEIE bit to 0.

CKE[1:0] Bits (Clock Enable)

Select the SCIFA clock source and enable or disable clock output from the SCK pin. Depending on the settings of these bits, the SCK pin can be used for serial clock output or serial clock input. If the SCK pin is set for the synchronous clock output in the clock synchronous mode, set the CM bit in the SMR register to 1, and then set the CKE[1:0] bits. The settings of the CKE[1:0] bits are listed in **Table 7.4-17**.

REIE Bit (Receive Error Interrupt Enable)

Specifies whether to enable or disable a receive-error interrupt (ERI) request and a break interrupt (BRI) request. The setting of this bit is only valid when the RIE bit is set to 0.

Note: ERI interrupt requests can be cleared by reading 1 from the ER bit in the FSR register, and then clearing the setting to 0, or by clearing both the RIE and REIE bits in this register to 0. BRI interrupt requests can be cleared by reading 1 from the BRK bit in the FSR register, or from the ORER flag in the LSR register, and then clearing the setting to 0, or by clearing both the RIE and REIE bits in this register to 0.

RE Bit (Receive Enable)

Specifies whether to enable or disable the serial data reception.

Note: Setting this bit to 0 does not affect the receive flags (DR, ER, BRK, RDF, FER, and PER in the FSR register, and ORER in the LSR register). These flags retain their previous values.

Note: Serial reception starts when a start bit is detected in asynchronous mode, or a synchronous clock input is detected in clock synchronous mode. Before setting this bit to 1, be sure to set the serial mode register (SMR) and the FIFO control register (FCR) to select the receive format and reset the receive FIFO.

TE Bit (Transmit Enable)

Specifies whether to enable or disable the serial data transmission.

Note: Serial transmission starts after writing of data to be transmitted into the FTDR register under this condition. Before setting this bit to 1, be sure to set the serial mode register (SMR) and the FIFO control register (FCR) to select the transmit format and reset the transmit FIFO.

RIE Bit (Receive Interrupt Enable)

Specifies whether to enable or disable a receive-FIFO-data-full (RXI) interrupt request when the RDF flag in the serial status register (FSR) is set to 1, a receive-data ready (DRI) interrupt request when the DR flag in the FSR register is set to 1, a receive-error (ERI) interrupt request when the ER flag in the FSR register is set to 1, and a break (BRI) interrupt request when the BRK flag in the FSR register or the ORER flag in the line status register (LSR) is set to 1.

Note: RXI interrupt requests can be cleared by reading 1 from the DR or RDF flag in the FSR register, then clearing the flag to 0, or by clearing the RIE bit to 0. DRI interrupt requests can be cleared by reading 1 from the DR flag in the FSR register, and then clearing the setting to 0, or by clearing the RIE bit in this register to 0. Receive error interrupt (ERI) requests and break interrupt (BRI) requests can be cleared by clearing both the RIE and REIE bits in this register to 0.

TIE Bit (Transmit Interrupt Enable)

Specifies whether to enable or disable a transmit-FIFO-data-empty interrupt (TXI) request when the serial transmit data is transferred from the transmit FIFO data register (FTDR) into the transmit shift register (TSR), the quantity of data in the transmit FIFO data register falls below the specified trigger number for transmission, and the TDFE flag in the serial status register (FSR) is set to 1.

Note: TXI interrupt requests can be cleared either by writing a greater quantity of transmit data than the specified transmission trigger number into the FTDR register, reading 1 from the TDFE flag, and then clearing the TDFE flag to 0, or by clearing this bit to 0.

7.4.2.7 Serial Status Register (FSR)

The FSR register is a 16-bit register. The 8 lower-order bits indicate the status flag representing the SCIFA operating state.

The CPU can always read and write to the FSR register, but cannot write 1 to the status flags (ER, TEND, TDFE, BRK, RDF, and DR bits) in this register. These flags can be only cleared to 0 when they have first been read (after being set to 1). b3 (FER) and b2 (PER) are read-only bits that cannot be written.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ER	TEND	TDFE	BRK	FER	PER	RDF	DR
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R(/W)*1	R(/W)*1	R(/W)*1	R(/W)*1	R	R	R(/W)*1	R(/W)*1

Bit	Bit Name	Initial Value	R/W	Description
b0	DR	0	R/(W) *1	Receive Data Ready Flag 0: Reception is in progress, or no received data has remained in the FRDR register after normally completed receiving. 1: Next receive data has not been received.
b1	RDF	0	R/(W) *1	Receive FIFO Data Full Flag 0: The quantity of receive data in the FRDR register falls below the specified reception trigger number. 1: The quantity of receive data written in the FRDR register is equal to or greater than the specified reception trigger number.
b2	PER	0	R	Parity Error Flag*4 0: No receive parity error occurred in the next receive data read from the FRDR register. 1: A receive parity error occurred in the next receive data read from the FRDR register.
b3	FER	0	R	Framing Error Flag*4 0: No receive framing error occurred in the next data read from the FRDR register. 1: A receive framing error occurred in the next data read from the FRDR register.
b4	BRK	0	R/(W) *1	Break Detect Flag 0: No break signal is received. 1: A break signal is received.*2
b5	TDFE	1	R/(W) *1	Transmit FIFO Data Empty Flag 0: The quantity of transmit data written in the FTDR register exceeds the specified transmission trigger number. 1: The quantity of transmit data written in the FTDR register is equal to or less than the specified transmission trigger number.*3
b6	TEND	0	R/(W) *1	Transmit End Flag 0: Transmission is in the waiting state or in progress. 1: Transmission is completed.
b7	ER	0	R/(W) *1	Receive Error Flag 0: Reception is in progress or has normally completed. 1: A framing error or parity error has occurred during reception.
b15 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. 0 can be only written to clear the flag after 1 is read.

Note 2. When a break signal is detected, transfer of the receive data (H'00) to the FRDR register stops after the detection. When the break ends and the receive signal becomes mark state (high level), the transfer of receive data resumes.

Note 3. Since the FTDR register is a 16-byte FIFO register, the maximum quantity of data that can be written when TDFE is 1 is "16 minus the number of non-transmitted data units". If additional data is written, the data is ignored. The quantity of data in the FTDR register is indicated by the 8 higher-order bits of the FDR register.

Note 4. When the DMAC is used to read data, the generation of errors cannot be checked by reading this flag.

DR Bit (Receive Data Ready Flag)

Indicates that the quantity of data stored in the receive FIFO data register (FRDR) falls below the specified reception trigger number, and that no next data has been received yet after the elapse of 15 ETUs from the last stop bit in asynchronous mode. In clock synchronous mode, this bit is not set to 1.

[Setting condition]

- DR is set to 1 when the FRDR register contains less data than the specified reception trigger number, and no next data has been received yet after the elapse of 15 ETUs*[1] from the last stop bit.

[Clearing conditions]

When either of the following is satisfied:

- DR is cleared to 0 when DR = 1 is read and then 0 is written to the DR flag.
- DR is cleared to 0 when all received data in the FRDR register are read.

Note 1. This is equivalent to one and a half (1.5) frames in the 8-bit format with one stop bit (ETU: elementary time unit).

Note: When the RE bit in SCR is cleared to 0, the DR bit is not affected and retains its previous value.

RDF Bit (Receive FIFO Data Full Flag)

Indicates that receive data has been transferred to the receive FIFO data register (FRDR), and the quantity of data in FRDR becomes equal to or greater than the specified reception trigger number.

[Setting condition]

- RDF is set to 1 when the quantity of receive data which is equal to or greater than the specified reception trigger number are stored in the FRDR register*[1].

[Clearing conditions]

- RDF is cleared to 0 when RDF = 1 is read and then 0 is written to this bit.
- RDF is cleared to 0 when the FRDR register is read.

Note 1. Since the FRDR register is a 16-byte FIFO register, the maximum quantity of data that can be read when this bit is 1 is equivalent to the specified reception trigger number. If an attempt is made to read after all the data in the FRDR register has been read, the read data is undefined. The quantity of receive data in the FRDR register is indicated by the 8 lower-order bits of the FDR register.

PER Bit (Parity Error Flag)

Indicates whether there is a parity error in the data read from the receive FIFO data register (FRDR) in asynchronous mode.

[Setting condition]

- PER is set to 1 when a parity error is present in the next data read from the FRDR register.

[Clearing condition]

- PER is cleared to 0 when no parity error is present in the next data read from the FRDR register.

FER Bit (Framing Error Flag)

Indicates whether there is a framing error in the data read from the receive FIFO data register (FRDR) in asynchronous mode.

[Setting condition]

- FER is set to 1 when a framing error is present in the next data read from the FRDR register.

[Clearing condition]

- FER is cleared to 0 when no framing error is present in the next data read from the FRDR register.

BRK Bit (Break Detect Flag)

Indicates that a break signal has been detected in receive data.

[Setting condition]

- BRK is set to 1 when data including a framing error is received, and the framing error is followed by at least one frame of data received at the space 0 level (low level).

[Clearing condition]

- BRK is cleared to 0 when software reads BRK after it has been set to 1 and then writes 0 to BRK.

TDFE Bit (Transmit FIFO Data Empty Flag)

Indicates that data has been transferred from the transmit FIFO data register (FTDR) into the transmit shift register (TSR), the quantity of data in the FRDR register becomes equal to or less than the specified transmission trigger number, and writing of transmit data to the FRDR register is enabled.

[Setting conditions]

When either of the following is satisfied:

- TDFE is set to 1 when the TE bit in SCR is 0.
- TDFE is set to 1 when the quantity of transmit data written in the FRDR register is equal to or less than the specified transmission trigger number.

[Clearing conditions]

- TDFE is cleared to 0 when 0 is written in the TDFE bit after reading TDFE = 1.
- When transmit data is written to the FTDR register

TEND Bit (Transmit End Flag)

Indicates that the FRDR register contains no more valid data and transmission is completed when transmitting the last bit of the transmit data.

[Setting condition]

When the following is satisfied:

- TEND is set to 1 when the FTDR register does not contain transmit data when the last bit of the serial transmission data is transmitted.

[Clearing conditions]

- When transmit data is written to the FTDR register
- When 0 is written to TEND after it has been read as 1

ER Bit (Receive Error Flag)

Indicates the occurrence of a framing error, or of a parity error when receiving the parity-added data*[1].

[Setting conditions]

When either of the following is satisfied:

- ER is set to 1 when the stop bit is found to be 0 after checking whether the stop bit of the received data is 1 at the end of one data receive operation*[1].
- ER is set to 1 when the total number of 1s in the received data and parity bit combined does not match the even or odd parity setting specified by the PM bit in the SMR register.

[Clearing condition]

- When 0 is written to ER after it has been read as 1

Note 1. Clearing the RE bit to 0 in the SCR register does not affect this bit, which retains its previous value. Even if a receive error occurs, the receive data is transferred to the FRDR register and the receive operation is continued. Whether the data read from the FRDR register includes a receive error can be detected by the FER and PER bits in the FSR register.

Note: In two stop bits mode, only the first stop bit is checked; the second stop bit is not checked.

7.4.2.8 Bit Rate Register (BRR)

The BRR register is an 8-bit register that, together with the baud rate generator clock source selected by the CKS[1:0] bits in the serial mode register (SMR), determines the serial transmit/receive bit rate.

This register is located in the same address as that of the MDDR register and selected when the MDDRS bit in SEMR is 0. The CPU can read and write to BRR. Writing to BRR should be executed when TE = RE = 0 in the SCR register.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The BRR setting is calculated using the following formulae.

[Asynchronous mode]

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$N = \frac{P0\phi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$N = \frac{P0\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$N = \frac{P0\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$N = \frac{P0\phi}{16 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

[Clock synchronous mode]

$$N = \frac{P0\phi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bit/s)

N: Setting of the BRR register ($0 \leq N \leq 255$) (The setting must satisfy the electrical characteristics).

P0ϕ: Operating frequency for peripheral modules (MHz)

n: Baud rate generator clock source (n = 0, 1, 2, 3) (For the clock sources and values of n, see **Table 7.4-5**).

Remark The MDDR register is used to adjust the bit rate. For details, see **7.4.2.9 Modulation Duty Register (MDDR)**.

Table 7.4-5 SMR Register Setting

n	Clock Source	SMR Register Settings	
		CKS1	CKS0
0	P0ϕ	0	0
1	P0ϕ/4	0	1
2	P0ϕ/16	1	0
3	P0ϕ/64	1	1

The bit rate error in asynchronous mode is calculated using the following formulae.

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 64 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 32 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 32 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 16 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

Table 7.4-6 list the examples of the BRR register setting in asynchronous mode, and **Table 7.4-7** list the examples of the BRR register setting in clock synchronous mode.

Table 7.4-6 Bit Rates and BRR Register Settings in Asynchronous Mode

	P0ϕ (MHz)		
	100		
Bit Rate (bps)	n	N	Error (%)
150	—	—	—
300	3	162	−0.15
600	3	80	0.47
1200	2	162	−0.15
2400	2	80	0.47
4800	1	162	−0.15
9600	1	80	0.47
14400	0	216	0.01
19200	0	162	−0.15
28800	0	108	−0.45
31250	0	99	0.00
38400	0	80	0.47
115200	0	26	0.47
500000	0	5	*1

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 0.
When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is doubled.
When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is quadrupled.
Configure settings so the range of error is no greater than 1%.

Note 1. Values for the blank cells in the table can be set using the MDDR register.
For details, see **7.4.2.9 Modulation Duty Register (MDDR)** and the **Table 7.4-12**.

Table 7.4-7 Bit Rates and BRR Register Settings in Clock Synchronous Mode

	Pϕ (MHz)	
	100	
Bit Rate (bps)	n	N
250	—	—
500	—	—
1000	—	—
2500	3	155
5000	3	77
10000	3	38
25000	1	249
50000	1	124
100000	0	249
250000	0	99
500000	0	49
1000000	0	24
2500000	0	9
5000000	0	4

Remarks —: Setting is prohibited.

Note: Continuous transmission or reception is not possible.
Set the BRR register so that the range of error can fall within 1% or less.

Table 7.4-8 lists the maximum bit rates for various frequencies in asynchronous mode when the baud rate generator is used. **Table 7.4-9** lists the maximum bit rates for various frequencies in clock synchronous mode when the baud rate generator is used. **Table 7.4-10** and **Table 7.4-11** list the maximum rates for external clock inputs in asynchronous mode and clock synchronous mode, respectively.

Table 7.4-8 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (in Asynchronous Mode)

		Settings	
Pϕ (MHz)	Maximum Bit Rate (bit/s)	n	N
100	12500000	0	0

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 1. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is 1/2. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is 1/4.

Table 7.4-9 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (in Clock Synchronous Mode)

	Discontinuous Transmission/Reception			Continuous Transmission/Reception		
		Settings			Settings	
Pϕ (MHz)	Maximum Bit Rate (bit/s)	n	N	Maximum Bit Rate (bit/s)	n	N
100	25000000	0	0	12500000	0	1

Table 7.4-10 Maximum Bit Rates with External Clock Input (in Asynchronous Mode)

Pϕ (MHz)	External Input Clock (MHz)	Maximum Bit Rate (bit/s)
100	25.00	3125000

Note: This is an example when the SEMR.ABCS0 bit is 1. When the ABCS0 bit is set to 0, the bit rate is 1/2.

Table 7.4-11 Maximum Bit Rates with External Clock Input (in Clock Synchronous Mode)

Pϕ (MHz)	External Input Clock (MHz)	Maximum Bit Rate (bit/s)
100	8.33	8330000

7.4.2.9 Modulation Duty Register (MDDR)

The MDDR register corrects the bit rate adjusted by the BRR register. The value after reset of this register is H'FF. When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (MDDR/256). The relationship between the MDDR register setting and the bit rate (B) is given by the following formula. The MDDR register is located in the same address as that of the BRR register and is selected when the MDDRS bit in SEMR is 1. This register is only writable when TE = RE = 0 in the SCR register. b7 in this register is fixed to 1.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The formulae below show the relationships between the MDDR setting and the bit rate (B) when the bit rate modulation function is used.

[Asynchronous mode]

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$B = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$B = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$B = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$B = \frac{P0\phi \times 10^6}{16 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

[Clock synchronous mode]

$$B = \frac{P0\phi \times 10^6}{8 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

When the bit rate modulation is used, the bit rate average error is given by the following formulae.

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{\text{B} \times 64 \times 2^{2\text{n}-1} \times (256/\text{MDDR}) \times (\text{N}+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{\text{B} \times 32 \times 2^{2\text{n}-1} \times (256/\text{MDDR}) \times (\text{N}+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{\text{B} \times 32 \times 2^{2\text{n}-1} \times (256/\text{MDDR}) \times (\text{N}+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{\text{B} \times 16 \times 2^{2\text{n}-1} \times (256/\text{MDDR}) \times (\text{N}+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

B: Bit rate (bits/s)

N: BRR register setting ($0 \leq N \leq 255$) (The setting must satisfy the electrical characteristics).

P0ϕ: Operating frequency for peripheral modules (MHz)

MDDR: MDDR setting ($128 \leq MDDR \leq 256$)

n: Baud rate generator clock source (n = 0, 1, 2, 3) (For the clock sources and values of n, see **Table 7.4-5**).

Table 7.4-12 Bit Rates and BRR and MDDR Registers Settings in Asynchronous Mode

	Pϕ (MHz)			
	100			
Bit Rate (bps)	n	N	MDDR	Error (%)
150	3	252	199	0.02
300	3	161	255	0.08
600	3	80	255	0.08
1200	2	161	255	0.08
2400	2	80	255	0.08
4800	1	161	255	0.08
9600	1	80	255	0.08
14400	—	—	—	—
19200	0	161	255	0.08
28800	0	107	254	0.08
31250	—	—	—	—
38400	0	80	253	0.08
115200	0	26	255	0.08
500000	0	5	246	0.10

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 0. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is doubled. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is quadrupled. Configure settings so the range of error is no greater than 1%.

7.4.2.10 FIFO Control Register (FCR)

The FCR register resets the quantity of data in the transmit FIFO data register (FTDR) and the receive FIFO data register (FRDR) and specifies the number of triggers. This register also specifies whether to enable the loop-back test.

The CPU can always read and write to the FCR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	RSTRG[2:0]			RTRG[1:0]		TTRG[1:0]		MCE	TFRST	RFRST	LOOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	LOOP	0	R/W	Loop-Back Test 0: Loop back test is disabled. 1: Loop back test is enabled
b1	RFRST	0	R/W	Receive FIFO Data Register Reset 0: Normal operation 1: Resets the FRDR register.
b2	TFRST	0	R/W	Transmit FIFO Data Register Reset 0: Normal operation 1: Resets the FTDR register.
b3	MCE	0	R/W	Modem Control Enable 0: Model signal is disabled.*1 1: Model signal is enabled.
b5, b4	TTRG[1:0]	All 0	R/W	Transmit FIFO Data Trigger Number Select b5 b4 0 0: 8 (8)*2 0 1: 4 (12)*2 1 0: 2 (14)*2 1 1: 0 (16)*2
b7, b6	RTRG[1:0]	All 0	R/W	Receive FIFO Data Trigger Number Select In asynchronous mode: b7 b6 0 0: 1 0 1: 4 1 0: 8 1 1: 14 In clock synchronous mode: b7 b6 0 0: 1 0 1: 2 1 0: 8 1 1: 14
b10 to b8	RSTRG[2:0]	All 0	R/W	RTS# Output Active Trigger Number Select b10 b8 0 0 0: 15 0 0 1: 1 0 1 0: 4 0 1 1: 6 1 0 0: 8 1 0 1: 10 1 1 0: 12 1 1 1: 14

Bit	Bit Name	Initial Value	R/W	Description
b15 to b11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. The CTS# input level does not affect the transmit operation. Similarly, the RTS# input level does not affect the receive operation.

Note 2. Values in parentheses mean the number of empty bytes in the FTDR register when the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

LOOP Bit (Loop-Back Test)

Internally connects between the transmit output pin (TXD) and the receive input pin (RXD) and between the RTS# pin and the CTS# pin, to perform loop-back testing.

RFRST Bit (Receive FIFO Data Register Reset)

Disables the receive data in the receive FIFO data register (FRDR) and makes the data to the empty state. If you set this bit to 1, be sure to clear it to 0 afterward.

TFRST Bit (Transmit FIFO Data Register Reset)

Disables the transmit data in the transmit FIFO data register (FTDR) and makes the data to the empty state. If you set this bit to 1, be sure to clear it to 0 afterward.

MCE Bit (Modem Control Enable)

Specifies whether to enable or disable the modem control signals, CTS# and RTS#. In clock synchronous mode, this bit should always be set to 0.

TTRG[1:0] Bits (Transmit FIFO Data Trigger Number Select)

Specify the reference quantity of data for transmission (i.e., the threshold number of entries to trigger the writing of further data for transmission) for setting of the TDFE flag in the serial status register (FSR). When the number of entries for transmission in the transmission FIFO, i.e. the number of entries written to the transmit FIFO data register (FTDR) that are yet to be transmitted, falls to or below the specified trigger number for transmission, the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

The setting in these bits is valid when the TTRGS bit in the FTCR register is 0. When the TTRGS bit in the FTCR register is 1, the setting of the TFTC[4:0] bits in the FTCR register is valid.

RTRG[1:0] Bits (Receive FIFO Data Trigger Number Select)

Specify the reference quantity of receive data (i.e., the threshold number of entries to trigger the reading of received data) for setting of the RDF flag in the serial status register (FSR). When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number for reception, the RDF flag is set to 1 and a receive FIFO data full interrupt (RXI) request is generated.

The setting in these bits is valid when the RTRGS bit in the FTCR register is 0. When the RTRGS bit in the FTCR register is 1, the setting of the RFTC[4:0] bits in the FTCR register is valid.

RSTRG[2:0] Bits (RTS# Output Active Trigger Number Select)

When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number, the RTS# signal is in the high state.

The setting in these bits is only valid when a modem signal is enabled by the MCE bit in this register in asynchronous mode.

7.4.2.11 FIFO Data Count Register (FDR)

The FDR register indicates the quantity of data stored in the transmit FIFO data register (FTDR) and the receive FIFO data register (FRDR).

This register indicates the quantity of transmit data in the FTDR register with the 8 higher-order bits, and the quantity of receive data in the FRDR register with the 8 lower-order bits. The CPU can always read the FDR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	T[4:0]					—	—	—	R[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b4 to b0	R[4:0]	All 0	R	Receive Data Quantity in FRDR Indicate the quantity of receive data stored in the FRDR register.
b7 to b5	—	All 0	R	Reserved These bits are read as 0.
b12 to b8	T[4:0]	All 0	R	Non-Transmitted Data Quantity in FTDR Indicate the quantity of non-transmitted data stored in the FTDR register.
b15 to b13	—	All 0	R	Reserved These bits are read as 0.

R[4:0] Bits

Indicate the quantity of receive data stored in the FRDR register.

H’00 means no received data, and H’10 means that all of the received data is stored in the FRDR register.

T[4:0] Bits

Indicate the quantity of non-transmitted data stored in the FTDR register.

H’00 means no transmit data, and H’10 means that all of the data for transmission is stored in the FTDR register.

7.4.2.12 Serial Port Register (SPTR)

The SPTR register controls input/output and data of the pins multiplexed to SCIFA function. The CPU can always read and write to the SPTR register.

NOTE

b6, b4, b2, and b0 of this register respectively indicate the input status of their corresponding pins. See the descriptions for each bit for details. Writings to these bits in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Remarks: x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
b0	SPB2DT	x	R/W	Serial Port Break Data Select Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2IO bit. See **Table 7.4-15**.
b1	SPB2IO	0	R/W	Serial Port Break Input/Output Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2DT bit.
b2	SCKDT	x	R/W	SCK Port Data Select Controls the SCK pin in combination with the CM bit in the SMR register, the SCKIO bit, and the CKE1 and CKE0 bits in the SCR register. See **Table 7.4-17**.
b3	SCKIO	0	R/W	SCK Port Input/Output Controls the SCK pin in combination with the CM bit in the SMR register, the SCKDT bit, and the CKE1 and CKE0 bits in the SCR register. See **Table 7.4-17**.
b4	CTS2DT	x	R/W	CTS# Port Data Select Controls the CTS# pin in combination with MCE bit in FCR and CTS2IO bit. See **Table 7.4-14**. The SCIF 3 and SCIF 4 channels are not supported.
b5	CTS2IO	0	R/W	CTS# Port Output Specify Controls the CTS# pin in combination with MCE bit in FCR and CTS2IO bit. See **Table 7.4-14**. The SCIF 3 and SCIF 4 channels are not supported.
b6	RTS2DT	x	R/W	RTS# Port Data Select Controls the RTS# pin in combination with MCE bit in FCR and RTS2IO bit. See **Table 7.4-13**. The SCIF 3 and SCIF 4 channels are not supported.
b7	RTS2IO	0	R/W	RTS# Port Output Specify Controls the RTS# pin in combination with MCE bit in FCR and RTS2IO bit. See **Table 7.4-13**. The SCIF 3 and SCIF 4 channels are not supported.
b15 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Remarks: x: Undefined

SPB2DT Bit (Serial Port Break Data Select)

This bit specifies the output level of the TXD pin when the setting of the SCR.TE bit is 0. The RXD pin input status can be read from this bit regardless of the SPB2IO bit setting. However, the RXD pin function must have been selected with the general I/O port.

SPB2IO Bit (Serial Port Break Input/Output)

Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2DT bit.

SCKDT Bit (SCK Port Data Select)

The SCK pin status can be read from this bit regardless of the SCKIO bit setting. (When the SCK pin is used for input, the input signal is invalid (has no means) but the pin status can be read.) However, the SCK pin function must have been selected with the general I/O port.

SCKIO Bit (SCK Port Input/Output)

Specifies input or output status of the SCK pin. This bit controls the SCK pin in combination with the SCKDT bit, the CM bit in the SMR register, and the CKE1 and CKE0 bits in the SCR register.

CTS2DT Bit (CTS# Port Data Select)

The status of the CTS# pin can be read from this bit regardless of the CTS2IO bit setting. However, the CTS# pin function must have been selected with the general I/O port.

RTS2DT Bit (RTS# Port Data Select)

The status of the RTS# pin can be read from this bit regardless of the RTS2IO bit setting. However, the RTS# pin function must have been selected with the general I/O port

Table 7.4-13 RTS# Pin Status

FCR.MCE Bit Setting	RTS2IO Bit Setting	RTS2DT Bit Setting	RTS# Pin Status
0	0	×	Setting prohibited*1
0	1	0	Low output
0	1	1	High output
1	×	×	Modem control output

Remarks: ×: Don't care

Note 1. There is no problem with the initial setting if the RTS# pin is not used.

Table 7.4-14 CTS# Pin Status

FCR.MCE Bit Setting	CTS2IO Bit Setting	CTS2DT Bit Setting	CTS# Pin Status
0	0	×	Setting prohibited*1
0	1	0	Low output
0	1	1	High output
1	×	×	Modem control input

Remarks: ×: Don't care

Note 1. There is no problem with the initial setting if the CTS# pin is not used.

Table 7.4-15 TXD Pin Status

SCR.TE Bit Setting	SPB2IO Bit Setting	SPB2DT Bit Setting	TXD Pin Status
0	0	×	Setting prohibited
0	1	0	Low output
0	1	1	High output
1	×	×	Transmit data output

Remarks: ×: Don’t care

7.4.2.13 Line Status Register (LSR)

The LSR register is a 16-bit register. The PER and FER bits indicate the number of receive errors in the receive FIFO data register. 1 cannot be written to the OREER status flag. The flag should be read as 1 prior to clearing it to 0.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	PER[3:0]				—	—	FER[3:0]				—	ORER
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R(W)*1

Bit	Bit Name	Initial Value	R/W	Description
b0	ORER	0	R/(W) *1	Overrun Error Flag 0: Reception is in progress or has normally completed. 1: An overrun error has occurred during reception.
b1	—	0	R	Reserved This bit is read as 0.
b5 to b2	FER[3:0]	All 0	R	Framing Error Count Indicates the quantity of data with a framing error among the receive data stored in the receive FIFO data register (FRDR).
b7, b6	—	All 0	R	Reserved These bits are read as 0.
b11 to b8	PER[3:0]	All 0	R	Parity Error Count Indicates the quantity of data with a parity error among the receive data stored in the receive FIFO data register (FRDR).
b15 to b12	—	All 0	R	Reserved These bits are read as 0.

Note 1. To clear the flag, 0 can be only written after 1 is read.

ORER Bit (Overrun Error Flag)

Indicates that receive operation abnormally stops due to occurrence of an overrun error. This flag is not affected and retains its previous state if the RE bit in the serial control register (SCR) is cleared to 0. The receive FIFO data register (FRDR) retains the data before an overrun error occurred, and newly received data is lost. When the ORER bit is set to 1, the SCIFA cannot continue subsequent serial reception.

[Setting condition]

- When the next serial reception is completed with the receive FIFO in full state (16-byte data is received)

[Clearing condition]

- When 0 is written to ORER after being read as 1.

Note: When the internal clock is selected while the SCIFA is in clock synchronous mode, the amount of receive data can be controlled, so no overrun occurs.

FER[3:0] Bits (Framing Error Count)

The values of bits 5 to 2 indicate the quantity of data with a framing error after the ER bit in the FSR register is set. Reading 0000 from the FER[3:0] bits means all 16-byte receive data in the FRDR register have a framing error.

PER[3:0] Bits (Parity Error Count)

The values of bits 11 to 8 indicate the quantity of data with a parity error after the ER bit in the FSR register is set. Reading 0000 from the PER[3:0] bits means all 16-byte receive data in the FRDR register have a parity error.

7.4.2.14 Serial Extended Mode Register (SEMR)

The SEMR register specifies either LSB or MSB first, enables the noise cancellation, operation in normal or double-speed mode of the baud rate generator, and bit rate modulation, and selects the modulation register and the sampling count (either 8 or 16 times).

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	BGDM	—	BRME	MDDRS	DIR	NFEN	—	ABCS0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	ABCS0	0	R/W	Asynchronous Base Clock Select 0: Operates on a frequency 16 times the transfer rate as the base clock. 1: Operates on a frequency 8 times the transfer rate as the base clock.
b1	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.
b2	NFEN	0	R/W	Noise Cancellation Enable 0: Noise cancellation for the RxD pin is disabled. 1: Noise cancellation for the RxD pin is enabled.
b3	DIR	0	R/W	Data Transfer Direction Select 0: Transmits the data in the FTDR register by the LSB-first method. The received data is stored in the FRDR register by the LSB- first method. 1: Transmits the data in the FTDR register by the MSB-first method. The received data is stored in the FRDR register by the MSB- first method.
b4	MDDRS	0	R/W	Modulation Duty Register Select 0: BRR register is accessible. 1: MDDR register is accessible.
b5	BRME	0	R/W	Bit Rate Modulation Enable 0: Bit rate modulation is disabled. 1: Bit rate modulation is enabled.
b6	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.
b7	BGDM	0	R/W	Baud Rate Generator Double- Speed Mode Select 0: Baud rate generator normal mode: Baud rate generator operates on the clock signal produced by dividing the clock source by two. 1: Baud rate generator double-speed mode: Baud rate generator operates on the clock signal produced by the clock source (no frequency division).

ABCS0 Bit (Asynchronous Base Clock Select)

Selects the base clock for 1-bit period in asynchronous mode.

This bit setting is valid only in asynchronous mode (i.e., when the CM bit in the SMR register is 0).

NFEN Bit (Noise Cancellation Enable)

Reduces noise of the input to the RxD pin. This function is only valid in asynchronous mode. For details, see **7.4.7 Noise Cancellation**.

In clock synchronous mode, this bit should always be set to 0.

DIR Bit (Data Transfer Direction Select)

Selects the serial communication format. This bit is valid only when the transmit/receive data is in 8-bit formats.*1

Note 1. Asynchronous mode or clock synchronous mode with the 8-bit data length

MDDRS Bit (Modulation Duty Register Select)

Selects the register to be enabled access to it.

BRME Bit (Bit Rate Modulation Enable)

Specifies whether to enable or disable the bit rate modulation.

BGDM Bit (Baud Rate Generator Double-Speed Mode Select)

Selects operating mode of the baud rate generator. When setting 1 in this bit, the baud rate generator included in the SCIFA operates in double-speed mode. The setting of this bit is only effective in asynchronous mode (SMR.CM bit = 0) when the internal clock is selected as the clock source (SCR.CKE[1:0] = 00b). Use normal mode under any other settings.

7.4.2.15 FIFO Trigger Control Register (FTCR)

The FTCR register is a 16-bit register that specifies FIFO trigger conditions. The CPU can always read from and write to the FTCR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RTRGS	—	—	RFTC[4:0]					TTRGS	—	—	TFTC[4:0]				
Initial Value	0	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b4 to b0	TFTC[4:0]	All 1	R/W	Transmit FIFO Data Trigger Number H'00: Transmit data trigger number is 0. H'0F: Transmit data trigger number is 15. Do not set H'10 to H'1F in these bits.
b6, b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b7	TTRGS	0	R/W	Transmit Trigger Select 0: TTRG[1:0] bits in FCR are valid. 1: TFTC[4:0] bits in FTCR are valid.
b12 to b8	RFTC[4:0]	All 1	R/W	Receive FIFO Data Trigger Number H'01: Receive data trigger number is 1. H'10: Receive data trigger number is 16. Do not set H'00 and H'11 to H'1F in these bits.
b14, b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b15	RTRGS	0	R/W	Receive Trigger Select 0: RTRG[1:0] bits in FCR are valid. 1: RFTC[4:0] bits in FTCR are valid.

TFTC[4:0] Bits (Transmit FIFO Data Trigger Number)

Specify the reference quantity of data for transmission (i.e., the threshold number of entries to trigger the writing of further data for transmission) for setting of the TDFE flag in the serial status register (FSR).

When the number of entries for transmission in the transmission FIFO, i.e. the number of entries written to the transmit FIFO data register (FTDR) that are yet to be transmitted, falls to or below the specified trigger number for transmission, the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

RFTC[4:0] Bits (Receive FIFO Data Trigger Number)

Specify the reference quantity of receive data (i.e., the threshold number of entries to trigger the reading of received data) for setting of the RDF flag in the serial status register (FSR).

When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number for reception, the RDF flag is set to 1 and a receive FIFO data full interrupt (RXI) request is generated.

7.4.3 Operation

7.4.3.1 Overview

For serial communication, the SCIFA can select either asynchronous mode in which characters are synchronized individually or a clock synchronous mode in which communication is synchronized with clock pulses.

The SCIFA has a 16-stage FIFO buffer for both transmission and receptions, reducing the overhead of the CPU and enabling continuous high-speed communication. The RTS# and CTS# signals are provided as modem control signals. Selection of a transmission/reception format is enabled with the serial mode register (SMR). **Table 7.4-16** shows the transmission format which can be selected in the serial mode register (SMR). As shown in **Table 7.4-17**, the SCIFA clock source can be selected by the combination of the CKE1 and CKE0 bits in the serial control register (SCR).

7.4.3.1.1 Asynchronous Mode

- Data length is selectable either 7 or 8 bits
- Parity addition and 1- or 2-bit stop bit addition are selectable.
  (The combination of the preceding selections determines the transmission/reception format and character length).
- In reception, it is possible to detect framing errors, parity errors, receive FIFO data full, overrun errors, receive data ready, and breaks.
- The stored data quantities are indicated in the FIFO data count register (FDR), respectively for transmit and receive FIFO data.
- An internal or external clock can be selected as the SCIFA clock source.
  When an internal clock is selected, the SCIFA operates using the clock of on-chip baud rate generator and can output the clock with a frequency 16 (or 8) times the bit rate.
  When an external clock is selected, the external clock input must have a frequency 16 (or 8) times the bit rate. (The on-chip baud rate generator is not used.)

7.4.3.1.2 Clock Synchronous Mode

- The transmission/reception format is fixed to the 8-bit data length.
- In reception, it is possible to detect overrun errors (ORER).
- An internal or external clock can be selected as the SCIFA clock source.
  When an internal clock is selected, the SCIFA operates using the clock of the on-chip baud rate generator, and outputs this clock to external devices as the synchronous clock.
  When an external clock is selected, the SCIFA operates on the input synchronous clock not using the on-chip baud rate generator.

Table 7.4-16 SMR Register Settings and SCIFA Communication Formats

SMR Register					SCIFA Transmission/Reception Format		
b7	b6	b5	b3				
CM	CHR	PE	STOP	Mode	Data Length	Parity Bit	Stop Bit Length
0	0	0	0	Asynchronous mode	8 bits	Not set	1 bit
			1				2 bits
		1	0			Set	1 bit
			1				2 bits
	1	0	0		7 bits	Not set	1 bit
			1				2 bits
		1	0			Set	1 bit
			1				2 bits
1	×	×	×	Clock synchronous mode	8 bits	Not set	None

Remarks ×: Don't care

Table 7.4-17 SMR, SCR, and SPTR Register Settings and SCIFA Clock Source Selection

SMR Register	SCR Register		SPTR Register				
b7	b1	b0	b3	b2			
CM	CKE1	CKE0	SCKIO	SCKDT	Mode	Clock Source	SCK Pin Function
0	0	0	0	×	Asynchronous mode	Internal	Input pin (input signal invalid) (Initial state)
			1	0			SCK pin state: Low
			1	1			SCK pin state: High
		1	×	×			Outputs a clock with frequency 16/8 times the bit rate*1
	1	0	×	×		External	Inputs a clock with frequency 16/8 times the bit rate*2
		1	×	×		Setting prohibited	
1	0	×	×	×	Clock synchronous mode	Internal	Outputs the synchronous clock
	1	0	×	×		External	Inputs the synchronous clock
		1	×	×		Setting prohibited	

Remarks: ×: Don't care

Note 1. SEMR.ABCS0 = 0: Output a clock that has a frequency 16 times the bit rate. SEMR.ABCS0 = 1: Output a clock that has a frequency 8 times the bit rate.

Note 2. SEMR.ABCS0 = 0: Input a clock that has a frequency 16 times the bit rate. SEMR.ABCS0 = 1: Input a clock that has a frequency 8 times the bit rate.

7.4.3.2 Operation in Asynchronous Mode

In asynchronous mode, each transmitted or received character begins with a start bit and ends with a stop bit. Serial communication is synchronized one character at a time.

The transmitting and receiving sections of the SCIFA are independent, so full duplex communication is possible. The transmitter and receiver are 16-stage FIFO buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmission and reception.

Figure 7.4-2 shows the general format of asynchronous serial communication.

In asynchronous serial communication, the communication line is normally held in the mark (high) state. The SCIFA monitors the line and starts serial communication when the line goes to the space (low) state, considered as a start bit. One serial character consists of a start bit (low), data (LSB first when LSB-first transfer is selected), parity bit (high or low), and stop bit (high), in that order.

When receiving in asynchronous mode, the SCIFA synchronizes at the falling edge of the start bit. The SCIFA samples each data bit on the eighth pulse of a clock with a frequency 16 or 8 times the bit rate*[1]. Receive data is latched at the center of each bit.

Note 1. When the SEMR.ABCS0 bit = 0, data is sampled on the eighth pulse of a clock with a frequency 16 times the bit rate.
When the SEMR.ABCS0 bit = 1, data is sampled on the fourth pulse of a clock with a frequency 8 times the bit rate.

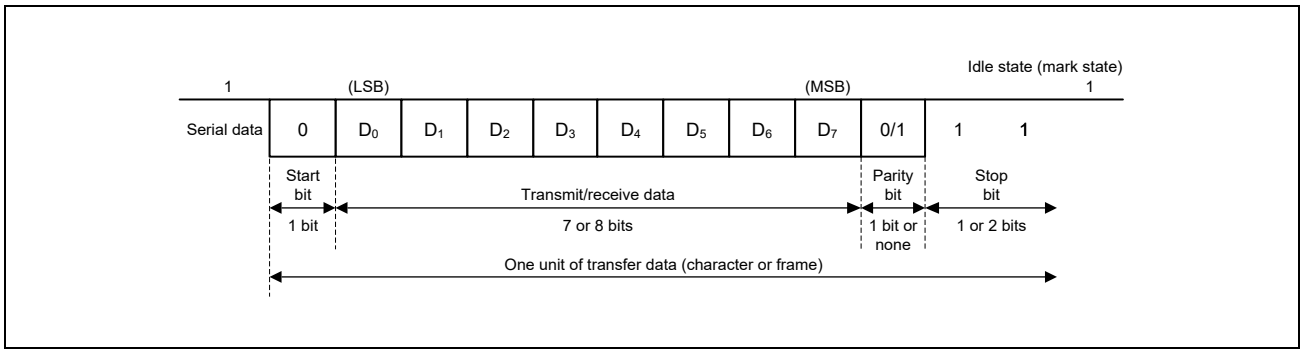

Figure 7.4-2 Data Format in Asynchronous Communication
(8-Bit Data with Parity and Two Stop Bits when LSB-First Transfer is Selected)

7.4.3.2.1 Transmit/Receive Formats

Table 7.4-18 lists the eight communications formats that can be selected in asynchronous mode. The format is selected by setting in the serial mode register (SMR).

Table 7.4-18 Serial Communications Formats (in Asynchronous Mode)

SMR Setting			Serial Transmit/Receive Format and Frame Length											
CHR	PE	STOP	1	2	3	4	5	6	7	8	9	10	11	12
0	0	0	START	8-bit data								STOP		
		1	START	8-bit data								STOP	STOP	
	1	0	START	8-bit data								P	STOP	
		1	START	8-bit data								P	STOP	STOP
1	0	0	START	7-bit data							STOP			
		1	START	7-bit data							STOP	STOP		
	1	0	START	7-bit data							P	STOP		
		1	START	7-bit data							P	STOP	STOP	

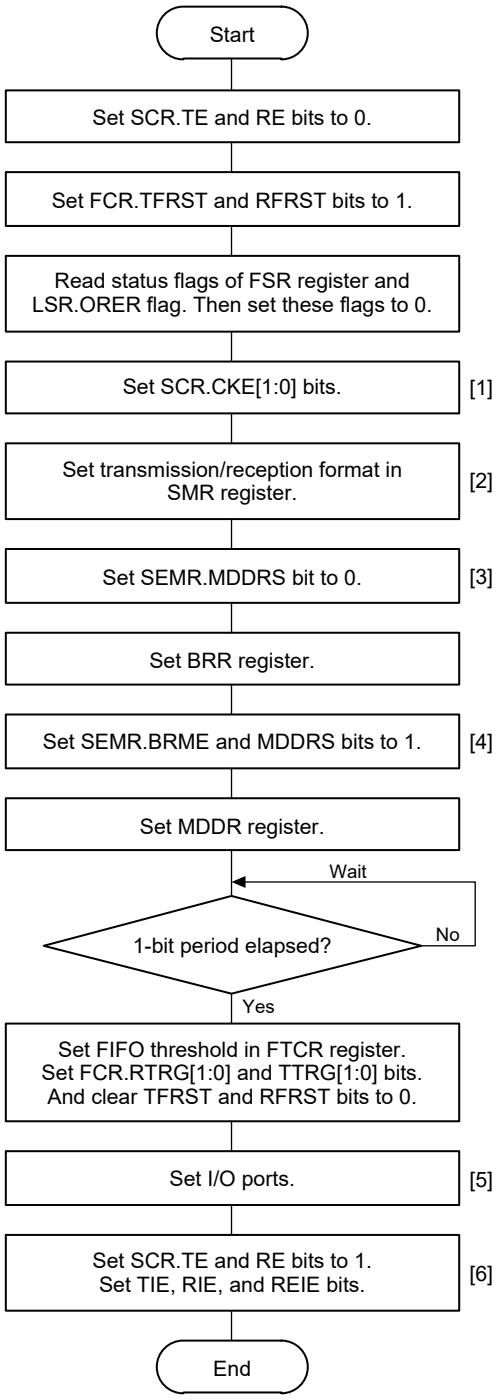
Note: START: Start bit
STOP: Stop bit
P: Parity bit

7.4.3.2.2 Clock

An SCIFA transmit/receive clock can be selected from two types of clock sources: the internal clock generated by the on- chip baud rate generator, the external clock input from the SCK pin. The clock source is selected by the settings of the CM bit in the serial mode register (SMR), the CKE[1:0] bits in the serial control register (SCR), and the ACS0 bit in the serial extended mode register (SEMR). For clock source selection, refer to **Table 7.4-17**.

When an external clock is input at the SCK pin, it must have a frequency equal to 16/8 times the desired bit rate.

When the SCIFA operates on an internal clock, it can output a clock signal on the SCK pin. The frequency of this output clock is 16/8 times the desired bit rate.



7.4.3.2.3 Transmitting and Receiving Data

SCIFA Initialization (in Asynchronous Mode)

Before transmitting or receiving data, clear the TE and RE bits to 0 in the serial control register (SCR), and then initialize the SCIFA as follows.

When changing operating mode or communication format, always clear the TE and RE bits in the SCR register to 0 before following the procedure given below. Clearing TE to 0 initializes the transmit shift register (TSR). Clearing TE and RE to 0, however, does not initialize the serial status register (FSR), transmit FIFO data register (FTDR), or receive FIFO data register (FRDR), which retain their previous contents. Clear TE to 0 after all transmit data has been transmitted and TEND flag in the FSR register is set. The TE bit can be cleared to 0 during transmission, but the transmit data (the TXD pin output level) after the TE bit is cleared to 0 depends on the settings of the SPB2IO and SPB2DT bits in the SPTR register. Set the TFRST bit in the FCR register to 1 and reset the FTDR register before TE is set to 1 again to start transmission.

When an external clock is used, the clock should not be stopped during initialization or subsequent operation. SCIFA operation becomes unreliable if the clock is stopped. **Figure 7.4-3** shows a sample flowchart for initializing the SCIFA in asynchronous mode.

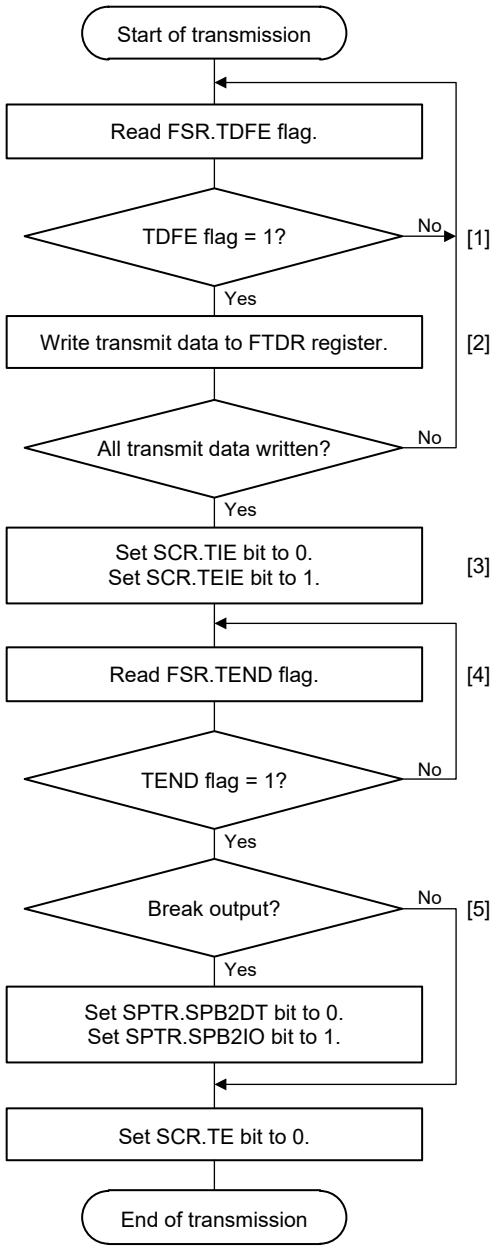
[1] Set the TIE, RIE, TE, and RE bits in the SCR register to 0 before setting the CKE[1:0] bits.

[2] Set the transmission/reception format in the SMR register.

[3] Clear the SEMR.MDDRS bit to 0 and write a value corresponding to the bit rate in the BRR register. Not necessary if an external clock is used.

[4] Set the SEMR.BRME and MDDRS bits to 1 and write a value corresponding to the bit rate in the MDDR register. Not necessary if an external clock is used. Wait for at least 1-bit period before proceeding to the next step.

[5] Set I/O ports and the MPC register so that they can be used as the SCK, TXD, and RXD pins.



[6] After setting the MDDR register, wait for at least 1-bit period and then write 1 to the SCR.TE or RE bit. To permit interrupt requests, set TIE, RIE and REIE bits to 1. Setting the TE and RE bits to 1 makes the TXD and RXD pins available to be used. The TXD pin enters the mark state and the RXD pin enters the idle state waiting for a start bit.

Figure 7.4-3 Sample Flowchart for SCIFA Initialization in Asynchronous Mode

Transmitting Serial Data (in Asynchronous Mode)

Figure 7.4-4 shows a sample flowchart for serial transmission in asynchronous mode.

Follow the procedure given below for serial data transmission after enabling the SCIFA for transmission.

[1] Check the SCIFA status and write the transmit data:
Read the FSR register, confirm that the TDFE flag is set to 1, and then write the transmit data to the FTDR register. The transmit data quantity that can be written is “16 - FDR.T[4:0]”. A change of the TDFE flag from 0 to 1 can be known by a TXIF interrupt request.

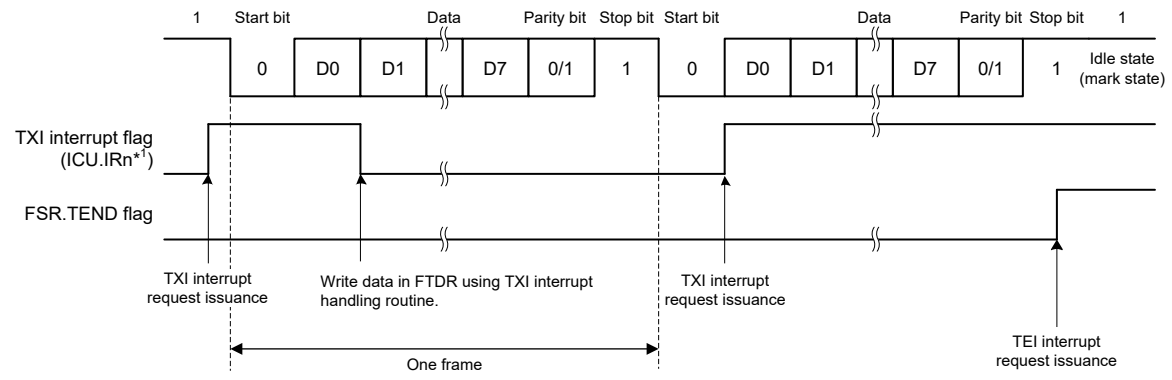
[2] Serial transmission continuation procedure:
When transmit data is written to the FTDR register, the TDFE flag is automatically cleared to 0.

[3] Serial transmission end procedure (when TXIF or TEIF interrupt is used):
After the last transmission data is written to the FTDR register, set the TIE bit to 0 and the TEIE bit to 1 in the SCR register. If the DMAC is activated to write the transmit data to the FTDR register, enable the transmit end interrupt. This will generate a CPU interrupt request when the last transmit data is written in the FTDR register. The TIE and TEIE bit settings will be changed by the CPU interrupt process.
This procedure is unnecessary if the TXIF or TEIF interrupt is not used.

[4] Serial transmission end confirmation:
Read the FSR register and confirm that the TEND flag has changed to 1.
A change of the TEND flag from 0 to 1 can be known by a TEIF interrupt request.

[5] Break output during serial transmission:
To cause a break to be output during serial transmission, set the SPB2DT bit to 0 and the SPB2IO bit to 1 in the SPTR register. Then set the SCR.TE bit to 0.*1

In Step [1], the number of data bytes that can be written can be checked by the FDR.T[4:0] flag (non-transmitted data quantity in the FTDR register).



Note 1. The SPB2DT bit of the SPTR register indicates the input status of the RXD pin. Writings to the SPB2DT and SPB2IO bits of this register in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written to the SPB2DT bit. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

Figure 7.4-4 Sample Flowchart for Transmitting Serial Data in Asynchronous Mode

In asynchronous mode, the SCIFA performs serial transmission as described below.

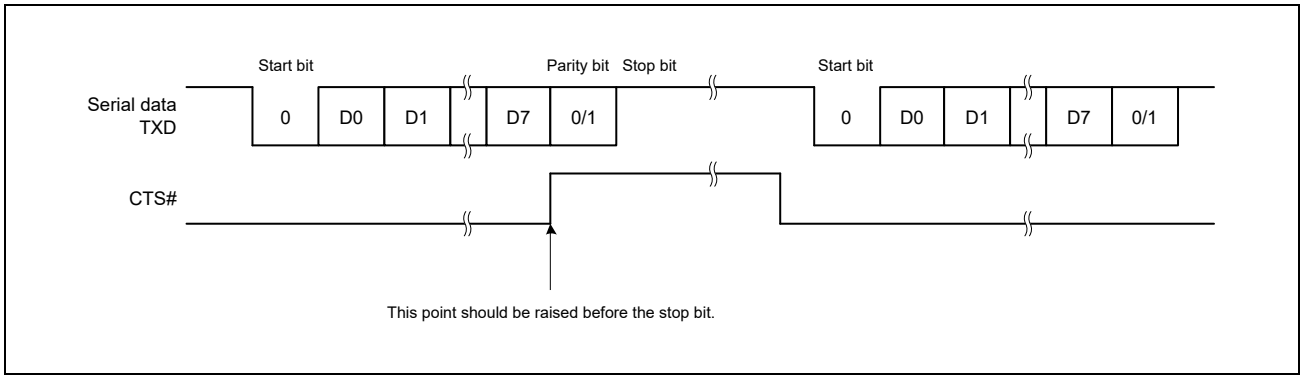
1. When data is written into the transmit FIFO data register (FTDR) by the TXI interrupt processing routine, the SCIFA transfers the data from the FTDR register to the transmit shift register (TSR) and starts transmission. Confirm that the TDFE flag in the serial status register (FSR) is set to 1 before writing transmit data to the FTDR register. The number of data bytes that can be written is “16 minus the number of non-transmitted data units”.
2. When data is transferred from the FTDR register to the TSR register and transmission is started, consecutive transmit operations are performed until there is no transmit data left in the FTDR register. When the number of transmit data bytes in the FTDR register becomes equal to or less than the transmission trigger number specified in the FIFO control register (FCR) or FIFO trigger control register (FTCR), the TDFE flag is set. If the TIE bit in the serial control register (SR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated. The serial transmit data is output from the TXD pin in the following order.
   a) Start bit: One-bit 0 is output.
   b) Transmit data: 8- or 7-bit data is output in LSB-first order (when LSB-first transfer is selected).
   c) Parity bit: One parity bit (even or odd parity) is output. (A format in which a parity bit is not output can also be selected.)
   d) Stop bit(s): One or two 1 bits (stop bits) are output.
   e) Mark state: 1 is output continuously until the start bit that starts the next transmission is output.
3. The SCIFA checks the transmit data of the FTDR register at the timing for sending the stop bit. If data is present, the data is transferred from the FTDR register to the TSR register, the stop bit is output, and then serial transmission of the next frame is started. If there is no data to be transmitted, TEND flag in the FSR register is set to 1, the stop bit is output, and then the SCIFA enters the mark state (high level) in which 1 is output continuously.

Figure 7.4-5 shows an example of the operation for transmission in asynchronous mode.

Note 1. For the corresponding interrupt number, see **4.6 Interrupt Controller**.

Figure 7.4-5 Example of Transmit Operation in Asynchronous Mode
(8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected)

4. When modem control is enabled, transmission can be stopped/resumed by the input level to the CTS# pin. When a high level is input to the CTS# pin during transmission, the SCIFA enters the mark state (high level) after completion of one-frame data transmission. When a low level is input to the CTS# pin, output of the next data to be transmitted begins with a start bit. **Figure 7.4-6** shows an example of the operation for transmission when using the modem control function.



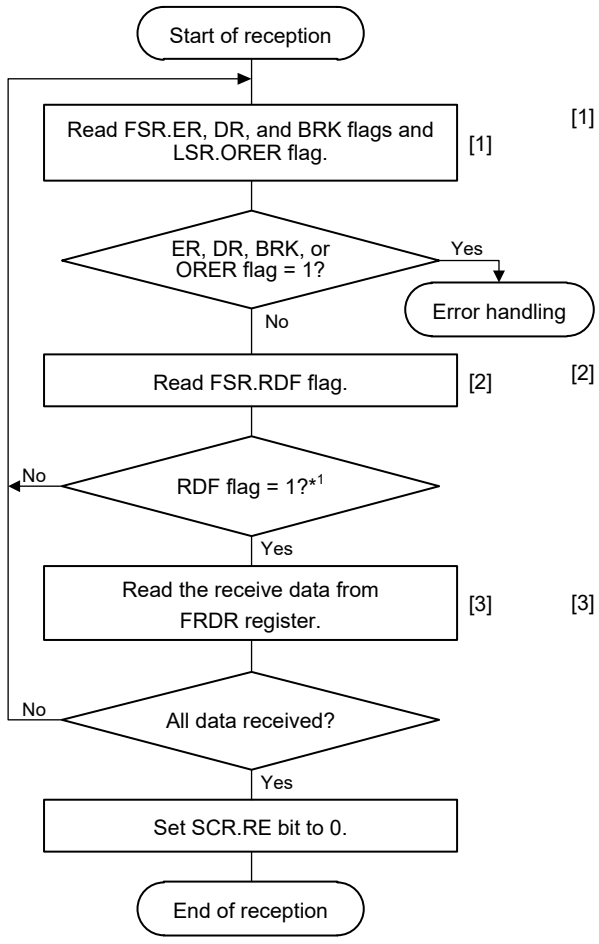


Figure 7.4-6 Example of Transmit Operation in Asynchronous Mode Using Modem Control Function (CTS#)

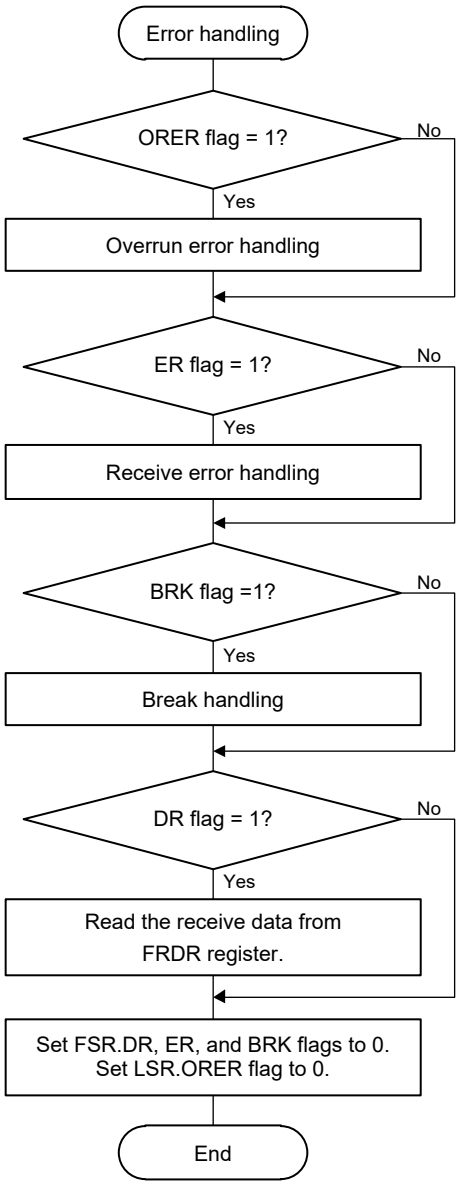
Receiving Serial Data (in Asynchronous Mode)

Figure 7.4-7 and **Figure 7.4-8** show sample flowcharts for serial reception in asynchronous mode. Follow the procedure given below for serial data reception after enabling the SCIFA for reception.



[1] Receive error handling and break detection:
When a receive error occurs, read the ER, DR, and BRK flags in the FSR register and the LSR.ORER flag to identify the error. After handling the error as specified, clear the ER, DR, BRK, and ORER flags to 0.
In the case where a framing error occurs, a break can be detected by reading the value of the RXD pin.
Error occurrence can be known by a BRIF, ERIF, or DRIF interrupt request.

[2] Check the SCIFA status and read the receive data:
Read the FSR register, confirm that the RDF flag is set to 1, and then read the receive data at least as much as the amount specified by the receive FIFO threshold from those stored in the FEDR register. The receive data quantity that can be read can be checked by the FDR.R[4:0] flag.
A change of the RDF flag from 0 to 1 can be known by an RXIF interrupt request.

[3] Serial reception continuation procedure:
When receive data is read from the FRDR register, the RDF flag is automatically cleared to 0.

Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 7.4-7 Sample Flowchart for Receiving Serial Data in Asynchronous Mode (1)

- Whether a framing error or parity error has occurred in the received data that is read from the FRDR register can be checked with the FER and PER flags in the FSR register.
- When a break signal is received, the received data is not transferred to the FRDR register while the BRK flag is set to 1. However, note that the last data in the FRDR register is H'00 and the break data in which a framing error occurred is stored.

Figure 7.4-8 Sample Flowchart for Receiving Serial Data in Asynchronous Mode (2)

In asynchronous mode, the SCIFA performs serial reception as described below.

1. The SCIFA monitors the communication line, and if a 0 start bit is detected, it performs internal synchronization to start reception.
2. The received data is stored into the RSR register in LSB-to-MSB order (when LSB-first transfer is selected).
3. The parity bit and stop bit are received.
   After receiving these bits, the SCIFA carries out the following checks.
   a) Stop bit check: The SCIFA checks whether the stop bit is 1. If there are two stop bits, only the first is checked.
   b) The SCIFA checks whether receive data can be transferred from the receive shift register (RSR) to the receive FIFO data register (FRDR).
   c) Parity bit check: The SCIFA checks whether the parity bit is an expected value.
