Rev.1.10 Jul, 2026

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

Trademarks

Renesas and the Renesas logo are trademarks of Renesas Electronics Corporation. All trademarks and registered trademarks are the property of their respective owners.

© 2026 Renesas Electronics Corporation. All rights reserved.

Trademarks (continued)

For the “Cortex” notation, it is used as follows;
— Arm® Cortex®-A55
— Arm® Cortex®-M33
Note that in each section of the Manual, this may be noted as Cortex-A55 and Cortex-M33 respectively.

Examples of trademark or registered trademark used in the document of RZ/G3L;
AMBA®: AMBA is a registered trademark of Arm Limited.
CoreLink™: CoreLink is a trademark of Arm Limited.
CoreSight™: CoreSight is a trademark of Arm Limited.
Mali™: Mali is a trademark of Arm Limited.
TrustZone®: TrustZone is a trademark of Arm Limited.
Neon™: Neon is a trademark of Arm Limited.
OpenGL ES™: OpenGL ES is a trademark of Khronos Group, Inc.
eMMC™: eMMC is a trademark of MultiMediaCard Association
PCIe®: PCIe is a registered trademark of PCI-SIG, Inc.
PCI Express®: PCI Express is a registered trademark of PCI-SIG, Inc.
MIPI®: MIPI is a registered trademark of MIPI Alliance, Inc.
CSI-2®: CSI-2 is a registered trademark of MIPI Alliance, Inc.
DSI®: DSI is a registered trademark of MIPI Alliance, Inc.
I3C®: I3C is a registered trademark of MIPI Alliance, Inc.
D-PHY®: D-PHY is a registered trademark of MIPI Alliance, Inc.

Note that in each section of the Manual, trademark notation of ® and TM may be omitted.
All other trademarks and registered trademarks are the property of their respective owners.

Portions Copyright ©2021, 2022, 2023 Synopsys, Inc. Used with permission. All rights reserved.
Synopsys & DesignWare are registered trademarks of Synopsys, Inc.

Notes on the Use of Specific Technologies

1. You are required to obtain a license for the use of the technologies listed in the table below (hereinafter referred to as the “specific technology” or “specific technologies”), that are used in this LSI chip. You shall correctly obtain a license for the use of each specific technology that is in use or available for use and maintain the validity of all such licenses for as long as any of your products incorporating this LSI chip continue to be manufactured, sold, or in use. In addition, if you manufacture and supply products that incorporate this LSI chip for sale under the trademark of a third party (OEM supply), you are requested to notify such third parties that obtaining licenses for the use of the specific technologies will be required.

Technology Name
SD
H.264
H.265

2. Renesas Electronics do not grant any rights to you, and make no warranties of any kind, including but not limited to warranties of merchantability and compatibility with specific purposes and warranties of non-infringement of third party rights. In the event that you receive a claim from a third party due to your failure to correctly obtain a license to use a specific technology, you shall resolve the claim at your own responsibility and expense. Renesas Electronics shall not be liable for any damages, liabilities, or costs that may be incurred by you or any third party.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

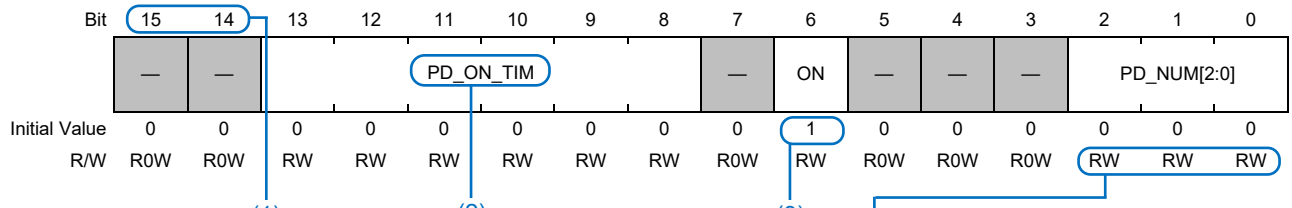
How to Use This Manual

1. Objective and Target Users

This manual was written to explain the hardware functions and electrical characteristics of this LSI to the target users, i.e. those who will be using this LSI chip in the design of application systems. Target users are expected to understand the fundamentals of electrical circuits, logic circuits, and microcomputers.

This manual is structured to cover the following items: an overview of the product, descriptions of the CPU, system control functions, and peripheral functions, electrical characteristics of the device, and usage notes.

When designing an application system that includes this LSI chip, take all points to note into account. Points to note are given in their contexts, at the final parts of each of the sections, and in the section giving usage notes.



The list of revisions is a summary of major points of revision or addition for this and earlier versions. It does not cover all revised items. For details on the revised points, see the actual locations in the manual.

---

2. Description of Registers

Each register description includes a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meanings of the bit settings. The standard format and notation for use with bit charts and tables are described below.

[Bit Chart]

[Table of Bits]

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R0W	Reserved These bits are read as 0b. The write value should be 0b.
13 to 8	PD_ON_TIM	0h	RW	Set the power-on time for power domain unit.
7	—	0h	R0W	Reserved These bits are read as 0b. The write value should be always 0b.
6	ON	1h	RW	Writing to this register starts the process of turning on/off the power domain. 0b: Power off 1b: Power on
5 to 3	—	All 0	R0W	Reserved These bits are read as 0b. The write value should be always 0b.
2 to 0	PD_NUM[2:0]	0h	RW	Specify the power domain to be turned on/off. 000b: The power on/off process does not start. 001b: The processing target is PD_1. 010b: The processing target is PD_2. 100b: The processing target is PD_3. Settings other than the above are prohibited.

Note: The bit names and statements in the above figure and table are examples and have nothing to do with the main contents of this manual.

(1) Bit

Indicates the bit number or numbers.
In the case of a 64-bit register, the bits are arranged in order from 63 to 0.
In the case of a 32-bit register, the bits are arranged in order from 31 to 0.
In the case of a 16-bit register, the bits are arranged in order from 15 to 0.
In the case of a 8-bit register, the bits are arranged in order from 7 to 0.

(2) Bit name

Indicates the name of the bit or bit field.
When the number of bits must be clearly indicated for a bit field, appropriate notation is included (e.g., PD_NUM[2:0]).
Certain kinds of bits, such as those of timer counters, are not assigned bit names. In such cases, the entry under “Bit Name” is blank (e.g., PD_ON_TIM).

A reserved bit is indicated by “—”. Make sure to use the specified values when writing to such bits or fields. Otherwise, the correct operation of this LSI chip is not guaranteed.

(3) Initial value

Indicates the initial value of each bit.

0: The initial value is 0.

1: The initial value is 1.

x/—: The initial value is undefined.

(4) R/W

For each bit and bit field, this entry indicates whether the bit or field is readable, writable, or both.

(5) Description

Describes the function of the bit or field and specifies the values for writing.

Note: Access to reserved addresses is prohibited.
Do not access these addresses. In case of access, correct operation of this LSI chip is not guaranteed.

Note: Access to the unavailable units is prohibited (see the product lineup). Use the related registers in the initial state.

3. Notation of Numbers and Symbols

Number notation: Binary numbers are given as XXXXb (or B’XXXX, b’XXXX), hexadecimal numbers are given as XXXXh (or H’XXXX, h’XXXX, 0xXXXX), and decimal numbers are given as XXXX.

4. List of Abbreviations

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ATB	Advanced Trace Bus
AWO	Always in use (ON) power
AXI	Advanced Extensible Interface
BCD	Binary Coded Decimal
CBC	Cipher Block Chaining
CCM	Counter with CBC-MAC
CMAC	Cipher-based Message Authentication Code
CSI	Camera Serial Interface
CTR	Counter
DACK	DMA acknowledgement
DAP	Debug Access Port
DDR	Double Data Rate
DPA	Differential Power Analysis
DREQ	external DMA request
DSI	Display Serial Interface
DSP	Digital Signal Processor
ECB	Electronic Codebook
ECC	Elliptic Curve Cryptography
ECC	Error Correcting Code
ETF	Embedded Trace FIFO
ETM	Embedded Trace Macrocell
ETR	Embedded Trace Router
FIPS	Federal Information Processing Standards
FPU	Floating Point Unit
GCM	Galois/Counter Mode
GMAC	Galois Message Authentication Code
GPIO	General Purpose Input Output
I2S	Inter IC Sound (Audio format)
IRQ	Interrupt Request
ISO	Isolation (Power domain)
JTAG	Joint Test Action Group
LFBGA	Low-profile Fine-pitch Ball Grid Array
LIN	Local Interconnect Network
LUT	Look Up Table
LPDDR	Low Power Double Date Rate
LSB	Least Significant Bit
MIPI	Mobile Industry Processor Interface
MMU	Memory Management Unit
MSB	Most Significant Bit
NIST	National Institute of Standards and Technology
NMI	Non Maskable Interrupt

Abbreviation	Description
PHY	PHYsical Layer
PLL	Phase Locked Loop
PMIC	Power Management Integrated Circuit
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
SDR	Single Data Rate
SHA	Secure Hash Algorithm
SPA	Simple Power Analysis
SSCG	Spread Spectrum Clock Generator
SWD	Serial Wire Debug
TCP/IP	Transmission Control Protocol/Internet Protocol
TDM	Time Division Multiplexing (Audio format)
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter
UHS-I	Ultra High Speed Phase I
Vcm	Common Mode Voltage (LVDS)
ViD	Differential input voltage (LVDS)
Vos	Offset Voltage (LVDS)
WFI	Wait For Interrupt
XTS	XEX encryption mode with tweak and ciphertext stealing

3.6.7.5 SRAM Interface with Byte Selection....241
3.6.7.6 Wait between Access Cycle 244
3.6.8 Usage Notes 247
3.6.8.1 Caution on Write Buffer 247
3.6.8.2 Usage Note on Changing CKIO Clock Selections....247
SECTION 4 SYSTEM....248
4.1 System Overview....248
4.2 Pin Function Controller (PFC) 250
4.2.1 Overview 250
4.2.1.1 General Purpose Input Output Port (GPIO) 250
4.2.1.2 Port Function Control....250
4.2.1.3 Special Purpose Port Function Control 251
4.2.1.4 General Purpose Input Output Port Configuration 252
4.2.1.5 Special Purpose Port Configuration 258
4.2.2 Register Configuration 262
4.2.2.1 Port Register (P_m)....262
4.2.2.2 Port Mode Register (PM_m)....263
4.2.2.3 Port Mode Control Register (PMC_m)....263
4.2.2.4 Port Function Control Register (PFC_m)....264
4.2.2.5 Port Input Register (PIN_m) 264
4.2.2.6 Interrupt Enable Control Register (ISEL_m)....265
4.2.2.7 Driving Ability Control Register (IOLH_m)....266
4.2.2.8 Pull-Up/Pull-Down Switching Register (PUPD_m) 267
4.2.2.9 Write Protected Register (PWPR) 267
4.2.2.10 Digital Noise Filter Switching Register (FILONOFF_m) 268

4.2.2.11 Digital Noise Filter Number Register (FILNUM_m) 269
4.2.2.12 Digital Noise Filter Clock Selection Register (FILCLKSEL_m) 270
4.2.2.13 Ether Ch0 IO Voltage Mode Control Register (ETH0_POC) 271
4.2.2.14 Ether Ch1 IO Voltage Mode Control Register (ETH1_POC) 271
4.2.2.15 Ether Mode Control Register (ETH_MODE) 271
4.2.2.16 SD Ch0 IO Voltage Mode Control Register (SD_CH0_POC) 271
4.2.2.17 SD Ch1 IO Voltage Mode Control Register (SD_CH1_POC) 271
4.2.2.18 XSPI IO Voltage Mode Control Register (XSPI_POC) 271
4.2.2.19 Input Enable Control Register (IEN_m) 272
4.2.2.20 I3C Control Register (I3C_SET) 272
4.2.2.21 XSPI Output Enable Control Register (XSPI Hi-Z) 272
4.2.2.22 SD Ch2 IO Voltage Mode Control Register (SD_CH2_POC) 272
4.2.2.23 OTHER IO Voltage Mode Control Register (OTHER_POC) 272
4.2.3 Register Descriptions 273
4.2.3.1 Port Register (P_m) 273
4.2.3.2 Port Mode Register (PM_m) 274
4.2.3.3 Port Mode Control Register (PMC_m) 275
4.2.3.4 Port Function Control Register (PFC_m) 276
4.2.3.5 Port Input Register (PIN_m) 278
4.2.3.6 Interrupt Enable Control Register (ISEL_m) 279
4.2.3.7 Driving Ability Control Register (IOLH_m) 281
4.2.3.8 Pull-Up/Pull-Down Switching Register (PUPD_m) 283
4.2.3.9 Write Protected Register (PWPR) 285
4.2.3.10 Digital Noise Filter Switching Register (FILONOFF_m) 286
4.2.3.11 Digital Noise Filter Number Register (FILNUM_m) 288
4.2.3.12 Digital Noise Filter Clock Selection Register (FILCLKSEL_m) 290
4.2.3.13 Ether Ch0 Voltage Mode Control Register (ETH0_POC) 293
4.2.3.14 Ether Ch1 Voltage Mode Control Register (ETH1_POC) 294
4.2.3.15 Ether Mode Control Register (ETH_MODE) 295
4.2.3.16 SD Ch0 IO Voltage Mode Control Register (SD_CH0_POC) 296
4.2.3.17 SD Ch1 IO Voltage Mode Control Register (SD_CH1_POC) 297
4.2.3.18 XSPI IO Voltage Mode Control Register (XSPI_POC) 298
4.2.3.19 Input Enable Control Register (IEN_m) 299
4.2.3.20 I3C Control Register (I3C_SET) 300
4.2.3.21 XSPI Output Enable Control Register (XSPI Hi-Z) 301
4.2.3.22 SD Ch2 IO Voltage Mode Control Register (SD_CH2_POC) 303
4.2.3.23 OTHER IO Voltage Mode Control Register (OTHER_POC) 304
4.2.4 Operation 305
4.2.4.1 Operation for GPIO Function 305
4.2.4.2 Operation for Peripheral Function 305
4.3 System Controller (SYSC) 306
4.3.1 Overview 306
4.3.1.1 Features 306
4.3.2 Block Diagram of SYSC 307
4.3.3 Registers 308
4.3.3.1 Register Configuration 308
4.3.3.2 Register Descriptions 311
4.3.3.2.1 Master Access Control Register 0 (SYS_MSTACCCTL0) 311
4.3.3.2.2 Master Access Control Register 1 (SYS_MSTACCCTL1) 313
4.3.3.2.3 Master Access Control Register 2 (SYS_MSTACCCTL2) 316
4.3.3.2.4 Master Access Control Register 3 (SYS_MSTACCCTL3) 319

4.3.3.2.5 Master Access Control Register 4 (SYS_MSTACCCTL4) 321
4.3.3.2.6 Master Access Control Register 6 (SYS_MSTACCCTL6) 323
4.3.3.2.7 Slave Access Control Register 0 (SYS_SLVACCCTL0) 325
4.3.3.2.8 Slave Access Control Register 2 (SYS_SLVACCCTL2) 326
4.3.3.2.9 Slave Access Control Register 3 (SYS_SLVACCCTL3) 327
4.3.3.2.10 Slave Access Control Register 4 (SYS_SLVACCCTL4) 328
4.3.3.2.11 Slave Access Control Register 5 (SYS_SLVACCCTL5) 329
4.3.3.2.12 Slave Access Control Register 6 (SYS_SLVACCCTL6) 330
4.3.3.2.13 Slave Access Control Register 7 (SYS_SLVACCCTL7) 331
4.3.3.2.14 Slave Access Control Register 8 (SYS_SLVACCCTL8) 332
4.3.3.2.15 Slave Access Control Register 9 (SYS_SLVACCCTL9) 333
4.3.3.2.16 Slave Access Control Register 10 (SYS_SLVACCCTL10) 334
4.3.3.2.17 Slave Access Control Register 11 (SYS_SLVACCCTL11) 335
4.3.3.2.18 Slave Access Control Register 12 (SYS_SLVACCCTL12) 336
4.3.3.2.19 Slave Access Control Register 14 (SYS_SLVACCCTL14) 336
4.3.3.2.20 Slave Access Control Register 16 (SYS_SLVACCCTL16) 337
4.3.3.2.21 Slave Access Control Register 17 (SYS_SLVACCCTL17) 337
4.3.3.2.22 Slave Access Control Register 18 (SYS_SLVACCCTL18) 338
4.3.3.2.23 Slave Access Control Register 20 (SYS_SLVACCCTL20) 338
4.3.3.2.24 ECCRAM0 ECC Setting Register (SYS_RAM0_ECC) 339
4.3.3.2.25 ECCRAM0 Access Control Register (SYS_RAM0_EN) 339
4.3.3.2.26 ECCRAM1 ECC Setting Register (SYS_RAM1_ECC) 340

4.6.1.5.5 TINT Status Control Register (TSCR) [IA55/IM33] 861
4.6.1.5.6 TINT Interrupt Type Selection Register0 (TITSR0) [IA55/IM33]..... 862
4.6.1.5.7 TINT Interrupt Type Selection Register1 (TITSR1) [IA55/IM33]..... 862
4.6.1.5.8 TINT Interrupt Input Select Register (INTTSEL) [IA55/IM33]..... 863
4.6.1.5.9 TINT Source Selection Register0 (TSSR0) [IA55/IM33] 866
4.6.1.5.10 TINT Source Selection Register1 (TSSR1) [IA55/IM33] 867
4.6.1.5.11 TINT Source Selection Register2 (TSSR2) [IA55/IM33] 868
4.6.1.5.12 TINT Source Selection Register3 (TSSR3) [IA55/IM33] 869
4.6.1.5.13 TINT Source Selection Register4 (TSSR4) [IA55/IM33] 870
4.6.1.5.14 TINT Source Selection Register5 (TSSR5) [IA55/IM33] 871
4.6.1.5.15 TINT Source Selection Register6 (TSSR6) [IA55/IM33] 872
4.6.1.5.16 TINT Source Selection Register7 (TSSR7) [IA55/IM33] 873
4.6.1.5.17 Bus Error Interrupt Status Control Register0 (BEISR0) [IA55/IM33]..... 874
4.6.1.5.18 Bus Error Interrupt Status Control Register1 (BEISR1) [IA55/IM33]..... 875
4.6.1.5.19 ECCRAM Error Interrupt Status Control Register0 (EREISR0) [IA55/IM33]876
4.6.1.5.20 ECCRAM Error Interrupt Status Control Register1 (EREISR1) [IA55/IM33]877
4.6.1.5.21 ECCRAM Error Interrupt Status Control Register2 (EREISR2) [IA55/IM33]878
4.6.1.5.22 ECCRAM Error Interrupt Status Control Register3 (EREISR3) [IA55/IM33]879
4.6.1.5.23 ECCRAM Error Interrupt Status Control Register4 (EREISR4) [IA55/IM33]880
4.6.1.5.24 ECCRAM Error Interrupt Status Control Register5 (EREISR5) [IA55/IM33]881
4.6.1.5.25 Interrupt Selection (GPT/MTU3a) Register0 (INTPMSEL0) [IA55/IM33].... 882
4.6.1.5.26 Interrupt Selection (GPT/MTU3a) Register1 (INTPMSEL1) [IA55/IM33].... 883
4.6.1.5.27 GPT Error Interrupt Status Control Register (PEISR) [IA55/IM33] 884
4.6.1.5.28 MHU CORE0 Interrupt Status Control Register (MISR0) [IA55 Only]..... 885
4.6.1.5.29 MHU CORE1 Interrupt Status Control Register (MISR1) [IA55 Only]..... 887
4.6.1.5.30 MHU CORE2 Interrupt Status Control Register (MISR2) [IA55 Only]..... 889
4.6.1.5.31 MHU CORE3 Interrupt Status Control Register (MISR3) [IA55 Only]..... 891
4.6.1.5.32 MHU CM33 Interrupt Status Control Register (MISR4) [IM33 Only]..... 893
4.6.1.5.33 Software Interrupt Status Control Register (SWISR) [IM33 Only]..... 895
4.6.1.6 Operation 896
4.6.1.6.1 NMI Interrupt..... 896
4.6.1.6.2 IRQ Interrupt..... 896
4.6.1.6.3 GPIO Interrupt (TINT)..... 897
4.6.1.6.4 Internal Interrupt 899
4.6.1.6.5 GPT/MTU3a Interrupt Selection 913
4.6.1.7 Usage Note 915
4.6.1.7.1 Precaution when use the peripheral modules which can initiate DMA Controller 915
4.6.1.7.2 Clear Timing of Interrupt Cause 915
4.6.1.7.3 Precaution when Changing Interrupt Settings..... 915

4.6.2 Generic Interrupt Controller (GIC) and Nested Vectored Interrupt Controller (NVIC) 916
4.6.2.1 GIC-600 and NVIC Register Configuration 916
4.6.2.2 GIC-600 and NVIC Register Descriptions 916
4.6.3 Message Handling Unit (MHU) 917
4.6.3.1 Features 917
4.6.3.2 Interrupt 921
4.6.3.3 Register Configuration 924
4.6.3.4 Register Descriptions 926
4.6.3.4.1 Non Secure Message Transmission Interrupt Status Register (MHU_MSG_INT_STSn_NS <n=0-19>) 926
4.6.3.4.2 Non Secure Message Transmission Interrupt Set Register (MHU_MSG_INT_SETn_NS <n=0-19>) 927
4.6.3.4.3 Non Secure Message Transmission Interrupt Clear Register (MHU_MSG_INT_CLRn_NS <n=0-19>) 927
4.6.3.4.4 Non Secure Response Transmission Interrupt Status Register (MHU_RSP_INT_STSn_NS <n=0-19>) 928
4.6.3.4.5 Non Secure Response Transmission Interrupt Set Register (MHU_RSP_INT_SETn_NS <n=0-19>) 928
4.6.3.4.6 Non Secure Response Transmission Interrupt Clear Register (MHU_RSP_INT_CLRn_NS <n=0-19>) 929
4.6.3.4.7 Non Secure Software Interrupt Status Register (MHU_SW_INT_STSn_NS <n=0-7>) 929
4.6.3.4.8 Non Secure Software Interrupt Set Register (MHU_SW_INT_SETn_NS <n=0-7>) 930
4.6.3.4.9 Non Secure Software Interrupt Clear Register (MHU_SW_INT_CLRn_NS <n=0-7>) 930
4.6.3.4.10 Secure Message Transmission Interrupt Status Register (MHU_MSG_INT_STSn_S <n=0-19>) 931
4.6.3.4.11 Secure Message Transmission Interrupt Set Register (MHU_MSG_INT_SETn_S <n=0-19>) 931
4.6.3.4.12 Secure Message Transmission Interrupt Clear Register (MHU_MSG_INT_CLRn_S <n=0-19> 932
4.6.3.4.13 Secure Response Transmission Interrupt Status Register (MHU_RSP_INT_STSn_S <n=0-19>) 932
4.6.3.4.14 Secure Response Transmission Interrupt Set Register (MHU_RSP_INT_SETn_S <n=0-19> 933
4.6.3.4.15 Secure Response Transmission Interrupt Clear Register (MHU_RSP_INT_CLRn_S <n=0-19>) 933
4.6.3.5 Function Description 934
4.6.3.5.1 Inter CPU Communication 934
4.6.3.5.2 Software Interrupt 936
4.6.3.6 Operation Sequence 937
4.6.3.6.1 Message Transmit Sequence 937
4.6.3.6.2 Response Transmit Sequence 938

4.6.3.6.3 Software interrupt sequence 939
4.7 Direct Memory Access Controller (DMAC) 940
4.7.1 Features 940
4.7.2 Input/Output Pins 941
4.7.3 Register Configuration 942
4.7.4 Register Descriptions 944
4.7.4.1 Next Source Address Register n/nS (N0SA_n/nS, N1SA_n/nS) 957
4.7.4.2 Next Destination Address Register n/nS (N0DA_n/nS, N1DA_n/nS) 957
4.7.4.3 Next Transaction Byte Register n/nS (N0TB_n/nS, N1TB_n/nS) 958
4.7.4.4 Current Source Address Register n/nS (CRSA_n/nS) 959
4.7.4.5 Current Destination Address Register n/nS (CRDA_n/nS) 960
4.7.4.6 Current Transaction Byte Register n/nS (CRTB_n/nS) 961
4.7.4.7 Channel Status Register n/nS (CHSTAT_n/nS) 962
4.7.4.8 Channel Control Register n/nS (CHCTRL_n/nS) 966
4.7.4.9 Channel Configuration Register n/nS (CHCFG_n/nS) 968
4.7.4.10 Channel Interval Register n/nS (CHITVL_n/nS) 971
4.7.4.11 Channel Extension Register n/nS (CHEXT_n/nS) 972
4.7.4.12 Next Link Address Register n/nS (NXLA_n/nS) 973
4.7.4.13 Current Link Address Register n/nS (CRLA_n/nS) 973
4.7.4.14 DMA Control Register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S) 974
4.7.4.15 DMA Status EN Register (DSTAT_EN_0_7/0_7S) 975
4.7.4.16 DMA Status EN Register (DSTAT_EN_8_15/8_15S) 976
4.7.4.17 DMA Status ER Register (DSTAT_ER_0_7/0_7S) 977
4.7.4.18 DMA Status ER Register (DSTAT_ER_8_15/8_15S) 978
4.7.4.19 DMA Status END Register (DSTAT_END_0_7/0_7S) 979
4.7.4.20 DMA Status END Register (DSTAT_END_8_15/8_15S) 980
4.7.4.21 DMA Status TC Register (DSTAT_TC_0_7/0_7S) 981
4.7.4.22 DMA Status TC Register (DSTAT_TC_8_15/8_15S) 982
4.7.4.23 DMA Status SUS Register (DSTAT_SUS_0_7/0_7S) 983
4.7.4.24 DMA Status SUS Register (DSTAT_SUS_8_15/8_15S) 984
4.7.4.25 DMA Extension Resource Selectors 0/0S to 7/7S (DMARS0/0S to DMARS7/7S) 985
4.7.4.26 DMA External Output Control Register (DMAEOC/DMAEOCS) 988
4.7.5 Operation 989
4.7.5.1 Transfer Flow 989
4.7.5.2 DMA Transfer Requests 990
4.7.6 DMA Mode 1004
4.7.6.1 Mode Setting 1004
4.7.6.2 Register Mode 1005
4.7.6.3 Link Mode 1011
4.7.7 DMA Transfer 1020
4.7.7.1 Transfer Mode 1020
4.7.7.2 Priority Control for DMA Channels 1021
4.7.7.3 DMA Transfer Request 1024
4.7.7.4 DMA Acknowledge Output Function 1026
4.7.7.5 DMA Transfer End Output Function 1029
4.7.7.6 DMA Transfer End Interrupt 1030
4.7.7.7 DMA Error Interrupt 1031
4.7.7.8 Interval Count Function 1031
4.7.7.9 Difference in Operation Due to the Transfer Size 1032
4.7.7.10 Transfer Status 1034
4.7.8 DMA Setting Examples 1038

4.7.8.1 Setting Example 1 (Register Mode/Hardware Request) 1038
4.7.8.2 Setting Example 2 (Register Mode/Software Request) 1040
4.7.8.3 Setting Example 3 (Register Mode/Continuous Execution) 1042
4.7.8.4 Setting Example 4 (Link Mode) 1044
4.7.8.5 Next Register Set Continuous Execution Setting 1047
4.7.9 Points for Caution 1050
4.7.9.1 Problem of the Interrupt Signal Overtaking DMA Transfer 1050
4.8 Renesas Secure IP (RSIP-E50B) 1051

4.10 Battery Backup Function (VBATTB) 1077
4.10.1 Overview 1077
4.10.2 Register Configuration 1079
4.10.3 Register Descriptions 1080
4.10.3.1 Backup Domain Power Status Register (BKPSR) 1080
4.10.3.2 Tamper Status Register (TAMPSR) 1081

4.10.3.3 Tamper Control Register (TAMPCR) 1082
4.10.3.4 Time Capture Event Control Register (TCECR) 1083
4.10.3.5 Tamper/RTCTC Input Control Register 1 (TAMPICR1) 1084
4.10.3.6 Tamper/RTCTC Input Control Register 2 (TAMPICR2) 1085
4.10.3.7 Tamper/RTCTC Input Monitoring Register (TAMPIMR) 1086
4.10.3.8 Backup Domain 32kHz-Clock Control Register (BKSCCR) 1087
4.10.3.9 32kHz-Clock Oscillator Control Register 2 (SOSCCR2) 1088
4.10.3.10 Isolation Enable Control Register (ISOEN) 1089
4.10.3.11 Isolation Enable Write Protect Control Register (ISOENPROT) 1090
4.10.3.12 Oscillator Control Register (XOSCCR) 1091
4.10.3.13 External Interrupt Control Register (EXTINTCR) 1092
4.10.3.14 External Interrupt Attribute Register (EXTINTATR) 1093
4.10.3.15 External Interrupt Source Select Register 1 (EXTINTSEL1) 1094
4.10.3.16 External Interrupt Source Select Register 2 (EXTINTSEL2) 1095
4.10.3.17 External Interrupt Status Register 1 (EXTINTSR1) 1096
4.10.3.18 External Interrupt Status Register 2 (EXTINTSR2) 1097
4.10.3.19 Zeroization Execute Control Register (ZEROIZCR) 1098
4.10.3.20 Zeroization Execute Status Register (ZEROIZSR) 1099
4.10.3.21 Backup Register n (BKRn) (n = 0 to 31) 1100
4.10.4 Operation 1101
4.10.4.1 Battery Backup Function 1101
4.10.4.2 Tamper Detector 1102
4.10.4.3 Zeroization Execute 1103
4.10.4.4 VBAT_RTC_WKUP Control 1104
4.10.4.5 Isolation Control 1104
4.10.4.6 Interrupt 1104
4.11 Realtime Clock (RTCA-3) 1105
4.11.1 Overview 1105
4.11.1.1 Features 1105
4.11.1.2 Block diagram 1107
4.11.1.3 External pins 1108
4.11.2 Register Configuration 1109
4.11.3 Register Description 1111
4.11.3.1 64-Hz Counter (R64CNT) 1111
4.11.3.2 Second Counter (RSECCNT)/Binary Counter 0 (BCNT0) 1112
4.11.3.3 Minute Counter (RMINCNT)/Binary Counter 1 (BCNT1) 1113
4.11.3.4 Hour Counter (RHRCNT)/Binary Counter 2 (BCNT2) 1114
4.11.3.5 Day-of-Week Counter (RWKCNT)/Binary Counter 3 (BCNT3) 1116
4.11.3.6 Data Counter (RDAYCNT) 1117
4.11.3.7 Month Counter (RMONCNT) 1118
4.11.3.8 Year Counter (RYRCNT) 1119
4.11.3.9 Second Alarm Register (RSECAR)/Binary Counter 0 Alarm Register (BCNT0AR) 1120
4.11.3.10 Minute Alarm Register (RMINAR)/Binary Counter 1 Alarm Register (BCNT1AR) 1121
4.11.3.11 Hour Alarm Register (RHRAR)/Binary Counter 2 Alarm Register (BCNT2AR) 1122
4.11.3.12 Day-of-Week Alarm Register (RWKAR)/Binary Counter 3 Alarm Register (BCNT3AR) 1124
4.11.3.13 Date Alarm Register (RDAYAR)/Binary Counter 0 Alarm Enable Register (BCNT0AER) 1125
4.11.3.14 Month Alarm Register (RMONAR)/Binary Counter 1 Alarm Enable Register (BCNT1AER) 1126

4.11.3.15 Year Alarm Register (RYRAR)/Binary Counter 2 Alarm Enable Register (BCNT2AER) 1127
4.11.3.16 Year Alarm Enable Register (RYRAREN)/Binary Counter 3 Alarm Enable Register (BCNT3AER) 1128
4.11.3.17 RTC Status Register (RSR) 1129
4.11.3.18 RTC Control Register 1 (RCR1) 1130
4.11.3.19 RTC Control Register 2 (RCR2) 1131
4.11.3.20 RTC Control Register 3 (RCR3) 1133
4.11.3.21 Time Error Adjustment Register (RADJ) 1134
4.11.3.22 Time Capture Control Register (RTCCR0) 1135
4.11.3.23 Second Capture Register (RSECCP0)/BCNT0 Capture Register (BCNT0CP0) 1137
4.11.3.24 Minute Capture Register (RMINCP0) /BCNT1 Capture Register (BCNT1CP0) 1138
4.11.3.25 Hour Capture Register (RHRCP0) /BCNT2 Capture Register (BCNT2CP0) 1139
4.11.3.26 Date Capture Register (RDAYCP0) /BCNT3 Capture Register (BCNT3CP0) 1140
4.11.3.27 Month Capture Register (RMONCP0) 1141
4.11.4 Operation 1142
4.11.4.1 Outline of Initial Settings of Registers after Power On 1142
4.11.4.2 Clock and Count Mode Setting Procedure 1143
4.11.4.3 Setting the Time 1144
4.11.4.4 30-Second Adjustment 1145
4.11.4.5 Reading 64-Hz Counter and Time 1146
4.11.4.6 Alarm Function 1147
4.11.4.7 Time Error Adjustment Function 1148
4.11.4.7.1 Automatic Adjustment 1148
4.11.4.7.2 Adjustment by Software 1149
4.11.4.7.3 Procedure for Changing the Mode of Adjustment 1149
4.11.4.7.4 Procedure for Stopping Adjustment 1150
4.11.4.8 Time Capture Function 1151
4.11.5 Interrupt Sources 1152
4.11.5.1 Alarm Interrupt (ALM) 1152
4.11.5.2 Periodic Interrupt (PRD) 1152
4.11.5.3 Carry Interrupt (CUP) 1153
4.11.6 Usage Notes 1154
4.11.6.1 Register Writing during Counting 1154
4.11.6.2 Use of Periodic Interrupts 1154
4.11.6.3 Transitions to Low Power Consumption Modes after Setting Registers 1155
4.11.6.4 Notes on Writing to and Reading from Registers 1155
4.11.6.5 Changing the Count Mode 1155
4.11.6.6 32 KHz-Clock Off Control 1155
4.12 OTP 1156
4.12.1 OTP Function Specification 1156
4.12.1.1 Functional Overview 1156
4.12.1.2 Initialization Sequence at OTP Unit Startup 1157
4.12.1.3 Operation Specifications 1158
4.12.2 Register Description 1159
4.12.2.1 Register Descriptions: OTP Data Storage Registers 1161
4.12.2.1.1 Chip ID Registers (OTPCPID0 to OTPCPID3) 1161
4.12.2.1.2 Product ID Registers (OTPPRODID) 1163
4.12.2.1.3 One Time Read Area Enable Setting Register (OTPOTREN) 1164
4.12.2.1.4 Boot Device Drive Strength Setting Register (OTPPOC) 1165

4.12.2.2 Register Descriptions: OTP Control Registers 1167
4.12.2.2.1 OTP Power Configuration Register (OTPPWR) 1167
4.12.2.2.2 OTP Status Register (OTPSTR) 1168
4.12.2.2.3 OTP Write Command Start Register (OTPSTAWR) 1170
4.12.2.2.4 OTP Write Address Register (OTPADRWR) 1170
4.12.2.2.5 OTP Write Data Register (OTPDATAWR) 1171
4.12.2.2.6 OTP Read Address Register (OTPADRRD) 1172
4.12.2.2.7 OTP Read Data Register (OTPDATARD) 1173
4.12.2.2.8 OTP Flag Register (OTPFLAG) 1173
4.12.3 Method of Control 1174
4.12.3.1 OTP Write 1174
4.12.3.2 OTP Read 1177
4.12.3.3 OTP Stop Control 1179
SECTION 5 TIMER 1180
5.1 Timer Overview 1180
5.2 System Counter (SYC) 1181
5.2.1 Overview 1181
5.2.1.1 Features 1181
5.2.1.2 Block Diagram of SYC 1182
5.2.2 Address Space 1183
5.2.3 Register Descriptions 1183
5.2.4 Operation 1184
5.2.4.1 System Bus Access Control 1184
5.2.4.2 Halt on Debug Function 1184
5.4 Watchdog Timer (WDT) 1185
5.4.1 Features 1186
5.4.1.1 Normal Watchdog Timer Function 1186
5.4.1.2 Reset Request Function due to CPU Parity Error 1186
5.4.1.3 Internal Block Diagram 1187
5.4.1.4 Input/Output Pin 1188
5.4.2 Register Configuration 1189
5.4.3 Register Descriptions 1191
5.4.3.1 WDT Control Register_n (WDTCNT_n) (n = 0, 1, 2) 1191
5.4.3.2 WDT Period Setting Register_n (WDTSET_n) (n = 0, 1, 2) 1192
5.4.3.3 WDT Elapsed Time Register_n (WDTTIM_n (n = 0, 1, 2)) 1193
5.4.3.4 WDT Interrupt Control Register_n (WDTINT_n (n = 0, 1, 2)) 1194
5.4.3.5 Parity Error Control Register_n (PECR_n (n = 0, 1, 2)) 1195
5.4.3.6 Parity Error Forced Enable Register_n (PEEN_n (n = 0, 1, 2)) 1196
5.4.3.7 Parity Error Status Register_n (PESR_n (n = 0, 1, 2)) 1197
5.4.3.8 Parity Error Enable Register_n (PEER_n (n = 0, 1, 2)) 1198
5.4.3.9 Parity Error Polarity Setting Register_n (PEPO_n (n = 0, 1, 2)) 1199
5.4.3.10 Register Setting Order for Each WDT Channel 1200
5.4.4 Operation 1201
5.4.4.1 WDT_CORE Operaton Timing 1201
5.4.4.2 WDT Interrupt Control Register (WDTINT) Specification for Write Access Interval 1202
5.4.4.3 Watchdog Timer Operation Reflection Timing of Register Setting Value 1203
5.4.4.4 Timing of Reflecting WDT Counter Value to WDTTIM Register 1205

5.4.4.5 Conditions Under which WDTRSTB and PERROUT Operate 1206
5.4.5 Reset Control 1210
5.4.5.1 WDTRST Control of Each WDT Channels 1210
5.4.6 Usage Note 1212
5.5 General Timer (GTM) 1213
5.5.1 Functional Overview 1213
5.5.1.1 Features of GTM 1213
5.5.2 Registers 1215
5.5.2.1 Registers Overview 1215
5.5.2.2 Details of OSTM Registers 1216
5.5.2.2.1 OSTM Compare Register (OSTMnCMP) 1216
5.5.2.2.2 OSTM Counter Register (OSTMnCNT) 1217
5.5.2.2.3 OSTM Count Enable Status Register (OSTMnTE) 1218
5.5.2.2.4 OSTM Count Start Trigger Register (OSTMnTS) 1219
5.5.2.2.5 OSTM Count Stop Trigger Register (OSTMnTT) 1219
5.5.2.2.6 OSTM Control Register (OSTMnCTL) 1220
5.5.3 Functional Description 1221
5.5.3.1 Block Diagram 1221
5.5.3.2 Count Clock 1222
5.5.3.3 Generation of Interrupt Request 1222
5.5.3.4 Starting and Stopping the Timer 1223
5.5.3.5 Interval Timer Mode 1224
5.5.3.5.1 Basic Operation in Interval Timer Mode 1224
5.5.3.5.2 Operation when OSTMnCMP = H'0000_0000 1226
5.5.3.6 Free-Running Comparison Mode 1227
5.5.3.6.1 Basic Operation in Free-Running Comparison Mode 1227
5.5.3.6.2 Operation when OSTMnCMP = H'0000_0000 1229
5.7 General PWM Timer (GPT) 1230
5.7.1 Overview 1230
5.7.2 Register Descriptions 1234
5.7.2.1 General PWM Timer Write-Protection Register (GTWP) 1236
5.7.2.2 General PWM Timer Software Start Register (GTSTR) 1237
5.7.2.3 General PWM Timer Software Stop Register (GTSTP) 1238
5.7.2.4 General PWM Timer Software Clear Register (GTCLR) 1239
5.7.2.5 General PWM Timer Start Source Select Register (GTSSR) 1240
5.7.2.6 General PWM Timer Stop Source Select Register (GTPSR) 1243
5.7.2.7 General PWM Timer Clear Source Select Register (GTCSR) 1246
5.7.2.8 General PWM Timer Up Count Source Select Register (GTUPSR) 1249
5.7.2.9 General PWM Timer Down Count Source Select Register (GTDNSR) 1253
5.7.2.10 General PWM Timer Input Capture Source Select Register A (GTICASR) 1257
5.7.2.11 General PWM Timer Input Capture Source Select Register B (GTICBSR) 1261
5.7.2.12 General PWM Timer Control Register (GTCR) 1265
5.7.2.13 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC) 1267
5.7.2.14 General PWM Timer I/O Control Register (GTIOR) 1270
5.7.2.15 General PWM Timer Interrupt Output Setting Register (GTINTAD) 1275
5.7.2.16 General PWM Timer Status Register (GTST) 1278
5.7.2.17 General PWM Timer Buffer Enable Register (GTBER) 1285
5.7.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC) 1288

5.7.2.19 General PWM Timer Counter (GTCNT) 1291
5.7.2.20 General PWM Timer Compare Capture Register n (GTCCRn) (n = A to F) 1291
5.7.2.21 General PWM Timer Cycle Setting Register (GTPR) 1292
5.7.2.22 General PWM Timer Cycle Setting Buffer Register (GTPBR) 1292
5.7.2.23 General PWM Timer Cycle Setting Double-Buffer Register (GTPDBR) 1293
5.7.2.24 A/D Converter Start Request Timing Register n (GTADTRn) (n = A, B) 1293
5.7.2.25 A/D Converter Start Request Timing Buffer Register n (GTADTBRn) (n = A, B) ..1294
5.7.2.26 A/D Converter Start Request Timing Double-Buffer Register n (GTADTDBRn) (n = A, B) 1294
5.7.2.27 General PWM Timer Dead Time Control Register (GTDTCR) 1295
5.7.2.28 General PWM Timer Dead Time Value Register n (GTDVn) (n = U, D) 1297
5.7.2.29 General PWM Timer Dead Time Buffer Register n (GTDBn) (n = U, D) 1297
5.7.2.30 General PWM Timer Output Protection Function Status Register (GTSOS) 1298
5.7.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR) 1299
5.7.3 Operation 1300
5.7.3.1 Basic Operation 1300
5.7.3.1.1 Counter Operation 1300
5.7.3.1.2 Waveform Output by Compare Match 1306
5.7.3.1.3 Input Capture Function 1310
5.7.3.2 Buffer Operation 1312
5.7.3.2.1 GTPR Register Buffer Operation 1312
5.7.3.2.2 Buffer Operation for GTCCRA and GTCCRB 1315
5.7.3.2.3 Buffer Operation for GTADTRA and GTADTRB 1322
5.7.3.3 PWM Output Operating Mode 1325
5.7.3.3.1 Saw-Wave PWM Mode 1325
5.7.3.3.2 Saw-Wave One-Shot Pulse Mode 1327
5.7.3.3.3 Triangle-Wave PWM Mode 1 (32-bit transfer at trough) 1330
5.7.3.3.4 Triangle-Wave PWM Mode 2 (32-bit transfer at crest and trough) 1332
5.7.3.3.5 Triangle-Wave PWM Mode 3 (64-bit transfer at trough) 1334
5.7.3.4 Automatic Dead Time Setting Function 1337
5.7.3.5 Count Direction Changing Function 1344
5.7.3.6 Function of Output Duty 0% and 100% 1345
5.7.3.7 Hardware Count Start/Count Stop and Clear Operation 1347
5.7.3.7.1 Hardware Start Operation 1347
5.7.3.7.2 Hardware Stop Operation 1349
5.7.3.7.3 Hardware Clear Operation 1353
5.7.3.8 Synchronized Operation 1356
5.7.3.8.1 Synchronized Operation by Software 1356
5.7.3.8.2 Synchronized Operation by Hardware 1358
5.7.3.9 PWM Output Operation Examples 1360
5.7.3.9.1 Synchronized PWM Output 1360
5.7.3.9.2 Three-Phase Saw-Wave Complementary PWM Output 1362
5.7.3.9.3 3-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting 1363
5.7.3.9.4 3-Phase Triangle-Wave Complementary PWM Output 1364

5.7.3.9.5 3-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting ... 1365
5.7.3.9.6 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting ... 1366
5.7.3.10 Phase Counting Function ... 1367
5.7.4 Interrupt Sources ... 1377
5.7.4.1 Interrupt Sources and Priorities ... 1377
5.7.4.2 DMAC Activation ... 1383
5.7.4.3 Interrupt and A/D Conversion Request Skipping Function ... 1383
5.7.5 A/D Converter Start Request ... 1389
5.7.6 Noise Filter Function ... 1391
5.7.7 Protection Function ... 1392
5.7.7.1 Write-Protection for Registers ... 1392
5.7.7.2 Disabling of Buffer Operation ... 1393
5.7.7.3 GTIOC Pin Output Negate Control ... 1394
5.7.7.4 Output Protection Function for GTIOC Pin Output ... 1396
5.7.7.4.1 Output Protection Function When the GTCCRA Register is Set to 0 during Buffer Transfer ... 1397
5.7.7.4.2 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Troughs ... 1401
5.7.7.4.3 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Crests ... 1403
5.7.7.4.4 Restricted Specification of Output Protection Function ... 1404
5.7.7.4.5 Temporary cancellation of Output Protection Function ... 1405
5.7.8 Initialization Method of Output Pins ... 1406
5.7.8.1 Pin Settings after Reset ... 1406
5.7.8.2 Pin Initialization Caused by Error during Operation ... 1406
5.7.9 Usage Notes ... 1407
5.7.9.1 GTCCRn Settings during Compare Match Operation (n = A to F) ... 1407
5.7.9.2 Setting Range for the GTCNT Counter ... 1408
5.7.9.3 Starting and Stopping the GTCNT Counter ... 1408
5.7.9.4 Priority On Conflicts ... 1408
5.8 Port Output Enable for GPT (POEG) ... 1410
5.8.1 Overview ... 1410
5.8.2 Register Descriptions ... 1412
5.8.2.1 POEG Group n Setting Register (POEGGn) (n = A to D) ... 1413
5.8.3 Output-Disable Control Operation ... 1415
5.8.3.1 Pin Input Level Detection Operation ... 1416
5.8.3.2 Output-Disable Requests from the GPT ... 1417
5.8.3.3 Output-Disable Control Using Registers ... 1417
5.8.3.4 Release from Output-Disable ... 1417
5.8.4 Interrupt Sources ... 1418
5.8.5 External Trigger Output to the GPT ... 1419
5.8.6 Usage Notes ... 1420
5.8.6.1 Specifying Pins Associated with the GPT ... 1420
5.9 Multi-Function Timer Pulse Unit 3 (MTU3a) ... 1421
5.9.1 Overview ... 1421

5.9.2 Register Descriptions 1428
5.9.2.1 Timer Control Register (TCR) 1433
5.9.2.2 Timer Control Register 2 (TCR2) 1435
5.9.2.3 Timer Mode Register 1 (TMDR1) 1440
5.9.2.4 Timer Mode Registers 2 (TMDR2A and TMDR2B) 1443
5.9.2.5 Timer Mode Register 3 (TMDR3) 1444
5.9.2.6 Timer I/O Control Register (TIOR) 1446
5.9.2.7 Timer Compare Match Clear Register (TCNTCMPCLR) 1465
5.9.2.8 Timer Interrupt Enable Register (TIER) 1466
5.9.2.9 Timer Status Register (TSR) 1470
5.9.2.10 Timer Buffer Operation Transfer Mode Register (TBTM) 1471
5.9.2.11 Timer Input Capture Control Register (TICCR) 1473
5.9.2.12 Timer Synchronous Clear Register (TSYCR) 1474
5.9.2.13 Timer Counter (TCNT) 1475
5.9.2.14 Timer Longword Counter (TCNTLW) 1476
5.9.2.15 Timer General Register (TGR) 1477
5.9.2.16 Timer Longword General Registers (TGRALW and TGRBLW) 1479
5.9.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR) 1480
5.9.2.18 Timer Synchronous Registers (TSYRA and TSYRB) 1483
5.9.2.19 Timer Counter Synchronous Start Register (TCSYSTR) 1485
5.9.2.20 Timer Read/Write Enable Registers (TRWERA and TRWERB) 1487
5.9.2.21 Timer Output Master Enable Registers (TOERA and TOERB) 1488
5.9.2.22 Timer Output Control Registers 1 (TOCR1A and TOCR1B) 1490
5.9.2.23 Timer Output Control Registers 2 (TOCR2A and TOCR2B) 1492
5.9.2.24 Timer Output Level Buffer Registers (TOLBRA and TOLBRB) 1495
5.9.2.25 Timer Gate Control Register A (TGCRA) 1496
5.9.2.26 Timer Subcounters (TCNTSA and TCNTSB) 1498
5.9.2.27 Timer Cycle Data Registers (TCDRA and TCDRB) 1498
5.9.2.28 Timer Cycle Buffer Registers (TCBRA and TCBRB) 1499
5.9.2.29 Timer Dead Time Data Registers (TDDRA and TDDRB) 1499
5.9.2.30 Timer Dead Time Enable Registers (TDERA and TDERB) 1500
5.9.2.31 Timer Buffer Transfer Set Registers (TBTERA and TBTERB) 1501
5.9.2.32 Timer Waveform Control Registers (TWCRA and TWCRB) 1502
5.9.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C) 1504
5.9.2.34 Noise Filter Control Register 5 (NFCR5) 1508
5.9.2.35 Timer A/D Converter Start Request Control Register (TADCR) 1509
5.9.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA and TADCORB) 1513
5.9.2.37 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA and TADCOBRB) 1514
5.9.2.38 Timer Interrupt Skipping Mode Registers (TITMRA and TITMRB) 1514
5.9.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A and TITCR1B) 1515
5.9.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B) 1518
5.9.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B) 1520
5.9.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B) 1522
5.9.2.43 Bus Master Interface 1524
5.9.3 Operation 1525
5.9.3.1 Basic Functions 1525
5.9.3.2 Synchronous Operation 1531
5.9.3.3 Buffer Operation 1533
5.9.3.4 Cascaded Operation 1538
5.9.3.5 PWM Modes 1543
5.9.3.6 Phase Counting Mode 1548

5.9.3.6.1 16-Bit Phase Counting Mode ... 1549
5.9.3.6.2 Cascade Connection 32-Bit Phase Counting Mode ... 1560
5.9.3.7 Reset-Synchronized PWM Mode ... 1563
5.9.3.8 Complementary PWM Mode ... 1566
5.9.3.9 A/D Converter Start Request Delaying Function ... 1614
5.9.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7 ... 1622
5.9.3.11 External Pulse Width Measurement ... 1626
5.9.3.12 Dead Time Compensation ... 1627
5.9.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode ... 1629
5.9.3.14 Noise Filter Function ... 1630
5.9.4 Interrupt Sources ... 1631
5.9.4.1 Interrupt Sources and Priorities ... 1631
5.9.4.2 DMAC Activation ... 1632
5.9.4.3 A/D Converter Activation ... 1633
5.9.5 Operation Timing ... 1635
5.9.5.1 Input/Output Timing ... 1635
5.9.5.2 Interrupt Signal Timing ... 1641
5.9.6 Usage Note ... 1644
5.9.6.1 Count Clock Restrictions ... 1644
5.9.6.2 Note on Cycle Setting ... 1644
5.9.6.3 Contention between TCNT Write and Clear Operations ... 1645
5.9.6.4 Contention between TCNT Write and Increment Operations ... 1645
5.9.6.5 Contention between TGR Write Operation and Compare Match ... 1646
5.9.6.6 Contention between Buffer Register Write Operation and Compare Match ... 1646
5.9.6.7 Contention between Buffer Register Write and TCNT Clear Operations ... 1647
5.9.6.8 Contention between TGR Read Operation and Input Capture ... 1647
5.9.6.9 Contention between TGR Write Operation and Input Capture ... 1648
5.9.6.10 Contention between Buffer Register Write Operation and Input Capture ... 1649
5.9.6.11 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation ... 1650
5.9.6.12 Counter Value When Count Operation is Stopped in Complementary PWM Mode ... 1651
5.9.6.13 Buffer Operation Setting in Complementary PWM Mode ... 1651
5.9.6.14 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode ... 1652
5.9.6.15 Overflow in Reset-Synchronized PWM Mode ... 1653
5.9.6.16 Contention between Overflow/Underflow and Counter Clearing ... 1654
5.9.6.17 Contention between TCNT Write Operation and Overflow/Underflow ... 1655
5.9.6.18 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode ... 1655
5.9.6.19 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode ... 1655
5.9.6.20 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection ... 1656
5.9.6.21 Interrupt-Skipping Function 2 ... 1656
5.9.6.22 Notes When Complementary PWM Mode Output Protection Function is Not Used ... 1656
5.9.6.23 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR) ... 1657
5.9.6.24 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode ... 1658
5.9.6.25 Continuous Output of Interrupt Signal in Response to a Compare Match ... 1660

5.9.6.26 Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode 1661
5.9.7 MTU Output Pin Initialization 1663
5.9.7.1 Operating Modes 1663
5.9.7.2 Operation in Case of Re-Setting Due to Error during Operation 1663
5.9.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation 1664
5.10 Port Output Enable 3 (POE3) 1694
5.10.1 Overview 1694
5.10.2 Register Descriptions 1697
5.10.2.1 Input Level Control/Status Register 1 (ICSR1) 1698
5.10.2.2 Input Level Control/Status Register 2 (ICSR2) 1699
5.10.2.3 Input Level Control/Status Register 3 (ICSR3) 1700
5.10.2.4 Input Level Control/Status Register 4 (ICSR4) 1702
5.10.2.5 Output Level Control/Status Register 1 (OCSR1) 1704
5.10.2.6 Output Level Control/Status Register 2 (OCSR2) 1705
5.10.2.7 Software Port Output Enable Register (SPOER) 1706
5.10.2.8 Port Output Enable Control Register 1 (POECR1) 1708
5.10.2.9 Port Output Enable Control Register 2 (POECR2) 1709
5.10.2.10 Port Output Enable Control Register 4 (POECR4) 1711
5.10.2.11 Port Output Enable Control Register 5 (POECR5) 1713
5.10.3 Operation 1714
5.10.3.1 MTU Pin Selection 1717
5.10.3.2 Input Level Detection Operation 1720
5.10.3.3 Output Level Compare Operation 1722
5.10.3.4 High-Impedance Control Using Registers 1722
5.10.3.5 Additional Functions for Controlling High-Impedance States 1722
5.10.3.6 Release from High-Impedance State 1723
5.10.4 POE3 Setting Procedure 1724
5.10.5 Interrupts 1725
5.10.6 Usage Notes 1726
5.10.6.1 High-Impedance Control when MTU6 and MTU7 are not Used 1726
SECTION 6 HIGH-SPEED INTERFACE 1727
6.1 High-Speed Interface Overview 1727
6.2 SD/MMC Host Interface (SD) 1728
6.2.1 Overview 1728
6.2.1.1 Features 1728
6.2.1.2 Block Diagram 1729
6.2.1.3 External Pins 1730
6.2.2 SD Registers 1731
6.2.2.1 List of Registers 1731
6.2.2.2 SD Register Description 1733
6.2.2.2.1 Command Type Register (SDm_SD_CMD) 1733
6.2.2.2.2 Command Argument Registers 1735
6.2.2.2.3 Data Stop Register (SDm_SD_STOP) 1737
6.2.2.2.4 Block Count Register (SDm_SD_SECCNT) 1739
6.2.2.2.5 SD Card Response Registers 1740
6.2.2.2.6 SD Card Interrupt Flag Register 1 (SDm_SD_INFO1) 1748

6.2.2.2.7 SD Card Interrupt Flag Register 2 (SDm_SD_INFO2) 1751
6.2.2.2.8 SD_INFO1 Interrupt Mask Register (SDm_SD_INFO1_MASK)..... 1754
6.2.2.2.9 SD_INFO2 Interrupt Mask Register (SDm_SD_INFO2_MASK)..... 1755
6.2.2.2.10 SD Clock Control Register (SDm_SD_CLK_CTRL) 1756
6.2.2.2.11 Transfer Data Length Register (SDm_SD_SIZE) 1759
6.2.2.2.12 SD Card Access Control Option Register (SDm_SD_OPTION)..... 1760
6.2.2.2.13 SD Error Status Register 1 (SDm_SD_ERR_STS1) 1762
6.2.2.2.14 SD Error Status Register 2 (SDm_SD_ERR_STS2) 1764
6.2.2.2.15 SD Buffer Read/Write Register (SDm_SD_BUF0)..... 1765
6.2.2.2.16 SDIO Mode Control Register (SDm_SDIO_MODE) 1766
6.2.2.2.17 SDIO Interrupt Flag Register (SDm_SDIO_INFO1)..... 1768
6.2.2.2.18 SDIO_INFO1 Interrupt Mask Register (SDm_SDIO_INFO1_MASK) 1769
6.2.2.2.19 DMA Mode Enable Register (SDm_CC_EXT_MODE) 1770
6.2.2.2.20 Software Reset Register (SDm_SOFT_RST)..... 1771
6.2.2.2.21 Version Register (SDm_VERSION) 1772
6.2.2.2.22 Host Interface Mode Setting Register (SDm_HOST_MODE)..... 1773
6.2.2.2.23 SD Interface Mode Setting Register (SDm_SDIF_MODE)..... 1774
6.2.2.2.24 SD Status Register (SDm_SD_STATUS)..... 1775
6.2.2.2.25 DMAC Transfer Mode Register (SDm_DM_CM_DTRAN_MODE)..... 1776
6.2.2.2.26 DMAC Transfer Control Register (SDm_DM_CM_DTRAN_CTRL)..... 1777
6.2.2.2.27 DMAC Reset Register (SDm_DM_CM_RST)..... 1778
6.2.2.2.28 DMAC Interrupt Register 1 (SDm_DM_CM_INFO1) 1779
6.2.2.2.29 DM_CM_INFO1 Interrupt Mask Register (SDm_DM_CM_INFO1_MASK) 1781
6.2.2.2.30 DMAC Interrupt Register 2 (SDm_DM_CM_INFO2) 1782
6.2.2.2.31 DM_CM_INFO2 Interrupt Mask Register (SDm_DM_CM_INFO2_MASK) 1783
6.2.2.2.32 DMAC Transfer Address Register (SDm_DM_DTRAN_ADDR) 1784
6.2.3 Operation 1785
6.2.3.1 SD Interface..... 1785
6.2.3.1.1 SD data format 1785
6.2.3.1.2 Bus signal voltage switch Sequence..... 1789
6.2.3.2 Card Detect/Write Protect..... 1790
6.2.3.2.1 Card detect..... 1790
6.2.3.2.2 Write protect 1791
6.2.3.3 Interrupt Request..... 1792
6.2.3.3.1 Interrupt request..... 1792
6.2.3.4 Communications Errors and Timeouts 1793
6.2.4 Usage Example..... 1795
6.2.4.1 Command without Data Transfer..... 1795
6.2.4.1.1 Flowchart..... 1795
6.2.4.1.2 Operation for command without data transfer..... 1796
6.2.4.2 Single Block Read 1797
6.2.4.2.1 Flowchart..... 1797

6.2.4.2.2 Operation for single block read 1798
6.2.4.3 Single Block Write 1799
6.2.4.3.1 Flowchart 1799
6.2.4.3.2 Operation for single block write 1800
6.2.4.4 Multiple Block Read 1801
6.2.4.4.1 Flowchart 1801
6.2.4.4.2 Operation for multiple block read 1802
6.2.4.5 Multiple Block Write (when Using Internal Timer) 1803
6.2.4.5.1 Flowchart 1803
6.2.4.5.2 Operation for multiple block write 1804
6.2.4.6 Multiple Block Write (when Using External Timer) 1805
6.2.4.6.1 Flowchart 1805
6.2.4.6.2 Operation for multiple block write 1806
6.2.4.7 IO_RW_DIRECT Command (CMD52) 1807
6.2.4.7.1 Flowchart 1807
6.2.4.8 IO_RW_EXTENDED (CMD53/Multiple Block Read) 1808
6.2.4.8.1 Flowchart 1808
6.2.4.9 IO_RW_EXTENDED (CMD53/Multiple Block Write) 1810
6.2.4.9.1 Flowchart 1810
6.2.4.10 DMA Transfer 1812
6.2.4.10.1 SD_BUF DMA transfer 1812
6.2.4.11 High-Priority Interrupt (without Data Transfer) 1814
6.2.4.11.1 Flowchart 1814
6.2.4.11.2 Operation for high-priority interrupt without data transfer 1815
6.2.4.12 High-Priority Interrupt (at Single Block Write) 1816
6.2.4.12.1 Flowchart 1816
6.2.4.12.2 Operation for HPI at single block write 1817
6.2.4.13 High-Priority Interrupt (at Multiple Block Write) 1818
6.2.4.13.1 Flowchart 1818
6.2.4.13.2 Operation for HPI at multiple block transfer 1820
6.2.4.14 Example of SD_CMD Register Setting 1822
6.2.5 Usage Notes 1825
6.2.5.1 SD_BUF Illegal Write Access 1825
6.2.5.2 Block Number Limitation for Multiple Block Read 1825
6.2.5.3 Automatic Control of SDCLK Output 1827
6.2.5.4 Control of the C52PUB Setting for Multiple Block Write 1827
6.2.5.5 Notes on SD_CLK_CTRL Register Settings 1827
6.2.5.6 Restrictions on specifications 1827
6.2.5.7 STP bit setting during multiple block read 1828
6.2.6 Sampling Clock Controller (SCC) 1829
6.2.6.1 Features 1829
6.2.6.2 SCC Block Diagram 1829
6.2.7 SCC Registers 1830
6.2.7.1 List of Registers 1830
6.2.7.2 SCC Register Descriptions 1831
6.2.7.2.1 Initial Setting Register (SDm_SCC_DTCNTL) 1831
6.2.7.2.2 Sampling Clock Position Setting Register (SDm_SCC_TAPSET) 1832

6.2.7.2.3 Sampling Clock Selection Register (SDm_SCC_CKSEL) 1833
6.2.7.2.4 Sampling Clock Position Correction Register (SDm_SCC_RVSCNTL) ... 1834
6.2.7.2.5 Sampling Clock Position Correction Request Register (SDm_SCC_RVSREQ) 1835
6.2.7.2.6 Hardware Adjustment Register 1 (SDm_SCC_DT2FF) 1836
6.2.7.2.7 Sampling Data Comparison Register (SDm_SCC_SMPCMP) 1837
6.2.7.2.8 HS400 Mode Register 1 (SDm_SCC_HS400MODE1) 1838
6.2.7.2.9 Hardware adjustment register 2 (SDm_SCC_HWADJ2) 1839
6.2.7.2.10 Hardware adjustment register 3 (SDm_SCC_HWADJ3) 1840
6.2.7.2.11 HS400 mode register 2 (SDm_SCC_HS400MODE2) 1841
6.2.7.2.12 Hardware adjustment register 4 (SDm_SCC_HWADJ4) 1842
6.2.8 Usage Example of SCC 1843
6.2.8.1 Tuning 1843
6.2.8.2 Sampling Clock Position Correction after Tuning 1846
6.2.8.2.1 Manual correction of the sampling clock position 1846
6.2.8.2.2 Automatic correction of the sampling clock position 1847
6.2.8.3 Change point of the input data 1848
6.2.8.4 MMC CMD tuning of the HS400 mode 1849
6.2.8.4.1 CMD terminal tuning flow in the HS400 mode 1849
6.3 Gigabit Ethernet Interface (GBETH) 1850
6.3.1 Overview 1850
6.3.1.1 Features 1850
6.3.1.2 Block Diagram 1852
6.3.1.3 External Pins 1853
6.5 USB2.0 1854
6.5.1 Features 1854
6.5.1.1 Ch0: USB2.0 OTG/DRD (Host/Function) Interface 1854
6.5.1.2 Ch1: USB2.0 OTG/DRD (Host/Function) Interface 1855
6.5.1.3 Block Diagram 1855
6.5.1.4 External Signal Pins 1856
6.5.1.5 Power and GND Pins 1856
6.5.1.6 Interrupt 1857
6.5.2 Register Configuration 1858
6.5.2.1 Host Controller Register 1858
6.5.2.2 Function Controller Register 1858
6.5.2.3 USBPHY Control Register 1858
6.5.3 Register Descriptions 1859
6.5.3.1 Reset Register (RESET) 1859
6.5.3.2 Clock Control Register (UCLKCTL) 1860
6.5.3.3 Direct Power Down Setting Register (UDIRPD) 1862
6.5.3.4 Connection Control Register (CON_CTRL) 1863
6.5.3.5 VBUSEN Control Register (VBENCTL) 1864
6.5.3.6 Clock Status Register (CLK_STAT) 1865
6.5.4 Operation 1866
6.5.4.1 USB/PHY Initialization 1866
6.5.4.2 Handling of Permanently Unused Pin 1867
6.5.4.2.1 USB/PHY Related Pins 1867
6.5.4.2.2 Handling of USB Controller Related Pins 1868

6.5.4.3 Direct Power Down (DIRPD) 1868
6.5.4.3.1 Enter to Direct Power Down Mode 1868
6.5.4.3.2 Resume from Direct power down mode 1869
6.5.5 Usage Notes 1870
6.5.5.1 Precautions in Power Down Mode 1870
6.5A USB 2.0 Host Module 1871
6.5A.1 Overview 1871
6.5A.1.1 Overview 1871
6.5A.1.2 Features 1871
6.5A.1.2.1 EHCI v1.1 functions 1872
6.5A.1.2.2 Link Power Management (LPM) function 1873
6.5A.1.2.3 OTG function 1874
6.5A.1.2.4 Battery-charging function 1874
6.5A.1.2.5 Suspend extension function 1874
6.5A.1.3 Support of USB-Related Specifications 1875
6.5A.2 Register Descriptions 1876
6.5A.2.1 Register Attributes 1876
6.5A.2.2 Base Address 1876
6.5A.2.3 Register Overview 1877
6.5A.2.4 Description of Registers 1879
6.5A.2.4.1 OHCI Operational Register 1879
6.5A.2.4.2 EHCI Controller Capability Register 1911
6.5A.2.4.3 HCI Operational Register 1916
6.5A.2.4.4 AHB Bridge Register 1933
6.5A.2.4.5 UCOM Register 1946
6.5A.3 Clock Signals 1953
6.5A.3.1 Clock Gating Specifications 1953
6.5A.3.1.1 Overview of clock gating 1953
6.5A.3.1.2 Specifications of NONUSE_CLK_MSK operation 1953
6.5A.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations 1954
6.5A.4 Interrupt Sources 1955
6.5A.4.1 Interrupt Signals 1955
6.5A.4.2 Interrupt Sources and Control 1956
6.5A.4.2.1 U2H_INT assertion source and control 1956
6.5A.4.2.2 U2H_OHCI_INT assertion source and control 1957
6.5A.4.2.3 U2H_EHCI_INT assertion source and control 1958
6.5A.4.2.4 U2H_WAKEON_INT assertion source and control 1959
6.5A.4.2.5 U2H_OBINT assertion source and control 1960
6.5A.4.3 Timing of De-asserting Interrupt Signals 1961
6.5A.5 Power-Saving Function 1962
6.5A.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USBPHY 1962
6.5A.5.2 Controlling the Clock-Gating Function 1962
6.5A.6 Battery Charging 1963
6.5A.6.1 Support of charging port 1963
6.5A.6.2 Support of portable device 1963
6.5A.7 Bus Master 1964

6.5A.7.1 Functional specifications of the bus master 1964
6.5A.7.1.1 Supported bus master functions 1964
6.5A.7.1.2 Issuing requests for different types of bus transfer 1964
6.5A.7.1.3 Supported responses 1964
6.5A.7.1.4 Protection control information 1964
6.5A.7.1.5 Maximum burst length 1965
6.5A.7.1.6 Boundary of transfer data 1965
6.5A.7.1.7 Start address of fixed-length INCR burst transfer 1966
6.5A.8 Overcurrent Control and VBUS Control 1967
6.5A.8.1 OVRCUR/VBUSEN pin 1967
6.5A.8.2 Overcurrent detection timer setting 1967
6.5A.8.3 Port Power (VBUS) control specifications 1968
6.5A.8.4 Timing Chart for Overcurrent Detection and Recovery 1969
6.5A.9 Procedure for Setting this Module 1970
6.5A.9.1 Host/Peripheral Common Setting Sequence 1970
6.5A.9.2 Initialization Sequence 1971
6.5A.9.3 Flow of Error Handling 1972
6.5B USB 2.0 Function Module 1973
6.5B.1 Overview 1973
6.5B.1.1 Overview 1973
6.5B.1.2 Features 1973
6.5B.1.2.1 Peripheral controller supporting high-speed USB 1973
6.5B.1.2.2 Support of all types of USB transfer 1973
6.5B.1.2.3 Bus interface 1973
6.5B.1.2.4 Pipe configuration 1974
6.5B.1.2.5 Features of peripheral functions 1974
6.5B.1.2.6 Features of DMA transfer 1974
6.5B.1.2.7 Other functions 1975
6.5B.1.3 Overview of Functions 1976
6.5B.1.3.1 Automatic recognition of USB transfer speed 1976
6.5B.1.3.2 USB event 1976
6.5B.1.3.3 USB data transfer 1976
6.5B.1.3.4 SOF pulse output function 1976
6.5B.1.4 Restriction matter and Notes 1977
6.5B.1.4.1 Restriction matter 1977
6.5B.1.4.2 Notes 1977
6.5B.2 Registers 1978
6.5B.2.1 Base Address 1979
6.5B.2.2 List of Registers 1980
6.5B.2.3 System Configuration Control Registers 1983
6.5B.2.3.1 System Configuration Control Register 0 [SYSCFG0] <Address: H'000> 1983
6.5B.2.3.2 System Configuration Control Register 1 [SYSCFG1] <Address: H'002> 1986
6.5B.2.4 System Configuration Status 1987
6.5B.2.4.1 System Configuration Status Register (SYSSTS0) <Address: H'004> 1987
6.5B.2.5 USB Signal Control Registers 1988
6.5B.2.5.1 Device State Control Register 0 [DVSTCTR0] <Address: H'008> 1988

6.5B.2.6 Test Mode Register 1990
6.5B.2.6.1 Test Mode Register [TESTMODE] <Address: H'00C> 1990
6.5B.2.7 FIFO Port Registers 1991
6.5B.2.7.1 CFIFO Port Register [CFIFO] <Address: H'014> 1991
6.5B.2.7.2 CFIFO Port Register [CFIFO] <Address: H'016> 1991
6.5B.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: H'020> 1993
6.5B.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address:H'028>
D1FIFO Port Select Register [D1FIFOSEL] <Address:H'02C> 1996
6.5B.2.7.5 CFIFO Port Control Register [CFIFOCTR] <Address: H'022>
D0FIFO Port Control Register [D0FIFOCTR] <Address: H'02A>
D1FIFO Port Control Register [D1FIFOCTR] <Address: H'02E> 1998
6.5B.2.8 Interrupt Enable Registers (INTENBx, BRDYENB, NRDYENB, BEMPENB) 2000
6.5B.2.8.1 Interrupt Enable Register 0 [INTENB0] <Address: H'030> 2000
6.5B.2.8.2 BRDY Interrupt Enable Register [BRDYENB] <Address: H'036> 2001
6.5B.2.8.3 NRDY Interrupt Enable Register [NRDYENB] <Address: H'038> 2002
6.5B.2.8.4 BEMP Interrupt Enable Register [BEMPENB] <Address: H'03A> 2003
6.5B.2.9 SOF Control Register 2004
6.5B.2.9.1 SOF Output Configuration Register [SOFCFG] <Address: H'03C> 2004
6.5B.2.10 Interrupt Status 2005
6.5B.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: H'040> 2005
6.5B.2.10.2 BRDY Interrupt Status Register [BRDYSTS] <Address: H'046> 2008
6.5B.2.10.3 NRDY Interrupt Status Register [NRDYSTS] <Address: H'048> 2011
6.5B.2.10.4 BEMP Interrupt Status Register [BEMPSTS] <Address: H'04A> 2013
6.5B.2.11 Frame Number Registers (FRMNUM, UFRMNUM) 2014
6.5B.2.11.1 Frame Number Register [FRMNUM] <Address: H'04C> 2014
6.5B.2.11.2 Micro Frame Number Register [UFRMNUM] <Address: H'04E> 2016
6.5B.2.12 USB Address 2017
6.5B.2.12.1 USB Address Register [USBADDR] <Address: H'050> 2017
6.5B.2.13 USB Request Registers 2018
6.5B.2.13.1 USB Request Type Register [USBREQ] <Address: H'054> 2018
6.5B.2.13.2 USB Request Value Register [USBVAL] <Address: H'056> 2019
6.5B.2.13.3 USB Request Index Register [USBINDX] <Address: H'058> 2019
6.5B.2.13.4 USB Request Length Register [USBLENG] <Address: H'05A> 2020
6.5B.2.14 DCP Configuration 2021
6.5B.2.14.1 DCP Configuration Register [DCPCFG] <Address: H'05C> 2021
6.5B.2.14.2 DCP Max. Packet Size Register [DCPMAXP] <Address: H'05E> 2022
6.5B.2.14.3 DCP Control Register [DCPCTR] <Address: H'060> 2023
6.5B.2.15 Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI) 2026
6.5B.2.15.1 Pipe Window Select Register [PIPESEL] <Address: H'064> 2026
6.5B.2.15.2 Pipe Configuration Register [PIPECFG] <Address: H'068> 2027
6.5B.2.15.3 Pipe Buffer Setting Register [PIPEBUF] <Address: H'06A> 2033
6.5B.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: H'06C> 2035
6.5B.2.15.5 Pipe Cycle Control Register [PIPEPERI] <Address: H'06E> 2036
6.5B.2.16 Pipe Control Registers (PIPExCTR) 2039

6.5B.2.16.1 PIPE1 Control Register [PIPE1CTR] <Address: H'070>
PIPE2 Control Register [PIPE2CTR] <Address: H'072>
PIPE3 Control Register [PIPE3CTR] <Address: H'074>
PIPE4 Control Register [PIPE4CTR] <Address: H'076>

6.5B.9.1.1 USB data bus resistor control..... 2091
6.5B.9.2 Interrupt Function.....2092
6.5B.9.2.1 Overview of Interrupt Function (other than DMA Master) 2092
6.5B.9.2.2 Device State Transition Interrupts 2094
6.5B.9.2.3 Control Transfer Stage Transition Interrupts 2095
6.5B.9.2.4 Interrupts Relating to DMA Master 2097
6.5B.9.3 Pipe Control 2098
6.5B.9.3.1 Maximum packet size setting 2099
6.5B.9.3.2 Response PID 2099
6.5B.9.3.3 Pipe control register switching procedure 2100
6.5B.9.3.4 Data PID sequence bit 2101
6.5B.9.4 FIFO Buffer 2102
6.5B.9.4.1 FIFO buffer allocation..... 2102
6.5B.9.4.2 Clearing FIFO buffers..... 2103
6.5B.9.5 FIFO Port Functions 2104
6.5B.9.5.1 FIFO port selection..... 2105
6.5B.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction)..... 2106
6.5B.9.5.3 BRDY interrupt timing selection function..... 2106
6.5B.9.6 Control Transfer (DCP).....2107
6.5B.9.6.1 Control transfer..... 2107
6.5B.9.7 Bulk Transfer (Pipes 1 to 5).....2109
6.5B.9.7.1 NYET handshake control 2109
6.5B.9.8 Interrupt Transfer (Pipes 6 to 9) 2110
6.5B.9.9 Isochronous Transfer (Pipes 1 and 2) 2111

6.5B.9.9.1 Isochronous transfer error detection 2111
6.5B.9.9.2 DATA-PID 2112
6.5B.9.9.3 Interval counter 2113
6.5B.9.9.4 Send data setup for isochronous transfer 2114
6.5B.9.9.5 Transmit buffer flush for isochronous transfer 2115
6.5B.9.10 SOF Interpolation Function 2117
6.5B.9.11 Link Power Management Processing 2118
6.5B.9.11.1 Descriptor 2118
6.5B.9.11.2 Basic processing 2119
6.5B.9.11.3 HIRD value negotiation 2119
6.5B.9.12 DMA Mode 2120
6.5B.9.12.1 Register mode/link mode 2120
6.5B.9.12.2 Write only mode 2137
6.5B.9.13 DMA Transfer 2138
6.5B.9.13.1 Transfer modes 2138
6.5B.9.13.2 DMA channel priority control 2139
6.5B.9.13.3 Forced sweeping request 2141
6.5B.9.13.4 DMA transfer completion interrupt (USBFDMAmn) 2142
6.5B.9.13.5 DMA error interrupt (USBFDMAERRm) 2142
6.5B.9.13.6 Interval Count Function 2143
6.5B.9.13.7 Operational difference depending on the transfer size 2144
6.5B.9.13.8 Transfer state 2146
6.5B.9.14 Access Type 2149
6.5B.9.14.1 DMA master transfer combination list 2149
6.5B.9.14.2 DMA master descriptor combination list 2152
6.5B.9.15 Arbitration between DMACs 2153
6.5B.9.16 Notes 2154
6.5B.9.16.1 Access 2154
6.5B.9.16.2 Level Interrupt bit 2154
6.6 PCI Express Interface (PCIe) 2155
6.6.1 Overview 2155
6.6.1.1 Features 2155
6.6.1.2 External Pins 2157
6.6.1.3 Block Diagram 2157
6.6.1.4 Reset 2158
6.6.1.4.1 Reset Sequence for Power-On Reset 2158
6.6.2 Register Configuration 2159
6.6.2.1 Register Type 2159
6.6.2.2 Register List 2160
6.6.2.2.1 AXI Bridge Registers 2161
6.6.2.2.2 PCI Express Configuration Registers (Type1) 2167
6.6.2.2.3 PHY Setting Registers 2169
6.6.3 Register Description 2170
6.6.3.1 AXI Bridge Register 2170
6.6.3.1.1 Request Data Registers (Offset: H’80/ H’84/ H’88) 2170

6.6.3.1.2 Request Receive Data Registers (Offset: H’8C) 2171
6.6.3.1.3 Request Address Registers 1 (Offset: H’90) 2172
6.6.3.1.4 Request Address Registers 2 (Offset: H’94) 2173
6.6.3.1.5 Request Byte Enable Registers (Offset: H’98) 2174
6.6.3.1.6 Request Issue Registers (Offset: H’9C) 2175
6.6.3.1.7 MSI Receive Window Address (Lower) Registers (Offset: H’100) 2177
6.6.3.1.8 MSI Receive Window Address (Upper) Registers (Offset: H’104) 2178
6.6.3.1.9 MSI Receive Window Mask Registers (Lower) (Offset: H’108) 2179
6.6.3.1.10 MSI Receive Window Mask Registers (Upper) (Offset: H’10C) 2180
6.6.3.1.11 PCI INTx Receive Interrupt Enable Registers (Offset: H’110) 2181
6.6.3.1.12 PCI INTx Receive Interrupt Status Registers (Offset: H’114) 2182
6.6.3.1.13 Message Receive Interrupt Enable Registers (Offset: H’120) 2183
6.6.3.1.14 Message Receive Interrupt Status Registers (Offset: H’124) 2184
6.6.3.1.15 Message Code Registers (Offset: H’130) 2185
6.6.3.1.16 Message Data Registers (Offset: H’134) 2186
6.6.3.1.17 Message Header 3rdDW Registers (Offset: H’138) 2187
6.6.3.1.18 Message Header 4thDW Registers (Offset: H’13C) 2188
6.6.3.1.19 Interrupt Table Registers (Offset: H’140) 2189
6.6.3.1.20 PCIe Event Interrupt Enable 0 Registers (Offset: H’200) 2190
6.6.3.1.21 PCIe Event Interrupt Status 0 Registers (Offset: H’204) 2192
6.6.3.1.22 PCIe Event Interrupt Enable 1 Registers (Offset: H’208) 2194
6.6.3.1.23 PCIe Event Interrupt Status 1 Registers (Offset: H’20C) 2196
6.6.3.1.24 AXI Master Error Interrupt Enable Registers (Offset: H’210) 2197
6.6.3.1.25 AXI Master Error Interrupt Status Registers (Offset: H’214) 2198
6.6.3.1.26 AXI Slave Error Interrupt Enable 1 Registers (Offset: H’220) 2199
6.6.3.1.27 AXI Slave Error Interrupt Status 1 Registers (Offset: H’224) 2200
6.6.3.1.28 AXI Slave Error Interrupt Status 3 Registers (Offset: H’230) 2201
6.6.3.1.29 Permission Registers (Offset: H’300) 2201
6.6.3.1.30 Reset Registers (Offset: H’310) 2202
6.6.3.1.31 Mode Set 0 Registers (Offset: H’314) 2204
6.6.3.1.32 Mode Set 1 Registers (Offset: H’318) 2206
6.6.3.1.33 Mode Set 3 Registers (Offset: H’380) 2207
6.6.3.1.34 PCIe Core Mode Set 1 Registers (Offset: H’400) 2208
6.6.3.1.35 PCIe Core Control 1 Registers (Offset: H’404) 2210
6.6.3.1.36 PCIe Core Status 1 Registers (Offset: H’408) 2212
6.6.3.1.37 PCIe Core Control 2 Registers (Offset: H’410) 2214
6.6.3.1.38 PCIe Core Status 2 Registers (Offset: H’414) 2216
6.6.3.1.39 PCIe Core Status 5 Registers (Offset: H’42C) 2218
6.6.3.1.40 LTR Reported value Registers (Offset: H’470) 2219
6.6.3.1.41 DMA Interrupt Vector 0 Registers (Offset: H’4D0) 2220
6.6.3.1.42 DMA Interrupt Vector 1 Registers (Offset: H’4D4) 2221
6.6.3.1.43 MSI Receive Enable 0 Registers (Offset: H’600) 2222
6.6.3.1.44 MSI Receive Message Data 0 Registers (Offset: H’604) 2223

6.6.3.1.45 MSI Receive Mask 0 Registers (Offset: H'608)..... 2224
6.6.3.1.46 MSI Receive Status 0 Registers (Offset: H'60C) 2225
6.6.3.1.47 DMA Control Registers (Offset: H'800) 2226
6.6.3.1.48 DMA Interrupt Enable Registers (Offset: H'808) 2227
6.6.3.1.49 DMA Interrupt Status Registers (Offset: H'80C)..... 2230
6.6.3.1.50 DMA Channel Control Registers (Offset: H'900/+Channel Offset)..... 2232
6.6.3.1.51 Descriptor Start Address (Lower) Registers (Offset: H'908/+Channel Offset) 2233
6.6.3.1.52 Descriptor Start Address (Upper) Registers (Offset: H'90C/+Channel Offset) 2234
6.6.3.1.53 Que Entry Registers (Offset: H'910/+Channel Offset) 2235
6.6.3.1.54 DMA Descriptor Control (Descriptor H'00) Registers (Offset: H'920/+Channel Offset)..... 2236
6.6.3.1.55 DMA Transaction Control (Descriptor H'04) Registers (Offset: H'924/+Channel Offset))..... 2237
6.6.3.1.56 DMA Size (Descriptor H'08) Registers (Offset: H'928/+Channel Offset) .. 2239
6.6.3.1.57 DMA Source Lower Address (Descriptor H'10) Registers (Offset: H'930/+Channel Offset)..... 2240
6.6.3.1.58 DMA Source Upper Address (Descriptor H'14) Registers (Offset: H'934/+Channel Offset)..... 2241
6.6.3.1.59 DMA Destination Lower Address (Descriptor H'18) Registers (Offset: H'938/+Channel Offset)..... 2242
6.6.3.1.60 DMA Destination Upper Address (Descriptor H'1C) Registers (Offset: H'93C/+Channel Offset) 2243
6.6.3.1.61 DMA Descriptor Lower Link Pointer (Descriptor H'20) Registers (Offset: H'940/+Channel Offset)..... 2243
6.6.3.1.62 DMA Descriptor Upper Link Pointer (Descriptor H'24) Registers (Offset: H'944/+Channel Offset)..... 2244
6.6.3.1.63 DMA Rest Size Registers (Offset: H'950/+Channel Offset) 2244
6.6.3.1.64 AXI Request Address (Lower) Registers (Offset: H'960/+Channel Offset)2245
6.6.3.1.65 AXI Request Address (Upper) Registers (Offset: H'964/+Channel Offset)2245
6.6.3.1.66 PCIe Request Address (Lower) Registers (Offset: H'968/+Channel Offset) 2246
6.6.3.1.67 PCIe Request Address (Upper) Registers (Offset: H'96C/+Channel Offset) 2246
6.6.3.1.68 QUE Status Registers (Offset: H'970/+Channel Offset) 2247
6.6.3.1.69 DMAC Error Status Registers (Offset: H'978/+Channel Offset)..... 2248
6.6.3.1.70 AXI Window Base (Lower) Registers (H'1000 + Offset: H'00/H'20/H'40/…/H'E0)..... 2249
6.6.3.1.71 AXI Window Base (Upper) Registers (H'1000 + Offset: H'04/H'24/H'44/…/H'E4)..... 2250
6.6.3.1.72 AXI Window Mask (Lower) Registers (H'1000 + Offset: H'08/H'28/H'48/…/H'E8)..... 2250

6.6.3.1.73 AXI Window Mask (Upper) Registers (H'1000 + Offset: H'0C/H'2C/H'4C/…/H'EC) 2251
6.6.3.1.74 AXI Destination (Lower) Registers (H'1000 + Offset: H'10/H'30/H'50/H'70/…/H'F0) 2251
6.6.3.1.75 AXI Destination (Upper) Registers (H'1000 + Offset: H'14/H'34/H'54/H'74/…/H'F4) 2252
6.6.3.1.76 PCIe Window Base (Lower) Registers (H'1000 + Offset: H'100/H'120/H'140/…/H'1E0) 2252
6.6.3.1.77 PCIe Window Base (Upper) Registers (H'1000 + Offset: H'104/H'124/H'144/…/H'1E4) 2253
6.6.3.1.78 PCIe Window Mask (Lower) Registers (H'1000 + Offset: H'108/H'128/H'148/…/H'1E8) 2253
6.6.3.1.79 PCIe Window Mask (Upper) Registers (H'1000 + Offset: H'10C/H'12C/H'14C/…/H'1EC) 2254
6.6.3.1.80 PCIe Destination (Lower) Registers (H'1000 + Offset: H'110/H'130/H'150/H'170/…/H'1F0) 2255
6.6.3.1.81 PCIe Destination (Upper) Register (H'1000 + Offset: H'114/H'134/H'154/H'174/…/H'1F4) 2255
6.6.3.2 PCI Express Configuration Registers (Type1) 2256
6.6.3.2.1 Vendor and Device ID (Offset: H'6000) 2256
6.6.3.2.2 Command and Status (Offset: H'6004) 2257
6.6.3.2.3 Revision ID and Class Code (Offset: H'6008) 2259
6.6.3.2.4 Cache Line and Header Type (Offset: H'600C) 2260
6.6.3.2.5 Base Address Register 0 (Offset: H'6010) 2261
6.6.3.2.6 Base Address Register 1 (Offset: H'6014) 2262
6.6.3.2.7 Bus Number Register (Offset: H'6018) 2262
6.6.3.2.8 I/O Base/Limit and Secondary Status (Offset: H'601C) 2263
6.6.3.2.9 Memory Base/Limit Register (Offset: H'6020) 2265
6.6.3.2.10 Prefetchable Memory Base/ Limit Register (Offset: H'6024) 2266
6.6.3.2.11 Prefetchable Base Upper 32Bits Registers (Offset: H'6028) 2266
6.6.3.2.12 Prefetchable Limit Upper 32Bits (Offset: H'602C) 2267
6.6.3.2.13 I/O Base/Limit Upper 16-Bit Register (Offset: H'6030) 2267
6.6.3.2.14 Capability Pointer (Offset: H'6034) 2268
6.6.3.2.15 Bridge Control and Interrupt (Offset: H'603C) 2269
6.6.3.2.16 PM Capabilities (Offset: H'6040) 2270
6.6.3.2.17 PM Status/Control (Offset: H'6044) 2272
6.6.3.2.18 PCI Express Capability (Offset: H'6060) 2274
6.6.3.2.19 Device Capabilities (Offset: H'6064) 2275
6.6.3.2.20 Device Control/Status (Offset: H'6068) 2277
6.6.3.2.21 Link Capabilities (Offset: H'606C) 2279
6.6.3.2.22 Link Control/Status (Offset: H'6070) 2281
6.6.3.2.23 Slot Capabilities (Offset: H'6074) 2283
6.6.3.2.24 Slot Control/Status (Offset: H'6078) 2285

6.6.3.2.25 Root Control/Capabilities (Offset: H'607C) 2287
6.6.3.2.26 Root Status (Offset: H'6080) 2288
6.6.3.2.27 Device Capabilities 2 (Offset: H'6084) 2289
6.6.3.2.28 Device Control 2/Status 2 (Offset: H'6088) 2291
6.6.3.2.29 Link Capabilities 2 (Offset: H'608C) 2293
6.6.3.2.30 Link Control 2/Status 2 (Offset: H'6090) 2294
6.6.3.2.31 Base Address Register Mask00(Lower) (Offset: H'60A0) 2296
6.6.3.2.32 Base Address Register Mask00(Upper) (Offset: H'60A4) 2296
6.6.3.2.33 Base Size 00/01 (Offset: H'60C8) 2297
6.6.3.2.34 Type Supported 00/01/02 (Offset: H'60D8) 2298
6.6.3.2.35 Advanced Error Reporting Capability (Offset: H'6100) 2299
6.6.3.2.36 Uncorrectable Error Status Register (Offset: H'6104) 2300
6.6.3.2.37 Uncorrectable Error Mask Register (Offset: H'6108) 2302
6.6.3.2.38 Uncorrectable Error Severity Register (Offset: H'610C) 2304
6.6.3.2.39 Correctable Error Status Register (Offset: H'6110) 2306
6.6.3.2.40 Correctable Error Mask Register (Offset: H'6114) 2307
6.6.3.2.41 Advanced Error Capabilities and Control Register (Offset: H'6118) 2308
6.6.3.2.42 Header Log Register 0 (Offset: H'611C) 2309
6.6.3.2.43 Header Log Register 1 (Offset: H'6120) 2309
6.6.3.2.44 Header Log Register 2 (Offset: H'6124) 2310
6.6.3.2.45 Header Log Register 3 (Offset: H'6128) 2310
6.6.3.2.46 Root Error Command (Offset: H'612C) 2311
6.6.3.2.47 Root Error Status (Offset: H'6130) 2312
6.6.3.2.48 Error source Identification Register (Offset: H'6134) 2313
6.6.3.2.49 Device Serial Number Extended Capability (Offset: H'6150) 2313
6.6.3.2.50 Serial Number Register (Lower DW) (Offset: H'6154) 2314
6.6.3.2.51 Serial Number Register (Upper DW) (Offset: H'6158) 2314
6.6.3.2.52 L1 PM Substates Extended Capability Header (Offset: H'6160) 2315
6.6.3.2.53 L1 PM Substates Capabilities Register (Offset: H'6164) 2316
6.6.3.2.54 L1 PM Substates Control 1 Register (Offset: H'6168) 2318
6.6.3.2.55 L1 PM Substates Control 2 Register (Offset: H'616C) 2320
6.6.3.3 PHY Setting Registers 2321
6.6.3.3.1 XCFGD Setting Register n (n = 0 to 38) (Offset: H'2000 + H'10 × n) 2321
6.6.3.3.2 XCFGA CMN Setting Register n (n = 0 to 15) (Offset: H'2400 + H'10 × n) 2321
6.6.3.3.3 XCFGA RX Setting Register n (n = 0 to 12) (Offset: H'2500 + H'10 × n) 2322
6.6.3.3.4 XCFGA TX Setting Register (Offset: H'25D0) 2322
6.6.3.3.5 XCFG Control Register (Offset: H'2A20) 2323
6.6.4 Function Description 2324
6.6.4.1 PCIe Core Functionality 2324
6.6.4.2 Issuing of PCIe Request and Register Access (From AXI) 2324
6.6.4.2.1 PCIe Requests which can be Issued (Supported Commands for TX) 2324
6.6.4.2.2 Register access 2325

6.6.4.2.3 Issuing Memory Requests ... 2325
6.6.4.2.4 Issuing Special Requests ... 2327
6.6.4.3 Issuing of AXI Transaction and Register Access (From PCIe) ... 2332
6.6.4.3.1 PCIe Requests which can be Received (Supported Commands for RX) ... 2332
6.6.4.3.2 Issuing AXI Transaction ... 2333
6.6.4.3.3 Narrow Transfer ... 2334
6.6.4.4 DMA Functions ... 2335
6.6.4.4.1 Register-Type Transfer ... 2335
6.6.4.4.2 Descriptor-Type Transfer ... 2338
6.6.4.4.3 Method of Transfer ... 2345
6.6.4.4.4 Inter-Channel Arbitration ... 2345
6.6.4.4.5 DMA Completed Interrupt ... 2346
6.6.4.5 Reception of PCIe Commands ... 2347
6.6.4.5.1 Reception of MSIs (Root Complex) ... 2347
6.6.4.5.2 Setting the MSI Window ... 2348
6.6.4.5.3 Reception of an Interrupt in Response to a Message Request (Root Complex) ... 2348
6.6.4.5.4 Reception of Message Requests ... 2349
6.6.4.6 Interrupt ... 2350
6.6.4.6.1 Error and Event Interrupt Notification ... 2350
6.6.4.6.2 INTx/MSI Interrupt Notification (Root Complex) ... 2350
6.6.4.6.3 Root Complex Interrupt Notification ... 2351
6.6.4.6.4 DMA Interrupt ... 2359
6.6.4.7 Power Management (Root Complex Mode) ... 2360
6.6.4.7.1 PCI Power Management (PCI-PM) ... 2360
6.6.4.7.2 Active State Power Management (ASPM) ... 2361
6.6.4.8 Error Processing ... 2362
6.6.4.8.1 Error Classification ... 2362
6.6.4.8.2 Error Checking Mechanism ... 2363
6.6.4.8.3 Error Message ... 2364
6.6.5 Operation ... 2365
6.6.5.1 Setting Up ... 2365
6.6.5.1.1 Changing the Initial Values of the Registers ... 2366
6.6.5.1.2 De-asserting the Reset ... 2366
6.6.5.1.3 Checking if the Link is Up ... 2367
6.6.5.2 Setting the Windows (Root Complex Mode) ... 2368
6.6.5.2.1 AXI Window Setting ... 2369
6.6.5.2.2 PCIe Window Setting ... 2371
6.6.5.2.3 Device Search ... 2372
6.6.5.3 Setting the PCIe Address Space ... 2373
6.6.5.4 Data Transfer ... 2376
6.6.5.4.1 PCIe MWr (when the AXI Slave is in Use) ... 2376
6.6.5.4.2 PCIe MWr (when the DMAC is in Use) ... 2378
6.6.5.4.3 PCIe MRd (when the AXI Slave is in Use) ... 2380
6.6.5.4.4 PCIe MRd (when the DMAC is in Use) ... 2382

6.6.6 Usage Notes 2384
6.6.6.1 Points for Caution and Prohibited Items in the Issuing of Requests 2384
6.6.6.2 Ordering Specifications of Received Non-Posted and Posted Requests....2384
6.6.6.3 Caution when Changing the Speed Spontaneously....2384
6.6.6.4 Error Processing of Unsupported Requests....2385
6.6.6.5 Processing on Reception of the Message....2386

7.3.18.2 Break Detection and Processing 2657
7.3.18.3 Mark State and Production of Breaks 2658
7.3.18.4 Receive Error Flags and Transmit Operations (Clock Synchronous Mode and Simple SPI Mode) 2658
7.3.18.5 Writing Data to TDR 2658
7.3.18.6 Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode and Simple SPI Mode) 2658
7.3.18.7 Notes on Starting Transfer 2660
7.3.18.8 Limitations on Simple SPI Mode 2660
7.3.18.9 Notes on Transmit Enable Bit (TE) 2661
7.3.18.10 Notes on Simple-LIN mode 2661
7.3.18.11 Notes on RS-485 Driver Control Function 2661
7.3.18.12 Notes on Loopback Function 2662
7.3.18.13 Notes Regarding Register Access when Operation Clock (RSCI_m_TCLK) is Slower than Bus Clock (RSCI_m_PCLK) 2662
7.3.18.14 Notes on Interrupting Operation 2662
7.3.18.15 Notes on Communication Mode Transition 2662
7.4 Serial Communications Interface with FIFO (SCIFA) 2663
7.4.1 Overview 2663
7.4.2 Register Descriptions 2665
7.4.2.1 Receive Shift Register (RSR) 2666
7.4.2.2 Receive FIFO Data Register (FRDR) 2666
7.4.2.3 Transmit Shift Register (TSR) 2666
7.4.2.4 Transmit FIFO Data Register (FTDR) 2667
7.4.2.5 Serial Mode Register (SMR) 2668
7.4.2.6 Serial Control Register (SCR) 2670
7.4.2.7 Serial Status Register (FSR) 2672
7.4.2.8 Bit Rate Register (BRR) 2676
7.4.2.9 Modulation Duty Register (MDDR) 2681
7.4.2.10 FIFO Control Register (FCR) 2684
7.4.2.11 FIFO Data Count Register (FDR) 2686
7.4.2.12 Serial Port Register (SPTR) 2687
7.4.2.13 Line Status Register (LSR) 2690
7.4.2.14 Serial Extended Mode Register (SEMR) 2691
7.4.2.15 FIFO Trigger Control Register (FTCR) 2693

7.4.3 Operation 2694
7.4.3.1 Overview 2694
7.4.3.1.1 Asynchronous Mode 2694
7.4.3.1.2 Clock Synchronous Mode 2694
7.4.3.2 Operation in Asynchronous Mode 2696
7.4.3.2.1 Transmit/Receive Formats 2697
7.4.3.2.2 Clock 2697
7.4.3.2.3 Transmitting and Receiving Data 2698
7.4.3.3 Operation in Clock Synchronous Mode 2707
7.4.4 Bit Rate Modulation 2716
7.4.5 Interrupt Sources 2717
7.4.6 Serial Port Register (SPTR) and SCIFA-Related Pins 2718
7.4.7 Noise Cancellation 2720
7.4.8 Usage Notes 2721
7.4.8.1 FTDR Register Writing and TDFE Flag 2721
7.4.8.2 FRDR Register Reading and RDF Flag 2721
7.4.8.3 Break Detection and Processing 2721
7.4.8.4 Writing to the SPTR Register 2721
7.4.8.5 Break Signal Transmission 2722
7.4.8.6 Receive Data Sampling Timing and Receive Margin in Asynchronous Mode 2723
7.4.8.7 Note on FER Flag and PER Flag in Serial Status Register (FSR) 2724
7.4.8.8 Notes on External Clock Input in Clock Synchronous Mode 2724
7.4.8.9 Module Standby Mode Setting 2724
7.4.8.10 Notes on Operation for Reception when an Internal Clock is Selected in Clock Synchronous Mode 2724
7.5 Serial Peripheral Interface (RSPI) 2725
7.5.1 Overview 2725
7.5.1.1 Features 2725
7.5.2 Registers 2729
7.5.2.1 List of Registers 2730
7.5.2.2 Register Description 2731
7.5.2.2.1 SPI Data Register (RSPIm_SPDR/SPDR_HA/SPDR_BY) 2731
7.5.2.2.2 SPI Clock Delay Register (RSPIm_SPCKD) 2734
7.5.2.2.3 SPI Slave Select Negation Delay Register (RSPIm_SSLND) 2735
7.5.2.2.4 SPI Next-Access Delay Register (RSPIm_SPND) 2737
7.5.2.2.5 SPI Clock Digital Control Register for Master Receive (RSPIm_MRCKD) 2738
7.5.2.2.6 SPI Control Register (RSPIm_SPCR) 2739
7.5.2.2.7 SPI Control Register for Master Receive Only (RSPIm_SPCRRM) 2745
7.5.2.2.8 SPI Control Register for Received Data Ready Detection (RSPIm_SPDRCR) 2746
7.5.2.2.9 SPI Pin Control Register (RSPIm_SPPCR) 2747
7.5.2.2.10 SPI Control Register 2 (RSPIm_SPCR2) 2749
7.5.2.2.11 SPI Slave Select Polarity Register (RSPIm_SSLP) 2750
7.5.2.2.12 SPI Bit Rate Register (RSPIm_SPBR) 2751
7.5.2.2.13 SPI Sequence Control Register (RSPIm_SPSCR) 2752
7.5.2.2.14 SPI Command Register n (RSPIm_SPCMDn) (n = 0 to 7) 2753

7.5.2.2.15 SPI Data Control Register (RSPIm_SPDCR) 2756
7.5.2.2.16 SPI Data Control Register 2 (RSPIm_SPDCR2) 2758
7.5.2.2.17 SPI Sequence Status Register (RSPIm_SPSSR) 2759
7.5.2.2.18 SPI Status Register (RSPIm_SPSR) 2760
7.5.2.2.19 SPI Transfer FIFO Status Register (RSPIm_SPTFSR) 2766
7.5.2.2.20 SPI Receive FIFO Status Register (RSPIm_SPRFSR) 2767
7.5.2.2.21 SPI Polling Register (RSPIm_SPPSR) 2768
7.5.2.2.22 SPI Status Clear Register (RSPIm_SPSRC) 2769
7.5.2.2.23 SPI FIFO Clear Register (RSPIm_SPFCR) 2770
7.5.3 Operation 2771
7.5.3.1 Overview of SPI Operations 2771
7.5.3.2 SPI Pin Control 2772
7.5.3.3 SPI System Configuration Examples 2774
7.5.3.3.1 Single master/single slave (this LSI = master) 2774
7.5.3.3.2 Single master/single slave (this LSI = slave) 2774
7.5.3.3.3 Single master/multi-slave (this LSI = master) 2775
7.5.3.3.4 Single master/multi-slave (with this LSI acting as slave) 2776
7.5.3.3.5 Multi-master/multi-slave (with this LSI acting as master) 2777
7.5.3.3.6 Master (clock synchronous operation)/slave (clock synchronous operation) (this LSI = master) 2778
7.5.3.3.7 Master (clock synchronous operation)/slave (clock synchronous operation) (this LSI = slave) 2779
7.5.3.4 Data Format 2780
7.5.3.4.1 Data format of one frame 2780
7.5.3.4.2 When parity is disabled (SPPE = 0b) 2780
7.5.3.4.3 When parity is enabled (SPPE = 1b) 2784
7.5.3.4.4 Byte swap transmission 2788
7.5.3.4.5 Byte swap reception 2791
7.5.3.5 Transfer Format (Frame Format) 2794
7.5.3.5.1 CPHA = 0b 2794
7.5.3.5.2 CPHA = 1b 2795
7.5.3.6 Communications Operating Mode 2796
7.5.3.6.1 Transmit-receive serial communication (TXMD[1:0] = 00b) 2796
7.5.3.6.2 Transmit-only serial communication (TXMD[1:0] = 01b) 2796
7.5.3.6.3 Receive-only serial communication (TXMD[1:0] = 10b) 2797
7.5.3.7 Transmission buffer empty/receive buffer full interrupt 2798
7.5.3.8 Idle Interrupt 2800
7.5.3.8.1 In the Motorola-SPI case 2800
7.5.3.8.2 In the TI-SSP case 2801
7.5.3.9 Communication End Interrupt 2801
7.5.3.9.1 Transmit-receive/transmit-only in master mode 2801
7.5.3.9.2 Receive-only in master mode 2803
7.5.3.9.3 Transmit-receive/transmit-only in slave mode on SPI operation (4-wire) 2805
7.5.3.9.4 Receive only in slave mode on SPI operation (4-wire) 2807

7.5.3.9.5 Transmit-receive/transmit-only in slave mode on clock synchronous operation (3-wire) ... 2809
7.5.3.9.6 Receive only in slave mode on clock synchronous operation (3-wire) ... 2809
7.5.3.9.7 Common operation ... 2810

7.9.1 Overview 3246
7.9.2 Register Descriptions 3250
7.9.2.1 Channel n Nominal Bit Rate Configuration Register (CFDCnNCFG) (n = 0, 1, 2) 3254
7.9.2.2 Channel n Control Register (CFDCnCTR) (n = 0, 1, 2) 3256
7.9.2.3 Channel n Status Register (CFDCnSTS) (n = 0, 1, 2) 3262
7.9.2.4 Channel n Error Flag Register (CFDCnERFL) (n = 0, 1, 2) 3265
7.9.2.5 Channel n Data Bit Rate Configuration Register (CFDCnDCFG) (n = 0, 1, 2) 3272
7.9.2.6 Channel n CAN-FD Configuration Register (CFDCnFDCFG) (n = 0, 1, 2) 3274
7.9.2.7 Channel n CAN-FD Control Register (CFDCnFDCTR) (n = 0, 1, 2) 3278
7.9.2.8 Channel n CAN-FD Status Register (CFDCnFDSTS) (n = 0, 1, 2) 3279
7.9.2.9 Channel n CAN-FD CRC Register (CFDCnFDCRC) (n = 0, 1, 2) 3282
7.9.2.10 Global IP Version Register (CFDGIPV) 3283
7.9.2.11 Global Configuration Register (CFDGCFG) 3284
7.9.2.12 Global Control Register (CFDGCTR) 3287
7.9.2.13 Global Status Register (CFDGSTS) 3290
7.9.2.14 Global Error Flag Register (CFDGERFL) 3292
7.9.2.15 Global TX Interrupt Status Register 0 (CFDGTINTSTS0) 3295
7.9.2.16 Global Timestamp Counter Register (CFDGTSC) 3298
7.9.2.17 Global Acceptance Filter List Entry Control Register (CFDGAFLECTR) 3299
7.9.2.18 Global Acceptance Filter List Configuration Register 0 (CFDGAFLCFG0) 3300
7.9.2.19 Global Acceptance Filter List Configuration Register 1 (CFDGAFLCFG1) 3301
7.9.2.20 Global Acceptance Filter List ID Registers n (CFDGAFLIDn) (n = 1 to 16) 3302
7.9.2.21 Global Acceptance Filter List Mask Registers n (CFDGAFLMn) (n = 1 to 16) 3304
7.9.2.22 Global Acceptance Filter List Pointer 0 Registers n (CFDGAFLP0n) (n = 1 to 16) 3306
7.9.2.23 Global Acceptance Filter List Pointer 1 Registers n (CFDGAFLP1n) (n = 1 to 16) 3309
7.9.2.24 RX Message Buffer Number Register (CFDRMNB) 3311
7.9.2.25 RX Message Buffer New Data Register n (CFDRMNDn) (n = 0, 1) 3312
7.9.2.26 RX FIFO Configuration/Control Register n (CFDRFCCn) (n = 0 to 7) 3314
7.9.2.27 RX FIFO Status Register n (CFDRFSTSn) (n = 0 to 7) 3317
7.9.2.28 RX FIFO Pointer Control Register n (CFDRFPCTRn) (n = 0 to 7) 3320
7.9.2.29 Common FIFO Configuration/Control Register n (CFDCFCCn) (n = 0 to 8) 3321
7.9.2.30 Common FIFO Configuration/Control Enhancement Register n (CFDCFCCEn) (n = 0 to 8) 3325
7.9.2.31 Common FIFO Status Register n (CFDCFSTSn) (n = 0 to 8) 3327
7.9.2.32 Common FIFO Pointer Control Register n (CFDCFPCTRn) (n = 0 to 8) 3332
7.9.2.33 FIFO Empty Status Register (CFDFESTS) 3333
7.9.2.34 FIFO Full Status Register (CFDFFSTS) 3334
7.9.2.35 FIFO Message Lost Status Register (CFDFMSTS) 3335
7.9.2.36 RX FIFO Interrupt Flag Status Register (CFDRFISTS) 3336
7.9.2.37 Common FIFO RX Interrupt Flag Status Register (CFDCFRISTS) 3337
7.9.2.38 Common FIFO TX Interrupt Flag Status Register (CFDCFTISTS) 3338
7.9.2.39 FIFO FDC Full Status Register (CFDFFFSTS) 3339
7.9.2.40 Common FIFO Message Overwrite Status Register (CFDCFMOWSTS) 3340
7.9.2.41 Common FIFO One Frame RX Interrupt Flag Status Register (CFDCFOFRISTS) 3341
7.9.2.42 Common FIFO One Frame TX Interrupt Flag Status Register (CFDCFOFTISTS) 3342
7.9.2.43 DMA Transfer Control Register (CFDCDTCT) 3343
7.9.2.44 DMA Transfer Status Register (CFDCDTSTS) 3345

7.9.2.45 DMA TX Transfer Control Register (CFDCDTTCT) 3347
7.9.2.46 DMA TX Transfer Status Register (CFDCDTTSTS) 3349
7.9.2.47 Global RX Interrupt Status Register n (CFDGRINTSTSn) (n = 0, 1, 2) 3351
7.9.2.48 TX Message Buffer Control Register n (CFDTMCn) (n = 0 to 191) 3354
7.9.2.49 TX Message Buffer Status Register n (CFDTMSTSn) (n = 0 to 191) 3356
7.9.2.50 TX Message Buffer Transmission Request Status Register n (CFDTMTRSTSn) (n = 0 to 5)....3358
7.9.2.51 TX Message Buffer Transmission Abort Request Status Register n (CFDTMTARSTSn) (n = 0 to 5)....3360
7.9.2.52 TX Message Buffer Transmission Completion Status Register n (CFDTMTCSTSn) (n = 0 to 5) 3362
7.9.2.53 TX Message Buffer Transmission Abort Status Register n (CFDTMTASTSn) (n = 0 to 5)....3364
7.9.2.54 TX Message Buffer Transmission Interrupt Enable Register n (CFDTMIECn) (n = 0 to 5)....3366
7.9.2.55 TX Queue Configuration/Control Register 0n (CFDTXQCC0n) (n = 0, 1, 2) 3368
7.9.2.56 TX Queue Configuration/Control Register 1n (CFDTXQCC1n) (n = 0, 1, 2) 3372
7.9.2.57 TX Queue Configuration/Control Register 2n (CFDTXQCC2n) (n = 0, 1, 2) 3376
7.9.2.58 TX Queue Configuration/Control Register 3n (CFDTXQCC3n) (n = 0, 1, 2) 3380
7.9.2.59 TX Queue Status Register 0n (CFDTXQSTS0n) (n = 0, 1, 2)....3383
7.9.2.60 TX Queue Status Register 1n (CFDTXQSTS1n) (n = 0, 1, 2)....3387
7.9.2.61 TX Queue Status Register 2n (CFDTXQSTS2n) (n = 0, 1, 2)....3391
7.9.2.62 TX Queue Status Register 3n (CFDTXQSTS3n) (n = 0, 1, 2)....3395
7.9.2.63 TX Queue Pointer Control Register 0n (CFDTXQPCTR0n) (n = 0, 1, 2)....3398
7.9.2.64 TX Queue Pointer Control Register 1n (CFDTXQPCTR1n) (n = 0, 1, 2)....3399
7.9.2.65 TX Queue Pointer Control Register 2n (CFDTXQPCTR2n) (n = 0, 1, 2)....3400
7.9.2.66 TX Queue Pointer Control Register 3n (CFDTXQPCTR3n) (n = 0, 1, 2)....3401
7.9.2.67 TX Queue Empty Status Register (CFDTXQESTS)....3402
7.9.2.68 TX Queue Full Interrupt Status Register (CFDTXQFISTS)....3403
7.9.2.69 TX Queue Message Lost Status Register (CFDTXQMSTS)....3405
7.9.2.70 TX Queue Message Overwrite Status Register (CFDTXQOWSTS)....3407
7.9.2.71 TX Queue Interrupt Status Register (CFDTXQISTS)....3409

SECTION 1 OVERVIEW

1.1 Overview

1.1.1 Features

This LSI includes:

■ CPU

- On-chip Quad 64-bit Arm® Cortex®-A55 Core processors [option]

  Application processing (up to 1.2 GHz)
- 32-bit Arm® Cortex®-M33 processor

  System management (up to 200 MHz)

■ Boot

- Selectable boot CPU from Arm® Cortex®-M33 or Arm® Cortex®-A55

■ Video and Graphics

- H.264 Video codec processor [option]
- 3D Graphics Engine of Arm® Mali™-G31 [option]
- Image Scaling Unit 2

■ On-chip SRAM and external memory interfaces

- On-chip shared SRAM (512-Kbyte on-chip SRAM with ECC)
- External DDR memory interface

  1-channel memory controller for DDR4-2133 or LPDDR4-2133 with a 16-bit bus width
- xSPI interface
- SDHI (eMMC/SD (1-, 4-, 8-bit bus width) supported)
- External Bus state controller with 16bit for SRAM

■ Camera and display interfaces

- MIPI CSI-2 (1 ch.: 1 or 2 lanes)
- Selectable 1 display interfaces from the following

  MIPI DSI (1 ch.: 1, 2, or 4 lanes)

  Parallel interface (1 ch.)

  LVDS (1 ch.)

■ Various communication/storage/network interfaces

- Ethernet (2 ch.: 10/100/1000 BASE) with TSN
- USB2.0 (2 ch.: Host/Function)
- PCIe Gen2 (1 ch : 1 lane, Root Complex only)
- CANFD (compliant with ISO11898-1) (3 ch.)
- RSCI (4 ch : UART/SPI/I2C-host)
- SCIF (6 ch)
- RSPI (3 ch.)
- RIIC (4 ch.)
- I3C (1 ch.)

■ Extended-function timers

- General-purpose PWM timer (8 ch : 32-bit)
- Multi-Function Timer Pulse Unit (8 ch : 16-bit, 1 ch : 32-bit)

■ Audio

- Serial sound interface (full-duplex 4 ch)
- SPDIF input/output interfaces (1 ch.)
- Pulse density modulation (PDM) input interfaces (3 ch.)

■ Analog/Digital converter (ADC) and sensors

- 1.0 Msps 12-bit ADC (8 ch.)
- Internal temperature sensors (1 ch.)

■ Security

- Hardware cryptographic engine

NOTE

- Products with #AC0 or #BC0 in the part number have limitations in the MIPI DSI feature.
- For details, please contact a Renesas Electronics sales representative.

1.1.2 Product Lineup

Figure 1.1-1 shows the product part number information. **Table 1.1-1** shows a list of products.

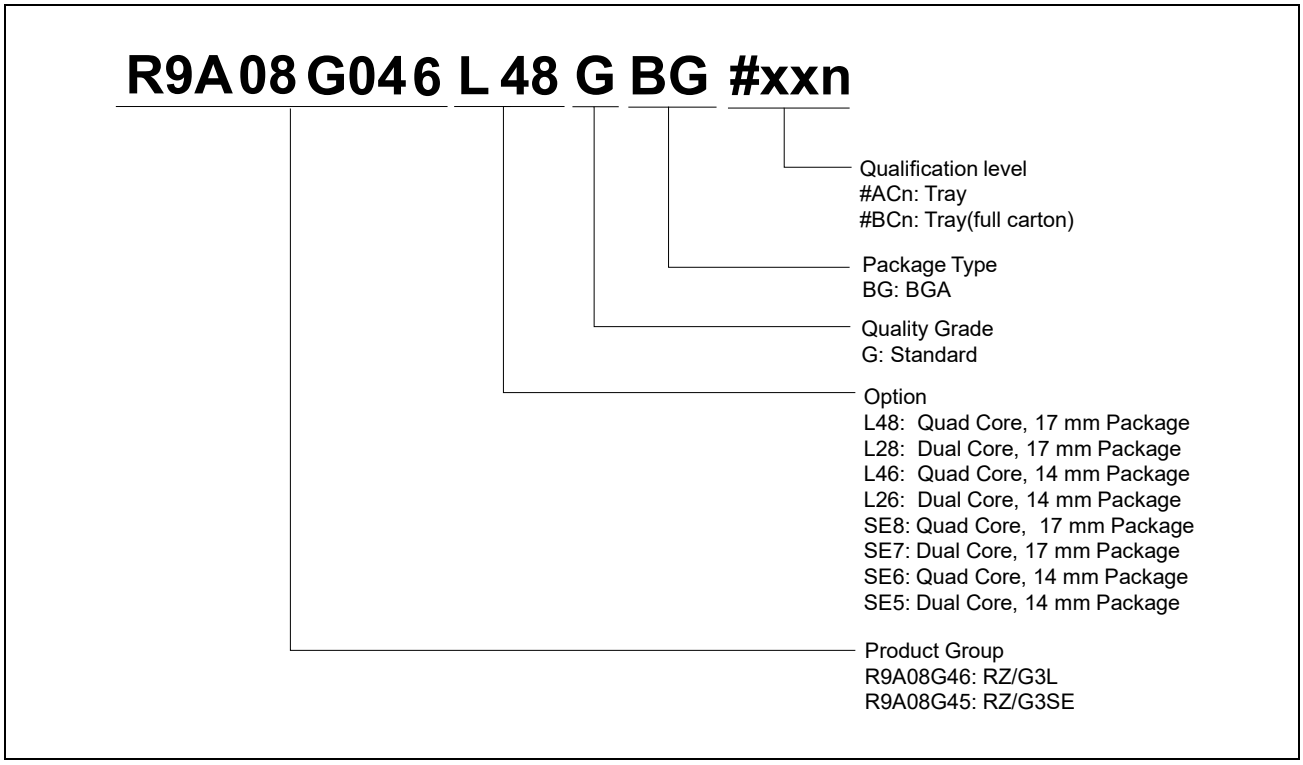

Figure 1.1-1 Part Numbering Scheme

Table 1.1-1 Product Lineup

Group	Package	Part Number	CPU	GE3D/VCP
RZ/G3L	17 mm LFBGA	R9A08G046L48GBG	4x Cortex-A55, 1x Cortex-M33	Available
		R9A08G046L28GBG	2x Cortex-A55, 1x Cortex-M33	
	14 mm LFBGA	R9A08G046L46GBG	4x Cortex-A55, 1x Cortex-M33	
		R9A08G046L26GBG	2x Cortex-A55, 1x Cortex-M33	
RZ/G3SE	17 mm LFBGA	R9A08G045SE8GBG	4x Cortex-A55, 1x Cortex-M33	Not supported
		R9A08G045SE7GBG	2x Cortex-A55, 1x Cortex-M33	
	14 mm LFBGA	R9A08G045SE6GBG	4x Cortex-A55, 1x Cortex-M33	
		R9A08G045SE5GBG	2x Cortex-A55, 1x Cortex-M33	

Note:

- Products with #AC0 or #BC0 in the part number have limitations in the MIPI DSI feature.
- For details, please contact a Renesas Electronics sales representative.

1.1.3 Functions

1.1.3.1 CPU

Item	Description
Application Processor Cortex-A55 (CA55) [option]	• Arm Cortex-A55 Quad Core 1.2 GHz • L1 I-cache 32 Kbytes (with parity) and D-cache 32 Kbytes (with ECC) per core • L2 cache: 0 Kbyte • L3 cache: 512 Kbyte (with ECC) • MMU supported • Neon™ and FPU supported • Cryptographic extension supported • Armv8-A architecture
System Manager Cortex-M33 (CM33)	• Arm Cortex-M33 Processor 200 MHz • Security Extension supported • Armv8-M architecture
Debug Interface	• Arm® CoreSight® architecture • JTAG and SWD interfaces supported • ETF: Total of 32 Kbytes for program flow tracing • JTAG disabling supported [option]

1.1.3.2 Boot

Item	Description
Boot	• Selectable boot from Arm Cortex-A55 or Arm Cortex-M33 • CA55 boot – Boot Mode 0: Booting from eSD 3.3 V – Boot Mode 1: Booting from eMMC 3.3 V – Boot Mode 2: Booting from a serial flash memory connected to the xSPI bus space 3.3 V – Boot Mode 3: Booting from SCIF download – Boot Mode 5: Booting from eMMC 1.8 V – Boot Mode 6: Booting from a serial flash memory connected to the xSPI bus space 1.8 V • CM33 boot – Boot Mode 2: Booting from a serial flash memory connected to the xSPI bus space 3.3 V – Boot Mode 3: Booting from SCIF download – Boot Mode 6: Booting from a serial flash memory connected to the xSPI bus space 1.8 V

1.1.3.3 Graphics Unit

Item	Description
3D Graphics Engine (GE3D) [option]	• Arm Mali-G31 600 MHz • One single-pixel shader core • 8 Kbytes L2 cache • Vulkan 1.2 • OpenGL ES™ 1.1, 2.0 and 3.2 • OpenCL 2.0 full profile

1.1.3.4 Video Processing Unit

Item	Description
Video Codec Processor (VCP) [option]	• H.264 codec module • Support for encoding and decoding – H.264 / AVC (High Profile / Main Profile / Baseline Profile) – H.264 / MVC (Stereo High Profile • Maximum pixel rate: 1920 × 1080 × 30 fps • Input image Size (max): 1920 × 1080 • Output image Size (max): 1920 × 1080 • Color format (input in encoding): YcbCr 4:2:0 8-bits, 2-planar supported – Color format (output in decoding): YcbCr 4:2:0, semi-planar supported
Image Scaling Unit2 (ISU2)	• Scaling up and down function with bilinear interpolation • Input image size(max): 2048 × 2048 • Output image size(max): 2048 × 2048 • Support color format conversion (YCbCr422, YCbCr420, RGB, ARGB / RAW(Grayscale))

1.1.3.5 Internal Memory

Item	Description
System RAM	• 512 Kbytes (with ECC)

1.1.3.6 External Memory Interface

Item	Description
External Bus Controller for DDR4/LPDDR4 SDRAM (DDR)	• 1 channel • Support DDR4-2133 – Bus Width: 16-bit – Memory Size: Up to 4 Gbytes, Single rank • Support LPDDR4-2133 – Bus Width: 16-bit – Memory Size: Up to 2 Gbytes, Single rank • In line ECC supported (support for error detection interrupts) • Auto Refresh/Self Refresh/IO Retention supported • Memory access protection for secure regions using TZC-400 (Arm® TrustZone® supported)
xSPI Controller (xSPI)	• 1 channel (2 chip select signals) • Compliant with the xSPI protocol • Protocol mode —1, 4 or 8 pins with SDR or DDR (1S-1S-1S, 4S-4D-4D, 8D-8D-8D) —2 or 4 pins with SDR (1S-4S-4S, 4S-4S-4S) • Support for XiP mode • Support for up to 256-Mbyte address space (support for up to 128 Mbytes per channel address space in boot sequence)
SD Card Host Interface/ Multimedia Card Interface (SD/MMC)	• 3 channels —Channel 0 supports SDHI/e-MMC (boot supported) —Channel 1 supports SDHI/e-MMC —Channel 2 supports SDHI • SD memory I/O card interface (1-bit/4-bit SD bus) • SD, SDHC and SDXC SD memory card access supported • Compliant with SD 3.0 • Default, high-speed, UHS-I/SDR50, SDR104 and DDR50 transfer modes supported • Error check function: CRC7 (Command), CRC16 (Data) • Support for card detection and write protection • MMC interface —Channel 0 (1-bit/4-bit/8-bit MMC bus) —Channel 1 (1-bit/4-bit MMC bus) • e-MMC device access supported • Compliant with eMMC 5.1(No Command Queue supported) • High-speed, HS400 transfer modes supported (Channel 0) • High-speed, HS200 transfer modes supported (Channel 0 and 1)
External Bus state controller with 16-bits for SRAM (EBSC)	• 1 channel • Support SRAM interface • Bus width: 8- or 16-bits • Support up to 2Mbytes address space

1.1.3.7 CPU Peripheral

Item	Description
Clock Pulse Generator (CPG)	• Generates the clocks from an external clock or external resonator (24 MHz). – Maximum Arm Cortex-A55 clock: 1.2 GHz – Maximum Arm Cortex-M33 clock: 200 MHz – Maximum DDR clock: 1066 MHz (DDR4-2133 / LPDDR4-2133) – Maximum 3DGE clock: 600 MHz – Maximum Video Codec processor clock: 200 MHz – Maximum System Bus clock: 200 MHz • SSC (Spread Spectrum Clock) supported
Direct Memory Access Controller (DMAC)	• 32 channels • Transfer modes: Single transfer mode and block transfer mode • LINK mode (DMA transfer under descriptor control) supported • Transfer size: 1, 2, 4, 8, 16, 32, 64, or 128 bytes • Transfer request: Software trigger, external DMA requests (DREQ) and interrupt requests from peripheral functions • A specific DMA transfer interval can be specified to adjust the bus occupancy.
Interrupt Controller	• Arm® CoreLink™ Generic Interrupt Controller (GIC-600) for Arm Cortex-A55 (32 priority levels available) • Nested Vectored Interrupt Controller (NVIC) for Arm Cortex-M33 • External Interrupt pins (NMI, IRQ0 to IRQ15, and TINT0 to TINT31) • On-chip peripheral Interrupts: priority level set for each module
Message Handling Unit (MHU)	• Message handling function between Arm Cortex-A55 and Arm Cortex-M33 • Assert interrupt to inform message and response from/to every core
General-purpose I/O (PFC)	• 113 General-purpose I/O ports

1.1.3.8 Camera Interface

Item	Description
MIPI CSI-2 Interface with camera image processing (CRU)	• Number of lanes: 1 or 2 lanes • MIPI CSI-2 v2.1 compliant • Maximum bandwidth: 1.5 Gbps per lane • Support for the throughput up to 2000 x 1200 RAW12 60 fps • Support for 4 virtual channels selected from VC0 to VC15 • Support for input data formats: – YUV422 8 bits or 10 bits – RGB444, RGB555, RGB565, RGB666, RGB888 – RAW6, RAW7, RAW8, RAW10, RAW12, RAW14, RAW16, RAW20 – YUV420 8-bits or 10-bits (image processing not supported) – Legacy YUV420 8-bits (image processing not supported) – YUV420 8-bits or 10-bits (chroma shifted pixel sampling) (image processing not supported) – User defined byte-based data • The other formats from the MIPI CSI-2 interface can also be output without image processing. • Generic long packet data types 1 to 4 • User defined 8-bit data types 1 to 8

1.1.3.9 Display Interfaces

Item	Description
LCD Controller (LCDC)	• 1 channel • 2 planes blending (can blend 2 different size images) • Support Image Processing: – Dither processing (RGB666) – Clipping – RGB Gamma Correction LUT • Support Input Data Format: – RGB565 / RGB666 / RGB888 – ARGB1555 / ARGB4444 / ARGB8888 – YCbCr444 8-bit / YCbCr422 8-bit / YCbCr420 8-bit • Selectable 1 display interfaces from the following – 1 channel MIPI DSI (1/2/4-Lane) interface – 1 parallel interface – 1 LVDS interface • Support 1920 pixels × 1920 lines Pixel clock must be within the following range – MIPI DSI = 5.4 to 187.5 MHz – Parallel = 5.4 to 87 MHz – LVDS (single) = 25 to 87 MHz
MIPI DSI Interface (DSI)	• 1 channel • The number of Lanes: 1,2 or 4-lane • Support 1920 × 1200, 60 fps (RGB888) • Maximum Bandwidth: 1.5 Gbps per lane • Support Output Data Format: RGB666 / RGB888
Parallel Output Interface	• 1 channel • Support WXGA (1280×800), 60 fps • Support Output Data Format: RGB666 / RGB888 • CLK/HD/VD timing signal supported
LVDS Interface (LVDS)	• 1 channel • Number of support lanes – Single-link: 4 lanes (Data) + 1 lane (Clock) • Single-link target – RGB888 640×480 (VGA) – RGB888 800×480 (QVGA) – RGB888 1366×768 60 Hz (WXGA) – RGB888 1280×800 60 Hz (WXGA) • Output clock range: 25 to 87 MHz • Clock Duty: 4:3 • Color: 8 bits or 6 bits • ViD: 250 to 450 mV • Vcm (Vos): 1.125 to 1.375 V • SSC supported (The SSCG function and delta-sigma modulator cannot be enable at the same time) – Spread Spectrum Modulation Frequency: 30 to 30 kHz – Center Spread: ±0.5, ±1.0, ±1.5 [%] – Down Spread: −1.0, −2.0, −3.0 [%]

1.1.3.10 Storage and Network

Item	Description
USB2.0 Host/Function (USB2)	• 2 channels • Compliance with USB2.0 • Support for On-The-Go (OTG) functionality • Supports Control/Bulk/Interrupt/Isochronous transfer • Internal dedicated DMA
PCI Express 2.0 (PCIE)	• 1 channel • PCIe Gen2 • 1-lane • Supported Root complex only
Gigabit Ethernet Interface (GBETH)	• 2 channels • Compliant with IEEE802.3 • Compliant with IEEE802.1Qav, IEEE802.1Qat, IEEE802.1AS, IEEE802.1Qbv • Compliant with IEEE1588-2008 with nano second timer in ch. 0 (master) and ch. 1 (slave) • Supports 10BASE, 100BASE, 1000BASE • Supports full duplex and half duplex • Supports RGMII / RMII Interfaces
CANFD Interface (CANFD)	• 3 channels • ISO 11898-1 (2003) compliant • CAN-FD ISO 11898-1 (CD2014) compliant • Support 1Mbps for arbitration phase and up to 8Mbps for data phase • Message buffer – 32 transmit message buffers per channel – 192 shared buffers for RXMB and FIFO buffers per channel

1.1.3.11 Peripheral Module

Item	Description
I3C Bus Interface (I3C)	• 1 channel • Master (Main Master/Secondary Master) mode and Slave mode selectable • SDR (I3C Single Data Rate) Mode – Private Message – Broadcast Message (Common Command Code) – Direct Message (Common Command Code) • Legacy I2C Message – Fast-mode (Fm): 0 to 400 kbit/s – Fast-mode Plus (Fm+): 0 to 1 Mbit/s • Slave Interrupt Request • Master Ship Request (Secondary Master only) • Support for 7-bits slave address formats • Synchronous Timing Control – Sync Mode: Synchronous Basic Mode • Asynchronous Timing Control – Async Mode 0: Asynchronous Basic Mode – Async Mode 1: Asynchronous Advanced Mode • Error Detection
I2C Bus Interface (RIIC)	• 4 channels • Master or Slave mode selectable • Support for the multi-master • Support for Standard mode (100 kHz), Fast mode (400 kHz), and Fast mode+ (1 MHz) • Support for DMAC
Renesas Serial Communication Interface (RSCI)	• 4 channels • 6 communication mode – Asynchronous interfaces – 8-bit clock synchronous interface – Simple IIC (host-only) – Simple SPI (with one chip select signal) – Smart card interface – Simple LIN (expanded SCIX mode) • 32-stage FIFO registers for transmission and reception • Clock sources is select from among four internal clock signals • Bit rate specifiable with the on-chip baud rate generator • Full-duplex and Half-duplex communication • Data length: 7 to 9 bits • Bit rate modulation • Double speed mode • Loopback function to enable self-diagnosis • Support for DMAC • Support for CRC calculation by the CRC unit

Item	Description
Renesas Serial Peripheral Interface (RSPI)	• 3 channels • SPI transfer facility – Using the MOSI (master out slave in), MISO (master in slave out), SSL (slave select), and RSPCK (SPI clock) signals enables serial transfer through SPI operation (four lines) or clock-synchronous operation (three lines) – Capable of handling serial transfer as a master or slave • Data formats – Switching between MSB first and LSB first – The number of bits in each transfer can be changed to any number of bits from 8 to 16, or 20, 24, or 32 bits. – 32 bits × 16 stage buffers for transmission and reception – Up to for frames can be transmitted or received in a single transfer operation (with each frame having up to 32 bits) • Buffered structure – 16 stages/channels for MOSI and MISO independently – Double buffers for both transmission and reception • RSPCK can be stopped automatically with the reception buffer full for master reception • Support for DMAC • Support CRC calculation by the CRC unit
Serial Communication Interface with FIFO (SCIF)	• 6 channels • Clock synchronous mode or asynchronous mode selectable • Simultaneous transmission and reception (full-duplex communication) supported • Dedicated baud-rate generator • Separate 16-byte FIFO registers for transmission and reception • Modem control function (channel 0, 1 and 2 in asynchronous mode)

1.1.3.12 Timer

Item	Description
Multi-function Timer Pulse Unit 3 (MTU3a)	• 9 channels (16-bits x 8 channels, 32-bits x 1 channels) • Module clock frequency (P1φ): 100 MHz • Maximum 28 lines of pulse inputs/outputs and 3 lines of pulse inputs • 14 types of count clocks selectable • Input capture function • 39 outputs compare and input capture registers • Counter clear operation (Simultaneous counter clearing by Compare match or Input capture is available) • Simultaneous writing to multiple timer counters (TCNT) • Synchronous input/output of each register due to synchronous operation of the counter • Buffered operation • Cascade-connected operation • 43 types of interrupt sources • Automatic transfer of register data • Pulse output modes • Toggle, PWM, complementary PWM, and reset-synchronized PWM modes • Synchronization of multiple counters • Phase counting mode • 16-bits mode (channel 1 and 2) • 32-bits mode (channel 1 and 2) • Counter function of dead time compensation • Digital filter functions for the input capture and external count clock pin
Port Output Enable 3 (POE3)	• Control of the high-impedance state of the MTU3a waveform output pins • Activation with four input pins • Activation on detection of short-circuited outputs (detection of simultaneous PWM output to the active level) • Activation by register write • Additional programming of output control target pins is possible.
General PWM Timer (GPT)	• 32 bits × 8 channels • Counting up or down (sawtooth-wave), counting up and down (triangle-wave) selectable for all channels • 2 input/output pins per channel • 2 output compare/input capture registers per channel • For the 2 output compare/input capture registers of each channel, 4 registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at peaks or troughs, enabling the generation of laterally asymmetrically PWM waveforms. • Registers for setting up frame intervals on each channel (with capability for generating interrupts on overflow or underflow) • Generation of dead times in PWM operation • Synchronous start / stop / clear of counters on arbitrary channels • Starting, stopping, and clearing up/down counters in response to a maximum of eight events • Starting, stopping, and clearing up/down counters in response to input level comparison • Starting, stopping, and clearing up/down counters in response to a maximum of four external triggers • Output pin invalidation functions due to dead time error or detection of short circuit between output pins • Digital filter functions for the input capture and external trigger pins
Port Output Enable for GPT (POEG)	• Output prohibition control of the GPT waveform output pin • Activation with up to four input pins • Activation by dead time error detection or output short detection • Activation by register write

Item	Description
Watchdog Timer (WDT)	• 3 channels • A counter overflow can reset the LSI • CPU parity error can reset the LSI
General Timer (GTM)	• 32 bits × 3 channels • Two operating modes: – Interval timer mode – Free-running comparison mode
Real Time Clock (RTC)	• A 100-year calendar from 2000 to 2099 • BCD code display • Clock source is an oscillator dedicated to RTC (32.768 kHz) • Automatic adjustment function for leap years • Alarm function

1.1.3.13 Audio Interface

Item	Description
Serial Sound Interface (SSIF)	• 4 channels bidirectional serial transfer • 2 external clock sources available • Full Duplex communication • Support of I2S / Monaural / TDM audio formats • Support of master and slave functions • Generation of programmable word clock and bit clock • Multi-channel formats • Support of 8-, 16-, 18-, 20-, 22-, 24-, and 32-bits data formats • Support of 32-stage FIFO for transmission and reception • Support of LR-clock continue function in which the LR-clock signal is not stopped
SPDIF Interface (SPDIF)	• 1 channel • Support of IEC60958 standard (stereo and consumer use modes only) • Sampling Rate: 32 kHz, 44.1 kHz, and 48 kHz • Audio word sizes of 16 to 24 bits per sample • Biphase mark encoding • Double buffered data • Parity encoded serial data • Simultaneous transmit and receive • Receiver autodetects IEC 61937 compressed mode data
Pulse Density Modulation (PDM)	• 3 channels • Direction: input • Sampling Rate: 8, 10, 12, 15, 16, 20, 24, 25, 30, 40, or 48 kHz • Capable of filtering 1-bit digital input data and converting them into 20-bit or 16-bit digital data • supports stereo microphone (L/R sampling by rising/falling clock edge) • supports sound activity detector to wake up CPU from WFI • Supports DMAC

1.1.3.14 Analog

Item	Description
A/D Converter (ADC)	• 8 channels • Resolution: 12 bits • Input range: 0 V to 1.8 V • Conversion rate: 1.0 Msps • Operation mode: Single scan, continuous scan • Condition for starting A/D conversion – Software trigger – Asynchronous trigger: External ADTRG trigger supported – Synchronous trigger: MTU3a and GPT timers
Temperature Sensor Unit (TSU)	• 1 channel for internal temperature

1.1.3.15 Battery backup function

Item	Description
Battery backup function (VBATT)	• Backup register (128 bytes) • Tamper detection – Triggered by input pin and software – Record RTC timestamp – Erase backup register – Reboot signal output for PMIC

1.1.3.16 Security

Item	Description
Secure IP (RSIP)	• Security algorism – Common key encryption: AES – Non-common key encryption: RSA, ECC • Other features – TRNG (true-random number generator) – Hash value generation: SHA-1, SHA-2, SHA-3 – Support of Unique ID

1.1.3.17 Others

Item	Description
Boundary Scan	Boundary scan based on IEEE 1149.1 via JTAG interface is supported. Note that some module pins are not available on this boundary scan.

1.1.3.18 Power Supply Voltage

Item	Description
Power supply voltage	• Refer to **10.1 Electrical Characteristics**

1.1.3.19 Temperature Range

Item	Description
Temperature range	• Tj: −40°C to +125°C

1.1.3.20 Quality Level

Item	Description
Quality level	• Industrial usage, etc.

1.1.3.21 Package

Item	Description
Package	• 368 pin LFBGA 17 mm square / 0.65 mm pitch • 400 pin LFBGA 14 mm square / 0.5 mm pitch

1.1.4 Function Comparison

The following table shows the function difference between RZ/G3L and RZ/G3SE.

There is no function difference between 14 mm package and 17 mm package.

Table 1.1-2 Function Comparison for RZ/G3L and RZ/G3SE (1/2)

Item		RZ/G3L		RZ/G3SE	
CPU	Cortex-A55 [Option]	Arm Cortex-A55 Processor 1.2 GHz			
		[Quad Core]	[Dual Core]	[Quad Core]	[Dual Core]
	Cortex-M33	Arm Cortex-M33 Processor 200 MHz			
	CST	Arm CoreSight architecture			
Boot		Selectable boot from Arm Cortex-A55 or Arm Cortex-M33			
Graphics	GE3D [option]	[Available] Arm Mali-G31 600 MHz		[Not supported]	
Video Processing	VCP [option]	[Available] H.264 codec		[Not supported]	
	ISU2	Scaling up and down function with bilinear interpolation			
Internal Memory	SRAM	512 Kbytes (with ECC)			
External Memory	DDR	DDR4-2133: Bus Width: 16-bit, Memory Size: Up to 4 Gbytes, Single rank			
		LPDDR4-2133: Bus Width: 16-bit, Memory Size: Up to 2 Gbytes, Single rank			
	xSPI	1 channel (2 chip select signals)			
	SD	3 channels			
	EBSC	1 channel

Table 1.1-3 List of Units (1/2)

Unit Name	Function
ADC0	A/D converter
ADC1	A/D Converter for TSU
CA55	Arm Cortex-A55
CANFD	CAN-FD interface
CM33	Arm Cortex-M33
CPG	Clock pulse generator
CRU	Camera data receive unit (MIPI CSI-2 interface)
CST	Debug interface (Arm CoreSight)
DDR	DDR4 / LPDDR4 controller
DMAC	Direct memory access (DMA) controller
DSI	MIPI DSI interface
EBSC	External Bus State Controller
GBETH	Gigabit Ethernet interface
GE3D	3D graphics engine
GIC	Generic interrupt controller
GPT	General PWM timer
GTM	General timer
I3C	I3C bus interface
IA55	Synchronized Interrupt signals for CA55
IM33	Synchronized Interrupt signals for CM33
ISU2	Image Scaling Unit2
LCDC	LCD controller
LVDS	Low Voltage Differential Signal interface
MHU	Massage Handling Unit
MTU3a	Multi-function Timer Unit3
OTP	One-time programmable memory
PCIE	PCIe Express 2.0 interface (Root Complex only)
PDM	Pulse density modulation (PDM) interface
PFC	Pin function controller
POE3	Port Output Enable for MTU3a
POEG	Port Output Enable for GPT
RIIC	I2C bus interface
RSCI	Serial communication interface
RSIP	Renesas Security IP
RSPI	Serial peripheral interface
RTC	Realtime clock
SCIF	Serial communication interface with FIFO
SD	SD/MMC host interface
SPDIF	Sony Philips Digital Interface
SRAM	System RAM
SSIF	Serial sound interface
SYC	System counter
SYSC	System controller
TSU	Temperature sensor unit
TZC	CoreLink TrustZone Address Space Controller

Table 1.1-3 List of Units (2/2)

Unit Name	Function
USB2	USB2.0 Host / Function interface
VBATT	Battery backup function
VCP	H.264 Video Codec Processor
WDT	Watchdog timer
xSPI	xSPI controller

SECTION 1 OVERVIEW

1.2 Pin

This section describes the pins of this LSI.

1.2.1 Pin Assignment

Refer to another excel file for the “ball view” about pin assignment of this LSI.

(Please double-click the icon on the right side)

1.2.2 External Pins and Multiplexed Functional Pins

Refer to attached excel file for the “pin function list” about information of external pins and multiplexed functional pins of this LSI.

(Please double-click the icon on the right side)

SECTION 1 OVERVIEW

1.3 Clocks

This section describes the clocks of this LSI.

1.3.1 Overview

The main functions of the CPG are to generate and control clocks for the respective units, to generate and control resets, to control booting, to control low power consumption, and to control the power supply domain.

Table 1.3-1 Types and Overview of Unit Clocks

Function	Subset	Details
Clock Pulse Generator	CPG	Clock generating and control functions
	.	Reset sequential control functions
		Boot sequential control functions

1.3.2 Clock Generating and Control Functions

The following functions are provided.

- The clocks to be supplied to various units are generated from external input clocks or PLL output clocks.
- The selection of frequency divider ratio is implemented (the setting can be changed by the register).
- The clock path is selected by the clock selector (the setting can be changed by the register).
- Clock supply ON/OFF control (the setting can be changed by register)
- SSCG control of PLL, multiplication ratio setting, ON/OFF control (the setting can be changed by the register)

Table 1.3-2 PLL Overview

PLL	Details	Initial Frequency	SSCG Default Value
PLL1	CA55	1,200 MHz	Depends on SYSCLK_SSCG_EN
PLL2	System bus in the AWO domain IP, SSCG non-configurable IP	1,600 MHz	OFF (fixed)
PLL3	System bus, SSCG configurable IP	1,600 MHz	Depends on SYSCLK_SSCG_EN
PLL4	DDR	1,067 MHz	ON
PLL6	GBETH	500 MHz	OFF
PLL7	DSI / LCDC / LVDS	3,000 MHz	OFF

Note 1. If the settings are changed, the PLL must be reset.

1.3.3 Clock Pin Specifications

Table 1.3-3 List of Pin Functions (1/2)

Pin Name	Input/ Output	Function	Frequency*1	Supply Source/ Destination Unit
LSI clock				
SYSCLK_XOUT	Output	24 MHz main clock	24 MHz	CPG
SYSCLK_EXTAL_XIN	Input	24 MHz main clock	24 MHz	CPG
RTC_XOUT	Output	32.768 kHz real-time clock	32.768 kHz	RTC
RTC_XIN	Input	32.768 kHz teal-time clock	32.768 kHz	RTC
AUDIO_CLK_B*2	Input	Audio clock-in	50 MHz	AUDIO CLK
AUDIO_CLK_C*2	Input	Audio clock-in	50 MHz	AUDIO CLK
Debugger interface				
JTAG_TCK_SWCLK	Input	Test clock pin for the on-chip emulator functions as the SWCLK pin in serial wire debug (SWD) mode	20 MHz	CST
Expanded serial peripheral interface (xSPI)				
XSPI0_CKP*3	Output	Clock output pins	133 MHz	xSPI
SD/MMC interface				
SD0_CLK	Output	Output the clock signal to external SD/MMC device	150 MHz	SD0
SD1_CLK	Output	Output the clock signal to external SD/MMC device	150 MHz	SD1
SD interface				
SD2_CLK	Output	Output the clock signal to external SD device	150 MHz	SD2
PCIe Gen2				
PCIE_REFCLK_P	I/O	Differential reference clock (positive), 100 MHz ±300 ppm	100 MHz	PCIE0
PCIE_REFCLK_N	I/O	Differential reference clock (negative), 100 MHz ±300 ppm	100 MHz	PCIE0
Gbit Ethernet ch. 0				
ET0_MDC	Output	Output management data clocks	2.5 MHz	GBETH0
ET0_RXC	Input	RX clocks	125 MHz	GBETH0
ETH0_TXC_REF_CLK	I/O	TX clocks	125 MHz	GBETH0
GbEthernet ch. 1				
ET1_MDC	Output	Output management data clocks	2.5 MHz	GBETH1
ET1_RXC	Input	RX clocks	125 MHz	GBETH1
ETH1_TXC_REF_CLK	I/O	TX clocks	125 MHz	GBETH1
MIPI-DSI /LVDS				
DSI_LVDS_CLK_P	Output	Output clocks (positive)	750 MHz	DSI
DSI_LVDS_CLK_N	Output	Output clocks (negative)	750 MHz	DSI
MIPI-CSI2				
CSI_CLK_P	Input	Input clocks (positive)	750 MHz	CRUn
CSI_CLK_N	Input	Input clocks (negative)	750 MHz	CRUn

Table 1.3-3 List of Pin Functions (2/2)

Pin Name	Input/ Output	Function	Frequency*1	Supply Source/ Destination Unit
Serial peripheral interface (RSPI) ch. n (n = 0, 1, 2)				
RSPIn_SCK	I/O	Synchronous clock signal	100 MHz / 50MHz	RSPIn
Serial communication interface (RSCI) ch. n (n = 0 to 3)				
RSCIn_SCLK	I/O	Clock pins (simple SPI mode)	50 MHz	RSCIn
RSCIn_RXD_MISO_ SCL	I/O	I2C clocks (simple I2C mode)	400 kHz	RSCIn
I2C bus interface (RIIC) ch. n (n = 0 to 3)				
RIICn_SCL	I/O	Clock pins with N-ch open drain	1 MHz	RIICn
I3C bus interface (I3C)				
I3C_SCL	I/O	Clock pin	12.5 MHz	I3C
Pulse density modulation interface (PDM)				
PDM_CLK0	Output	Output PDM sampling clocks	4 MHz	PDM
PDM_CLK1	Output	Output PDM sampling clocks	4 MHz	PDM
PDM_CLK2	Output	Output PDM sampling clocks	4 MHz	PDM
Serial sound interface (SSIU) ch. n (n = 0 to 3)				
SSIn_SCK	I/O	Output clocks	12.5 MHz	SSIU
LCDC Parallel Out				
DPI_CLK	Output	LCDC clocks	87 MHz	LCDC
CAN interface				
CAN_CLK	Input	CAN clocks	80 MHz	CAN
EBSC interface				
EBSC_CKO	Output	EBSC clocks	133 MHz	EBSC

Note 1. The clock frequencies are either variable or fixed. In the case of the variable clocks, the maximum frequencies which can be output are listed for the output clocks and the maximum frequencies which can be input to this LSI are listed for the input clocks.

Note 2. For use of these pins, the function selection of multiplexed function pins is required. For details, refer to **4.2 Pin Function Controller (PFC)**.

Note 3. CKP and CKN waves have opposite phase.

SECTION 1 OVERVIEW

1.4 Reset

This section describes resets of this LSI.

1.4.1 Overview

Each reset source generates a reset signal. The types of reset are described below.

For further details regarding the resets, see **4.4 Clock Pulse Generator (CPG)**.

1.4.1.1 System Reset (External SYS_RST#)

Asserting the reset signal on the external SYS_RST# pin initializes the whole LSI (except PD_VBATT domain).

1.4.1.2 Debug Reset (Software Reset by CoreSight)

When the external SYS_RST#, JTAG_TRST#, and BOOT_MODE3 pins are at the high level, the JTAG debugger is capable of resetting the CoreSight module (except the DAP) and Cortex-A55.

1.4.1.3 WDT Reset

Depending on the reset request and CPG_WDTRST_SEL settings from WDT, system reset, CPU Cold Reset (CA55/CM33) and WDT overflow notification will be performed.

1.4.1.4 Resetting of Individual Units

Switching reset signals for individual units off and on can be realized by switching a reset pin for the unit off and on according to enable conditions. Sources of control for switching reset sources off and on are listed below.

- Off and on control by a register setting
- Reset control in a boot sequence
- Debug reset control
- CA55 cold reset control
- CM33 cold reset control

1.4.1.5 CA55 Reset

The CA55 has several types of reset, differing in terms of hardware or software control and the CA55 reset signal through which control is applied. At the time of a reset, the 4 cores and the cluster require handshake control by the individual P-channels.

■ **Hardware control: by the CPG**

System cold reset (by the function or the debugger),
WDT error cold reset

■ **Software control: by the CM33**

Cold reset (normal/debug mode), warm reset (cluster, core 0/1/2/3)

1.4.1.6 CM33 Reset

The CM33 has several types of reset, differing in terms of hardware or software control and the CM33 reset signal through which control is applied.

■ **Hardware control: by the CPG**

System cold reset, WDT error cold reset

■ **Software control:**

Cold reset (normal/debug mode), warm reset

1.4.1.7 VBATT Reset (External VBAT_RST#)

Asserting the reset signal on the external VBAT_RST# pin reset the PD_VBATT domain.

System Reset does not reset the PD_VBATT domain.

SECTION 1 OVERVIEW

1.5 Interrupts

This section describes the interrupt functions of this LSI.

1.5.1 Overview

The interrupt controller decides the priority of interrupt sources and controls interrupt requests to the CPU.

The interrupt controller registers set the order of priority of each interrupt, allowing the user to process interrupt requests according to the user-set priority.

■ Equipped with Arm® CoreLink™ GIC-600 Generic Interrupt Controller*1 for Arm Cortex-A55.

- 32 levels of priority.
- SGI (Software Generated Interrupt): 16 interrupts
- PPI (Private Peripheral Interrupt): 16 interrupts
- SPI (Shared Peripheral Interrupt): 544 interrupts
- LPI (Locality-specific Peripheral Interrupt): Not supported

■ Nested Vectored Interrupt Controller (NVIC)*2 built in Arm Cortex-M33.

- 256 levels of priority
- 480 interrupts

■ External Interrupts

- NMI, IRQ0-15, TINT0-31 (Selectable 32 TINT from 113 GPIOINT)
- Noise filter function.*3

■ Internal Interrupts

- On-chip peripheral interrupts
- On-chip Bus error interrupts
- On-chip RAM ECC error interrupts

Note 1. Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual.
Note 2. Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual.
Note 3. Refer to **4.2 Pin Function Controller (PFC)**.

1.5.2 Block Diagram

The block diagram of Interrupt Controller is as follows.

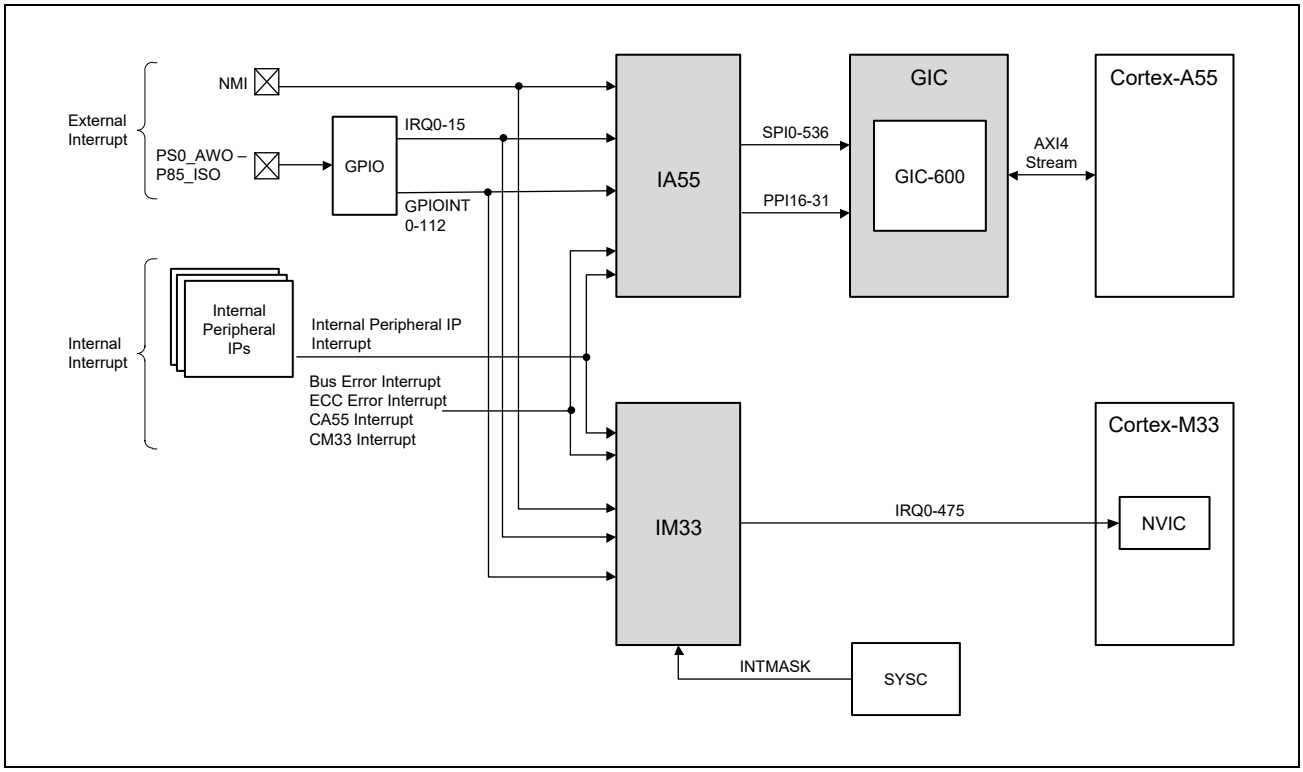

Figure 1.5-1 Interrupt Controller Block Diagram

GIC

GIC is equipped with Arm® CoreLink™ GIC-600 Generic Interrupt Controller for Cortex-A55.

IA55

IA55 performs various interrupt controls including synchronization for the external interrupts of NMI, IRQ, and GPIOINT and the interrupts of the built-in peripheral interrupts output by each IP. And it notifies the interrupt to the GIC.

- Selectable 32 TINT from 113 GPIOINT.
- Integration of bus error interrupts from system bus.
- Integration of ECC error interrupts from On-chip RAM.
- Integration of error interrupts from GPT.
- Integration of interrupts from MHU.
- Indicate interrupt status. (NMI, IRQ, TINT, integrated bus error interrupt and integrated ECC error interrupt)
- Setting of interrupt detection method. (NMI, IRQ and TINT)
- Selection function of GPT/MTU interrupts.

IM33

IM33 performs various interrupt controls including synchronization for the external interrupts of NMI, IRQ and GPIOINT and internal peripheral interrupts output by each IP. And it notifies the interrupt to the built-in interrupt controller (NVIC) for Cortex-M33.

- Selectable 32 TINT from 113 GPIOINT.
- Integration of bus error interrupts from system bus.
- Integration of ECC error interrupts from On-chip RAM.
- Integration of error interrupts from GPT.
- Integration of interrupts from MHU.
- Integration of software interrupts.
- Selection function of GPT/MTU interrupts.
- Indicate interrupt status. (NMI, IRQ, TINT, integrated bus error interrupt and integrated ECC error interrupt)
- Set interrupt detection method. (NMI, IRQ and TINT)
- All interrupts can be masked by setting of SYSC Register. (IM33_MASK bit of SYS_LP_CLT7 register.)
  Refer to **4.5 Low Power Management**.

SECTION 1 OVERVIEW

1.6 Power Management

This section describes the power management of this LSI.

1.6.1 Overview

This LSI has several functions to achieve low power consumption. By combining with power supply isolation, further power consumption can be reduced.

1.6.2 Power Domain

The power domain is classified into four main units. For details, see **4.5 Low Power Management**.

Table 1.6-1 PD_AWO Domain

Item	Target Unit
System	SYSTEM BUS, CPG, SYSC, IA55, IM33, PFC, OTP, CST, RSIP, DMAC (32 ch.), TZC, etc.
CPU	Cortex-M33
Audio	PDM (3 ch.), SPDIF (1 ch.)
SRAM	256 Kbytes
Timer	GTM (3 ch.), WDT (3 ch.), SYC
Interface	xSPI (1 ch.), RIIC (1 ch.), SCIF (2 ch.), RSCI (1 ch.), RSPI (1 ch.), CANFD (3 ch.) GPIO (27 pins)/IRQ/NMI, ADC0 (8 ports)

Table 1.6-2 PD_ISO Domain

Item	Target Unit
System	SYSTEM BUS, ADC1 (1 port), TSU (1 ch.), GIC, MHU, TZC, etc.
CPU	Cortex-A55
Video & Graphics	GE3D, VCP, ISU2, CRU (1 ch.), LCDC (1 ch.), DSI (1 ch.), LVDS (1 ch.)
Audio	SSIF (4 ch.)
SRAM	256 Kbytes
Timer	MTU3 (9 ch), GPT (8 ch.)
Interface	DDR (1 ch.), eMMC/SD (2 ch.), SD (1 ch.), USB2 (2 ch.), GBETH (2 ch.), PCIE (1 ch.), EBSC (1 ch.), I3C (1 ch.), RIIC (3 ch.), SCIF (4 ch.), RSCI (3 ch.), RSPI (2 ch.), GPIO (86 pins)/IRQ

Table 1.6-3 PD_VBATT Domain

Item	Target Unit
Battery	VBATT (Tamper detection, backup regisrer etc.), RTC

Table 1.6-4 PD_DDRIO Domain

Item	Target Unit
Interface	DDRPHY IO

1.6.3 Lower Power Management

The low-power management of the system is supported. In some low-power modes, handshake control is performed with the CPU.

- Power domain control
- Low frequency mode
- Module standby mode
- Cortex-A55 sleep mode
- Cortex-M33 sleep mode

For the operation procedure, refer to **4.4 Clock Pulse Generator (CPG)** and **4.5 Low Power Management**.

SECTION 1 OVERVIEW

1.7 Internal Bus

This section describes the internal bus configuration of this LSI.

1.7.1 Overview

1.7.1.1 Features

The bus system of this LSI provides a physical address space of 16 Gbytes (address bus width of 34 bits). The LSI internal bus of this LSI incorporates Arm CoreLink NIC-400, etc., and controls the following bus functions.

Security control:

Security attribute re-setting and security level determination

Address translation:

34-bit address space access

Interrupt generation:

AXI bus error interrupt generation

Unit state detection:

Slave unit stop state detection

NOTE

The security control function is valid only for secure products.

For information on secure products, please contact our sales representative.

1.7.1.2 LSI Internal Bus Configuration

The LSI internal bus of the LSI consists of the ACPU bus, MCPU bus, VIDEO bus, and System bus. The configuration of the buses is shown in **1.1 Overview**.

ACPU bus:

A bus connected to CA55, Storage units, Network units, and DDR memory controllers

MCPU bus:

A bus connected to CM33 and serial interface units

VIDEO bus:

A bus connected to Image processing units, and DDR memory controllers

System bus:

A bus connected to system control units and the control registers of each unit

1.7.2 Accessible Areas

In the bus system of this LSI, each bus master unit can only access the areas that are used for register access or data transfer. **Table 1.7-1** shows the areas that can be accessed from each master.

Table 1.7-1 Accessible Areas (1/2)

Slave Unit	Master Unit															
	CA55 (Main / Peripheral)	CM33 (C-AHB / S-AHB)	DMAC (Secure)	DMAC (Non-secure)	CST (AXI-AP)	CST (ETR)	SD (0,1,2)	GBETH (0,1)	USB20 (Host, Function) USB21 (Host, Function)	PCIE	CRU (Statostics, Video)	ISU2	H.264	DSI	LCDC	GE3D

Note: Using paths marked with × in the table is prohibited. If access to such a path is attempted, incorrect operation may occur.

Note: For details on access control of each unit and bus, refer to CPG (MSTOP Registers) and SYS (Master Access Control/Slave Access Control Registers).

Remarks: ✓: Accessible path, ×: Prohibited path

Note 1. Only secure access is accessible

1.7.3 Bus System Control

1.7.3.1 Security Control

1.7.3.1.1 Re-Setting the Security Attribute Output from Bus Masters

This facility is for re-setting the security attributes of bus transactions that are by bus master units. Specifically, use the master access control register (SYS_MSTACCCTLn) to re-set the security attributes. For details on the SYS_MSTACCCTLn register, see **4.3 System Controller (SYSC)**.

NOTE

The bus transaction signals ARPROT[1:0] and AWPROT[1:0] indicate the security attributes, which can be used to protect against illicit transactions.

- ARPROT[0] and AWPROT[0] being 0 or 1 respectively indicate non-privileged access or privileged access.
- ARPROT[1] and AWPROT[1] being 0 or 1 respectively indicate secure access or non-secure access.

The ARPROT and AWPROT signals are prescribed in as part of the AXI protocol. For details, see the AMBA AXI and ACE Protocol Specifications published by Arm Ltd.

Use the SYS_MSTACCCTLn register to make the following settings.

- Selection of security attribute source

  Selection of whether to use the unchanged values of ARPROT[1:0] or AWPROT[1:0] of the ARPROT[2:0] or AWPROT[2:0] signals, which are output from the bus master units, or to re-set ARPROT[1:0] or AWPROT[1:0] according to the settings of the SYS_MSTACCCTL register
- Value to be re-set for ARPROT[1:0] or AWPROT[1:0]

Table 1.7-2 shows the relation between the registers and bits for use in re-setting the security attributes and the target masters for control.

Table 1.7-2 List of Register Bits for Use in Re-setting of Security Attributes

Target Master for Control*1	Control Register*2	Write Access Control Bits*3,*4			Read Access Control Bits*3,*5		
		Bit for use in re-setting the security attributes immediately below		Bit for use in selecting the security attribute source	Bit for use in re-setting the security attributes immediately below		Bit for use in selecting the security attribute source
		AWPROT[0]	AWPROT[1]		ARPROT[0]	ARPROT[1]	
Secure DMAC	SYS_MST ACCCTL0	Bit 0: DMAC0_AWPU	Bit 1: DMAC0_AWNS	Bit 3: DMAC0_AWSEL	Bit 4: DMAC0_ARPU	Bit 5: DMAC0_ARNS	Bit 7: DMAC0_ARSEL

Note 1. Re-setting of security attributes for the CA55, CM33, and CST bus masters is not possible.

Note 2. See **4.3.3.2 Register Descriptions** for details on the registers.

Note 3. See **4.3.3.2 Register Descriptions** for details on the bits.

Note 4. The values set in AWPU and AWNS are effective when the setting of the corresponding AWSEL bit is 1. For details, see the specifications of the registers in **4.3.3.2 Register Descriptions**.

Note 5. The values set in ARPU and ARNS are effective when the setting of the corresponding ARSEL bit is 1. For details, see the specifications of the registers in **4.3.3.2 Register Descriptions**.

Note 6. AWPU and ARPU, AWNS and ARNS, and AWSEL and ARSEL for use in control of the non-secure DMAC are respectively fixed to 1, 1, 0, 0, and 1, 1. Accordingly, access to the non-secure DMAC is always non-secure and non-privileged.

Note 7. When the setting of AWSEL for use in control of the USB20 and USB21 is 0, the values in AWPROT[0] and ARPROT[0] are the same as the value of HPROT[1] output from the USB20 and USB21, and the values of AWPROT[1] and ARPROT[1] are always 1. For control of HPROT[1] in the USB20 and USB21, see **6.5 USB2.0 Host Controller**. The HPROT signal is prescribed in the HB-Lite protocol. For details, see the AMBA 3 AHB-Lite Protocol Specification published by Arm Ltd.

1.7.3.1.2 Determining the Security Levels of Bus Slaves

This facility is for enabling or disabling access to a bus slave unit by comparing the security attribute that is input to the bus slave unit in a bus transaction with the security setting of the given slave. The security level can be set in one of the following ways. The applicable way depends on the slave.

- Setting by using the SL[1:0] bits in the slave control register (SYS_SLVACCCTLn)
  For details on the SYS_SLVACCCTLn register, see **4.3 System Controller (SYSC)**.
- Setting by using the nsaid_wr_en[31:16] and nsaid_rd_en[15:0] bits in the region ID access register (REGION_ID_ACCESS_<n>: n = 0 to 2) of the TrustZone address space controller (TZC). For details on the TZC, see **3.5 TrustZone Address Space Controller (TZC)**.

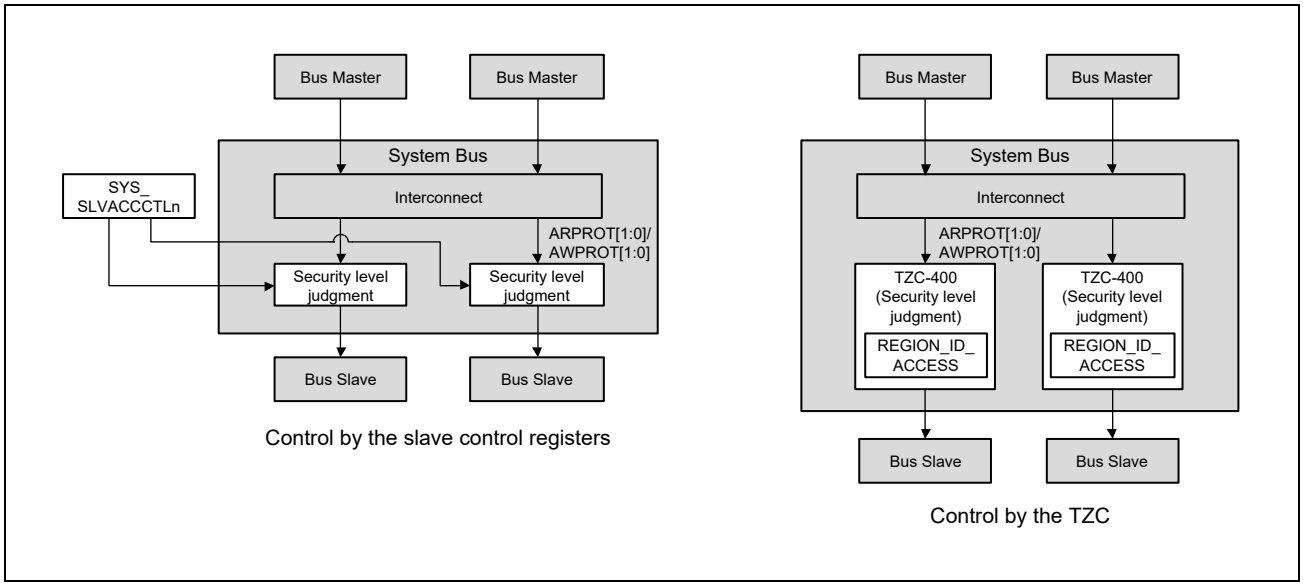

Figure 1.7-1 Security Level Determination Ways

NOTE

The bus transaction signals ARPROT[1:0] and AWPROT[1:0] indicate the security attributes, which can be used to protect against illicit transactions.

- ARPROT[0] and AWPROT[0] being 0 or 1 respectively indicate non-privileged access or privileged access.
- ARPROT[1] and AWPROT[1] being 0 or 1 respectively indicate secure access or non-secure access.

The ARPROT and AWPROT signals are prescribed in as part of the AXI protocol. For details, see the AMBA AXI and ACE Protocol Specifications published by Arm Ltd.

Table 1.7-3 shows the correspondence between the settings of the slave control register and the security levels for input transactions. **Table 1.7-4** shows the correspondence between the settings of the region ID access register of the TZC and the security levels for input bus transactions.

If comparison indicates that access is disabled, a bus error is generated in response to the corresponding attempted bus transaction. Stopping of a slave unit is detected by reference to the module stop state (MSTOP) setting in the CPG. Attempted access to a slave unit in the module stop state leads to a bus error.

Table 1.7-3 Security Levels Set by Using the Slave Control Register

Setting of SL[1:0]	Security Attribute for Input Bus Transactions			
	Non-privileged Non-secure	Privileged Non-secure	Non-privileged Secure	Privileged Secure
00b	Access allowed	Access allowed	Access allowed	Access allowed
01b	Access not allowed	Access allowed	Access allowed	Access allowed
10b	Access not allowed	Access not allowed	Access allowed	Access allowed
11b	Access not allowed	Access not allowed	Access not allowed	Access allowed

Table 1.7-4 Security Levels Set by Using the TZC

Setting of nsaid_wr_en[31:16] and nsaid_rd_en[15:0]	Security Attribute for Input Bus Transactions			
	Non-privileged Non-secure	Privileged Non-secure	Non-privileged Secure	Privileged Secure
000Fh	Access allowed	Access allowed	Access allowed	Access allowed
000Bh	Access not allowed	Access allowed	Access allowed	Access allowed
0003h	Access not allowed	Access not allowed	Access allowed	Access allowed
0002h	Access not allowed	Access not allowed	Access not allowed	Access allowed

Table 1.7-5 lists the bus slaves for which the security levels are determined by using the slave control registers (SYS_SLVACCCTLn: n = 0, 2 to 12, 14, 16 to 18, 20). **Table 1.7-6** lists the bus slaves for which security levels are determined by using the region ID access registers (REGION_ID_ACCESS_<n>) of the TZC.

Table 1.7-5 Bus Slaves for which the Security Levels are Determined by Using the Slave Control Registers (1/3)

Note 1. The security levels for the following bus slaves incorporated in this product are determined by using TZC-400. For details on the registers for controlling the security levels of these bus slaves, see **Table 1.7-6 Bus Slaves for which Security Levels are Determined by Using the Region ID Access Registers of the TZC**.
— DDR4 and LPDDR4
— Memory areas of the SRAM ACU and SRAM MCPU
— Memory area, write buffer area, and control register area of SPI Multi I/O

Note 2. See **4.3.3.2 Register Descriptions** for details on the registers.

Note 3. See **4.3.3.2 Register Descriptions** for details on the bits.

Note 4. The SYSC has registers to control these functions. Setting of the security levels for each of the functions is possible. For details on the SYSC registers, see **4.3.3.2 Register Descriptions**.

Table 1.7-6 Bus Slaves for which Security Levels are Determined by Using the Region ID Access Registers of the TZC

Target Bus Slave for Control	Security Control Unit (locations of the control registers)	Control Register*1	Control Bits*2
DDR	TZC (DDR_ACPU)	REGION_ID_ACCESS_<n> (n: 0,1)*3	nsaid_wr_en[31:16], nsaid_rd_en[15:0]
DDR	TZC (DDR_VIDEO)	REGION_ID_ACCESS_<n> (n: 0,1)*4	nsaid_wr_en[31:16], nsaid_rd_en[15:0]
xSPI	TZC (xSPI)	REGION_ID_ACCESS_0	nsaid_wr_en[31:16], nsaid_rd_en[15:0]
SRAM MCPU	TZC (SRAM MCPU)	REGION_ID_ACCESS_0	nsaid_wr_en[31:16], nsaid_rd_en[15:0]
SRAM ACPU	TZC (SRAM ACPU)	REGION_ID_ACCESS_0	nsaid_wr_en[31:16], nsaid_rd_en[15:0]

Note 1. For details on the related registers, see the Technical Reference Manual of CoreLink TZC-400 TrustZone Address Space Controller published by Arm Ltd.

Note 2. For details on the related bits, see the Technical Reference Manual of CoreLink TZC-400 TrustZone Address Space Controller published by Arm Ltd.

Note 3. REGION_ID_ACCESS_0 is for setting the security level for access to the DDR memory by using port 0 of the MEMC. REGION_ID_ACCESS_1 is for setting the security level for access to the DDR memory by using port 1 of the MEMC. See **3.5.1.2 Block Diagram** and **Figure 3.5-1** for the port number of the MEMC for use in access to the DDR memory from the bus masters.

Note 4. REGION_ID_ACCESS_0 is for setting the security level for access to the DDR memory by using port 0 of the MEMC. REGION_ID_ACCESS_1 is for setting the security level for access to the DDR memory by using port 1 of the MEMC. See **3.5.1.2 Block Diagram** and **Figure 3.5-1** for the port number of the MEMC for use in access to the DDR memory from the bus masters.

1.7.3.2 Address Translation

1.7.3.2.1 34-Bit Address Space Access

This LSI has bus master units that can handle up to a 34-bit address space and bus master units that can only handle up to a 32-bit address space (actual size of 4 Gbytes). This function enables a bus master unit that can only handle up to a 32-bit address space (actual size of 4 Gbytes) to access an address space of greater than 4 Gbytes. The target bus master units are as follows.

- SD0, SD1, SD2
- GBETH0, GBETH1
- USB20, USB21
- DMAC
- H.264
- DSI
- LCDC

This function translates bus transaction addresses that are output from a bus master unit in 1-Gbyte units according to the settings of the address offset registers (SYS_AOFn), as shown in the figure below. For details on the SYS_AOFn registers, see **4.3 System Controller (SYSC)**.

- In the SYS_AOF registers, set bits [33:30] of the remapping destination address in each 1-Gbyte space corresponding to bits [31:30] of the address that is output from the bus master unit.
- Select the 4-bit value of the SYS_AOF register corresponding to the upper two bits (bits [31:30]) of the 32-bit address that is output from the bus master unit.
- In the selected 4-bit value, use the lower two bits to overwrite bits [31:30] of the original address that was output from the bus master unit, and add the upper four or three bits as bits [33:32] to the original address.

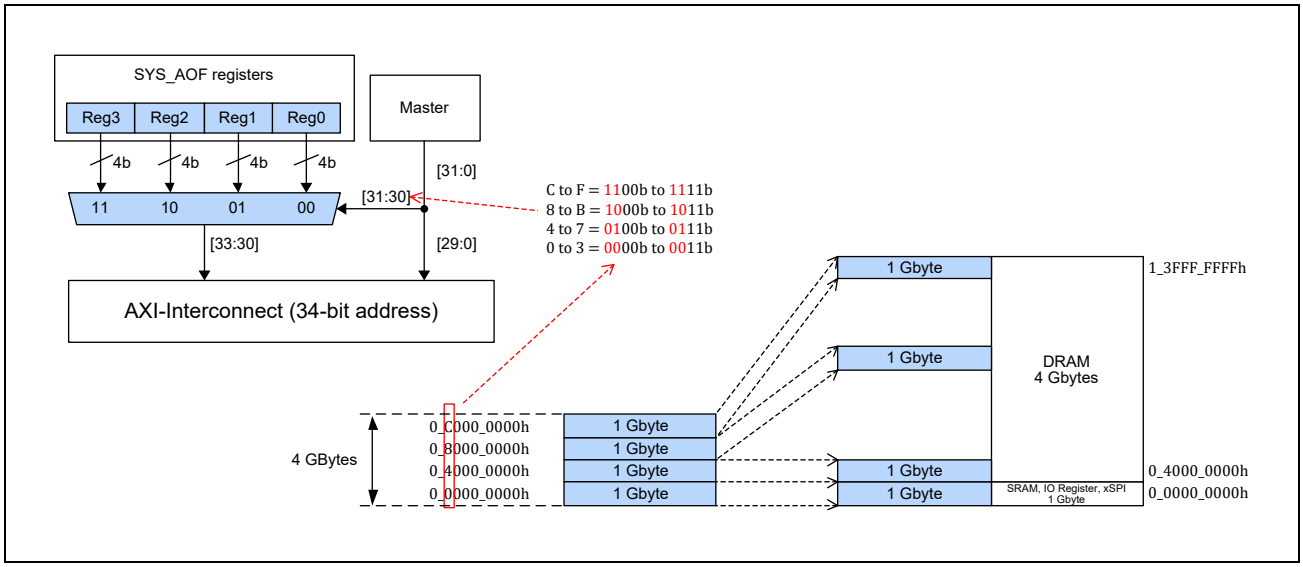

Figure 1.7-2 Address Space Extension (Overview)

CAUTION

When accessing DRAM from these bus master units, accesses that exceed a 4-Gbyte boundary are prohibited.

1.7.3.3 Bus Error Interrupt Generation

This LSI generates a bus error interrupt when any of the following conditions is met.

- A bus error is generated when access is disabled by the security setting.
- A bus error is generated when access to a slave unit in the module stop state (MSTOP) is attempted.
- A bus error is generated by a slave unit.

This function is supported for all bus master units included in this LSI.

Bus error interrupts are controlled (retained, cleared, and gathered into a single signal) by the interrupt synchronization circuit (IA55, IM33). For details, including the types of the bus errors, see **4.6 Interrupt Controller**.

NOTE

This function cannot distinguish between a bus error generated when access is disabled by the security setting and a bus error generated due to other causes.

In addition to the above bus error, an ERRINT interrupt is generated in any of the following cases.

- When the response to a write transaction with the bufferable attribute from the CM33 C-AHB interface is ERROR.
- When the response to a write transaction with the bufferable attribute from the CM33 S-AHB interface is ERROR.

SECTION 1 OVERVIEW

1.8 Address Map

This section describes the address space of this LSI.

1.8.1 Overall Address Space

Figure 1.8-1 shows the overall address space of this LSI and **Table 1.8-1** shows the detailed address space.

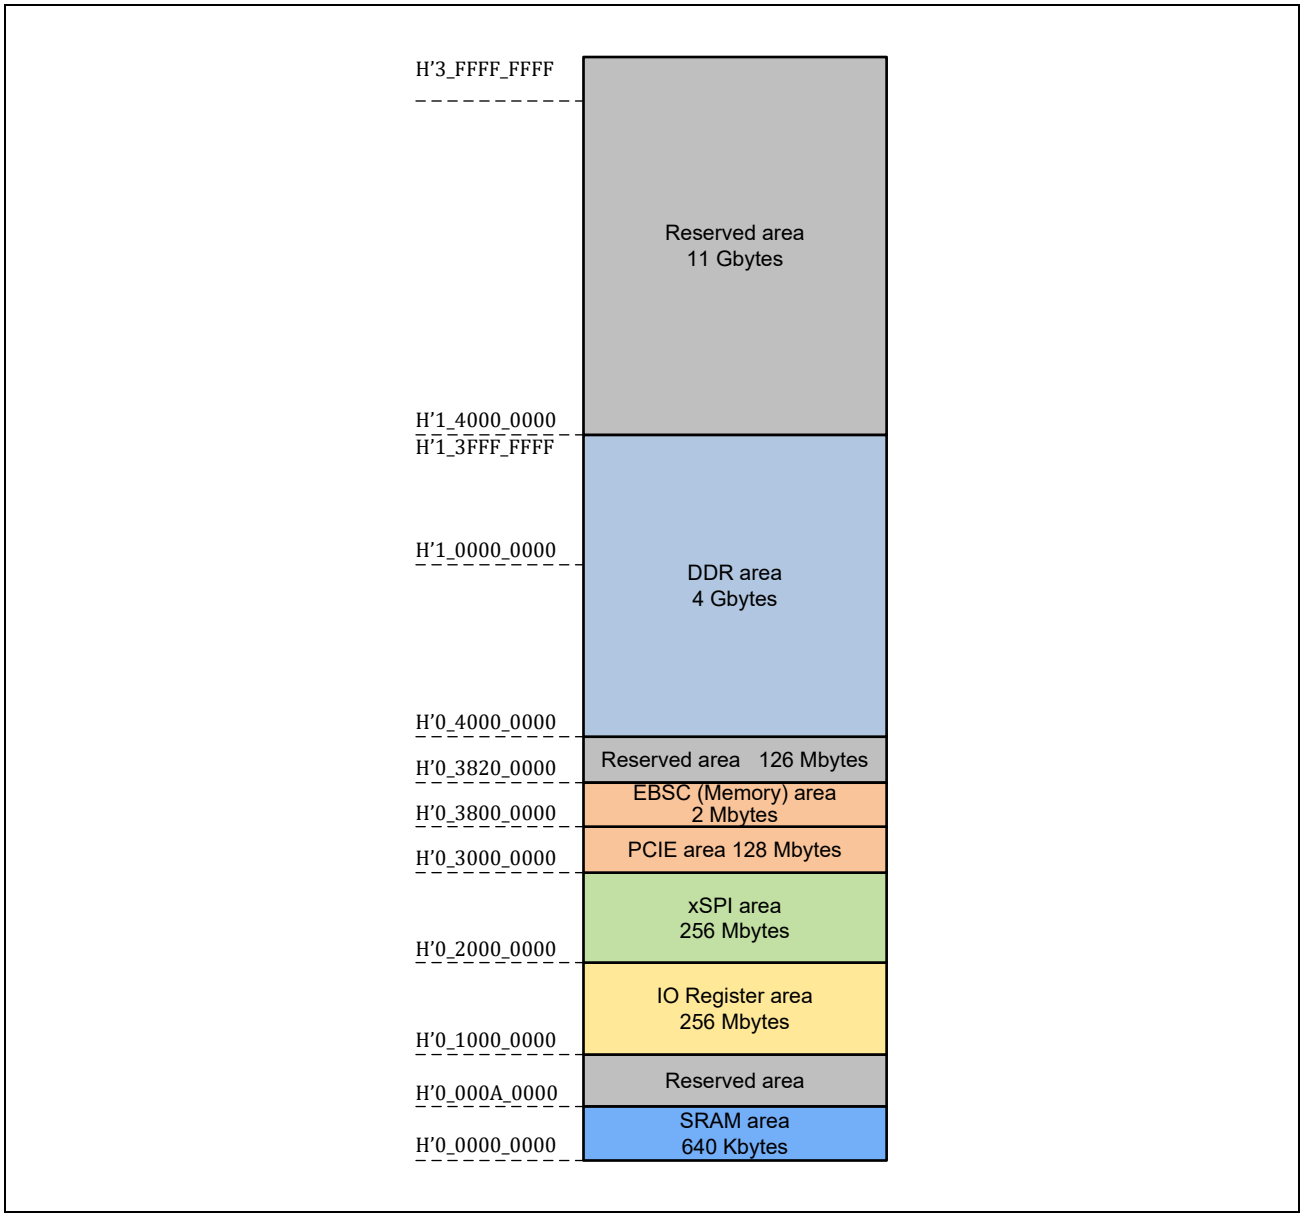

Figure 1.8-1 Overall Address Space

Some bus master units of this LSI require 34-bit address space access to access an address space of greater than 4 Gbytes in the whole 16-Gbyte address space of this LSI. For details, see **1.7 Internal Bus**.

The areas listed in **Table 1.8-1** are accessible by the CA55. Address space extension is needed for access to areas requiring addresses with widths of 33 or more bits.

The CM33 address space for this LSI differs from the overall address space. It is the same as the address space of the default memory map of CM33. For details, see **1.8.2 CM33 Address Space**.

Table 1.8-1 Detailed Address Space (1/5)

Start Address	End Address	Size		Space	Remarks

Note 1. Access to the reserved areas is prohibited. If access to the reserved area is attempted, incorrect operation may occur.

1.8.2 CM33 Address Space

Figure 1.8-2 shows the default memory map of CM33 and an overview of the CM33 address space for this LSI, and **Table 1.8-2** shows the detailed address space. For the concept of the secure and non-secure states, see **2.2 CPU**.

In this LSI, addresses H'0000_0000 to H'1FFF_FFFF are used as the code (program) area and addresses H'2000_0000 to H'3FFF_FFFF are used as the data area in the 1-Gbyte SRAM area (H'0000_0000 to H'3FFF_FFFF).

In this LSI, the hardware automatically translates the addresses in the CM33 address space to those in the overall address space of this LSI. Users can therefore write programs using the addresses in the address space shown in **Figure 1.8-2** and **Table 1.8-2**, without considering the overall address space.

NOTE

Non-Secure area and Secure area of CM33 Address Space for this LSI in **Figure 1.8-2** and **Table 1.8-2** are exchangeable by SYS_IPCONT_IDAUZERONS register for CM33 Address Space. Non-Secure area and Secure area shown in **Figure 1.8-2** and **Table 1.8-2** are in case of the default CM33 Address Space definition.

Note 1. Access to the reserved areas is prohibited.
If access to the reserved area is attempted, incorrect operation may occur.

Note 2. The same SRAM ACPU (256 Kbyes) space is assigned to H'0006_0000 to H'0009_FFFF, H'1006_0000 to H'1009_FFFF, H'2006_0000 to H'2009_FFFF, H'3006_0000 to H'3009_FFFF.

Note 3. The same SRAM MCPU (256 Kbyes) space is assigned to H'0002_0000 to H'0005_FFFF, H'1002_0000 to H'1005_FFFF, H'2002_0000 to H'2005_FFFF, H'3002_0000 to H'3005_FFFF.

Note 4. For details on the PPB/Vendor_SYS area, refer to "Arm Cortex-M33 Processor Technical Reference Manual".

SECTION 1 OVERVIEW

1.9 Boot Operation

This section describes the boot operation of this LSI.

Boot mode is determined by the settings on external pins or at the time of release from the reset state. This LSI has three types of mode: CPU (CA55 or CM33) normal execution mode, boundary scan mode, and debug mode.

1.9.1 CPU (CA55 or CM33) Normal Execution Mode

The LSI has two types of execution method: CM33 cold boot and CA55 cold boot. BOOT_CPU_SELECT controls the CPU from which a cold boot is initiated. **Table 1.9-1** describes BOOT_CPU_SELECT.

During a CM33 cold boot, booting from either the serial flash memory or through SCIF downloading is selectable. During a CA55 cold boot, booting from any among an embedded SD memory (eSD), eMMC, serial flash memory, or through SCIF downloading is selectable. The BOOT_MODE0, BOOT_MODE1 and BOOT_MODE2 pins control the device from which booting is initiated. **Table 1.9-2** describes BOOT_MODE0, BOOT_MODE1 and BOOT_MODE2.

Table 1.9-1 Boot CPU Selection Pin

Signal Name	Function	Description
BOOT_CPU_SELECT	Boot CPU selection	Selects whether to initiate a cold boot from the CA55 or CM33 0: CM33 cold boot 1: CA55 cold boot

Table 1.9-2 Boot Device Selection Pins

Signal Name			Mode	Selected Module	Selected Device	CA55 Boot	CM33 Boot
BOOT_MODE2	BOOT_MODE1	BOOT_MODE0					
0	0	0	Boot mode 0	SD/eMMC ch0	eSD (3.3 V for execution)*2	Supported*1	Not supported
0	0	1	Boot mode 1	SD/eMMC ch0	eMMC (IO voltage is 3.3 V.)*3	Supported*1	Not supported
0	1	0	Boot mode 2	xSPI	Serial flash memory (IO voltage is 3.3 V.)	Supported*1	Supported*1
0	1	1	Boot mode 3	SCIF ch0	SCIF download	Supported	Supported
1	0	0	—	—	—	—	—
1	0	1	Boot mode 5	SD/eMMC ch0	eMMC (IO voltage is 1.8 V.)	Supported*1	Not supported
1	1	0	Boot mode 6	xSPI	Serial flash memory (IO voltage is 1.8 V.)	Supported*1	Supported*1

Note 1. In the boot modes other than SCIF download mode, if reading or writing data from the opposite device fails, the mode shifts to SCIF download mode. If SCIF download mode processing fails, the SCIF download mode process is repeated. (In this case, SCIF ch0 outputs “SCIF Download mode due to parameter error”.)

Note 2. The standard that eSD Boot conforms to is defined in *SD Specification Part 1 eSD Addendum (Version 2.10)*.
When using this mode, eSD should be mounted on a board. This mode can be used with an SD card only for evaluation purposes.

Note 3. The standard that eMMC Boot (Alternative boot) conforms to is defined in JESD84-B51A.

1.9.1.1 Operation of Booting

1.9.1.1.1 Boot Mode 0 (eSD)

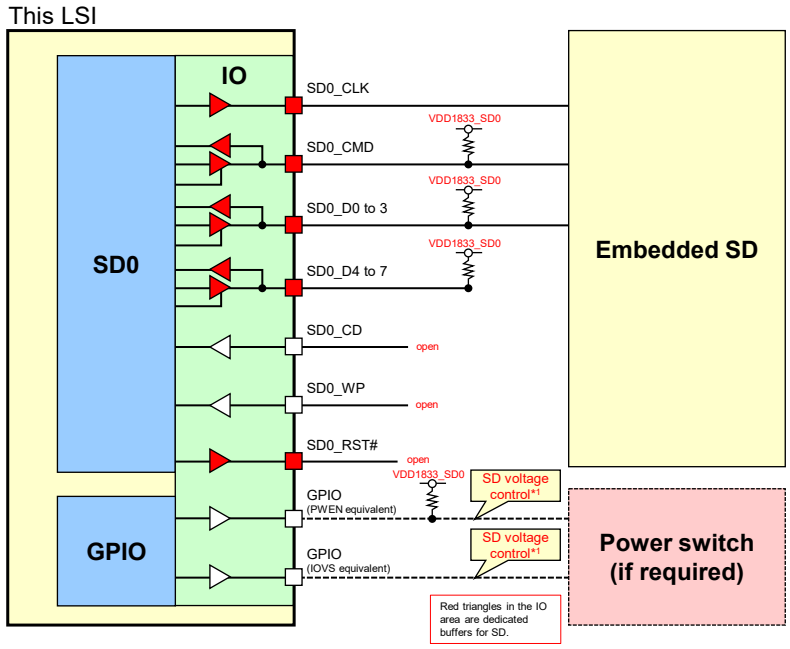
Embedded SD Boot (hereafter eSD boot) performs boot processing from the loader program stored in the eSD device connected to channel 0 of the SD/MMC host interface (hereafter SD0).

In execution in this mode, the voltage is 3.3 V and the width of the data bus is always 4 bits. The module standby of the controller (SD0) of the device used for boot is in a release state. Execution of the ROM program proceeds and involves setting the CPG, selecting of the clock that produces the external clock signal, and initializing SD0.

(1) Information on related pins

Table 1.9-3 lists interface signals with the external device in boot mode 0 (eSD).

Table 1.9-3 External Interface Signals in Boot Mode 0



Pin Name	Input/Output	Function
SD0_CLK	Output	SD clock
SD0_CMD	I/O	SD command/response
SD0_D0	I/O	SD data 0
SD0_D1	I/O	SD data 1
SD0_D2	I/O	SD data 2
SD0_D3	I/O	SD data 3

Note: Sharing of the bus between the embedded SDIO and an 8-bit SD bus is not supported.

(2) External connection

Figure 1.9-1 is a schematic diagram of the connections of the IO pins of SD0 and the external device.
The boot program does not monitor the states of SD0_CD and SD0_WP.

In addition, the voltage is controlled by the GPIO pin as necessary in the program after boot operation.

Note: For details, refer to **(3) Note**.

Figure 1.9-1 Schematic Diagram of Connections for Boot Mode 0

(3) Note

Boot operation using SD card is available for evaluation purposes only.

To speed up the access after booting, handshaking with the other devices, changing to 1.8 V if required, and access between the LSI and the SD card is made by the user program. At this time, changing of voltage is handled by transfer among this device, the other device, and the power management IC or power switch. However, changing of speed is executed by the user program stored in the SD card because it is dependent on the user system.

Figure 1.9-2 is a schematic diagram of the connections when the voltage is to be changed after booting.

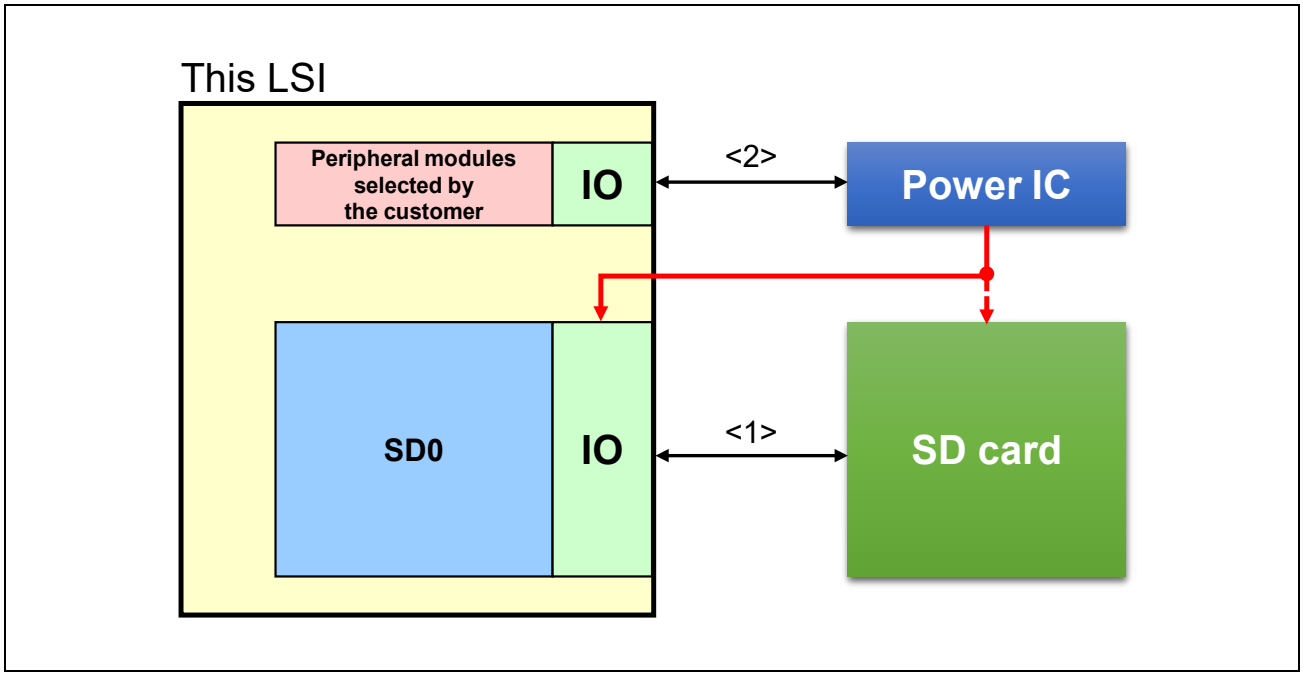


Figure 1.9-2 Schematic Diagram of SD Voltage Control in Boot Mode 0

1.9.1.1.2 Boot Mode 1 / Boot Mode 5 (eMMC 3.3V / 1.8V)

eMMC Boot performs boot processing from the loader program stored in the eMMC device connected to channel 0 of the SD/MMC host interface (hereafter SD0).

When eMMC is selected as the boot device, the width of the data bus is limited to 8 bits. The module standby of the controller (SD0) of the device used for boot is in a release state. Execution of the ROM program proceeds and involves setting the CPG, selecting of the clock that produces the external clock signal, initializing SD0, and Changing I/O settings according to specified BootMode (1.8 V/3.3 V). When the eMMC boot is complete, assert the eMMC Reset (SD0_RST#) to exit the Boot program.

(1) Information on related pins

Table 1.9-4 lists interface signals with the external devices in boot mode 1 / boot mode 5 (eMMC).

Table 1.9-4 External Interface Signals in Boot Mode 1 / Boot Mode 5

Pin Name	Input/Output	Function
SD0_CLK	Output	eMMC clock
SD0_CMD	I/O	eMMC command/response
SD0_D0	I/O	eMMC data 0
SD0_D1	I/O	eMMC data 1
SD0_D2	I/O	eMMC data 2
SD0_D3	I/O	eMMC data 3
SD0_D4	I/O	eMMC data 4
SD0_D5	I/O	eMMC data 5
SD0_D6	I/O	eMMC data 6
SD0_D7	I/O	eMMC data 7
SD0_RST#	Output	eMMC reset

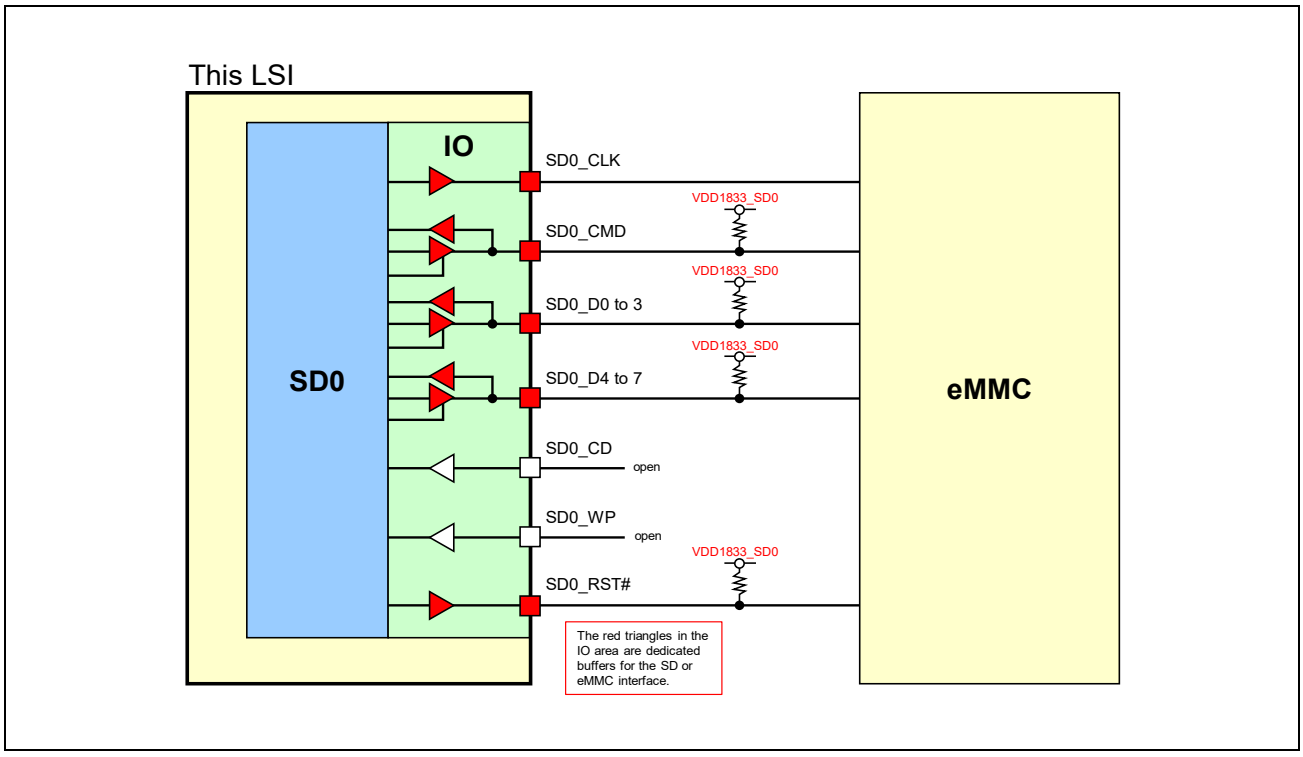
Note: Booting from an MMC card is not supported.

Note: The only supported data width is 8 bits; that is, booting through a 1-bit or 4-bit interface is not supported.

(2) External connection

Figure 1.9-3 is a schematic diagram of the connection with eMMC.

The boot program does not monitor the states of SD0_CD and SD0_WP.



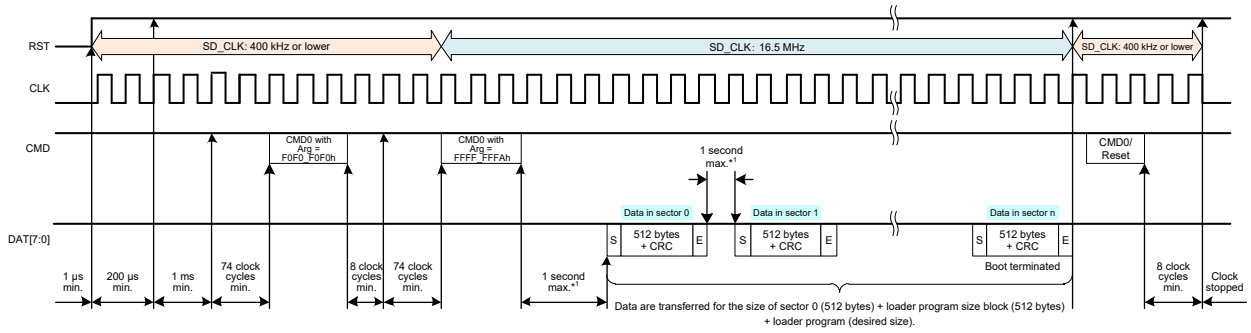


Figure 1.9-3 Schematic Diagram of Connections for Boot Mode 1 / Boot Mode 5

(3) Alternative Boot Operation

Figure 1.9-4 shows the alternative boot operation to read the loader program. This boot program sets up the registers in SD0 so that the SD0 operates with an 8-bit bus width when booting from the eMMC device. On the eMMC device side, the data bus width in the alternative boot operation is determined by the setting of the BOOT_BUS_WIDTH[177] field in the extended CSD register. To boot up from the eMMC device correctly, set up the extended CSD register in the eMMC device as shown in **Table 1.9-5** when writing a program to the eMMC device.

- This boot program accesses the eMMC device with a data bus width of 8 bits in the alternative boot operation. The data bus width of the eMMC device can be specified in the BOOT_BUS_WIDTH[177] field of the extended CSD register. When writing a loader program to the eMMC device, specify the 8-bit bus width in this field.
- The eMMC device sequentially outputs data from sector 0 of the partition selected in the PARTITION_CONFIG[179] field of the extended CSD register in the alternative boot operation.
- This boot program does not detect Boot Ack.
  The output of Boot Ack from the eMMC device can be specified in the PARTITION_CONFIG[179] field. Be sure to stop the output of Boot Ack by using this field.

Note 1. For a maximum of one second, the BRE, ERR3, and ERR1 bits of the SD_INFO2 register are polled to check whether data have been received, a timeout has occurred, and a CRC error has occurred, respectively.
<Normal operation>
SD_INFO2.BRE = 1
Data are transferred from SD_BUF to the SRAM.
<Error>
CRC error: SD_INFO2.ERR1 = 1
The loader program is read from a reserved area.
Timeout error: SD_INFO2.ERR3 = 1
Execution of the boot program for eMMC is terminated.

Figure 1.9-4 Alternative Boot Operation to Read the Loader Program

Table 1.9-5 Setting of the Data Bus Width in Alternative Boot Operation

Field in Extended CSD Register of eMMC Device	Setting
BOOT_BUS_WIDTH [177]	Bits 1 and 0: BOOT_BUS_WIDTH = 10b (The bus width is set to 8 bits in alternative boot operation.)

■ Partitions

An eMMC device has multiple partitions (**Figure 1.9-5**). The partition used for booting can be specified in the PARTITION_CONFIG[179] field of the extended CSD (EXT_CSD) register. To boot up correctly, specify the boot partition in the extended CSD (EXT_CSD) register of the eMMC device as shown in **Table 1.9-6** when writing a program to the eMMC device.

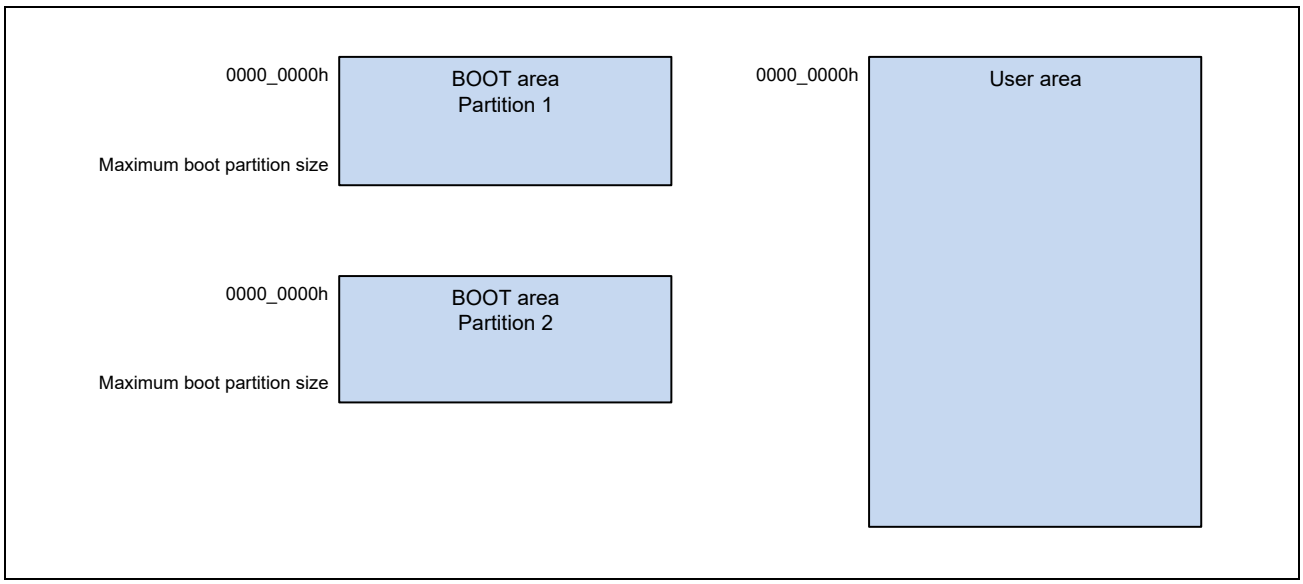

Figure 1.9-5 Partitions in the eMMC Device

Table 1.9-6 Boot Partition Setting in the Alternative Boot Operation

Field in Extended CSD Register of eMMC Device	Setting
PARTITION_CONFIG [179]	• Set bit 6 (BOOT_ACK) to 0b (the eMMC device does not output a boot acknowledge in the alternative boot operation). • Specify the boot partition in bits 5 to 3 (BOOT_PARTITION_ENABLE). 000b: Booting is disabled. 001b: Booting from sector 0 in boot partition 1 in the boot operation. 010b: Booting from sector 0 in boot partition 2 in the boot operation. 011b to 110b: Reserved 111b: Booting from sector 0 in the user area in the boot operation.

1.9.1.1.3 Boot Mode 2 / Boot Mode 6 (Serial Flash Memory 3.3V / 1.8V)

xSPI Boot performs boot processing from the loader program stored in the serial flash memory connected to channel 0 of the xSPI interface. In this mode, the mode of xSPI is changed to Array address mode. When boot completes, xSPI mode is set to Array address mode.

This mode is for execution from a user program stored in an externally connected single, quad, or octa flash device. Starting up is accompanied by handshaking through the SPI protocol with the single, quad, or octa flash device, so the ROM boot program controls the pins labeled ■ in the figures of **(2) External connection**, and subsequent access is controlled by the stored user program.

(1) Information on related pins

Table 1.9-7 lists interface signals with the external devices in boot mode 2 / boot Mode 6 (serial flash memory).

Table 1.9-7 External Interface Signals in Boot Mode 2 / Boot Mode 6

Pin Name	Input/Output	Function
XSPI_CKP	Output	xSPI clock (positive)
XSPI_CS0#	Output	xSPI chip selection 0
XSPI_DS	I/O	xSPI read data strobe/write data mask
XSPI_IO0	I/O	xSPI data 0
XSPI_IO1	I/O	xSPI data 1
XSPI_IO2	I/O	xSPI data 2
XSPI_IO3	I/O	xSPI data 3
XSPI_IO4	I/O	xSPI data 4
XSPI_IO5	I/O	xSPI data 5
XSPI_IO6	I/O	xSPI data 6
XSPI_IO7	I/O	xSPI data 7
XSPI_RST0#	Output	xSPI reset 0
XSPI_WP0#	Output	xSPI write protection 0

(2) External connection

Figure 1.9-6 is a schematic diagram of the connection with a single SPI memory, **Figure 1.9-7** with a quad SPI memory, and **Figure 1.9-8** with a flash memory (octal).

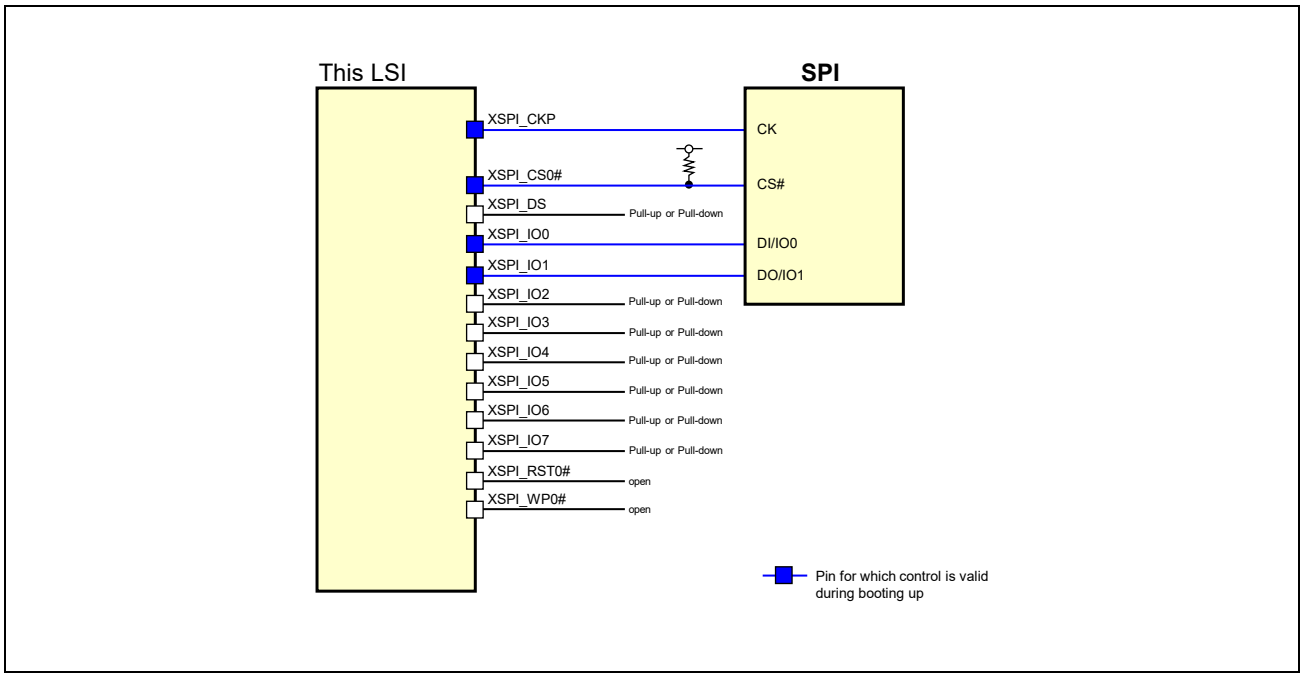

Figure 1.9-6 Schematic Diagram of Connection with a Single SPI Device in Boot Mode 2 / Boot Mode 6

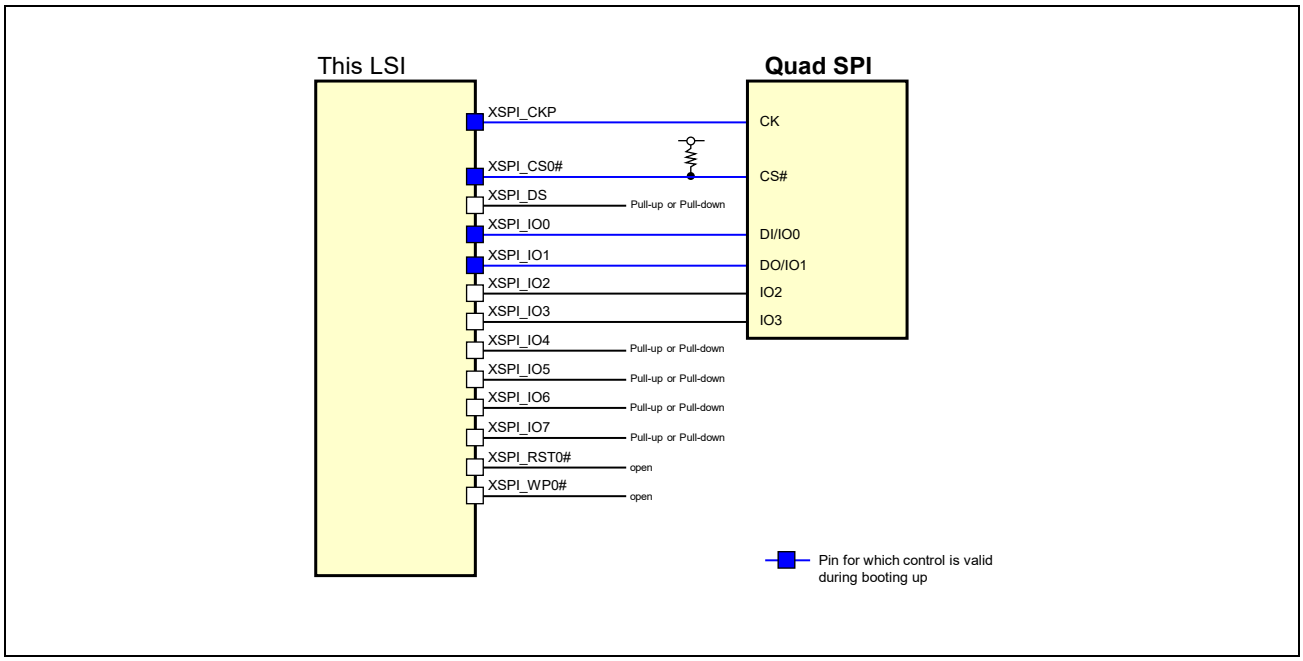

Figure 1.9-7 Schematic Diagram of Connection with a Quad SPI Device in Boot Mode 2 / Boot Mode 6

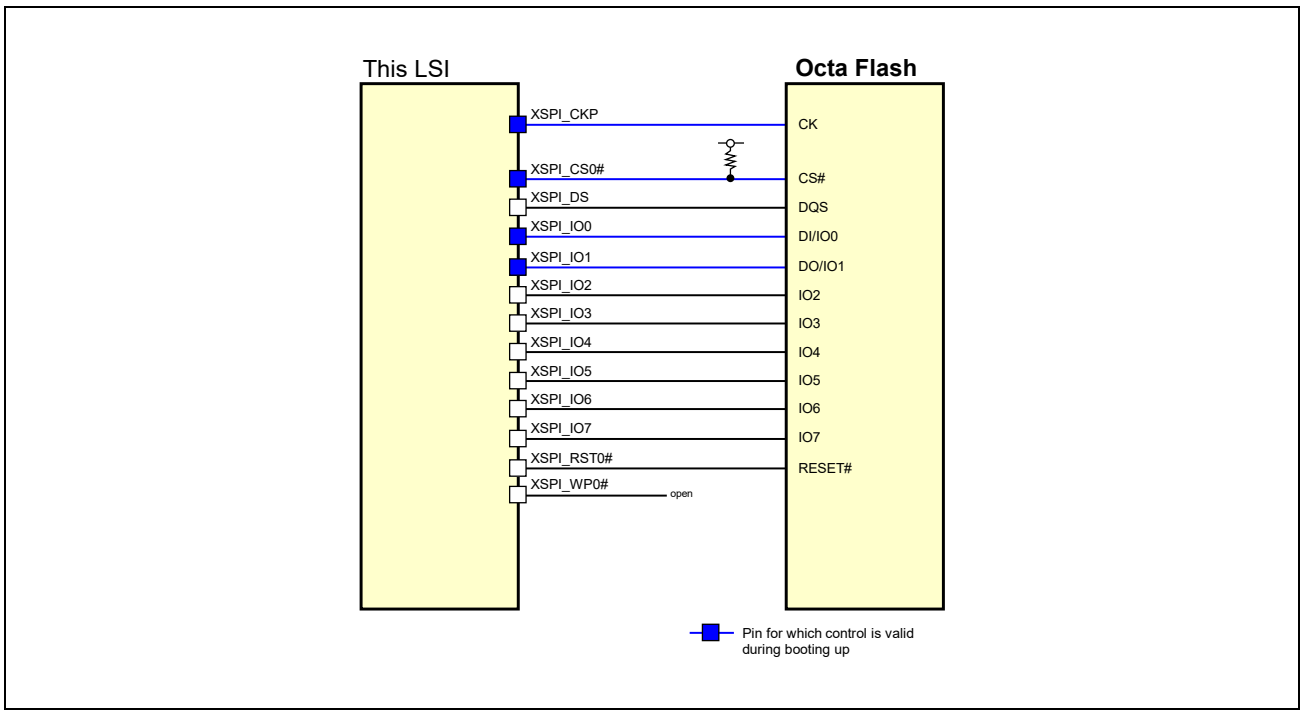

Figure 1.9-8 Schematic Diagram of Connection with an Octa Flash Device in Boot Mode 2 / Boot Mode 6

1.9.1.1.4 Boot Mode 3 (SCIF Download)

This mode connects the RS232C port of this LSI to an external PC and downloads data stored in the PC.

If an external PC does not have RS-232C ports, the connection is made via a serial-to-USB conversion chip mounted on a board or in the cable.

Note: The baud rate is fixed at 115,200 bps.

When the LSI starts up in this mode, the following processing is performed.

1. Setting up the necessary peripheral modules (SCIF channel 0 and PFC) and specifying the parameters for communications.

   When the LSI becomes ready for data reception, the boot program outputs the following message to the SCIF.
   "SCI Download mode (Normal SCI boot)"

2. Upon receiving the Motorola S0 record sent from the external host PC through the SCIF, the boot program converts the S3 record to binary data and copies the data to the addresses 0_0002_2000h to 0_0009_FFFFh (up to 116 Kbytes) of the SRAM.

   The boot program outputs the following message to the SCIF.
   "-- Load Program to System RAM ----------"

3. Upon receiving the S7 record, the boot program outputs the following message to the SCIF and terminates copying to the SRAM.
   "-- Start Boot Program on System RAM ---------"

   After that, execution branches to the address 0_0002_2000h of the SRAM.

(1) Supported file format

Prepare the files used in this mode so that it meets the following specifications.

- SRECORD format
- The S0 record must always be generated
  (because the boot program requires an S0 record as a trigger for the reception processing)
- S0, S3, and S7 only
- The role of each format:
  S0, S7: Only use the byte count and checksum fields
  S3: Transfer boot parameters and boot loader in the record

(2) When the file format is out of specifications

If the data in the Motorola S records sent from the external host PC satisfies any of the following error conditions, the corresponding error message is output to the SCIF and copying to the SRAM is aborted.

- An S1 or S2 record is received: "Invalid Record Type Error!!!"
- An address outside the SRAM area is specified: "Address Error!!!"
- An illegal character code is found: "Invalid Character Error!!!"
- An illegal byte count is found: "Invalid Byte Count Error!!!"

(1) Information on related pins

Table 1.9-8 lists interface signals with the external devices in boot mode 3 (SCIF download).

Table 1.9-8 External Interface Signals in Boot Mode 3

Pin Name	Input/Output	Function
SCIF0_RXD	Input	SCIF received data
SCIF0_TXD	Output	SCIF transmitted data

(2) External connection

Figure 1.9-9 is a schematic diagram of the connections for downloading through the SCIF.

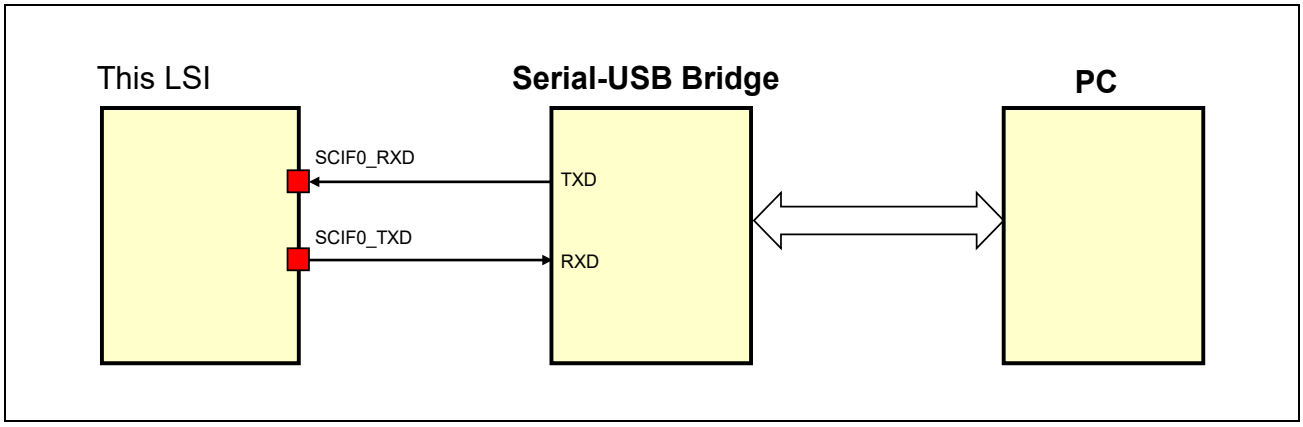

Figure 1.9-9 Schematic Diagram of Connections for Boot Mode 3

1.9.1.2 Allocation of the Loader Program

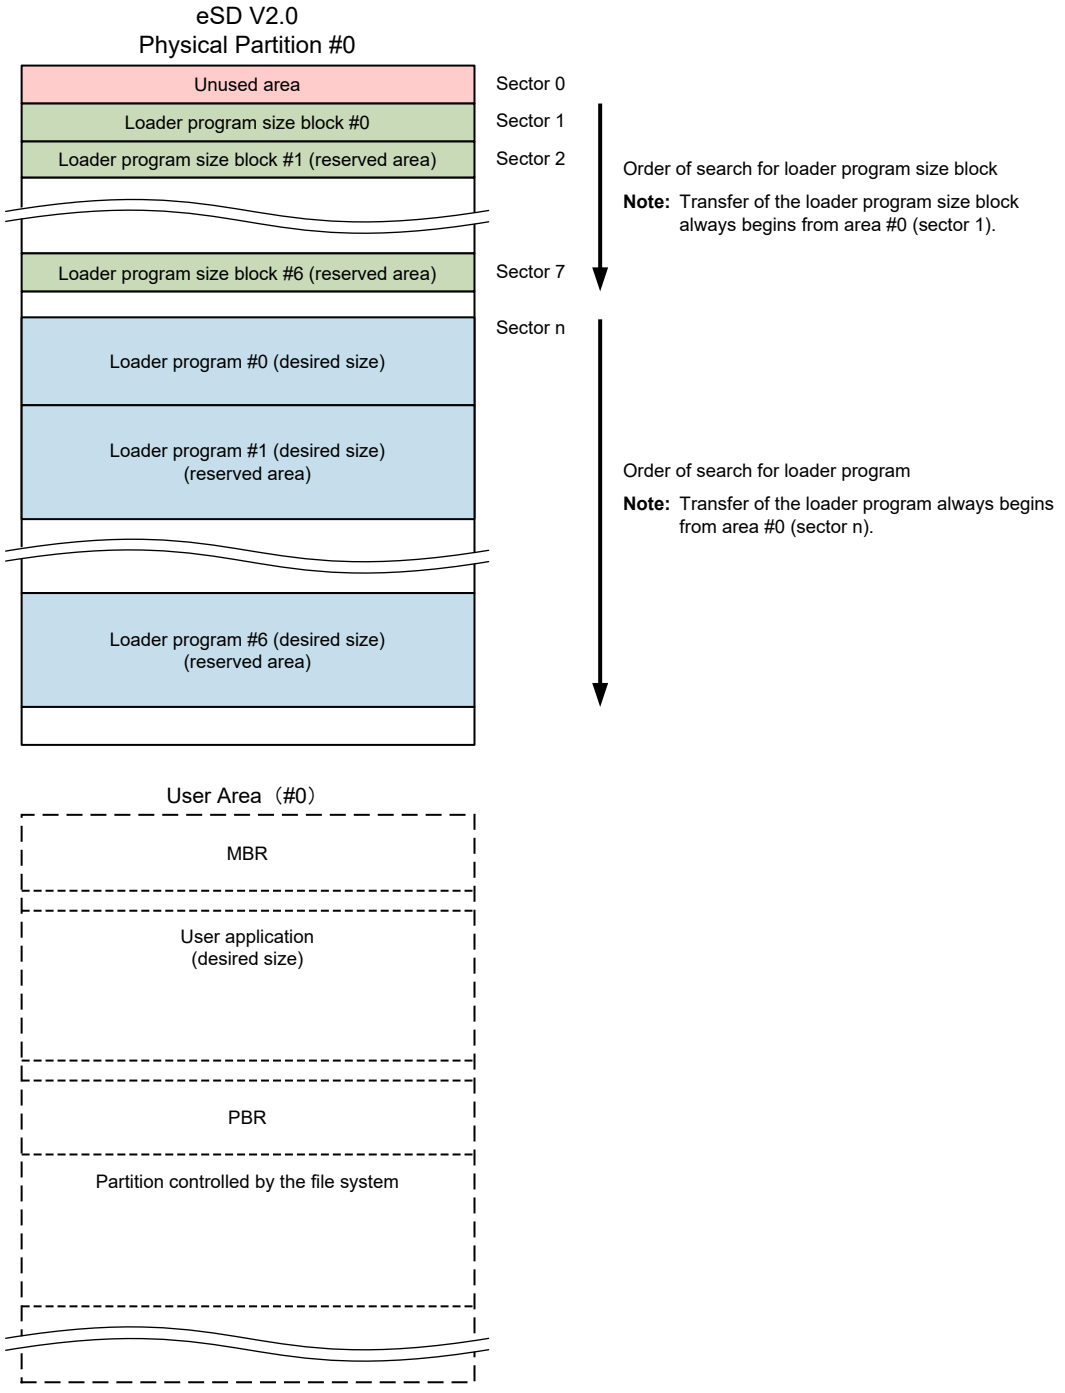
1.9.1.2.1 Boot Mode 0 (eSD)

(1) Allocation in eSD V2.0 (Single Partition)

Figure 1.9-10 shows the allocation of the loader program size blocks and loader programs in the eSD device conforming to the eSD V2.0 standard. To prevent read-disturb errors, up to seven loader program size blocks and loader programs can be multiplexed and written to the eSD device.

The loader program size blocks are allocated to sectors 1 to 7. The Boot program reads the LoaderProgram from the Load Address and places it in the Destination Address. In a loader program size block, the loader program size is stored in the first four bytes and the signature AA55h is stored in the last two bytes. **Figure 1.9-11** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The following describes the operation of transferring the loader program.



(1) The loader program size block is transferred from sector 1 in physical partition #0 of the eSD device to the SRAM.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader program size block in a single area, another loader program size block is transferred from the next multiplexed area.

(2) The signature in the transferred loader program size block is checked. When the signature matches the expected value (AA55h), the size of the loader program data is obtained from the loader program size block and the processing for transferring the loader program is executed.
If the signature does not match the expected value, another loader program size block is transferred from the next multiplexed area.

(3) The transfer of the loader program begins from the loader program load address in physical partition #0 of the eSD device. The loader program is transferred to the SRAM for the obtained loader program size.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the loader program transfer in a single area, another loader program is transferred from the next multiplexed area.

NOTE

Even when the loader size block is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.

Note 1. Write the same data to loader program size block areas #0 to #6.

Note 2. Write the same data to loader program areas #0 to #6.

Note 3. The start sector location of the loader program is calculated as follows.
Loader program load address + obtained size (number of sectors) × n

Figure 1.9-10 Allocation of Loader Programs in the eSD Device Conforming to the eSD V2.0 Standard

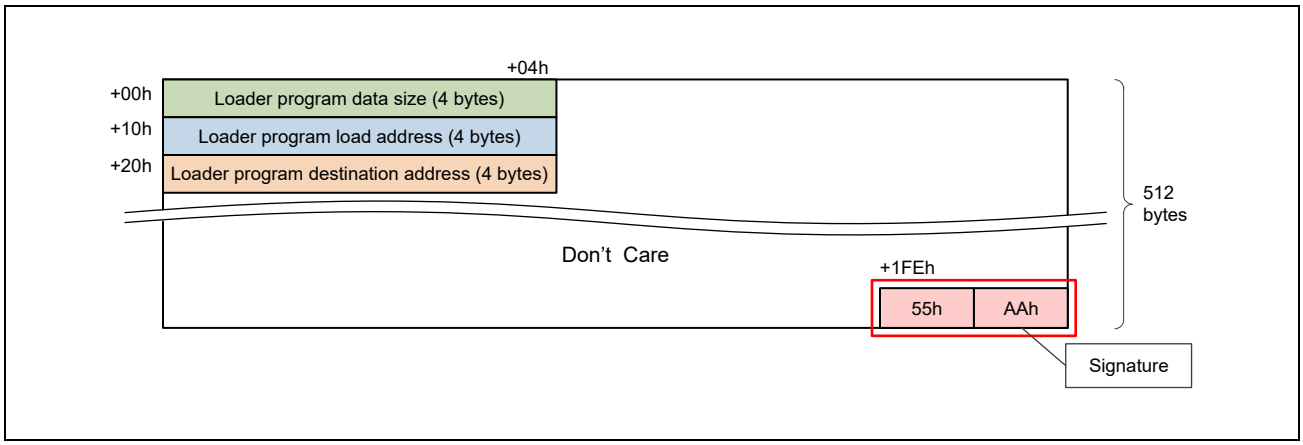


Figure 1.9-11 Structure of the Loader Program Size Block

NOTE

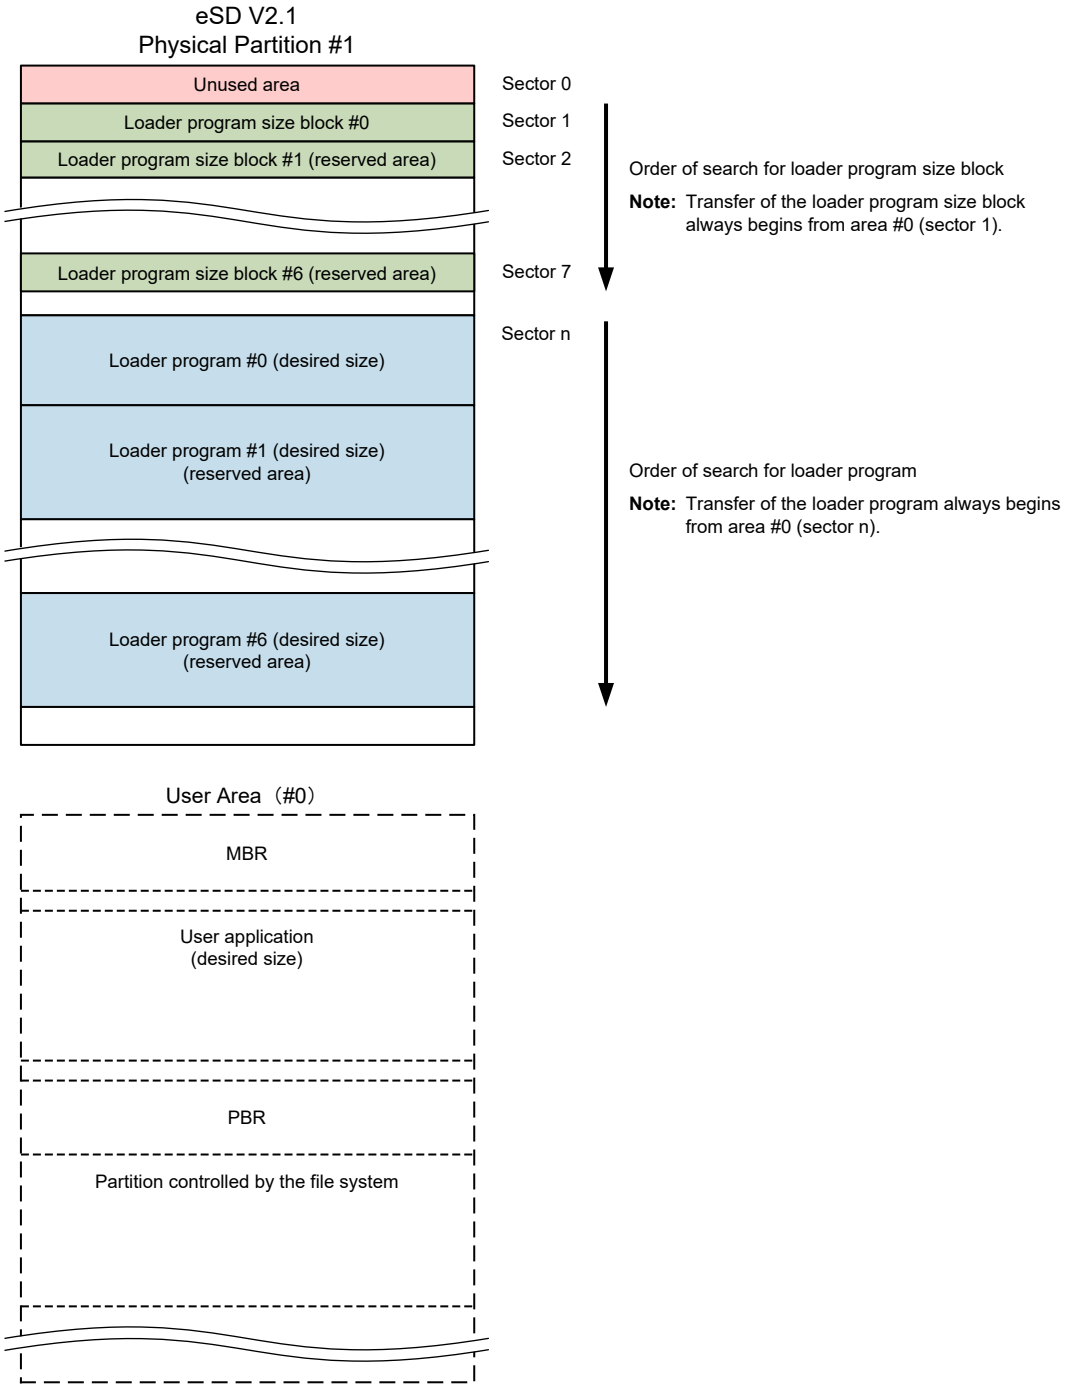
Store the loader program data size in 4-byte little endian.

(2) Allocation in eSD V2.1 (Multi Partitions)

Figure 1.9-12 shows the allocation of the loader program size blocks and loader programs in the eSD device conforming to the eSD V2.1 standard. To prevent read-disturb errors, up to seven loader program size blocks and loader programs can be multiplexed and written to the eSD device

The specifications and allocation of loader program size blocks are the same as those in eSD V2.0. For the structure of the loader program size block, see **Figure 1.9-11**.

The following describes the operation of transferring the loader program.



(1) The loader program size block is transferred from sector 1 in physical partition #1 of the eSD device to the SRAM. If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader program size block in a single area, another loader program size block is transferred from the next multiplexed area.

(2) The signature in the transferred loader program size block is checked. When the signature matches the expected value (AA55h), the size of the loader program data is obtained from the loader program size block and the processing for transferring the loader program is executed. If the signature does not match the expected value, another loader program size block is transferred from the next multiplexed area.

(3) The transfer of the loader program begins from the loader program load address in physical partition #1 of the eSD device. The loader program is transferred to the SRAM for the obtained loader program size.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the loader program transfer in a single area, another loader program is transferred from the next multiplexed area.

NOTE

Even when the loader size block is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.

Note 1. Write the same data to loader program size block areas #0 to #6.

Note 2. Write the same data to loader program areas #0 to #6.

Note 3. The start sector location of the loader program is calculated as follows.
Loader program load address + obtained size (number of sectors) × n

Figure 1.9-12 Allocation of Loader Programs in the eSD Device Conforming to the eSD V2.1 Standard

(3) How to Distinguish between eSD V2.0 (Single Partition) and V2.1 (Multi Partitions)

This boot program first assumes that an eSD device supporting multi partitions is connected and begins loader program transfer from physical partition #1. If an error regarding a command for multi partitions shown in the following table occurs, the boot program assumes that an eSD device with a single partition is connected and transfers the loader program from physical partition #0.

Table 1.9-9 Errors Regarding Commands for Multi Partitions

No.	Issued Command	Command Function	Error	Remarks
1	CMD43 (SELECT_PARTITION)	Selects physical partition #1.	Multi partitions are not supported.	
2	CMD45 (QUERY_PARTITION)	Obtains the physical partition ID.	The specified partition does not exist.	

1.9.1.2.2 Boot Mode 1 / Boot Mode 5 (eMMC 3.3V / 1.8V)

Figure 1.9-13 shows the allocation of the loader program in the eMMC device conforming to the MMCA 4.4 standard.

In the loader program size block, the loader program size is stored in the first four bytes and the signature AA55h is stored in the last two bytes. **Figure 1.9-14** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The transfer of the loader program begins from the first address (sector 0) of the boot partition. A dummy read from sector 0 is done, and then the size of the loader program data is obtained from the data read from sector 1.

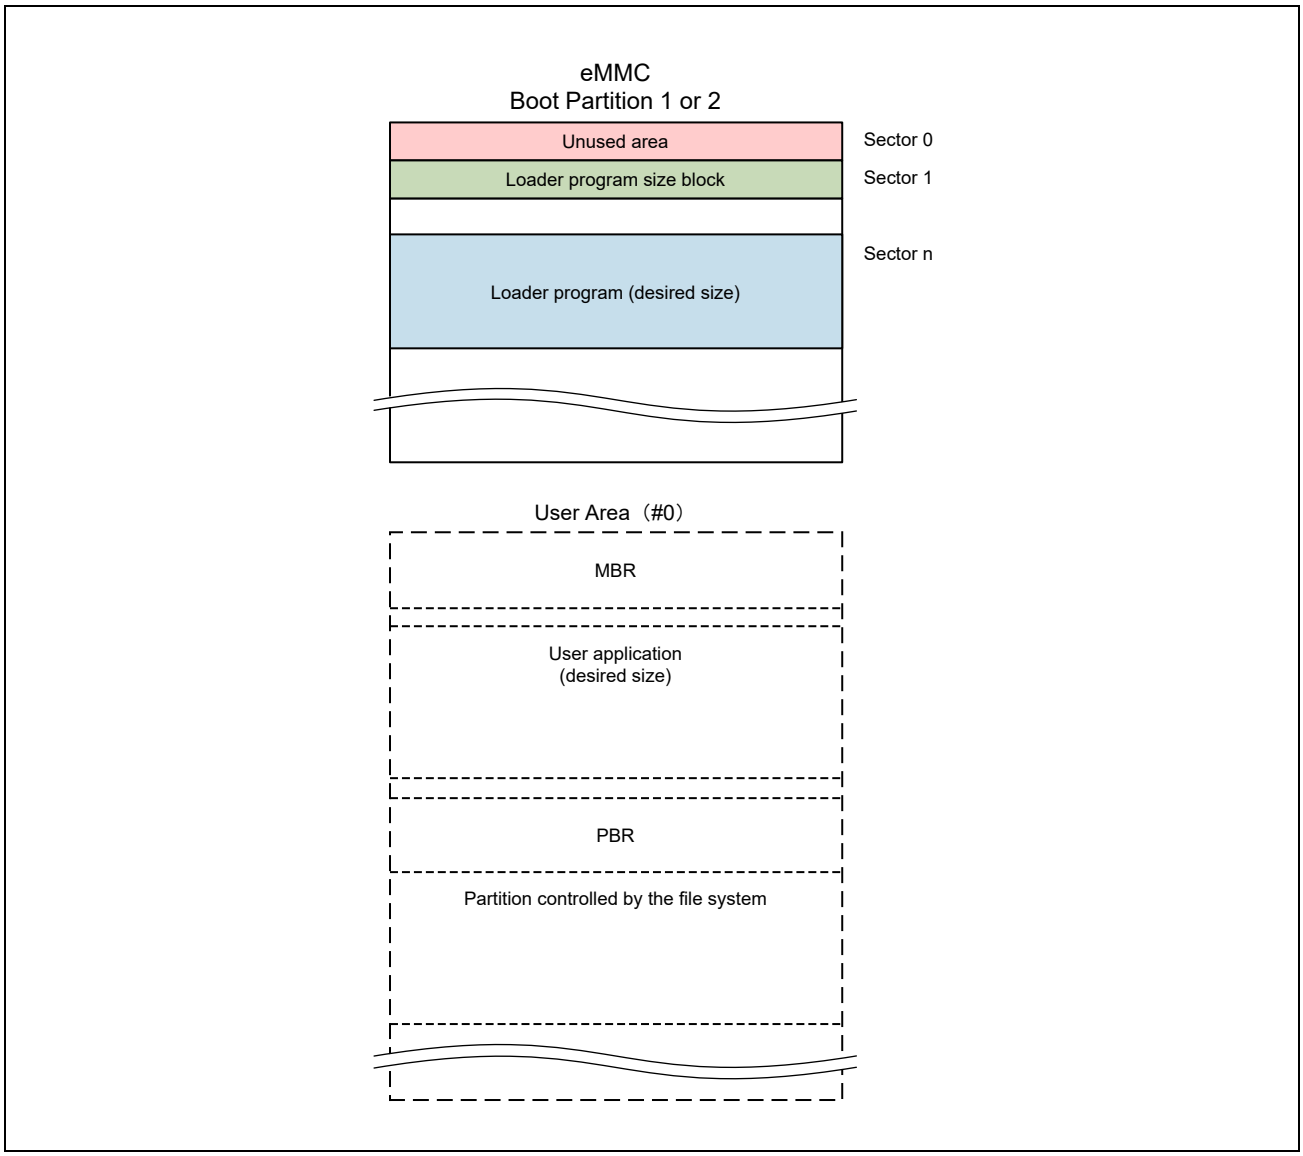


Figure 1.9-13 Allocation of Loader Program in the eMMC Device

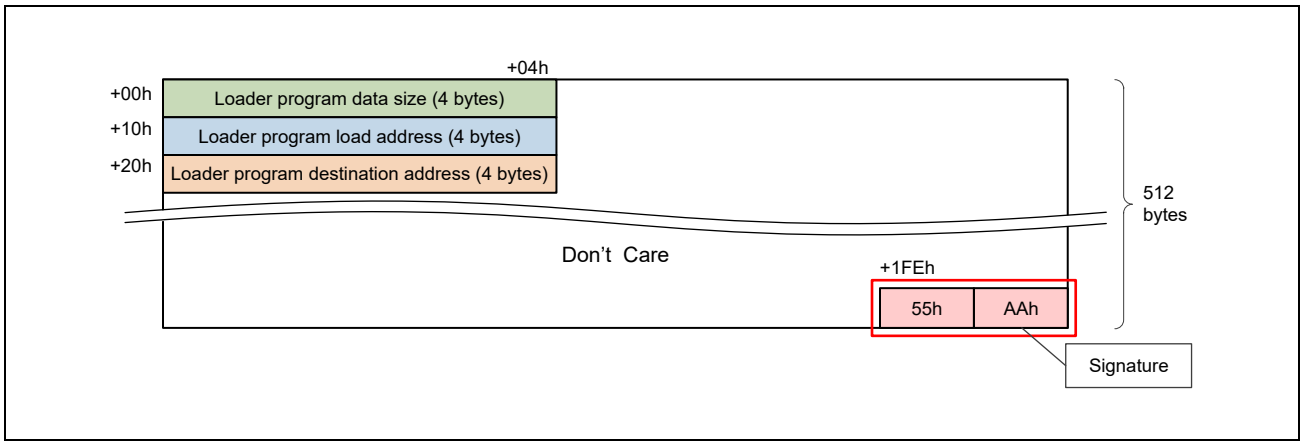

Figure 1.9-14 Structure of the Loader Program Size Block

In the eMMC device, the loader program is read from the partition specified by the BOOT_PARTITION_ENABLE bits in the PARTITION_CONFIG (ECSD[179]) field of the extended CSD register. Write the loader program to the partition selected by this register. **Table 1.9-10** shows the specifications of the extended CSD register.

Table 1.9-10 Specifications of the Extended CSD Register

No.	Field Name	Bit Name	Setting	Remarks
1	PARTITION_CONFIG (ECSD[179])	BOOT_PARTITION_ENABLE bits [5:3]	0h: Device not enabled for boot (default) 1h: Boot partition 1 enabled for boot 2h: Boot partition 2 enabled for boot 7h: User area enabled for boot	

Allocate partitions as follows.

- Store the loader program in boot partition 1.
- Store the application program in boot partition 2.
- Allocate the user area to a partition controlled by the file system.

1.9.1.2.3 Boot Mode 2 / Boot Mode 6 (Serial Flash Memory 3.3V / 1.8V)

Figure 1.9-15 shows the allocation of the loader program size block and loader program in the serial flash memory.

In the loader program size block, the loader program size is stored in the first four bytes and the signature AA55h is stored in the last two bytes. **Figure 1.9-16** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

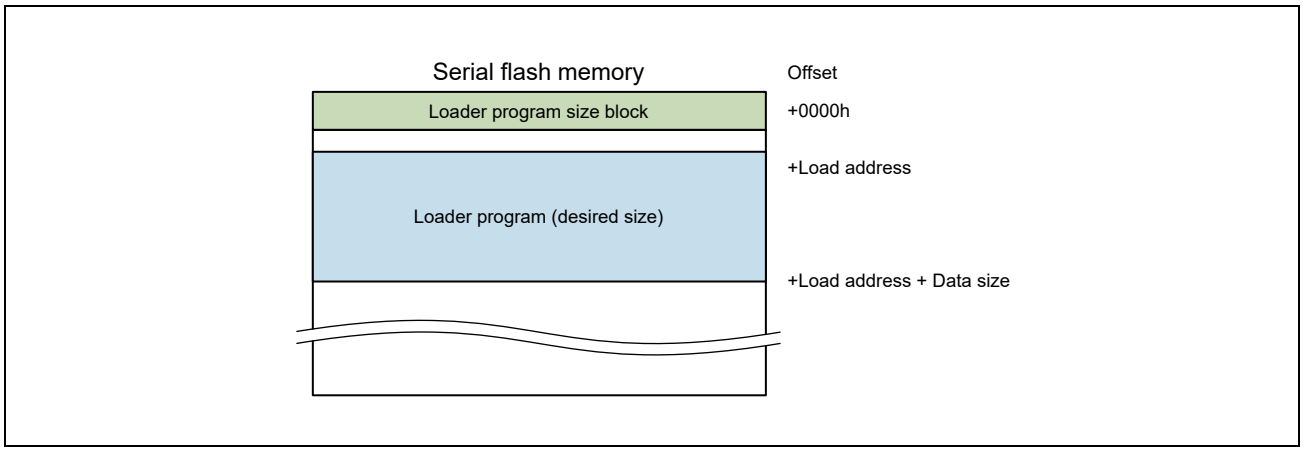

Figure 1.9-15 Allocation of Loader Program in the Serial Flash Memory Device

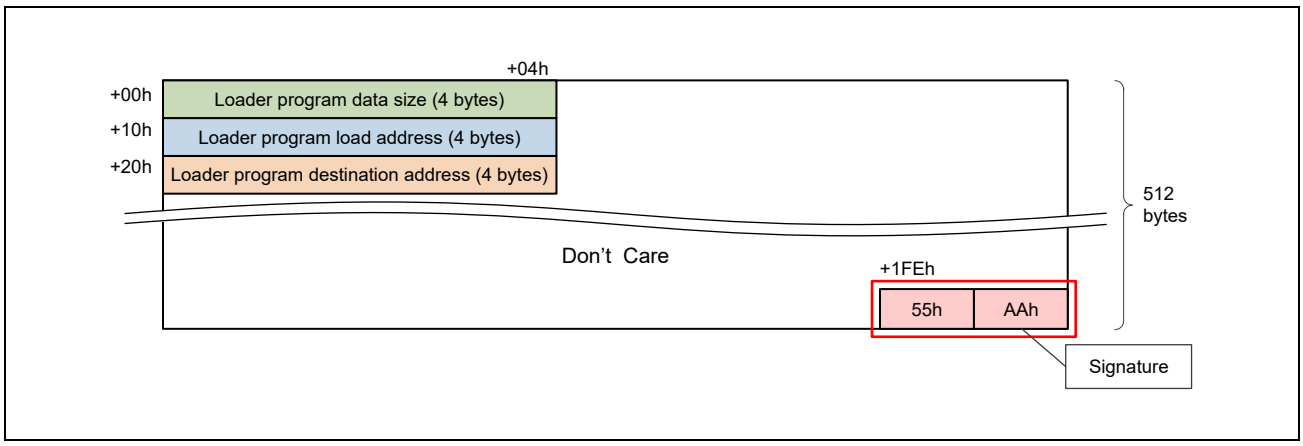

Figure 1.9-16 Structure of the Loader Program Size Block

1.9.1.2.4 Boot Mode 3 (SCIF Download)

In the loader program size block (512 bytes), the loader program size is stored in the first four bytes and the signature AA55h is stored in the last two bytes. Be sure to store the loader program size in 4-byte little endian.

The offset addresses in the SRAM for storing the file (the loader program size data) downloaded in this mode are as follows:

- CA55 cold boot: 0_0002_1E00h to 0_0002_1FFFh
- CM33 cold boot: 0_2002_1E00h to 0_2002_1FFFh

The offset addresses in the SRAM for storing the file (the loader program) downloaded in this mode are as follows:

- CA55 cold boot: 0_0002_2000h to 0_0009_FFFFh
- CM33 cold boot: 0_2002_2000h to 0_2009_FFFFh

1.9.2 Boundary Scan Mode

Table 1.9-11 shows the pin that is related to the boundary scan.

Table 1.9-11 Boundary Scan Mode Pin

Pin Name	Function	Description
BSCAN_EN	Boundary scan setting	0: Normal operation 1: Inter-LSI connection test on the user board (in the board)

The boundary scan mode is used to conduct connection tests between other ICs that connect to the external pins of this LSI, and it is enabled when BSCAN_EN is high.

Five pins of the JTAG are used to control when this mode is enabled. This LSI has functionality to limit access for increased security when accessing from a debugger via the JTAG, however, no limitation is applied in the boundary scan mode.

1.9.3 Debug Mode

The LSI has pins for applying control that is different from that for the normal mode when debugging is to proceed. **Table 1.9-12** lists the relationships between the mode and the state of BOOT_MODE3.

Table 1.9-12 Debug-Related Pins

BOOT_MODE3	Mode	Overview of Operation
0	Normal operation	Normal operation mode
1	Debug mode	A mode for making a debugger connection and debugging the functions of the LSI.

Note 1. The level on the pin is captured by SYS on the rising edge of SYS_RST#. Setting of BOOT_MODE3 to 1 is required to be in advance on the rising edge of SYS_RST# even if the JTAG connection is made in the midst of execution after booting up.

SECTION 2 PROCESSORS

2.1 Processors Overview

This LSI is equipped with 2 CPUs.

- Cortex®-A55 Quad/Dual (CA55)
- Cortex®-M33 (CM33)

The CA55 is intended for application processing, the CM33 for system control.

For details on each CPU, see **2.2 CPU (CA55: 2.2.2, CM33: 2.2.3)**.

SECTION 2 PROCESSORS

2.2 CPU

2.2.1 Overview

This LSI has following CPUs.

- Quad 64-bit Arm® Cortex®-A55 processors (Application processing)
- 32-bit Arm® Cortex®-M33 processor (System management)

2.2.2 Application Processors Cortex-A55 (CA55)

The CA55 is a core block equipped with quad Cortex-A55 cores. For details on the functions including interrupts of the CA55, see the Arm® Cortex®-A55 Core Technical Reference Manual and related documents in **2.2.2.5 Function Reference**. For details of interrupt type and control, see **4.6 Interrupt Controller**.

2.2.2.1 Features

The CA55 incorporates an extensively redesigned microarchitecture system that improves performance across the board while being very competitive in area and power efficiency.

Table 2.2-1 Function Summary

	Description
CPU	• Cortex-A55 r2p0 (ARMv8-A) quad cores
Cache memory	• L1$ (I/D) = 32 KB (Parity) / 32 KB (ECC) • L2$ = None • L3$ = 512 KB (ECC)
Maximum operating frequency	• CPU — Core: 1200 MHz — Cluster: 1200 MHz
Interrupt controller	• External interrupt controller*1

Note 1. Interrupts generated in the system of this LSI are conveyed to GIC-600 via the IA55. For the various settings and setting procedures for the GIC, refer to the *GIC-600 Generic Interrupt Controller Technical Reference Manual* and **4.6 Interrupt Controller**.

Table 2.2-2 Core Configuration

	Value	Description
L1 instruction cache size	32 KB	L1 instruction cache = 32 KB (Parity)
L1 data cache size	32 KB	L1 data cache = 32 KB (ECC)
L3 cache size	512 KB	L3 cache = 512 KB (ECC)
ECC or parity core cache protection	Included	Support for core cache ECC
Advanced SIMD and floating-point support (including dot product instruction support)	Included	Support for Neon™ FPU engine
Cryptographic extension	Included (optional)	Support for cryptography engine
AArch32	N/A	Not supported
Big endian	N/A	Not supported

Table 2.2-3 Cluster Configuration

Item	Initial Value	Description	Switching Timing
AA64nAA32[0]	1b	For core 0. Fixed to 1 (AArch64).	—
AA64nAA32[1]	1b	For core 1. Fixed to 1 (AArch64).	—
AA64nAA32[2]	1b	For core 2. Fixed to 1 (AArch64).	—
AA64nAA32[3]	1b	For core 3. Fixed to 1 (AArch64).	—
CFGEND[0]	0b	For core 0. Fixed to 0 (little endian).	—
CFGEND[1]	0b	For core 1. Fixed to 0 (little endian).	—
CFGEND[2]	0b	For core 2. Fixed to 0 (little endian).	—
CFGEND[3]	0b	For core 3. Fixed to 0 (little endian).	—
CLUSTERIDAFF2[7:0]	0h	For core 0. The value is fixed.	—
CLUSTERIDAFF3[7:0]	0h	For core 1. The value is fixed.	—
CRYPTODISABLE	—	Fixed to 0 and 1 respectively for secure and normal products.	—
RVBARADDR0[39:2]	00_0000_1000h	For core 0. The value can be changed. The dedfault is start address of boot code in MASKROM (correcponding to 00_0000_4000h).	Cold, cluster, core 0 reset
RVBARADDR1[39:2]	00_0001_8000h	For core 1. The value can be changed. The default is the start address of ACPU_SRAM (corresponding to 00_0006_0000h).	Cold, cluster, core 1 reset
RVBARADDR2[39:2]	00_0001_8000h	For core 2. The value can be changed. The default is the start address of ACPU_SRAM (corresponding to 00_0006_0000h).	Cold, cluster, core 2 reset
RVBARADDR3[39:2]	00_0001_8000h	For core 3. The value can be changed. The default is the start address of ACPU_SRAM (corresponding to 00_0006_0000h).	Cold, cluster, core 3 reset
GICCDISABLE	0b	Fixed to 0 (CPU interface enabled)	—
ASTARTMP[39:20]	0_0100h	Start address of PP IF*1. The value can be changed.	Cold, cluster reset
AENDMP[39:20]	0_0200h	End address of PP IF*1. The value can be changed.	Cold, cluster reset

Note 1. PP IF stands for Peripheral Port Interface.
For details, see the Arm® DynamIQ™ Shared Unit Technical Reference Manual and related documents.

The settings by the configuration pins are reflected when a reset is applied to the target core. For the types of reset and the areas to be reset, see **Table 2.2-4**. The configuration pins are RVBARADDR0/1/2/3 for specifying the base addresses and ASTARTMP and AENDMP for specifying the areas of PP IF.

The procedure for changing RVBARADDR0/1/2/3 is given below.

1. Transfer the program to the changed base address.
2. Write the base address to the SYS_CA55_CFG_RVAL0/1/2/3 and SYS_CA55_CFG_RVAH0/1/2/3 registers.
3. Apply a reset for core 0/1/2/3.

The procedure for changing ASTARTMP and AENDMP is given below.

1. Write ASTARTMP to the SYS_CA55_CFG_SMPH and SYS_CA55_CFG_SMPL registers.
2. Write AENMP to the SYS_CA55_CFG_EMPH and SYS_CA55_CFG_EMPL registers.
3. Apply a reset for the cluster.

CAUTION

When ASTARTMP or AENDMP is changed, note the points below.

- When AENDMP <= ASTARTMP, the PP IF is not used.
- When ASTARTMP < AENDMP, the PP IF is used. The lower limit address of the peripheral area includes the setting value of ASTARTMP; the upper limit address of the peripheral area does not include the setting value of AENDMP. The upper limit address is set by subtracting 1 byte from AENDMP.

2.2.2.2 Resets

Table 2.2-4 shows the supported types of reset and the areas that are reset by the respective types. For the procedures of handling the individual resets, see **2.2.2.2.1 Cold Reset** and the subsequent parts. See the Arm® DynamIQ™ Shared Unit Technical Reference Manual and Arm® Cortex®-A55 Core Technical Reference Manual.

Table 2.2-4 Areas to be Reset

Reset Function	Areas to be Reset
Cold reset	Entire area
Cluster warm reset	Entire area of the cluster + core 0 (and cores 1, 2, and 3 in quad-core devices) except for the debug, RAS, and ETM registers
Core warm reset	Entire area of the target core except for the debug, RAS, and ETM registers
Debug reset	Debug block

The P-Channels can be used to control safety in resetting. For details on the P-Channels, see the AMBA® Low Power Interface Specification Arm® Q-Channel and P-Channel Interfaces. For details on registers for controlling the P-Channel and reset pins, see **4.4 Clock Pulse Generator (CPG)**. **Table 2.2-5** shows the supported power modes for each P-Channel. Transitions to power modes other than those listed in the table below are not supported.

Table 2.2-5 Supported Power Modes

PSTATE	Power Mode
CLUSTERPSTATE[6:0]	• 100_1000b (ON) • 000_0000b (OFF)
COREPSTATE0[5:0]	• 00_1000b (ON) • 00_0001b (OFF_EMU) • 00_0000b (OFF)
COREPSTATE1[5:0]	• 00_1000b (ON) • 00_0001b (OFF_EMU) • 00_0000b (OFF)
COREPSTATE2[5:0]*1	• 00_1000b (ON) • 00_0001b (OFF_EMU) • 00_0000b (OFF)
COREPSTATE3[5:0]*1	• 00_1000b (ON) • 00_0001b (OFF_EMU) • 00_0000b (OFF)

Note 1. Only OFF mode is supported in the Dual Core products.

2.2.2.2.1 Cold Reset

A cold reset is applied at any of the following cases.

(a) The sequence of a power-on reset by the CPG is executed (in CA55 boot mode).
(b) The WDT counter has underflowed.
(c) Software control by the CM33 is applied.

For details on (a) and (b) reset, see **4.4 Clock Pulse Generator (CPG)** and **5.4 Watchdog Timer (WDT)**, respectively. To apply a cold reset by case (c) reset, follow the procedure below. The CPU column shows the CPU which executes processing. At the time of reading in the Processing column, continue polling until the expected value is obtained.

Table 2.2-6 Procedure for Applying Cold Reset

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence described in the TRM on all powered-on cores.		
2	CM33	SYS_LP_CA55CK_CTL4	READ	0000_0000h
3	CM33	CPG_CORE0_PCHCTL	WRITE	0000_0001h
		CPG_CORE1_PCHCTL	WRITE	0000_0001h
		CPG_CORE2_PCHCTL	WRITE	0000_0001h
		CPG_CORE3_PCHCTL	WRITE	0000_0001h
4	CM33	CPG_CORE0_PCHMON	READ	0000_0001h
		CPG_CORE1_PCHMON	READ	0000_0001h
		CPG_CORE2_PCHMON	READ	0000_0001h
		CPG_CORE3_PCHMON	READ	0000_0001h
5	CM33	CPG_CORE0_PCHCTL	WRITE	0000_0000h
		CPG_CORE1_PCHCTL	WRITE	0000_0000h
		CPG_CORE2_PCHCTL	WRITE	0000_0000h
		CPG_CORE3_PCHCTL	WRITE	0000_0000h
6	CM33	CPG_CORE0_PCHMON	READ	0000_0000h
		CPG_CORE1_PCHMON	READ	0000_0000h
		CPG_CORE2_PCHMON	READ	0000_0000h
		CPG_CORE3_PCHMON	READ	0000_0000h
7	CM33	CPG_CLUSTER_PCHCTL	WRITE	0000_0001h
8	CM33	CPG_CLUSTER_PCHMON	READ	0000_0001h
9	CM33	CPG_CLUSTER_PCHCTL	WRITE	0000_0000h
10	CM33	CPG_CLUSTER_PCHMON	READ	0000_0000h
11	CM33	CPG_RST_CA55_1	WRITE	3FFF_0000h
12	CM33	CPG_RST_CA55_2	WRITE	0007_0000h
13	CM33	CPG_RSTMON_CA55_1	READ	0000_3FFFh
14	CM33	CPG_RSTMON_CA55_2	READ	0000_0007h

Note: Processing from step 1 to 10 is a recommended procedure to minimize the impact on the system.

The control procedure for releasing the cold reset by (c) to start core 0 is as follows.

Table 2.2-7 Procedure for Releasing Cold Reset to Start Core 0

Step	CPU	Register Name	Processing	Value
1	CM33	CPG_RSTMON_CA55_1	READ	0000_3FFFh
2	CM33	CPG_ RSTMON_CA55_2	READ	0000_0007h
3	CM33	CPG_CLUSTER_PCHCTL	WRITE	0048_0001h
4	CM33	CPG_CORE0_PCHCTL	WRITE	0008_0001h
5	CM33	CPG_RST_CA55_2	WRITE	0007_0007h
6	CM33	CPG_RSTMON_CA55_2	READ	0000_0000h
7	CM33	CPG_RST_CA55_1	WRITE	3FFF_3FFFh
8	CM33	CPG_RSTMON_CA55_1	READ	0000_0000h
9	CM33	CPG_CLUSTER_PCHMON	READ	0000_0001h
10	CM33	CPG_CORE0_PCHMON	READ	0000_0001h
11	CM33	CPG_CLUSTER_PCHCTL	WRITE	0048_0000h
12	CM33	CPG_CLUSTER_PCHMON	READ	0000_0000h
13	CM33	CPG_CORE0_PCHCTL	WRITE	0008_0000h
14	CM33	CPG_CORE0_PCHMON	READ	0000_0000h

The procedure for starting another core (core x) after the startup of core 0 is as follows.

Table 2.2-8 Procedure for Starting Core x

Step	CPU	Processing
1	CM33	Release the cold reset to start the cluster according to **Table 2.2-7**.
2	Any	Set the PREQx_SET bit of CPG_COREx_PCHCTL to 1b and the PSTATEx_SET bits to 00_1000b.
3	Any	Check that the PDENYx_MON bit of CPG_COREx_PCHMON is 0b and the PACCEPTx_MON bit is 1b.
4	Any	Set the PREQx_SET bit of CPG_COREx_PCHCTL to 0b.
5	Any	Check that the PDENYx_MON bit of CPG_COREx_PCHMON is 0b and the PACCEPTx_MON bit is 0b.

2.2.2.2.2 Core Warm Reset

There are the two types of core warm reset: internal and external resets. The former requires software control by the CA55 itself and the latter requires software control by the CA55 and CM33. Though the CA55 handles an internal reset in the same way as an external reset, if you intend to reset a single core, using an internal reset is recommended because handling this requires fewer steps than an external reset. An external reset is mainly used as part of a cluster warm reset, which is described in **2.2.2.2.3 Cluster Warm Reset**.

To apply an internal reset, follow the procedure below.

Table 2.2-9 Core Warm Reset (Internal)

Step	CPU	Register Name	Processing	Value
1	CA55	RMR_EL3.RR	Write	1b
2	CA55	—	WFI	—

Release from an internal reset is automatic following application of the reset. No specific processing is required. For details, see the Arm® DynamIQ™ Shared Unit Technical Reference Manual and Arm® Cortex®-A55 Core Technical Reference Manual.

Application of the reset requires transition of the core power mode to OFF or EMU_OFF by the P-channel pin. The following describes the reset sequence for each core using the sequence for setting the power mode to OFF. Read the power mode as EMU_OFF when placing each core into this state.

The control procedure for applying an external reset to core 0 is as follows.

Table 2.2-10 Core x Warm Reset (External Reset Procedure)

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence*1 on core x.		
2	Any	SYS_LP_CA55CK_CTL4	READ	0000_000s*2h
3	Any	CPG_COREx_PCHCTL	WRITE	0000_0001h
4	Any	CPG_COREx_PCHMON	READ	0000_0001h
5	Any	CPG_COREx_PCHCTL	WRITE	0000_0000h
6	Any	CPG_COREx_PCHMON	READ	0000_0000h
7	Any	CPG_RST_CA55_1	WRITE	00t*20_0000h
8	Any	CPG_RSTMON_CA55_1	READ	0000_00t*30h

Note 1. For details, refer to the Arm® Cortex®-A55 Core Technical Reference Manual.

Note 2. Each bit of s[3:0] corresponds to core number x. The s[x] bit for the core x to be reset is 0. The value of the other bits are arbitrary (depned on core state, 0 to OFF or WFI/WFE, 1 to ON).

Note 3. Each bit of t[3:0] corresponds to core number x. The t[x] bit for the core x to be reset is 1. The values of the other bits are 0.

The control procedure for releasing the core warm reset to start core x is as follows.

Table 2.2-11 Core x Warm Reset (External Reset Release Procedure)

Step	CPU	Register Name	Processing	Value
1	Any	CPG_COREx_PCHCTL	WRITE	0008_0001h
2	Any	CPG_RST_CA55_1	WRITE	03FF_03FFh
3	Any	CPG_RSTMON_CA55_1	READ	0000_0000h
4	Any	CPG_COREx_PCHMON	READ	0000_0001h
5	Any	CPG_COREx_PCHCTL	WRITE	0008_0000h
6	Any	CPG_COREx_PCHMON	READ	0000_0000h

2.2.2.2.3 Cluster Warm Reset

There are the two types of cluster warm reset: normal and immediate resets. Both require software control by the CA55 and CM33. Though the CA55 handles an immediate reset in the same way as a normal reset, an immediate reset should only be used for debugging because handling this may cause a deadlock.

The control procedure for applying a normal reset while cores 0/1/2/3 are started up is as follows.

If there is any core that is not started up, do not perform steps 1 to 5 on this core.

Table 2.2-12 Cluster Warm Reset (Normal Reset Procedure)

Step	CPU	Register Name	Processing	Value
1	CA55	Execute a power-down sequence*1 on all powered-on cores 0/1/2/3.		
2	CM33	SYS_LP_CA55CK_CTL4	READ	0000_0000h
3	CM33	CPG_CORE0_PCHCTL	WRITE	0000_0001h
		CPG_CORE1_PCHCTL	WRITE	0000_0001h
		CPG_CORE2_PCHCTL	WRITE	0000_0001h
		CPG_CORE3_PCHCTL	WRITE	0000_0001h
4	CM33	CPG_CORE0_PCHMON	READ	0000_0001h
		CPG_CORE1_PCHMON	READ	0000_0001h
		CPG_CORE2_PCHMON	READ	0000_0001h
		CPG_CORE3_PCHMON	READ	0000_0001h
5	CM33	CPG_CORE0_PCHCTL	WRITE	0000_0000h
		CPG_CORE1_PCHCTL	WRITE	0000_0000h
		CPG_CORE2_PCHCTL	WRITE	0000_0000h
		CPG_CORE3_PCHCTL	WRITE	0000_0000h
6	CM33	CPG_CORE0_PCHMON	READ	0000_0000h
		CPG_CORE1_PCHMON	READ	0000_0000h
		CPG_CORE2_PCHMON	READ	0000_0000h
		CPG_CORE3_PCHMON	READ	0000_0000h
7	CM33	CPG_CLUSTER_PCHCTL	WRITE	0000_0001h
8	CM33	CPG_CLUSTER_PCHMON	READ	0000_0001h
9	CM33	CPG_CLUSTER_PCHCTL	WRITE	0000_0000h
10	CM33	CPG_CLUSTER_PCHMON	READ	0000_0000h
11	CM33	CPG_RST_CA55_1	WRITE	14F0_0000h
12	CM33	CPG_RST_CA55_2	WRITE	0003_0000h
13	CM33	CPG_RSTMON_CA55_1	READ	0000_14F0h
14	CM33	CPG_RSTMON_CA55_2	READ	0000_0003h

Note 1. For details, refer to the Arm® Cortex®-A55 Core Technical Reference Manual.

When applying an immediate reset, perform only steps 11 to 14 of the normal reset sequence.

The control procedure for releasing the cluster warm reset to start core 0 is as follows.

Table 2.2-13 Cluster Warm Reset (Normal Reset Release and Core 0 Startup Procedure)

Step	CPU	Register Name	Processing	Value
1	CM33	CPG_CLUSTER_PCHCTL	WRITE	0048_0001h
2	CM33	CPG_CORE0_PCHCTL	WRITE	0008_0001h
3	CM33	CPG_RST_CA55_2	WRITE	0007_0007h
4	CM33	CPG_RSTMON_CA55_2	READ	0000_0000h
5	CM33	CPG_RST_CA55_1	WRITE	3FFF_3FFFh
6	CM33	CPG_RSTMON_CA55_1	READ	0000_0000h
7	CM33	CPG_CLUSTER_PCHMON	READ	0000_0001h
8	CM33	CPG_CORE0_PCHMON	READ	0000_0001h
9	CM33	CPG_CLUSTER_PCHCTL	WRITE	0048_0000h
10	CM33	CPG_CLUSTER_PCHMON	READ	0000_0000h
11	CM33	CPG_CORE0_PCHCTL	WRITE	0008_0000h
12	CM33	CPG_CORE0_PCHMON	READ	0000_0000h

2.2.2.2.4 Debug Reset

Debug resets can only be applied under software control.

To apply a debug reset, follow the procedure below.

Table 2.2-14 Procedure for Applying Debug Reset

Step	CPU	Register Name	Processing	Value
1	Any	CPG_RST_CA55_2	WRITE	0004_0000h
2	Any	CPG_RSTMON_CA55_2	READ	0000_0004h

To release from the debug reset state, follow the procedure below.

Table 2.2-15 Procedure for Releasing Debug Reset

Step	CPU	Register Name	Processing	Value
1	Any	CPG_RST_CA55_2	WRITE	0004_0004h
2	Any	CPG_RSTMON_CA55_2	READ	0000_0000h

2.2.2.3 Interrupts

Table 2.2-16 lists the interrupt output signals.

Table 2.2-16 Interrupt Output Signals

Port name	Type*3	Pulse / Level	INT ID*2
nVCPUMNTIRQ[3:0]	PPI	Level	PPI : 25
nCNTHPIRQ[3:0]	PPI	Level	PPI : 26
nCNTPNSIRQ[3:0]	PPI	Level	PPI : 30
nCNTPSIRQ[3:0]	PPI	Level	PPI : 29
nCNTVIRQ[3:0]	PPI	Level	PPI : 27
nCNTHVIRQ[3:0]	PPI	Level	PPI : 28
nFAULTIRQ[4:1]	SPI	Level	—
nFAULTIRQ[0]	SPI	Level	—
nERRIRQ[4:1]	SPI	Level	—
nERRIRQ[0]	SPI	Level	—
CTIIRQ[3:0]	PPI	Level*1	PPI : 24
nCLUSTERPMUIRQ	SPI	Level	—
nPMUIRQ[3:0]	PPI	Level	PPI : 23
nCOMMIRQ[3:0]	PPI	Level	PPI : 22

Note 1. These signals are configured as level interrupt because this LSI is intended to use software control. To clear the interrupt, use the CTIAPPCLEAR register.

Note 2. For details of INT ID of SPI, see **4.6 Interrupt Controller**. The interrupts classified as PPI under the Type column can also be used as SPI.

Note 3. For details on PPI and SPI interrupts, see **4.6.2 Generic Interrupt Controller (GIC).**

2.2.2.4 Low Power Consumption Mode

The CA55 supports two standby modes.

- Core wait for interrupt (WFI)
- Core wait for event (WFE)

For details on each mode, see the Arm® Cortex®-A55 Core Technical Reference Manual and related documents.

The CA55 enters standby mode immediately after the execution of a WFI/WFE instruction.

2.2.2.4.1 Cortex-A55 Sleep Mode

This LSI defines the procedure for the CA55 to execute WFI/WFE instructions as the application sleep mode. This mode allows the CA55 to move to the low-power consumption mode safely without adversely affecting the system.

The following procedure is the example sequence of a transition to Cortex-A55 Sleep Mode (core0).

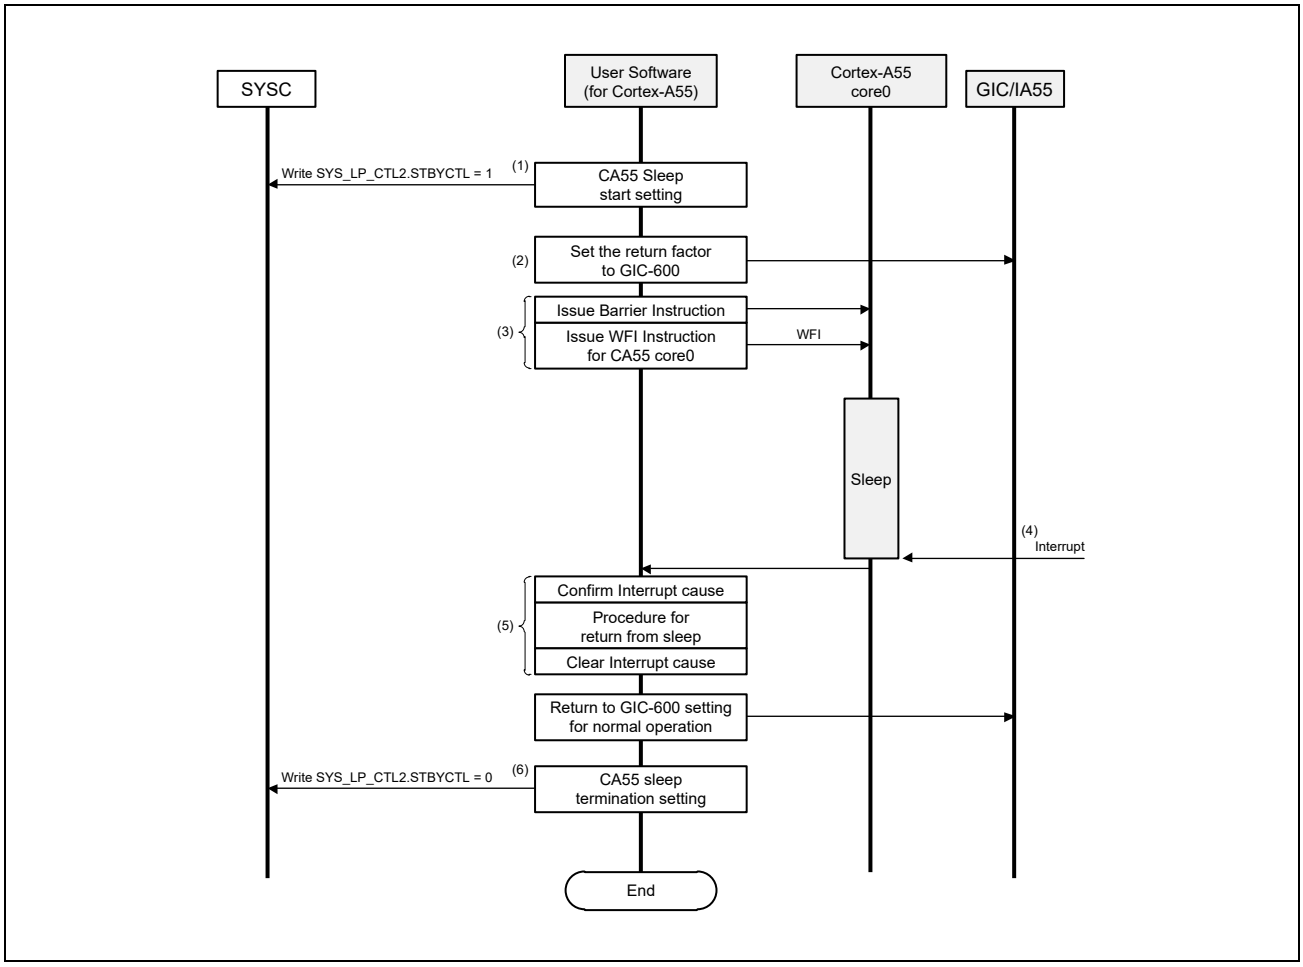

Figure 2.2-1 Cortex-A55 Sleep Mode Procedure

(1) Set the STBYCTL bit of the SYS_LP_CTL2 register to 1 to start the Cortex-A55 Sleep Mode.

(2) Set the return factor to GIC. Enables only the interrupts used for return from the sleep mode and disables the interrupts used for the normal operation.

(3) Issue Barrier instruction.
Issue the WFI instruction for Cortex-A55 core0. The Cortex-A55 core0 is put into the sleep mode.

(4) Return from the sleep mode when the event occurs or the interrupt set in GIC occurs.

(5) Confirm the interrupt cause and perform the processing required for returning from the sleep mode.
And then clear the interrupt cause.
Set the end of interrupt to GIC.
Set the interrupt causes for the normal operation to GIC.

(6) Clear the STBYCTL bit of the SYS_LP_CTL2 register.

2.2.2.5 Function Reference

For details on the functions of the DynamIQ™ Shared Unit and CA55, see the documents listed below.

- Arm® DynamIQ Shared Unit Technical Reference Manual
- Arm® Cortex®-A55 Core Technical Reference Manual
- Arm® Cortex®-A55 Core Advanced SIMD and Floating-point Support Technical Reference Manual
- Arm® Cortex®-A55 Core Cryptographic Extension Technical Reference Manual

For details on clock and the controls, see **4.4 Clock Pulse Generator (CPG)**.

2.2.2.6 Boot Procedure

The procedure for booting the CA55 is the same as that for releasing the cold reset.

Before releasing the cold reset, the following steps are required.

1. Set the configuration settings controllable by the SYS*[1].
2. Set the clock supply*[2].

Note 1. Related SYS registers
SYS_CA55_CFG_SMPH / L
SYS_CA55_CFG_EMPH / L
SYS_CA55_CFG_RVAHx / Lx (x = 0 to 3)

Note 2. Related CPG registers (see **4.4 Clock Pulse Generator (CPG)** for the settings of PLLs and dividers.)
CPG_CLKON_CA55
CPG_CLKMON_CA55

When starting the CA55 with debug mode enabled, check that it has been released from reset (perform step 7 in **Table 2.2-7**) and then set the connection with CoreSight (CST) to the communication ready state.

2.2.2.7 CoreSight Connection

The CA55 performs local communications with CST using the ATB, APB, and timestamp interfaces. Though power-down is supported in this LSI, since the CA55 and CST belong to a different power domain, the two states are defined for the availability of communications.

- Communication ready state
- Communication interrupted state (default setting)

When powering down, place these interfaces in the communication interrupted state. When performing communications with the CST, place them in the communication ready state.

Since the ATB and timestamp interfaces have power-down registers, use software control to place these interfaces in the communication interrupted state.

The procedure for transition to the communication ready state is given below.

Table 2.2-17 Procedure for Transition to Communication Ready State

Step	CPU	Processing
1	Any	Write 1b to the CSYSREQ_ATx (x = 0/1/2/3) and CSYSREQ_TS bits of the CPG_LP_CA55_CTL1 register.
2	Any	Check that the CSYSACK_ATx (x = 0/1/2/3) and CSYSACK_TS bits of the CPG_LP_CA55_CTL1 register are 1b.
3	Any	Write 1b to the csysreq_lpi_atbasyncx bit (x = 0/1/2/3) of the CPG_LP_CST_CTL2 registers.*1
4	Any	Check that the csysack_lpi_atbasyncx bit (x = 0/1/2/3) of the CPG_LP_CST_CTL2 register is 1b.

Note 1. Controlling the timestamp interface of the CST is not required because it is common to all CPUs.

The procedure for transition to the communication interrupted state is given below.

Table 2.2-18 Procedure for Transition to Communication Interrupted State

Step	CPU	Processing
1	Any	Write 0b to the CSYSREQ_ATx (x = 0/1/2/3) and CSYSREQ_TS bits of the CPG_LP_CA55_CTL1 register.
2	Any	Check that the CSYSACK_ATx (x = 0/1/2/3) and CSYSACK_TS bits of the CPG_LP_CA55_CTL1 register are 0b.
3	Any	Write 0b to the csysreq_lpi_atbasyncx bit (x = 0/1/2/3) of the CPG_LP_CST_CTL2 register.*1
4	Any	Check that the csysack_lpi_atbasyncx bit (x = 0/1/2/3) of the CPG_LP_CST_CTL2 register is 0b.

Note 1. Controlling the timestamp interface of the CST is not required because it is common to all CPUs.

2.2.3 System CPU Cortex-M33

This LSI has the Cortex-M33 system CPU.

The Cortex-M33 system CPU is a core block equipped with an Arm Cortex-M33 processor without floating-point.

The Cortex-M33 processor is a highly energy-efficient processor that is intended for a microcontroller and deeply embedded applications. The processor is based on the Armv8-M architecture.

Refer to **1.8.2 CM33 Address Space** for CM33 address space.

2.2.3.1 Features

The following table shows the Cortex-M33 Configuration.

For details on the functions of the Cortex-M33, see the Arm® Cortex®-M33 Processor Technical Reference Manual.

Table 2.2-19 Cortex-M33 Configuration

Description	Configuration
CPU	200 MHz Cortex-M33 r0p4 (ARMv8-M)
DSP extension	No Armv8-M DSP extension
Security extension	Armv8-M security extension
Non-secure protected memory regions	16 regions
Secure protected memory regions	16 regions
Security attribution unit (SAU)	8 regions
Interrupts	480 interrupts
Number of bits of interrupt priority	8 bits are supported. 256 levels of priority are implemented.
Debug watchpoints and breakpoints	Full set 4 data watchpoint comparators and 8 breakpoint comparators
ITM and data watchpoint and trace (DWT) trace functionality	Complete ITM and DWT trace
Embedded trace macrocell (ETM)	ETM instruction execution trace
Micro trace buffer (MTB)	MTB is not supported.
Cross trigger interface (CTI)	CTI is included.
Wakeup interrupt controller (WIC)	WIC is included.
External coprocessor interface	Coprocessor hardware is not supported.

2.2.3.1.1 Interrupt Pins

Table 2.2-20 Cortex-M33 System CPU Interrupt

Name	Description	Type	Active Level
CTIIRQ [1:0]	CTI interrupt output	Level	High

2.2.3.2 Address Space

For details on the address space, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual.

2.2.3.2.1 IDAU Setting

The Cortex-M33 system CPU uses the IDAU. **Table 2.2-21** shows the security attributes assigned by the IDAU.

Base address of Non-Secure and Secure are exchangeable by SYS_IPCONT_IDAUZERONS register for Cortex-M33 Address Space After registers are set, release Cortex-M33 Reset.

Table 2.2-21 IDAU Security Attributes

Area No.	Security Attribute IDAUZERONS = 0 (default)	Security Attribute IDAUZERONS = 1	Lower-limit Address	Upper-limit Address
0	Secure	Non-secure	0000_0000h	0FFF_FFFFh
1	Non-secure	Secure	1000_0000h	1FFF_FFFFh
2	Secure	Non-secure	2000_0000h	2FFF_FFFFh
3	Non-secure	Secure	3000_0000h	3FFF_FFFFh
4	Secure	Non-secure	4000_0000h	4FFF_FFFFh
5	Non-secure	Secure	5000_0000h	5FFF_FFFFh
6	Secure	Non-secure	6000_0000h	6FFF_FFFFh
7	Non-secure	Secure	7000_0000h	7FFF_FFFFh
8	Secure	Non-secure	8000_0000h	8FFF_FFFFh
9	Non-secure	Secure	9000_0000h	9FFF_FFFFh
10	Secure	Non-secure	A000_0000h	AFFF_FFFFh
11	Non-secure	Secure	B000_0000h	BFFF_FFFFh
12	Secure	Non-secure	C000_0000h	CFFF_FFFFh
13	Non-secure	Secure	D000_0000h	DFFF_FFFFh
14	Secure	Non-secure	E000_0000h	EFFF_FFFFh
15	Non-secure	Secure	F000_0000h	FFFF_FFFFh

2.2.3.3 Register Descriptions

For details on registers, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual.

For the device-specific Cortex-M33 system CPU control registers, see the section on the system controller (SYSC).

2.2.3.4 Description of Functions

For the registers and functions of Cortex-M33, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual and Arm®v8-M Architecture Reference Manual.

2.2.3.4.1 Startup Sequence

The startup sequence of the Cortex-M33 system CPU is shown in the figure below.

It is designed to execute by other processor (Cortex-A55) for the function and sequence of Cortex-M33 control here.

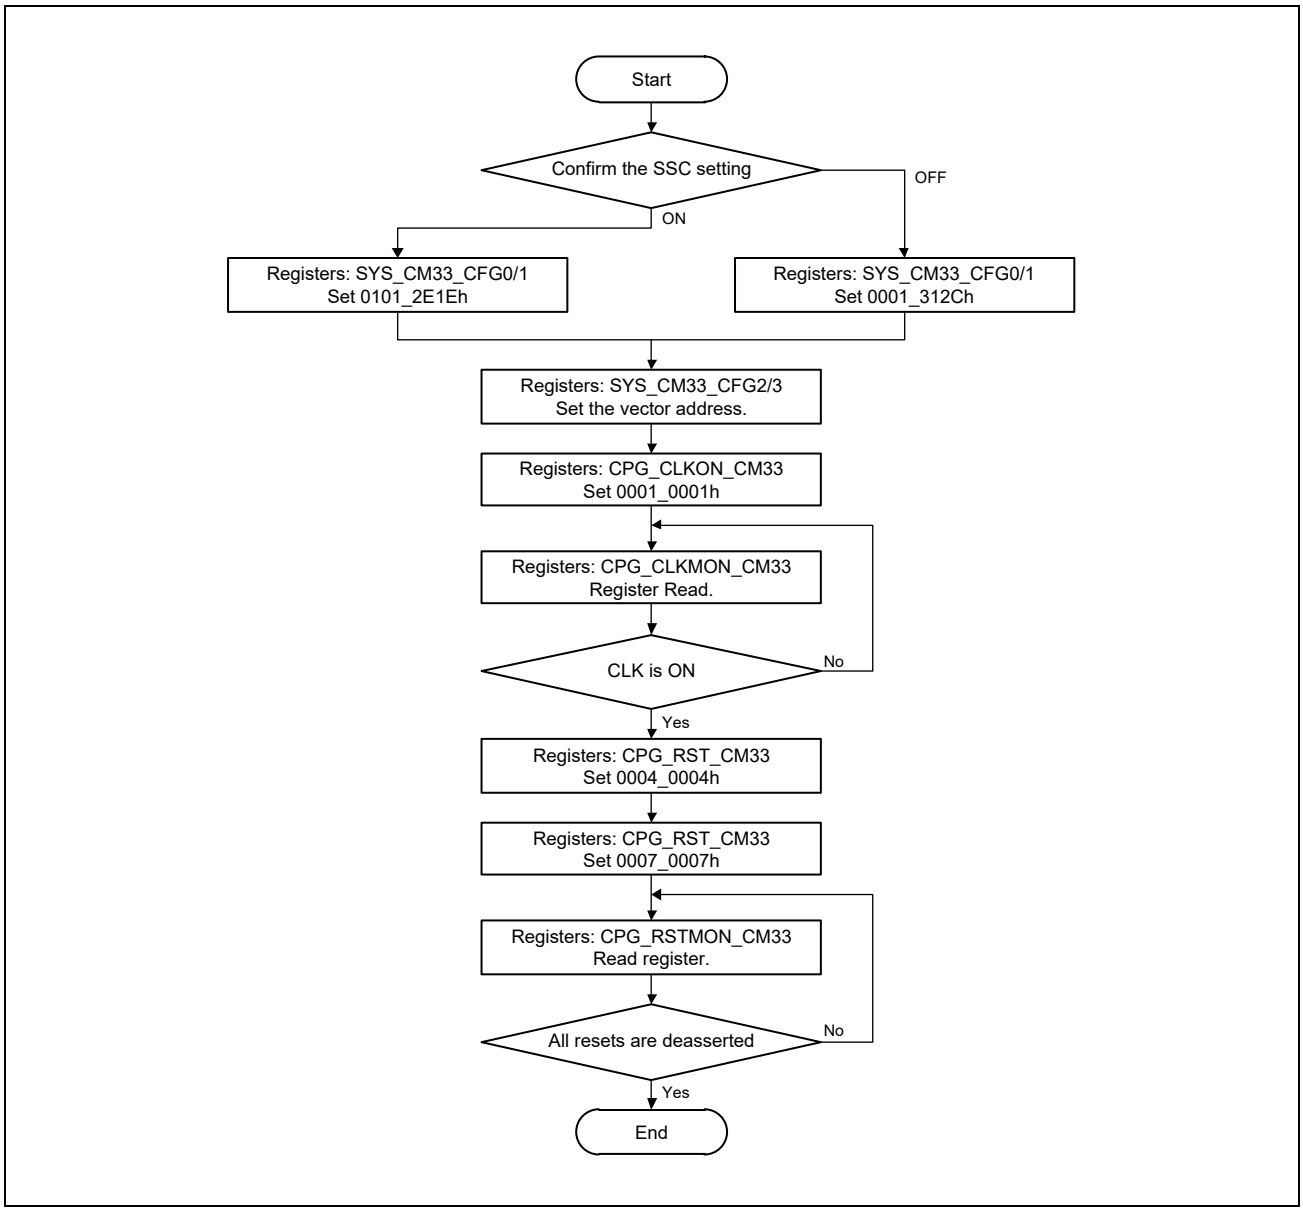

Figure 2.2-2 Startup Sequence (Cortex-M33)

2.2.3.4.2 Control by the SYSC

In this LSI, the system controller (SYSC) is used to control the functions of the Cortex-M33 system CPU. For details of SYSC registers, see the section on the system controller (SYSC).

Table 2.2-22 List of Functions Controlled by the SYSC

No.	Description
1	Cortex-M33 control registers • CM33 Config registers (SysTick timer, reset vector address): (SYS_CM33_CFGx) • Low-power Sequence CM33 Control Register0: (SYS_LP_CM33CTL0/SYS_LP_CM33_CTL1/SYS_CM33_CTL)
2	Warm reset request Cooperation with the SYSC is necessary for executing a warm reset. For details, see **2.2.3.4.3 Warm Reset**.
3	Control of low power consumption function The Cortex-M33 system CPU supports two low power modes. For details on how to control Cortex-M33 Sleep Mode, see **2.2.3.4.4 Cortex-M33 Sleep Mode**.

2.2.3.4.3 Warm Reset

When executing a warm reset, the WFI instruction is used to guarantee that no transaction is issued.

The warm reset sequence is shown below. For details of SYSC registers, see the section on the system controller (SYSC).

1. Set the SYSRESETREQ bit in the Cortex-M33 register AIRCR to 1.
2. Confirm that the value of the SYSRESETREQ bit in the SYSC register SYS_LP_CM33CTL0 is 1.
3. Set the IM33_MASK bit in the SYSC register SYS_LP_CTL7 to 1.
4. Issue a WFI instruction.*[1]

The above procedure is used to execute a warm reset. Clearing the IM33_MASK bit and release from the warm reset state are controlled by hardware.

Note 1. If the WFE instruction is executed during a warm reset in this LSI, correct operation cannot be guaranteed.

2.2.3.4.4 Cortex-M33 Sleep Mode

In this LSI, the sleep mode for the Cortex-M33 system CPU is Cortex-M33 Sleep Mode. In this mode, some modules (SysTick timers, NVIC, etc.) of the core can operate.

The following procedure is the example sequence of a transition to Cortex-M33 Sleep Mode.

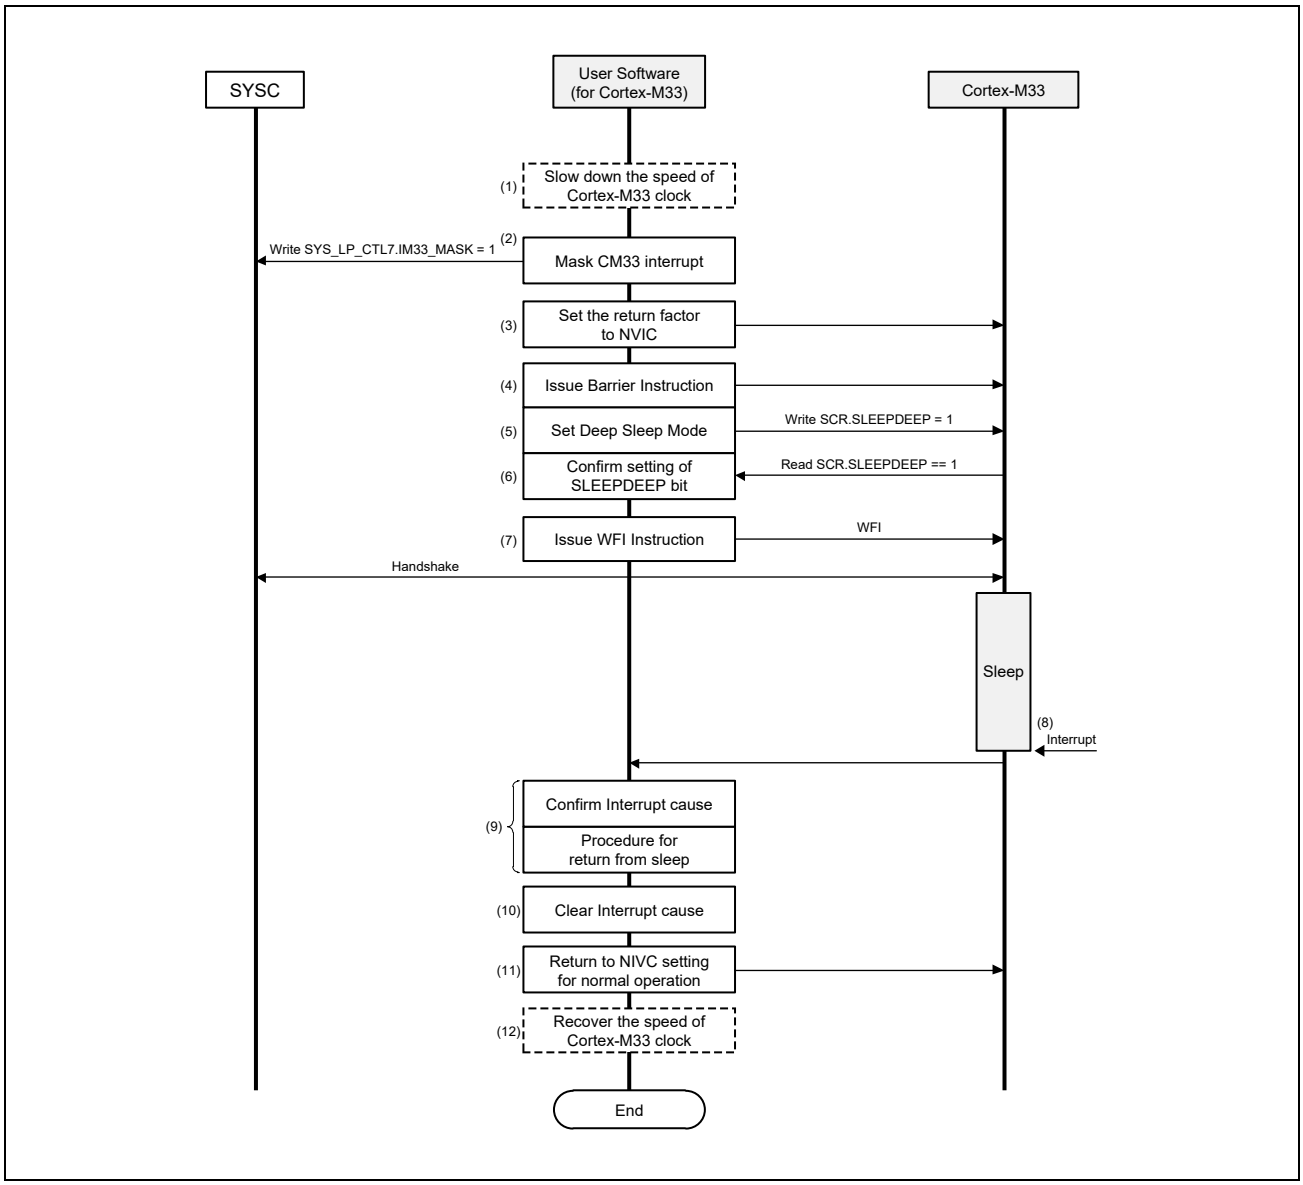

Figure 2.2-3 Cortex-M33 Sleep Mode Procedure

(1) Slow down the speed of Cortex-M33 clock.*1

(2) Set the IM33_MASK bit of the SYS_LP_CTL7 register to 1.
Interrupts to IM33 are masked and interrupts from IM33 to Cortex-M33 are not accepted.
The IM33_MASK bit is automatically cleared after completing the transition to Cortex-M33 Sleep Mode.
Refer to the SYS_LP_CTL7 register in the SYSC section.

(3) Set the return factor to NVIC. Enables only the interrupts used for return from Cortex-M33 Sleep Mode and disables the interrupts used for the normal operation.*2

(4) Issue Barrier instruction.

(5) Set the SLEEPDEEP bit of the SCR register in Cortex-M33 to 1.*3

(6) Read SCR register to confirm whether the SLEEPDEEP bit is set to 1.

(7) Issue a WFI instruction to enter Cortex-M33 Sleep Mode.

(8) Return from Cortex-M33 Sleep Mode when the event occurs or the interrupt set in NVIC occurs.

(9) Confirm the interrupt cause and perform the processing required for returning from Cortex-M33 Sleep Mode.*2

(10) And then clear the interrupt cause.*2

(11) Set the interrupt causes for the normal operation to NVIC.*2

(12) Recover the speed of Cortex-M33 clock.*1

Note 1. Switching clock (I2ϕ/I3ϕ, all Cortex-M33 clock systems) frequency is controlled by software in this LSI. Refer to the CPG_PL3B_DDIV register in the CPG section.
Note that the step of slowing down clock (I2ϕ/I3ϕ) is not mandatory.

Note 2. See Arm® Cortex®-M33 Processor Technical Reference Manual for NVIC.

Note 3. To make SLEEPDEEP bit 1 in the case of non-secure mode, SLEEPDEEPS bit is required to be 0. See Armv8-M Architecture Reference Manual for details.

2.2.3.4.5 SysTick Timers

The SysTick timers in the Cortex-M33 is described below.

- There is one Secure SysTick timer and one Non-secure SysTick timer.
- The count cycle of SysTick timers is common to Secure and Non-secure.
- A reference clock for counting by a SysTick timer is implemented in this LSI.
- Though the cycle of the reference clock is constant regardless of the clock (I2ϕ/I3ϕ) cycle, the accuracy is degraded when the clock (I2ϕ/I3ϕ) frequency is switched. Therefore, the accuracy of counting is not guaranteed when there is clock (I2ϕ/I3ϕ) frequency switchover.
- The configuration of SysTick timers can be set in the SYSC registers SYS_CM33_CFG0, and SYS_CM33_CFG1*[1]. Before the Cortex-M33 system CPU is started up, set the following values in accordance with the PLL3 SSCG being turned on or off*[2]. SSCG clock is used for SysTick timer when turned on.

  When turned on: 0101_2E1Eh
  When turned off: 0001_312Ch

The above settings are reflected in the Cortex-M33 register SYST_CALIB*[3]. The settings of the 24 lower-order bits and the 25th bit are reflected in the TENMS and SKEW bits, respectively. When the SSCG is ON, set the SKEW bit to 1. The setting of the 26th bit is reflected in the NOREF bit. Set the bit to 0 because a reference clock is implemented in this LSI.

Note 1. The register settings are reflected after release from the cold reset state.
Note 2. For details on turning on and off the SSCG, see the section on the clock pulse generator (CPG).
Note 3. For details on the SYST_CALIB register, refer to the Arm®v8-M Architecture Reference Manual.

2.2.3.4.6 Restrictions of Functions

The Cortex-M33 system CPU has some restrictions on the functions due to specification of this LSI. **Table 2.2-23** lists the restrictions on the functions.

Table 2.2-23 List of Restrictions of Functions

No.	Description
1	WFE instruction is not supported in a warm reset. In this LSI, operation of the WFE instruction is not guaranteed while a warm reset is being executed.
2	SysTick timer accuracy Though the clock(I2ϕ/I3ϕ) frequency can be switched dynamically in this LSI, the timer accuracy cannot be guaranteed when there is a dynamic frequency switchover during the measurement period.

SECTION 3 MEMORY

3.1 Memory Overview

■ On-Chip Memory (SRAM) (See 3.2)

This LSI has a 2-channel SRAM (SRAM_ACPU, SRAM_MCPU) with ECC.

Each SRAM size is 256 KB for a total of 512 KB SRAM. See **3.2 SRAM** for details on SRAM.

■ External Memory Interface (LPDDR4/DDR4 Interface) (See 3.4)

The LPDDR4/DDR4 controller (DDR) is used to connect external memory.

This unit conforms to the following standards.

- LPDDR4 (JEDEC STANDARD JESD209-4D)
- DDR4 SDRAM (JEDEC STANDARD JESD79-4D)

See **3.4 LPDDR4/DDR4 Controller (DDR)** for details.

■ TrustZone Address Space Controller (TZC) (See 3.5)

This LSI is equipped with five TrustZone address space controllers (TZCs) to ensure safe memory access.

See **3.5 TrustZone Address Space Controller (TZC)** for details.

■ External Bus State Controller (EBSC) (See 3.6)

This LSI equipped with External memory address space. The bus state controller outputs control signals for SRAM (maximum 2 Mbytes) that are connected to the external address CS0 space. The functions of this module enable this LSI to connect directly with SRAM.

See **3.6 Bus State Controller (EBSC)** for details.

SECTION 3 MEMORY

3.2 SRAM

This LSI has on-chip RAM for work area. These memory units can be used to store instructions or data. The operation and write access to the on-chip RAM can be enabled or disabled through the RAM enable bit ((VCEN in SYS_RAMn_EN register) (n = 0, 1) and RAM write enable bit (VLWEN in SYS_RAMn_EN register) (n = 0, 1).

For details on the register, refer to **4.3.3 Register Descriptions** in **4.3 System Controller (SYSC)**.

3.2.1 Features

■ Memory size

512 Kbytes (SRAM ACPU: 256 Kbytes (256KB × 1), SRAM MCPU: 256 Kbytes (256KB × 1)) with ECC

■ Ports

On-chip RAM has one read and write port and is connected to the AXI bus.

■ Method of arbitration

When the same port of the on-chip RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.

■ Number of access cycles

The number of cycles for access to read or write is one cycle of SRAM_ACPU_ACLK (P1ϕ).

The number of cycles for access to read or write is one cycle of SRAM_MCPU_ACLK (P3ϕ).

3.2.2 Error Correcting Code (ECC)

This LSI chip has two 256-Kbyte areas of on-chip RAM for use as the working area.

Each on-chip RAM incorporates an ECC function, which allows the detection and correction of 1-bit errors and the detection of 2-bit errors. When a 1-bit or 2-bit error occurs, the address where the error occurred can be stored in an ECC error address register.

The data bus width is 256 bits. This is divided into eight channels as shown in **Figure 3.2-1**, with detection handled in each 32-bit channel.

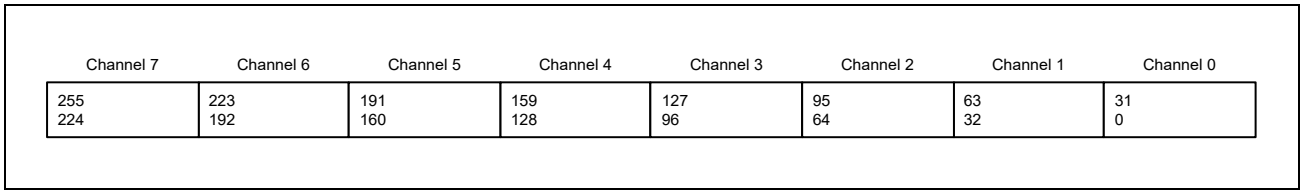

Figure 3.2-1 Division for ECC Processing

- Error detection and correction
  - Detection and correction of 1-bit errors and detection of 2-bit errors are possible.
  - An error involving 3 or more bits cannot be correctly handled and may result in erroneous detection and correction.
- Control of error detection and correction
  - Error detection and correction, and correction of 1-bit errors can respectively be enabled or disabled.
- Capture of the addresses where errors occurred
  - When a 1-bit or 2-bit error is detected, the address where the error was encountered is stored in an ECC error address register. Each channel has eight ECC error address registers.
- Interrupt request
  - An interrupt request can be generated on the detection of a 1-bit error (selectable as enabled or disabled).
  - An interrupt request can be generated on the detection of a 2-bit error (selectable as enabled or disabled).
  - An overflow interrupt is generated from each channel on detection of an error when all ECC error address registers contain values.

3.2.3 Register Configuration

Table 3.2-1 and **Table 3.2-2** respectively show the base register and base address. The addresses of the ECC registers are represented by offsets from the base address.

Table 3.2-1 Base Register

Base Register Name	On-Chip RAM	Register Abbreviation
<REG_base>	SRAM ACPU	ECCRAM0
	SRAM MCPU	ECCRAM1

Table 3.2-2 Base Register

Base Register Name	On-Chip RAM	Register Abbreviation
<ADR_base>	SRAM ACPU	H'0_1127_0000 (Overall Address Space) H'4127_0000 (Cortex-M33 Address Space Secure) H'5127_0000 (Cortex-M33 Address Space Non-Secure)
	SRAM MCPU	H'0_112A_0000 (Overall Address Space) H'412A_0000 (Cortex-M33 Address Space Secure) H'512A_0000 (Cortex-M33 Address Space Non-Secure)

Table 3.2-3 lists the ECC registers.

Do not attempt access to the on-chip RAM areas while the registers listed in **Table 3.2-3** are being set.

Table 3.2-3 List of the ECC Registers (1/2)

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	ECC control register_0	<REG_base>CTL_0	R/W	H'0000_0010	<ADR_base> + H'0000	32

	ECC error address register 7_7	<REG_base>EAD7_7	R	H'0000_0000	<ADR_base> + H'01EC	32

3.2.4 Register Descriptions

3.2.4.1 ECC Control Registers_n (<REG_base>CTL_n) (n = 0 to 7)

Each ECC control register_n is used to control the ECC function in the corresponding channel n shown in **Figure 3.2-1**.

After writing the initial value to the entire usage area of the on-chip RAM, set the given ECERVF bits to 1 to enable error detection. Be sure to write 01b to the corresponding EMCA[1:0] bits to enable writing to an ECERVF bit.

For writing the initial value to the on-chip RAM areas, refer to **3.2.6 Initializing the Detection-Usage Areas of the On-Chip RAM**.

16	ECSEDF0	0	R	
15, 14	EMCA[1:0]	00b	R/W	Enable Writing to ECERVF 01b: Enabled Others: Disabled These bits are always read as 00b.
13, 12	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
11	ECOVFF	0	R	ECC Overflow Detection Flag This bit is set to 1 and an overflow interrupt is output on detection of an error when the ECC error address registers (<REG_base>EADm_n (m = 0 to 7)) all contain data. An overflow interrupt is output even if the error is detected while the setting of this bit is already 1. This bit is cleared to 0 under any of the following conditions. 1. Power-on reset 2. Writing 1 to the corresponding ECER2C bit or ECER1C bit 3. Setting the ECC error detection enable bit to “disabled” (ECERVF = 0)
10	ECER2C	0	R/W	2-Bit Error Detection Flag Clear 0: The internal state does not change. 1: The corresponding 2-bit error detection flag ECER2F is cleared. This bit is always read as 0.
9	ECER1C	0	R/W	1-Bit Error Detection Flag Clear 0: The internal state does not change. 1: The corresponding 1-bit error detection flag ECER1F is cleared. This bit is always read as 0.
8, 7	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	ECERVF	0	R/W	ECC Error Detection Enable 0: Disables error detection. 1: Enables error detection. 1-bit error correction (EC1ECP) and interrupt control (EC2EDIC and EC1EDIC) are only possible when error detection is enabled. *Note*: To write to this bit, the corresponding EMCA[1:0] bits must be set to 01b.
5	EC1ECP	0	R/W	1-Bit Error Correction Enable 0: The error is corrected when a 1-bit error is detected. 1: The error is not corrected when a 1-bit error is detected.
4	EC2EDIC	1	R/W	2-Bit Error Detection Interrupt Control 0: An interrupt is not generated when a 2-bit error is detected. 1: An interrupt is generated when a 2-bit error is detected. The interrupt is only generated when the corresponding 2-bit error detection flag (ECER2F) changes from 0 to 1.
3	EC1EDIC	0	R/W	1-Bit Error Detection Interrupt Control 0: An interrupt is not generated when a 1-bit error is detected. 1: An interrupt is generated when a 1-bit error is detected. The interrupt is only generated when the corresponding 1-bit error detection flag (ECER1F) changes from 0 to 1.
2	ECER2F	0	R	2-Bit Error Detection Flag 0: A 2-bit error has not occurred. 1: A 2-bit error has occurred. This bit is cleared to 0 under any of the following conditions. 1. Power-on reset 2. Writing 1 to the corresponding ECER2C bit 3. Setting the ECC error detection enable bit to "disabled" (ECERVF = 0)
1	ECER1F	0	R	1-Bit Error Detection Flag 0: A 1-bit error has not occurred. 1: A 1-bit error has occurred. This bit is cleared to 0 under any of the following conditions. 1. Power-on reset 2. Writing 1 to the corresponding ECER1C bit 3. Setting the ECC error detection enable bit to "disabled" (ECERVF = 0)

Bit	Bit Name	Initial Value	R/W	Description
0	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

3.2.4.2 ECC Error Address Registers m_n (<REG_base>EADm_n) (m = 0 to 7) (n = 0 to 7)

When a 1- or 2-bit error occurs, up to eight error addresses are sequentially stored in the registers from <REG_base>EAD0_n to <REG_base>EAD7_n.

When a 2-bit error is detected while only 1-bit error addresses were stored up to <REG_base>EAD7_n, <REG_base>EAD7_n is overwritten by the address of the 2-bit error. Otherwise, it will not be overwritten. For details, refer to **3.2.7.4 ECC Error Address Register Overwrite Conditions**.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ECEAD0 [31:0]	All 0	R	These bits hold the address of the (m + 1)th error to have been detected. These bits are cleared to 0 under the following condition: clearing ECER2F or ECER1F in the <REG_base>CTL_n register.

3.2.5 Initializing the ECC Function

Initialize the ECC by following the procedure below to enable the ECC function.

1. Set the VECCEN bit in the ECCRAM setting register corresponding to the RAM area for which the ECC function is to be enabled to 1.
2. Write the initial value to the entire usage area of the RAM for which the ECC function is to be enabled.
3. Set the ECERVF bits in the ECC control registers_n to 1 to enable error detection. Then, set the respective bits to control 1-bit error correction and interrupts.

For notes on the settings of registers of this module, refer to **3.2.7.1 Notes on Setting the Registers of This Module**.

3.2.6 Initializing the Detection-Usage Areas of the On-Chip RAM

Before using the ECC function, write the initial value to the entire usage area of the on-chip RAM for which the ECC function is to be enabled. The initial value can be any value. Since the detection of ECC errors is handled in 32-bit units in each channel, the initial value should also be written in 32-bit units.

Enabling error detection without initialization may cause an ECC error due to unintended reading.

Examples of Operations that May Lead to Errors

1. When writing is to proceed in 8- or 16-bit units, reading the 32-bit value from the given address and then writing the data
2. If the locations are not initialized, an ECC error may occur when the 32-bit value is read. For details on writing in 8- or 16-bit units, refer to **3.2.7.2 8- or 16-Bit Access**.
3. When the CPU cache is enabled, if a cache miss occurs in writing, the cache being refilled by a 1-line unit
   At this time if data are not initialized, an ECC error may occur because data are read in 1-line (32-byte) units.

3.2.7 Usage Notes

3.2.7.1 Notes on Setting the Registers of This Module

Ensure that none of the bus masters proceeds with access to the on-chip RAM areas while the registers listed in **Table 3.2-3** are being set up.

3.2.7.2 8- or 16-Bit Access

The ECC function for the on-chip RAM areas handles error detection in 32-bit units. Accordingly, when access is to be in 8- or 16-bit units, the operations proceed as follows.

(1) 8- or 16-bit reading

- The 32 bits of data are read and the ECC is used to determine whether or not an error is present.
- The 8 or 16 bits of data are then returned to the bus master that issued the read request.

(2) 8- or 16-bit writing

- The 32 bits of data from the address that contains the location for writing are read and the ECC is used to determine whether or not an error is present.
- The 32 bits of data that have been read are then overwritten with the 8- or 16-bit data.
- The ECC value for the overwritten 32-bit data in (b) is added by writing it to the RAM.

3.2.7.3 Numbers of Cycles for Reading from or Writing to a RAM Area with the ECC Function Enabled

The numbers of cycles for reading from or writing to an on-chip RAM area with the ECC function enabled are as follows.

(1) Reading

The number of cycles for reading in 8- or 16-bit and 32-bit units when the ECC function is enabled is one cycle of SRAM_ACPU_ACLK or SRAM_MCPU_ACLK longer than when the ECC function is disabled.

(2) Writing

The number of cycles for writing in 8- or 16-bit units when the ECC function is enabled is two cycles of SRAM_ACPU_ACLK or SRAM_MCPU_ACLK longer than when the ECC function is disabled. The number of cycles for writing in 32-bit units when the ECC function is enabled is the same as when the ECC function is disabled.

3.2.7.4 ECC Error Address Register Overwrite Conditions

If a new ECC error occurs with the ECC error address stored up to <REG_base> EAD7_n, <REG_base> EAD7_n may or may not be overwritten. The conditions to be overwritten are shown below.

Table 3.2-4 ECC Error Address Register Overwrite Conditions

Error Address Storage Status Up to <REG_base> EAD7_n	New ECC Error	<REG_base>EAD7_n Overwrite	Overflow Interrupt
Only 1-bit error	1-bit error	Not overwritten	Occur
Only 1-bit error	2-bit error	Overwritten	Occur
Only 2-bit error	1-bit error	Not overwritten	Occur
Only 2-bit error	2-bit error	Not overwritten	Occur
1-bit error and 2-bit error	1-bit error	Not overwritten	Occur
1-bit error and 2-bit error	2-bit error	Not overwritten	Occur

SECTION 3 MEMORY

3.4 LPDDR4/DDR4 Controller (DDR)

This manual is a simplified version. For more information, refer to the Hardware Manual Additional Document.

3.4.1 Overview

This section describes the features of the DDR unit of this LSI.

This unit is an external bus controller for LPDDR4 and DDR4. This unit supports LPDDR4-2133 and DDR4-2133. The interface bus width is 16 bits. It supports the in-line ECC feature.

It is composed of the DDR controller block (MC) and the DDR PHY block (PHY).

For the setup of this block, refer to the Linux software package of this LSI, which contains the DDR setup codes.

3.4.1.1 Features

This unit supports the following specifications.

- LPDDR4 (JEDEC STANDARD JESD209-4E)
- DDR4 (JEDEC STANDARD JESD79-4D)

Table 3.4-1 lists the features of this unit.

Table 3.4-1 LPDDR4/DDR4 Controller Features

Feature	Description
DRAM I/F	• LPDDR4: 2133 Mbps (1066.5 MHz), 16 bits (Single channel), 1 rank, 16 Gb per Die (Total 2 GB) • DDR4: 2133 Mbps (1066.5 MHz), 16 bits (x8 per Die, DDP*1), 1 rank, 16 Gb per Die (Total 4 GB) • DDR4: 2133 Mbps (1066.5 MHz), 16 bits (x16 per Die, SDP*2), 1 rank, 16 Gb per Die (Total 2 GB) • Width: 16 bits • Rank: 1 • Density: Up to 4 GB
MC	• Fully pipelined command, read and write data interfaces to the controller. • Advanced bank look-ahead features for high memory throughput. • A programmable register interface to control memory parameters and protocols including auto pre-charge. • Full initialization of memory on controller reset. • Supports the Weighted Round-Robin arbitration schema for arbitrating request from the ports. • ECC function for single bit and double bit error reporting, single bit error correction, and programmable removal of ECC storage. • Built-in self-test (BIST) for external DRAM memories. • Supports exclusive access each port up to 2 transactions.
PHY	For more information, refer to the Hardware Manual Additional Document.
Low power	• Multiple low power states (power-down, self-refresh, I/O retention) • Automatic or software interface

Note 1. DDP: Dual Die Package

Note 2. SDP: Single Die Package

3.4.1.3 External Pins

Table 3.4-2 lists the external pins of this unit.

Table 3.4-2 External Pins (1/2)

Pin Name	Input/ Output	Description	Default Function	
			LPDDR4	DDR4
LP4DDR4_ZN	—	Calibration external reference resistor	—	—
LP4DDR4_RST#	O	DRAM reset	RESET_n	RESET_n
LP4DDR4_CKE0	IO	DRAM Clock Enable	CKE0_A	CKE
LP4DDR4_CS0_CS0#	IO	DRAM Chip Select	CS0_A	CS_n
LP4DDR4_CK_T_BG0	IO	DRAM Command/Address	CK_t_A	BG0
LP4DDR4_CK_C_BG1	IO	DRAM Command/Address	CK_c_A	BG1
DDR4_ACT#	IO	DRAM Command/Address	—	ACT_n
DDR4_A9	IO	DRAM Command/Address	—	A9
LP4DDR4_CA0_A12_BC#	IO	DRAM Command/Address	CA0_A	A12/BC_n
LP4DDR4_CA1_A11	IO	DRAM Command/Address	CA1_A	A11
LP4DDR4_CA2_A7	IO	DRAM Command/Address	CA2_A	A7
LP4DDR4_CA3_A8	IO	DRAM Command/Address	CA3_A	A8
LP4DDR4_CA4_A6	IO	DRAM Command/Address	CA4_A	A6
LP4DDR4_CA5_A5	IO	DRAM Command/Address	CA5_A	A5
DDR4_A4	IO	DRAM Command/Address	—	A4
DDR4_A3	IO	DRAM Command/Address	—	A3
DDR4_CK_T	IO	DRAM Clock (positive)	—	CK_t
DDR4_CK_C	IO	DRAM Clock (negative)	—	CK_c
DDR4_A2	IO	DRAM Command/Address	—	A2
DDR4_A1	IO	DRAM Command/Address	—	A1
DDR4_BA1	IO	DRAM Command/Address	—	BA1
DDR4_A13	IO	DRAM Command/Address	—	A13
DDR4_BA0	IO	DRAM Command/Address	—	BA0
DDR4_A10_AP	IO	DRAM Command/Address	—	A10/AP
DDR4_A0	IO	DRAM Command/Address	—	A0
DDR4_A15_CAS#	IO	DRAM Command/Address	—	CAS_n/A15
DDR4_A14_WE#	IO	DRAM Command/Address	—	WE_n/A14
DDR4_A16_RAS#	IO	DRAM Command/Address	—	RAS_n/A16
DDR4_ODT	IO	DRAM On Die Termination	—	ODT
LP4DDR4_DQ0	IO	DRAM Data	DQ0_A	DQ0
LP4DDR4_DQ1	IO	DRAM Data	DQ1_A	DQ1
LP4DDR4_DQ2	IO	DRAM Data	DQ2_A	DQ2
LP4DDR4_DQ3	IO	DRAM Data	DQ3_A	DQ3
LP4DDR4_DQ4	IO	DRAM Data	DQ4_A	DQ4
LP4DDR4_DQ5	IO	DRAM Data	DQ5_A	DQ5
LP4DDR4_DQ6	IO	DRAM Data	DQ6_A	DQ6
LP4DDR4_DQ7	IO	DRAM Data	DQ7_A	DQ7
LP4DDR4_DMI0_DM0#	IO	DRAM Data Mask and Data Bus Inversion	DMI0_A	DM0_n/DBI0_n
LP4DDR4_DQS0_T	IO	DRAM Data Strobe (positive)	DQS0_t_A	DQS0_t
LP4DDR4_DQS0_C	IO	DRAM Data Strobe (negative)	DQS0_c_A	DQS0_c

Table 3.4-2 External Pins (2/2)

Pin Name	Input/ Output	Description	Default Function	
			LPDDR4	DDR4
LP4DDR4_DQ8	IO	DRAM Data	DQ8_A	DQ8
LP4DDR4_DQ9	IO	DRAM Data	DQ9_A	DQ9
LP4DDR4_DQ10	IO	DRAM Data	DQ10_A	DQ10
LP4DDR4_DQ11	IO	DRAM Data	DQ11_A	DQ11
LP4DDR4_DQ12	IO	DRAM Data	DQ12_A	DQ12
LP4DDR4_DQ13	IO	DRAM Data	DQ13_A	DQ13
LP4DDR4_DQ14	IO	DRAM Data	DQ14_A	DQ14
LP4DDR4_DQ15	IO	DRAM Data	DQ15_A	DQ15
LP4DDR4_DMI1_DM1#	IO	DRAM Data Mask and Data Bus Inversion	DMI1_A	DM1_n/DBI1_n
LP4DDR4_DQS1_T	IO	DRAM Data Strobe (positive)	DQS1_t_A	DQS1_t
LP4DDR4_DQS1_C	IO	DRAM Data Strobe (negative)	DQS1_c_A	DQS1_c

3.4.2 Usage Notes

This unit has the following restrictions.

Table 3.4-3 Restrictions

Item	Restriction
Period of DRAM inaccessibility	It has the period of DRAM inaccessibility to execute the periodic training. It is 1,280 core clock cycles every 134,217,728 core clock cycles. So, it depends only on the Bit Rate (the frequency of the core clock). It is below: 2133 Mbps: 2.4 µs every 251 ms
Density when ECC function is enabled	When the ECC function is enabled, 1/8 is used for the ECC code, so the usable density is 7/8.
LPDDR4	Not support the followings; Refresh Management (RFM), Scaling Level (SCL).
DDR4	Not support the followings; Burst Chop mode, Interleaving, Gear-down Mode, Fine Granularity Refresh Mode except Normal mode (Fixed 1x), CAL Mode, CRC, CA Parity, Connectivity Test Mode, MBIST PPR. ODT is only allowed in DLL on mode.
Exclusive access	Each port can monitor the exclusivity of up to 2 transactions. If the exclusive monitor buffer is full and a new exclusive access command is received, the oldest exclusive access entry will be overwritten. As a result, performance may decrease.

SECTION 3 MEMORY

3.5 TrustZone Address Space Controller (TZC)

3.5.1 Overview

This LSI has five TrustZone Address Space Controller (TZC) to realize memory access in a safe area. It performs security checks on transactions to memory or peripherals. Transactions must meet security requirements to access memory or peripherals. This is an IP (“CoreLink™ TrustZone Address Space Controller TZC-400”) provided by Arm, for details on the functions of TZC-400, see the relevant Technical Reference Manual.

3.5.1.1 Features

The TZC works between TrustZone system ACE-Lite masters and ACE-Lite slaves to filter bus access from master to slave. It performs filtering based on the security requirements specified in the address space.

Each TZC is installed on the interface of the following modules of this LSI.

- Internal RAM for ACPU (SRAM: 256KB × 1)
- Internal RAM for MCPU (SRAM: 256 KB × 1)
- xSPI Controller
- DDR4/LPDDR4 SDRAM Memory Controller (TZC_DDR_ACPU)
- DDR4/LPDDR4 SDRAM Memory Controller (TZC_DDR_VIDEO)

For details on the internal bus, please refer to **1.7 LSI Internal Bus**.

The TZC provides the following key features:

- The ability to define up to eight address regions in the area map.
- A default base region to cover all remaining portions of the address map.
- Software programmable security access permissions for each address region through an APB interface. This includes the default base region, Region 0.
- Filter units only allow data transfer between an ACE-Lite master and an ACE-Lite slave if the security status of the ACE-Lite transaction and its identity match the security settings of the memory region it addresses.
- Common region configuration register settings shared between multiple filter units.
- Normal path for accesses with a much higher outstanding access support.
- Identity-based filtering of Non-secure accesses.
- Reporting and interrupt signaling that is configurable from software to manage failed permission checks. You can program the TZC to assert Interrupt (TZC_SRAM_ACPU_INT, TZC_SRAM_MCPU_INT, TZC_XSPI_INT, TZC_DDR_ACPU_INT, TZC_DDR_VIDEO_INT) when an access fails its security check.
- Gate keeper to allow or block accesses to each filter unit.
- Support for 256 outstanding transactions on the normal paths.

3.5.1.2 Block Diagram

Figure 3.5-1 shows a block diagram.

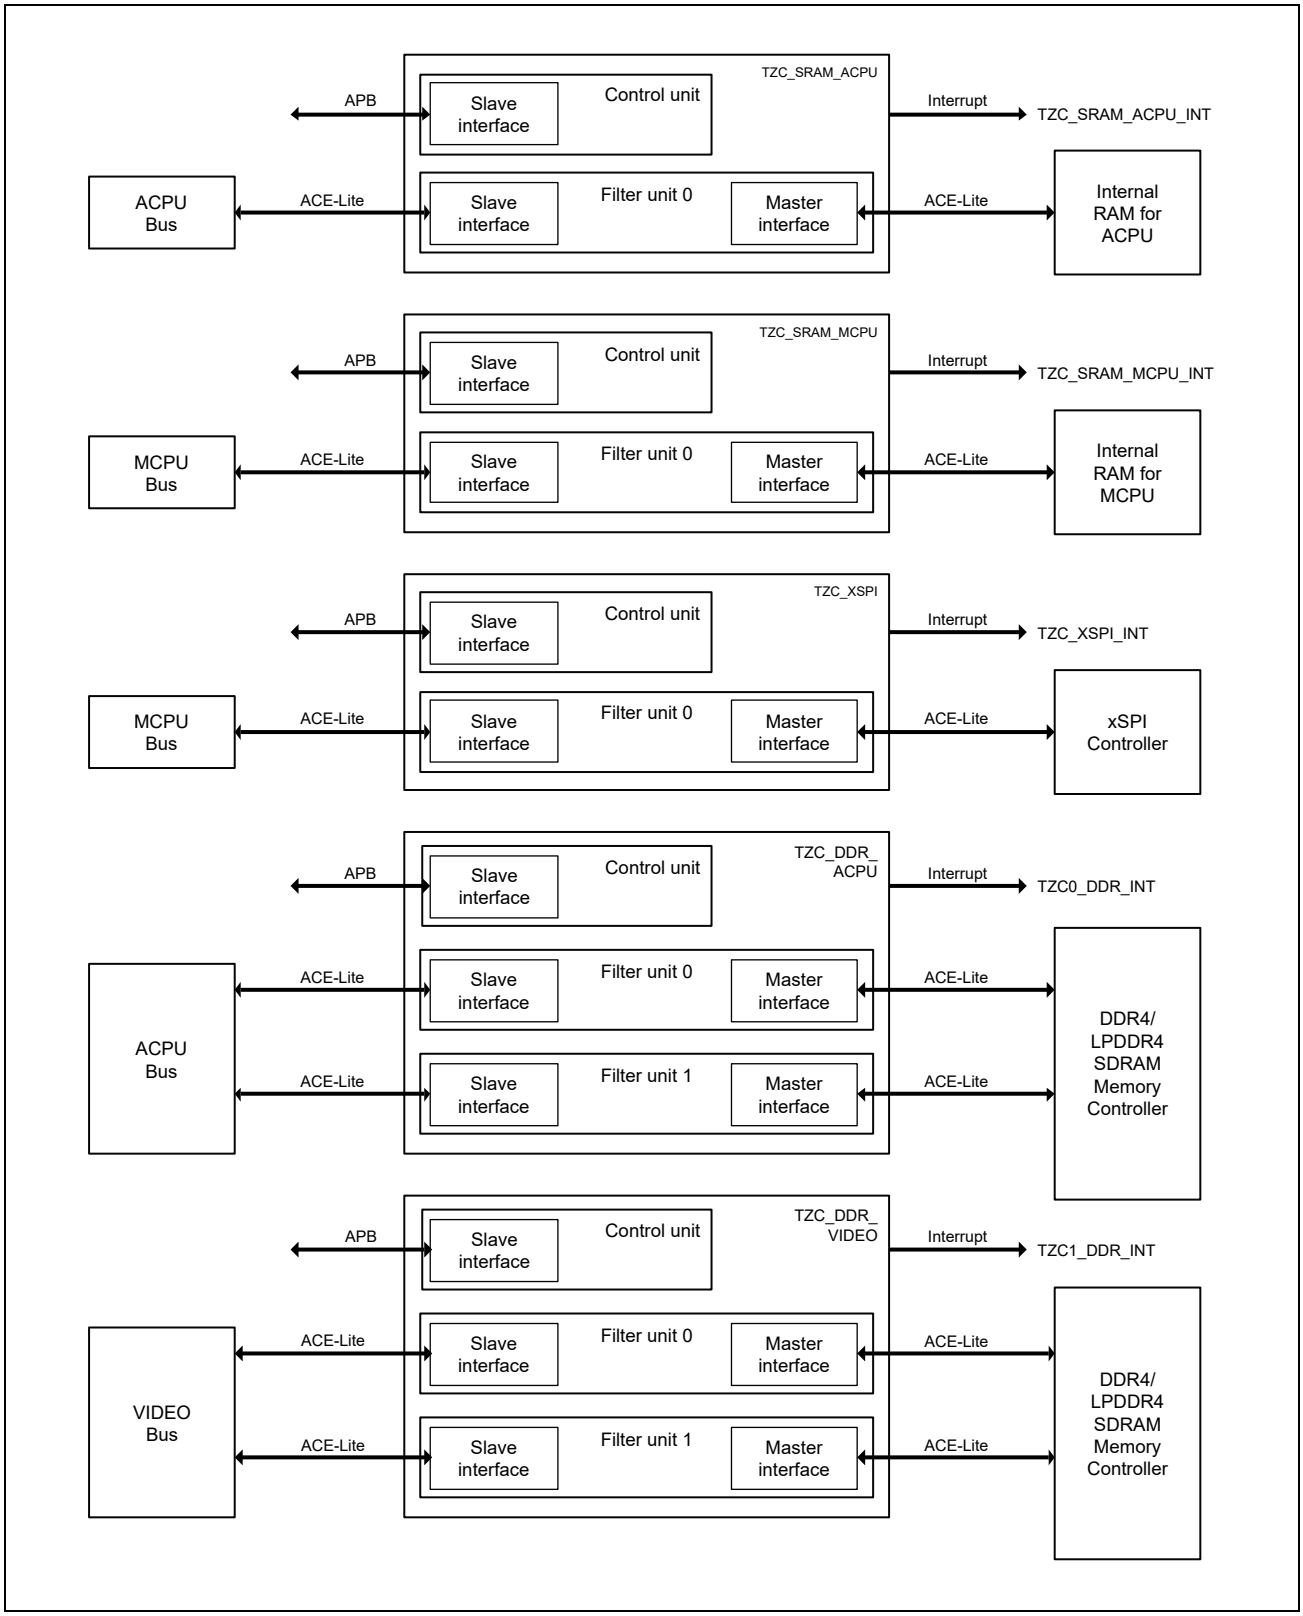

Figure 3.5-1 Block Diagram

Filter units perform security checks. Each filter unit has an ACE-Lite slave interface and an ACE-Lite master interface. All filter units operate from one set of shared region configuration registers. This ensures consistency across all filter units.

The number of filter units of TZC installed on each interface is as follows.

- Internal RAM for ACPU (256 KB): 1 filter unit 0
- Internal RAM for MCPU (256 KB): 1 filter unit 0
- xSPI Controller: 1 filter unit 0
- DDR4/LPDDR4 SDRAM Memory Controller TZC_DDR_ACPU: 2 filter units 0, 1
  - filter unit 0: Access from SDHI, GbEther, PCIe, USB2
  - filter unit 1: Access from ACPU bus other than SDHI, GbEther, PCIe, USB2
- DDR4/LPDDR4 SDRAM Memory Controller TZC_DDR_VIDEO: 2 filter units 0, 1
  - filter unit 0: Access from DSI, LCDC, GE3D
  - filter unit 1: Access from CRU, ISU, H264

3.5.1.3 External Pins

In TZC, there are no external pins.

3.5.2 Register Configuration

The base address of the TZC associated with each module is as follows:

- TZC_SRAM_ACPU: Internal RAM for ACPU (256KB)

  H'0_1120_0000 (Cortex-A55 Address Space)
  H'4120_0000 (Cortex-M33 Address Space Secure)
  H'5120_0000 (Cortex-M33 Address Space Non-Secure)

- TZC_SRAM_MCPU: Internal RAM for MCPU (256KB)

  H'0_1123_0000 (Cortex-A55 Address Space)
  H'4123_0000 (Cortex-M33 Address Space Secure)
  H'5123_0000 (Cortex-M33 Address Space Non-Secure)

- TZC_XSPI: xSPI Controller

  H'0_1125_0000 (Cortex-A55 Address Space)
  H'4125_0000 (Cortex-M33 Address Space Secure)
  H'5125_0000 (Cortex-M33 Address Space Non-Secure)

- TZC_DDR_ACPU: DDR4/LPDDR4 SDRAM Memory Controller

  H'0_1126_0000 (Cortex-A55 Address Space)
  H'4126_0000 (Cortex-M33 Address Space Secure)
  H'5126_0000 (Cortex-M33 Address Space Non-Secure)

- TZC_DDR_VIDEO: DDR4/LPDDR4 SDRAM Memory Controller

  H'0_112E_0000 (Cortex-A55 Address Space)
  H'412E_0000 (Cortex-M33 Address Space Secure)
  H'512E_0000 (Cortex-M33 Address Space Non-Secure)

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

3.5.3 Register Descriptions

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

TZC has registers to specify the address area where access is controlled. Please refer to Overall Address Space (**Table 1.8-1 Detailed Address Space**) for the addresses specified in these registers.

3.5.4 Operation

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

3.5.5 Usage Note

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

SECTION 3 MEMORY

3.6 External Bus State Controller

The external bus state controller outputs control signals for SRAM and external device that are connected to the external address space. The functions of this module enable this LSI to connect directly with SRAM and external devices.

3.6.1 Features

■ External address space

- A maximum of 2 Mbytes for areas CS0.
- Can specify the normal space interface, SRAM interface with byte selection.
- Can select the data bus width (8 or 16 bits).
- Controls insertion of wait cycles.
- Controls insertion of wait cycles for each read access and write access.
- Can set independent idle cycles during the continuous access for five cases: read-write, read-read, the first cycle is a write access.

■ Normal space interface

- Supports the interface that can directly connect to the SRAM.

■ SRAM interface with byte selection

- Can connect directly to a SRAM with byte selection.

■ Detection of long wait state for access by the signal on the external WAIT# pin

- A timeout detection condition is specifiable.
- Once timeout is detected, the external WAIT function is disabled and a timeout detection interrupt request is issued.

3.6.2 Block Diagram

Figure 3.6-1 shows a block diagram of this module.

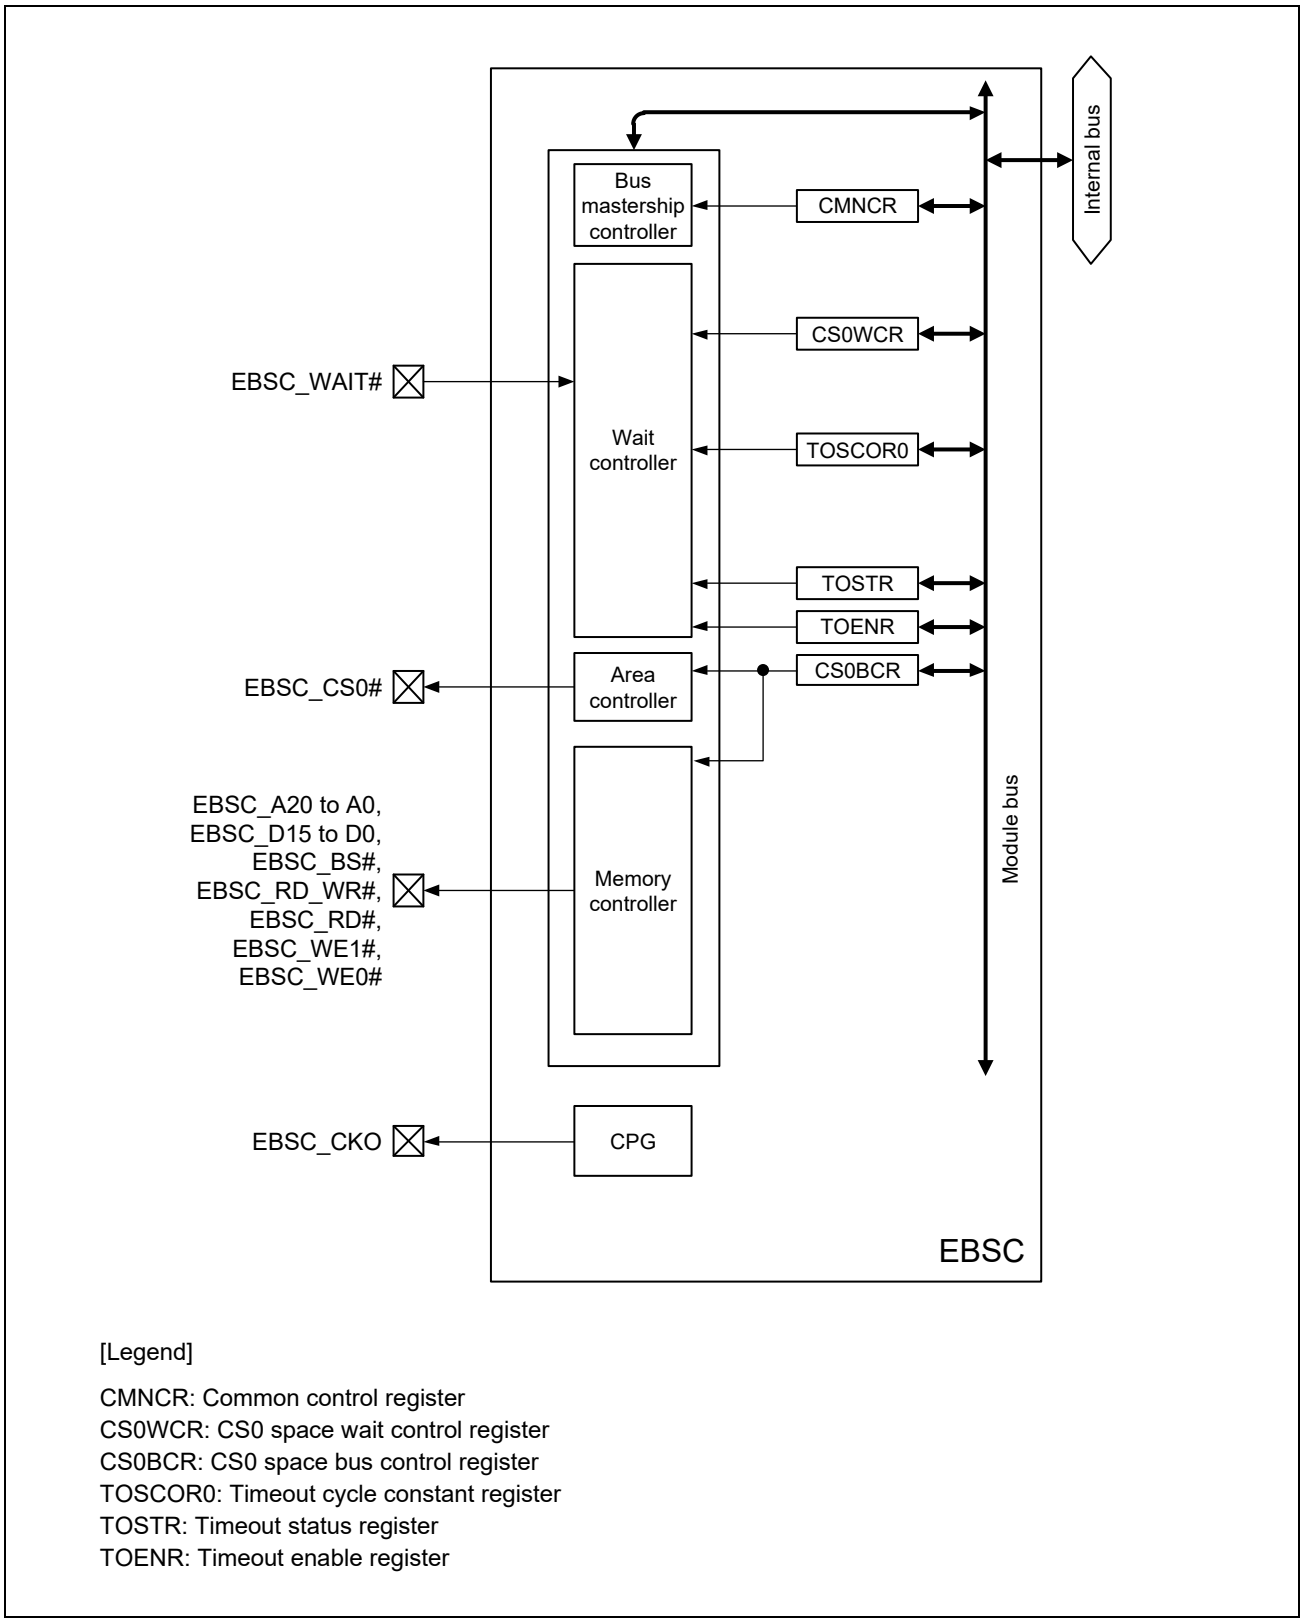

Figure 3.6-1 Block Diagram of External Bus State Controller

3.6.3 Input/Output Pins

Table 3.6-1 shows the pin configuration.

Table 3.6-1 Pin Configuration

Pin Name	Signal Name in This Section	Input/Output	Functional Description
EBSC_RD#	RD#	Output	Read pulse signal (read data output enable signal)
EBSC_RD_WR#	RD/WR#	Output	Read/write Connects to WE# pins when SRAM with byte selection is connected.
EBSC_WAIT#	WAIT#	Input	External wait input
EBSC_CKO	CKIO	Output	Clock for external memory
EBSC_BS#	BS#	Output	Bus cycle start
EBSC_WE0#	WE0#	Output	Indicates that D7 to D0 are being written to. Connected to the byte select signal when a SRAM with byte selection is connected. Functions as the select signals for D7 to D0 when SRAM is connected.
EBSC_WE1#	WE1#	Output	Indicates that D15 to D8 are being written to. Connected to the byte select signal when a SRAM with byte selection is connected. Functions as the select signals for D15 to D8 when SRAM is connected.
EBSC_CS0#	CS0#	Output	Chip select
EBSC_A20 to EBSC_ A0	A20 to A0	Output	Address bus
EBSC_D15 to EBSC_D0	D15 to D0	I/O	Data bus

3.6.4 Address Map

In the architecture, this LSI has a 32-bit address space, which is divided into external memory spaces (SPI multi I/O bus space, on-chip large-capacity RAM, on-chip data retention RAM, on-chip peripheral modules, and reserved areas) according to the upper bits of the address.

The kind of memory to be connected and the data bus width are specified in each partial space. The address map for the external address space is listed below. Accessible data width are only 8 bits (D7 to D0) and 16 bits (D15 to D0), 32 bit access is not available. Address space is 2 Mbytes (A20 to A0). The address A0 is not available in 16bits access mode.

Table 3.6-2 Address Map

Internal Address	Space	Memory to be Connected
H'0000_0000 to H'001F_FFFF	CS0	Normal space, SRAM of 2 Mbytes with byte selection

Note: Do not access addresses which are not described in these sections. Otherwise, the correct operation cannot be guaranteed.

3.6.5 Register Configuration

Table 3.6-3 shows base address of this module.

Table 3.6-3 Base Register

Base Register Name	Unit Name	Base Address
<EBSC_base>	EBSC (Reg)	H'0_108E_0000 (Overall Address Space) H'408E_0000 (Cortex-M33 Address Space Secure) H'508E_0000 (Cortex-M33 Address Space Non-Secure)
	EBSC (Memory)	H'0_3800_0000 (Overall Address Space) H'A800_0000 (Cortex-M33 Address Space Secure) H'B800_0000 (Cortex-M33 Address Space Non-Secure)

Table 3.6-4 shows the register configuration of this module.

Do not access the areas until settings of the connected memory interface are completed.

Table 3.6-4 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Common control register	CMNCR	R/W	H'00001018	H'1F000000	32
CS0 space bus control register	CS0BCR	R/W	H'36DB0C00	H'1F000004	32
CS0 space wait control register	CS0WCR	R/W	H'00000500	H'1F000028	32
Timeout cycle constant register 0	TOSCOR0	R/W	H'00000000	H'1F000060	32
Timeout status register	TOSTR	R/W	H'00000000	H'1F000080	32
Timeout enable register	TOENR	R/W	H'00000000	H'1F000084	32

3.6.6 Register Descriptions

3.6.6.1 Common Control Register (CMNCR)

CMNCR is a 32-bit register that controls the common items for each area.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	1	0	0	0	0	0	0	0	1	1	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0000_0406	R, R/W	Reserved These bits are always read as 406h. The write value should always be 406h.
1	HIZMEM	0	R/W	High-Z Memory Control Specifies the pin state in software standby mode or deep standby mode for A20 to A0, BS#, CS0#, RD/WR#, WEn#, and RD#. 0: High impedance in software standby mode or deep standby mode. 1: Driven in software standby mode or deep standby mode
0	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.

3.6.6.2 CS0 Space Bus Control Register (CS0BCR)

CS0BCR is a 32-bit readable/writable register that specifies the memory connected to each space, the number of idle cycles between bus cycles, and the bus width.

Do not access external memory for the corresponding area until CS0BCR initial setting and pin setting are completed. Idle cycles may be inserted even when they are not specified. For details, see **3.6.7.6 Wait between Access Cycle**.

R/W	R	R/W	R/W	R/W	R	R/W	R/W	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	IWW[2:0]	011	R/W	Idle Cycles between Write-Read Cycles and Write-Write Cycles These bits specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target access cycles are the write-read cycle and write-write cycle. 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted
27 to 25	—	011	R/W	Reserved This bit is always read as initial value. The write value should always be initial value.
24 to 22	IWRWS[2:0]	011	R/W	Idle Cycles for Read-Write in the Same Space Specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target cycle is a read-write cycle of which continuous access cycles are for the same space. 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted
21 to 19	—	011	R/W	Reserved This bit is always read as initial value. The write value should always be initial value..

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	IWRRS[2:0]	011	R/W	Idle Cycles for Read-Read in the Same Space Specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target cycle is a read-read cycle of which continuous access cycles are for the same space. 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	TYPE[2:0]	000	R/W	Specify the type of memory connected to a space. 000: Normal space 011: SRAM with byte selection For details for memory type in each area, see **Table 3.6-2**. *Note*: The other setting is prohibited.
11	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
10, 9	BSZ[1:0]	10	R/W	Data Bus Width Specification Specify the data bus widths of spaces. 00: Reserved (setting prohibited) 01: 8-bit size 10: 16-bit size 11: Reserved (setting is prohibited)
8 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

3.6.6.3 CS0 Space Wait Control Register (CS0WCR)

CS0WCR specifies various wait cycles for memory access. Specify CS0WCR before accessing the target area. Specify CS0BCR first, then specify CS0WCR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

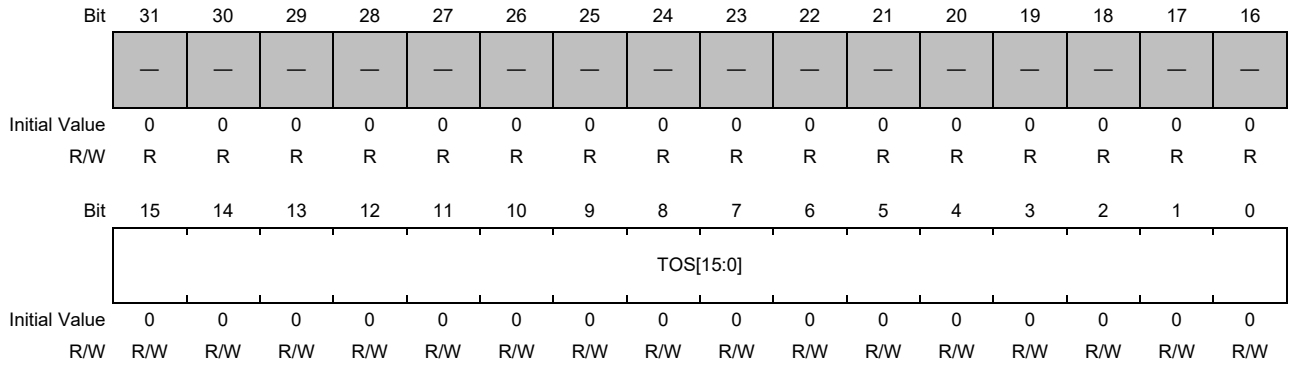
Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	—	0	R/W	Reserved Set this bit to 0 when the interfaces for normal space or for SRAM with byte selection are used.
20	BAS	0	R/W	SRAM with Byte Selection Byte Access Select Specifies the WEn# and RD/WR# signal timing when the SRAM interface with byte selection is used. 0: Asserts the WEn# signal at the read/write timing and asserts the RD/WR# signal during the write access cycle. 1: Asserts the WEn# signal during the read/write access cycle and asserts the RD/WR# signal at the write timing.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12, 11	SW[1:0]	00	R/W	Number of Delay Cycles from Address, CS0# Assertion to RD#, WEn# Assertion Specify the number of delay cycles from address and CS0# assertion to RD# and WEn# assertion. 00: 0.5 cycles 01: 1.5 cycles 10: 2.5 cycles 11: 3.5 cycles

Bit	Bit Name	Initial Value	R/W	Description
10 to 7	WR[3:0]	1010	R/W	Number of Access Wait Cycles Specify the number of cycles that are necessary for read/write access. 0000: No cycle 0001: 1 cycle 0010: 2 cycles 0011: 3 cycles 0100: 4 cycles 0101: 5 cycles 0110: 6 cycles 0111: 8 cycles 1000: 10 cycles 1001: 12 cycles 1010: 14 cycles 1011: 18 cycles 1100: 24 cycles 1101: Reserved (setting prohibited) 1110: Reserved (setting prohibited) 1111: Reserved (setting prohibited)
6	WM	0	R/W	External Wait Mask Specification Specifies whether or not the external wait input is valid. The specification by this bit is valid even when the number of access wait cycle is 0. 0: External wait input is valid 1: External wait input is ignored
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	HW[1:0]	00	R/W	Delay Cycles from RD# , WEn# Negation to Address, CS0# Negation Specify the number of delay cycles from RD# and WEn# negation to address and CS0# negation. 00: 0.5 cycles 01: 1.5 cycles 10: 2.5 cycles 11: 3.5 cycles



3.6.6.4 Timeout Cycle Constant Register (TOSCOR0)

TOSCOR0 is a 16-bit register the value of which is effective when the WM bit in the CS0 space wait control register (CS0WCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1.

When the number of cycles of waiting due to the signal on the eternal wait input pin matches the setting of TOSCOR0, external wait input is disabled to end the cycle of access, the timeout status flag for the corresponding space in the timeout status register (TOSTR) is set, and a timeout detection interrupt request is generated.

The timeout detection interrupt request is retained until the corresponding bit in TOENR is set to 0 or 0 is written to the timeout status flag for the corresponding space.

Note that timeout detection is enabled even while the timeout status flag for the corresponding space in TOSTR is 1, and external wait input is disabled in response to a further timeout.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0.
15 to 0	TOS[15:0]	All 0	R/W	16-Bit Register H'0000: 65536 cycles H'0001: 1 cycle ⋮ H'FFFF: 65535 cycles

3.6.6.5 Timeout Staus Register (TOSTR)

TOSTOR is an 8-bit register that holds the timeout status flags for the CS0 space.

When the WM bit in the CS0 space wait control register (CS0WCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1 and the number of cycles of waiting in response to the signal on the eternal wait input matches the setting of TOSCOR0, the timeout status flag for the corresponding space is set and a timeout detection interrupt request is generated. The only writable value for the timeout status flags is 0, which clears the flag. Writing 1 to a flag is ignored.

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0.
5 to 1	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CS0TOSTF	0	R/W	CS0 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of the CS0 space timeout cycle constant register (TOSCOR0). This bit is set or cleared in the following conditions. 0: Clearing condition When 0 is written in CS0TOSTF. 1: Setting condition When the WM bit in the CS0 space wait control register (CS0WCR) is 0 and the CS0TOEN bit in the timeout enable register (TOENR) is 1, the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of TOSCOR0.

3.6.6.6 Timeout Enable Register (TOENR)

TOENR is an 8-bit register that specifies enabling or disabling the detection of timeout for waiting in the CS0 space.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5 to 1	—	0	R/	Reserved These bits are always read as 0. The write value should always be 0.
0	CS0TOEN	0	R/W	CS0 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS0 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.

3.6.7 Operation

3.6.7.1 Access Size and Data Alignment

This LSI supports little endian, in which the least significant byte (LSB) is that in the direction of the 0th address.

Data bus width can be selected from 8 bits and 16 bits for the normal memory and SRAM with byte selection. The data bus width is fixed to either 8 or 16 bits, or made selectable as 8 bits or 16 bits by one of the address lines.

Data alignment is performed in accordance with the data bus width selected for the device. This also means that four read operations are required to read 32-bit data from a byte-width device. In this LSI, data alignment and conversion of data length is performed automatically between the respective interfaces.

Table 3.6-5 and **Table 3.6-6** show the relationship between device data width and access unit.

Table 3.6-5 16-Bit External Device Access and Data Alignment in Little Endian

Operation		Data Bus		Strobe Signals	
		D15 to D8	D7 to D0	WE1#, DQMU	WE0#, DQML

	4th access at address 3	—	Data 31 to 24	—	Assert

3.6.7.2 Normal Space Interface

For access to a normal space, this LSI uses strobe signal output in consideration of the fact that mainly static RAM will be directly connected. When using SRAM with a byte-selection pin, see **3.6.7.5 SRAM Interface with Byte Selection**. **Figure 3.6-2** shows the basic timings of normal space access. A no-wait normal access is completed in two cycles. The BS# signal is asserted for one cycle to indicate the start of a bus cycle.

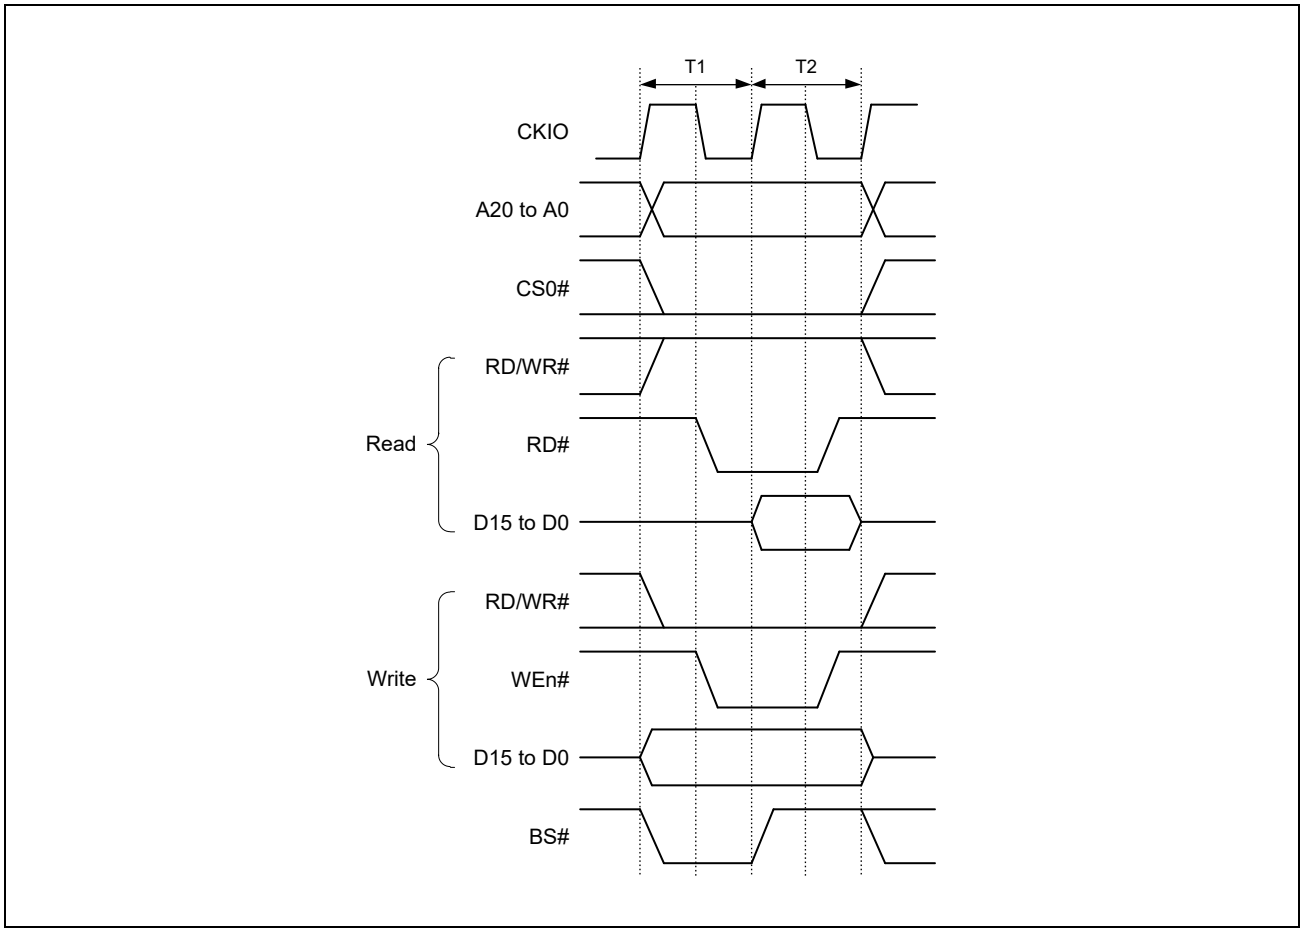

Figure 3.6-2 Normal Space Basic Access Timing (Access Wait 0)

There is no access size specification when reading. The correct access start address is output in the least significant bit of the address, but since there is no access size specification, 16 bits are always read in case of a 16-bit device. When writing, only the WEn# signal for the byte to be written is asserted.

It is necessary to output the data that has been read using RD# when a buffer is established in the data bus. The RD#/WR# signal is in a read state (high output) when no access has been carried out. Therefore, care must be taken when controlling the external data buffer with this signal, to avoid output collision.

Figure 3.6-3 and **Figure 3.6-4** show the basic timings in continuous access to normal space. If the WM bit in CS0WCR is cleared to 0, a T_{NOP} cycle is inserted after the CS0 space access to evaluate the external wait (**Figure 3.6-3**). If the WM bit in CS0WCR is set to 1, external waits are ignored and no T_{NOP} cycle is inserted (**Figure 3.6-4**).

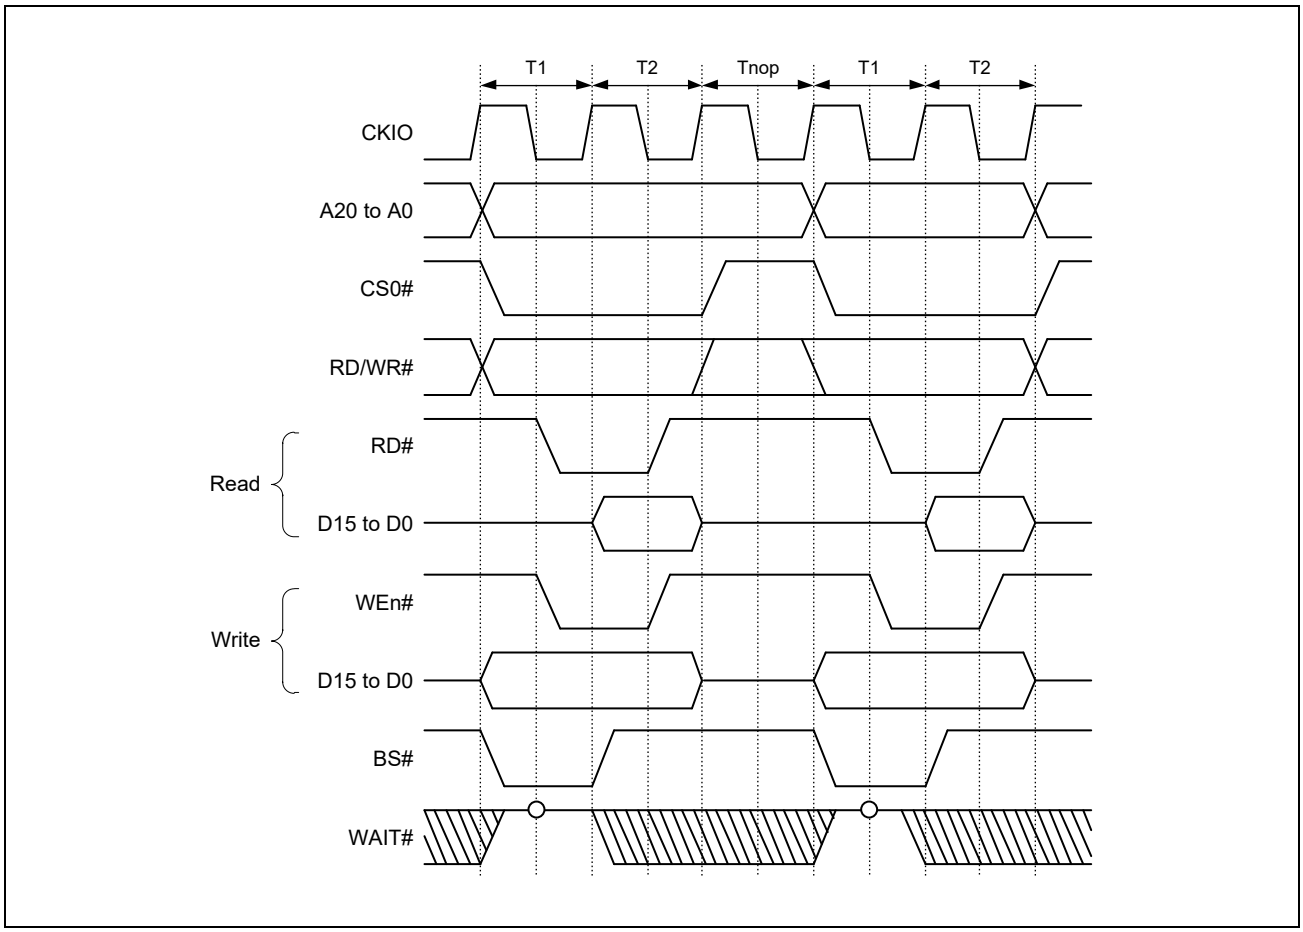

Figure 3.6-3 Continuous Access to Normal Space (1) Bus Width = 16 Bits, 32-Bit Access, CS0WCR.WM Bit = 0 (Access Wait = 0, Cycle Wait = 0)

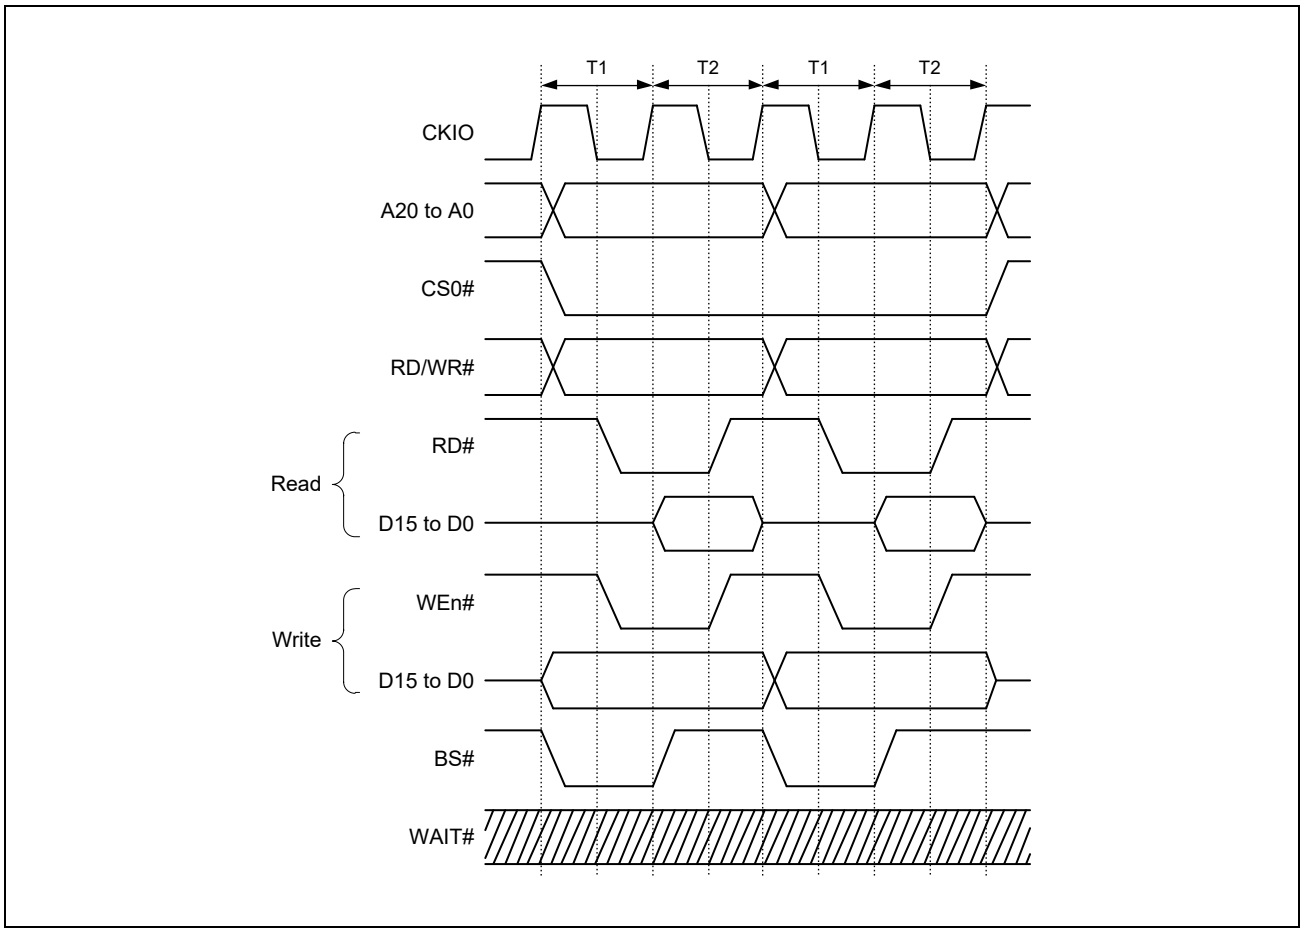

Figure 3.6-4 Continuous Access to Normal Space (2) Bus Width = 16 Bits, 32-Bit Access, CS0WCR.WM Bit = 1 (Access Wait = 0, Cycle Wait = 0)

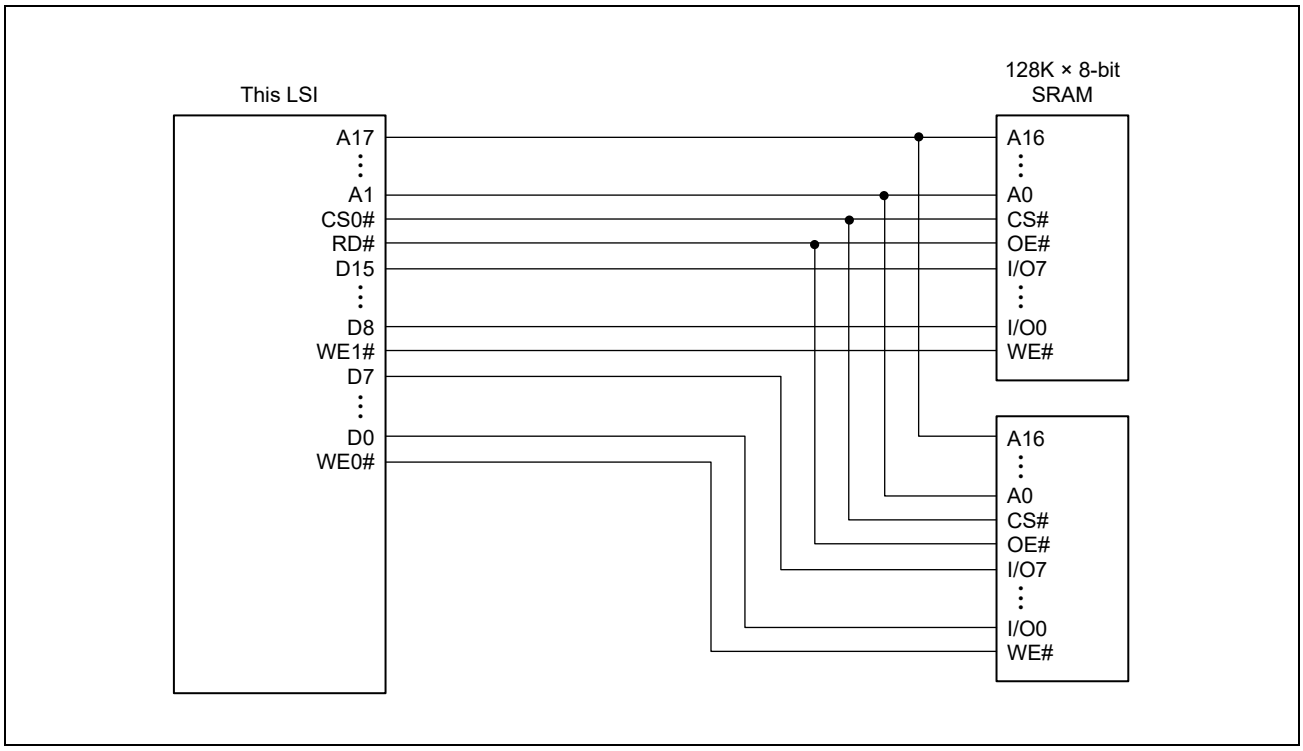

Figure 3.6-5 Example of 16-Bit Data-Width SRAM Connection

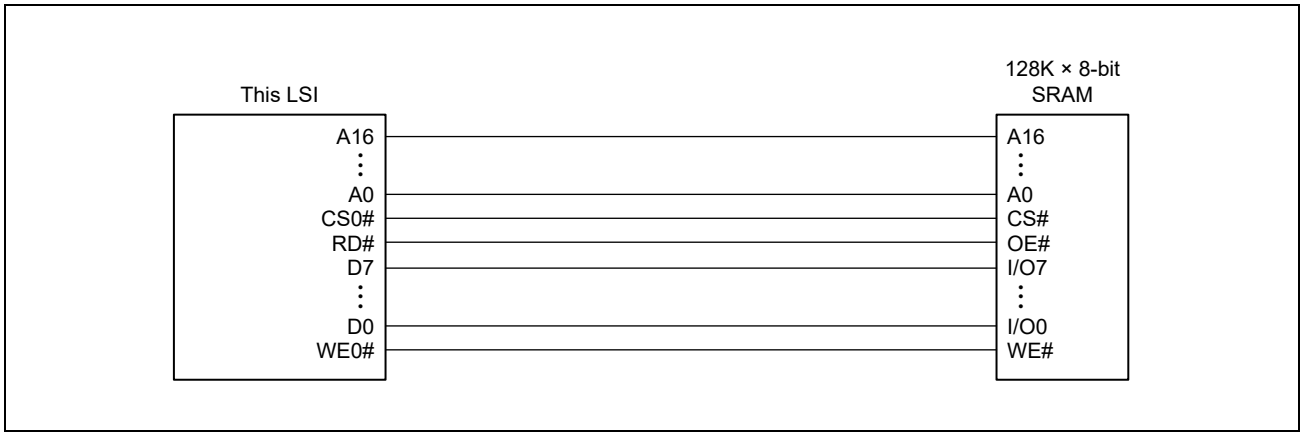

Figure 3.6-6 Example of 8-Bit Data-Width SRAM Connection

3.6.7.3 Access Wait Control

Wait cycle insertion on a normal space access can be controlled by the settings of bits WR3 to WR0 in CS0WCR. Areas 0 have common access wait for read cycle and write cycle. The specified number of Tw cycles are inserted as wait cycles in a normal space access shown in **Figure 3.6-7**.

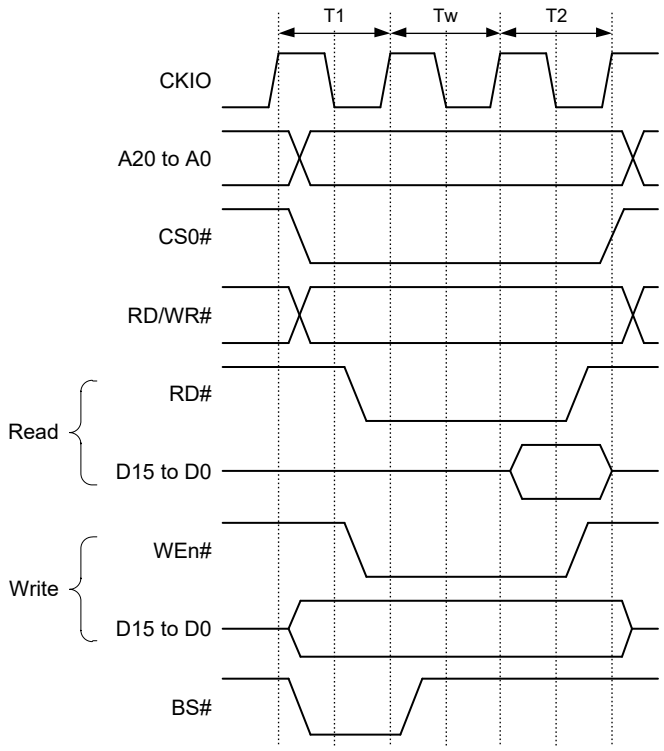

Figure 3.6-7 Wait Timing for Normal Space Access (Software Wait Only)

When the WM bit in CS0WCR is cleared to 0, the external wait input WAIT# signal is also sampled. WAIT# pin sampling is shown in **Figure 3.6-8**. A 2-cycle wait is specified as a software wait. The WAIT# signal is sampled on the falling edge of CKIO at the transition from the T1 or Tw cycle to the T2 cycle.

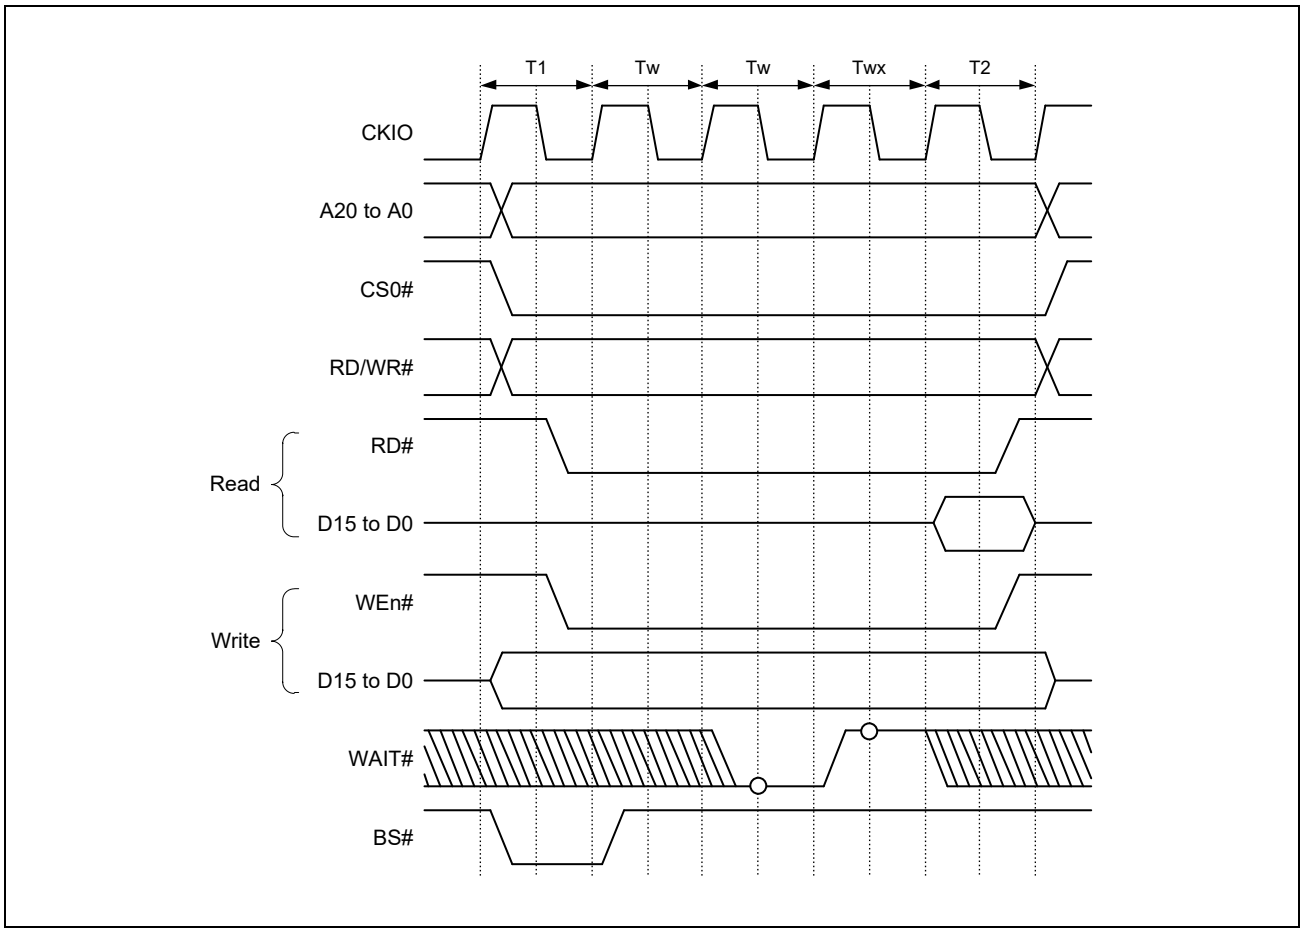

Figure 3.6-8 Wait Cycle Timing for Normal Space Access (Wait Cycle Insertion Using WAIT# Signal)

3.6.7.4 CS0# Assert Period Expansion

The number of cycles from CS0# assertion to RD#, WEn# assertion can be specified by setting bits SW1 and SW0 in CS0WCR. The number of cycles from RD#, WEn# negation to CS0# negation can be specified by setting bits HW1 and HW0. Therefore, a flexible interface to an external device can be obtained. **Figure 3.6-9**. shows an example. A Th cycle and a Tf cycle are added before and after an ordinary cycle, respectively. In these cycles, RD# and WEn# are not asserted, while other signals are asserted. The data output is prolonged to the Tf cycle, and this prolongation is useful for devices with slow writing operations.

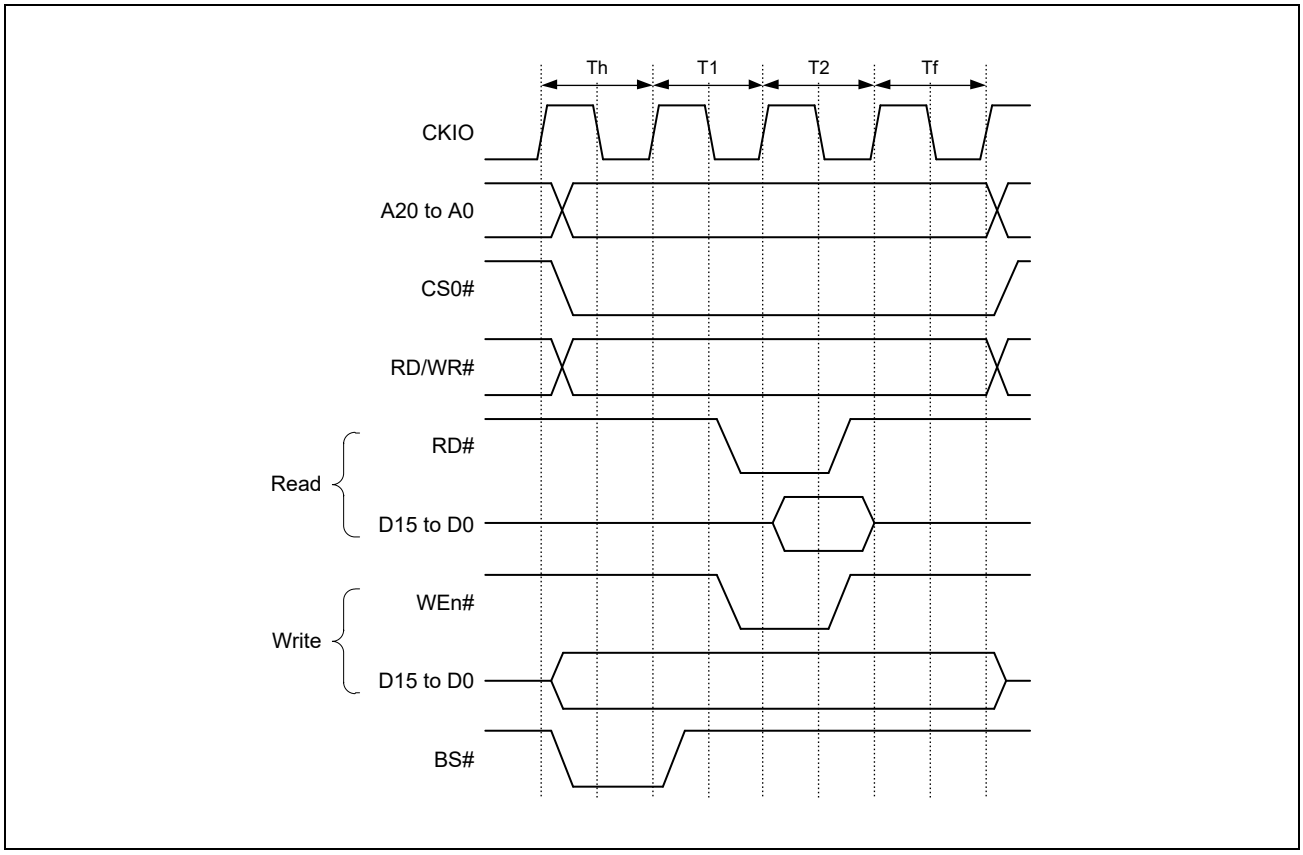

Figure 3.6-9 CS0# Assert Period Expansion

3.6.7.5 SRAM Interface with Byte Selection

The SRAM interface with byte selection is a memory interface that outputs the byte selection signal (WEn#) in both read and write bus cycles. This interface has 16-bit data pins and accesses SRAMs having upper and lower byte selection pins, such as UB# and LB#.

When the BAS bit in CS0WCR is cleared to 0 (initial value), the write access timing of the SRAM interface with byte selection is the same as that for the normal space interface. While in read access of a byte-selection SRAM interface, the byte-selection signal is output from the WEn# pin, which is different from that for the normal space interface. The basic access timing is shown in **Figure 3.6-10**. In write access, data is written to the memory according to the timing of the byte- selection pin (WEn#). For details, please refer to the Data Sheet for the corresponding memory.

If the BAS bit in CS0WCR is set to 1, the WEn# pin and RD/WR# pin timings change. **Figure 3.6-11** shows the basic access timing. In write access, data is written to the memory according to the timing of the write enable pin (RD/WR#). The data hold timing from RD/WR# negation to data write must be acquired by setting the HW1 and HW0 bits in CS0WCR. **Figure 3.6-12** shows the access timing when a software wait is specified.

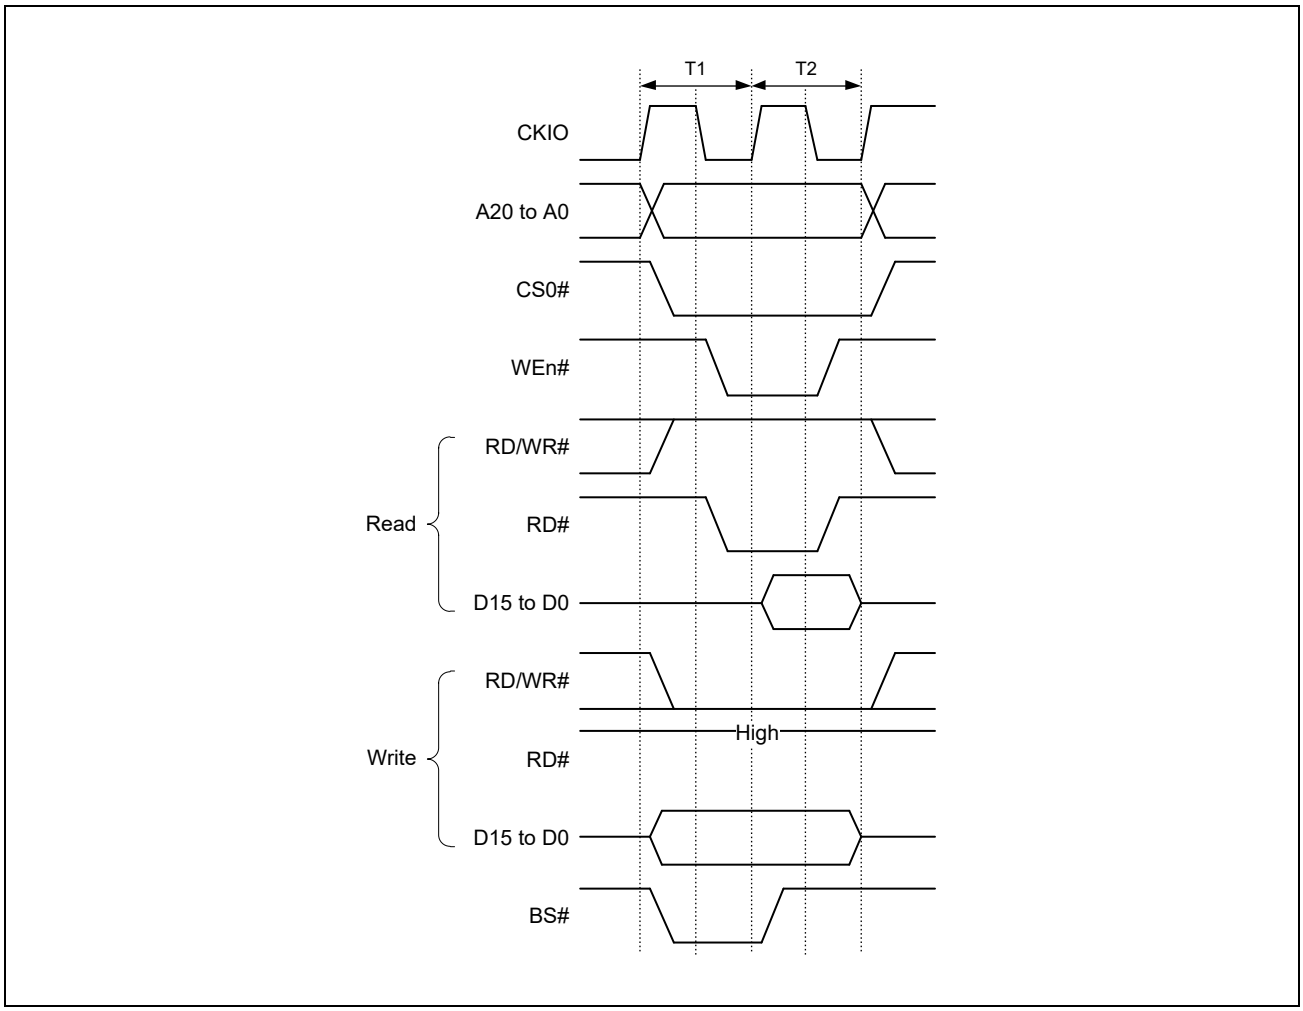

Figure 3.6-10 Basic Access Timing for SRAM with Byte Selection (BAS = 0)

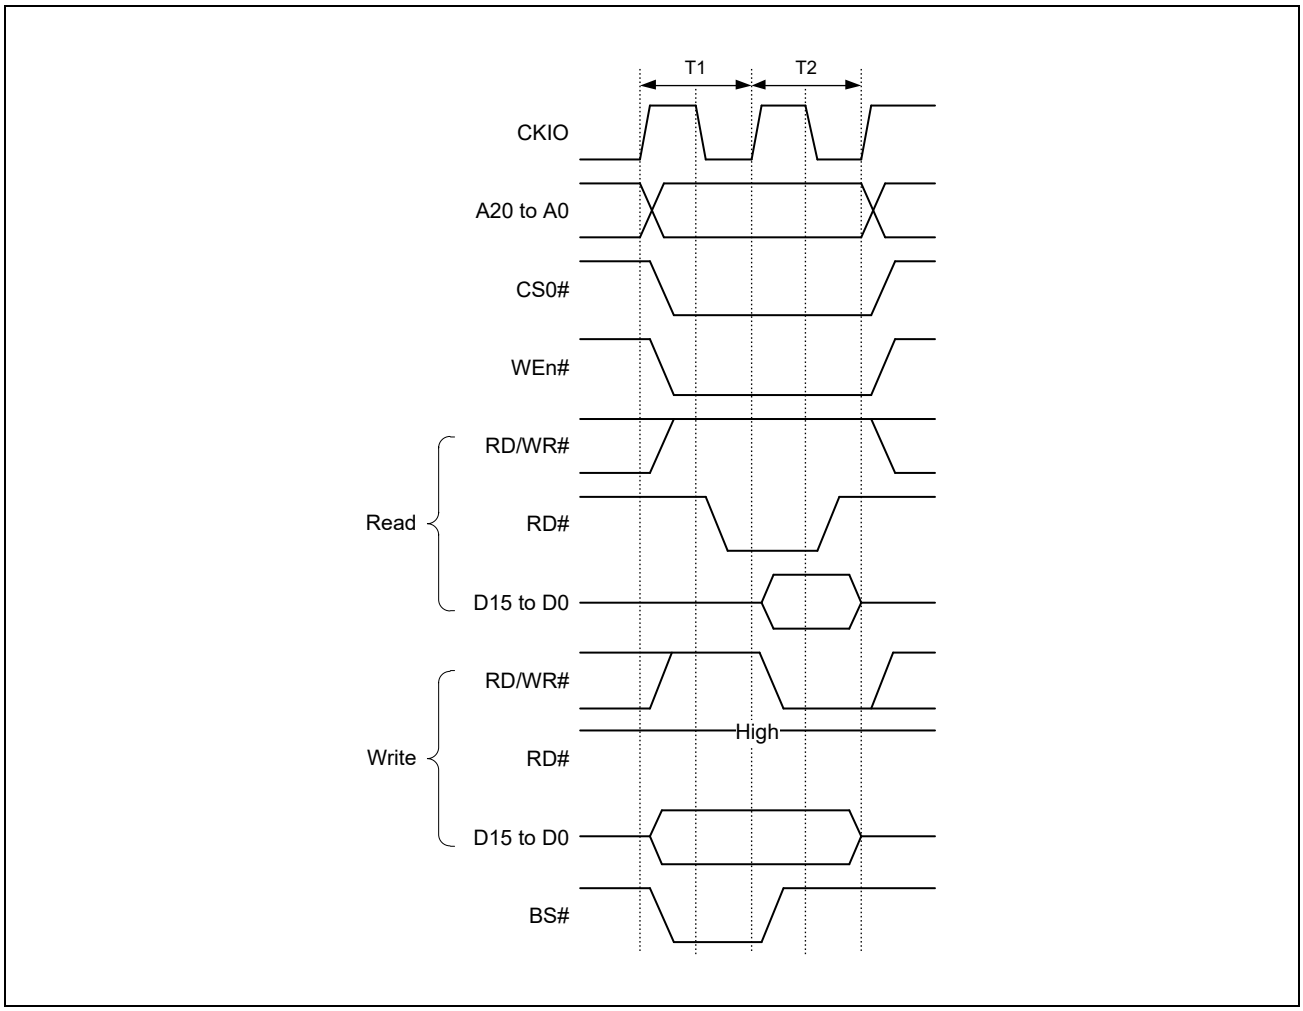

Figure 3.6-11 Basic Access Timing for SRAM with Byte Selection (BAS = 1)

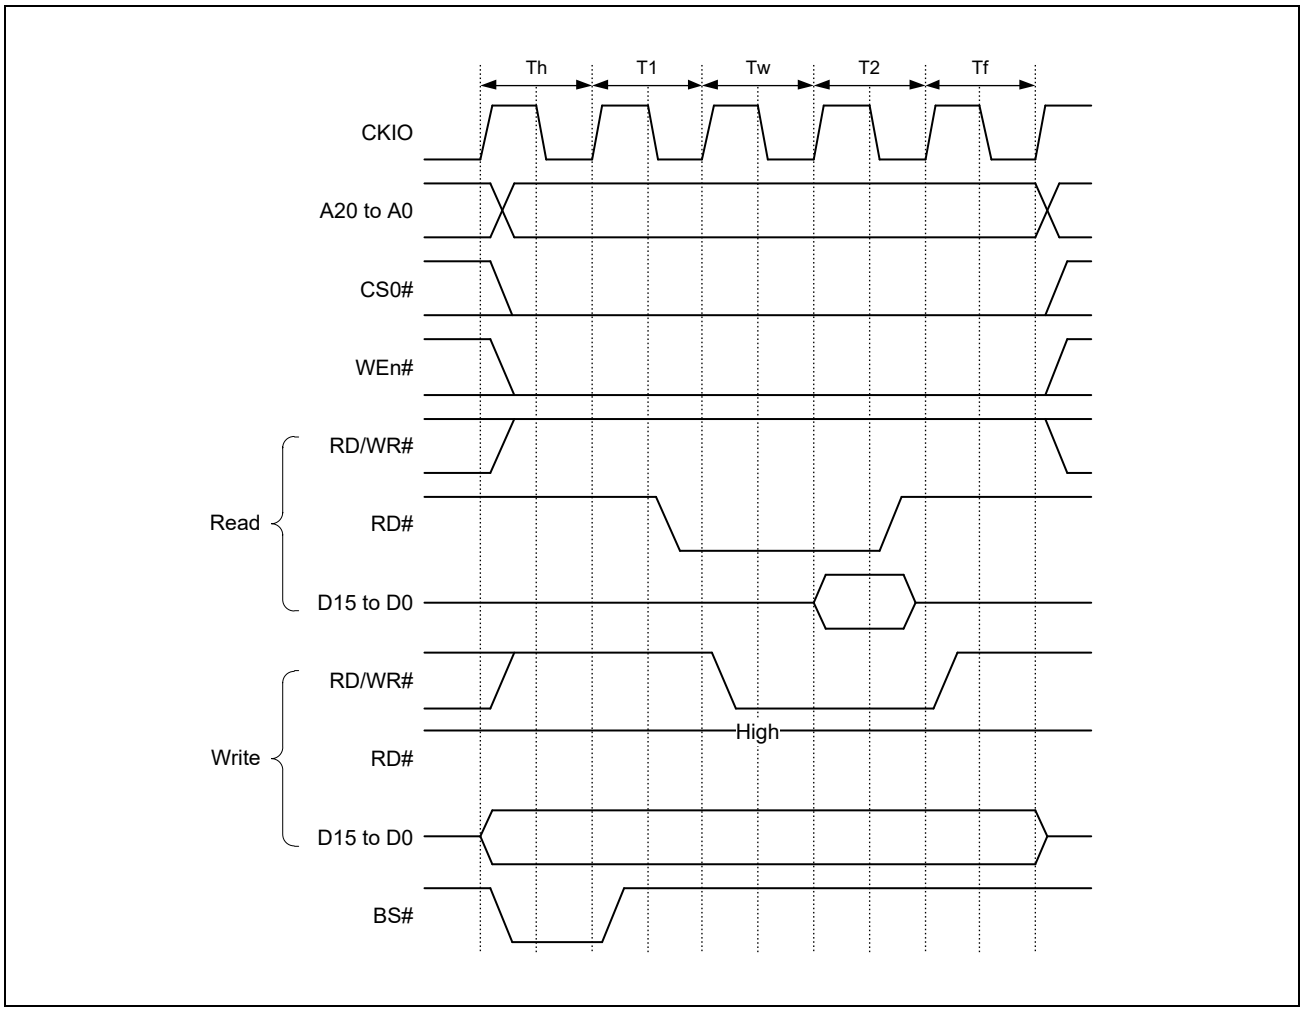

Figure 3.6-12 Wait Timing for SRAM with Byte Selection (BAS = 1) (SW[1:0] = 01, WR[3:0] = 0001, HW[1:0] = 01)

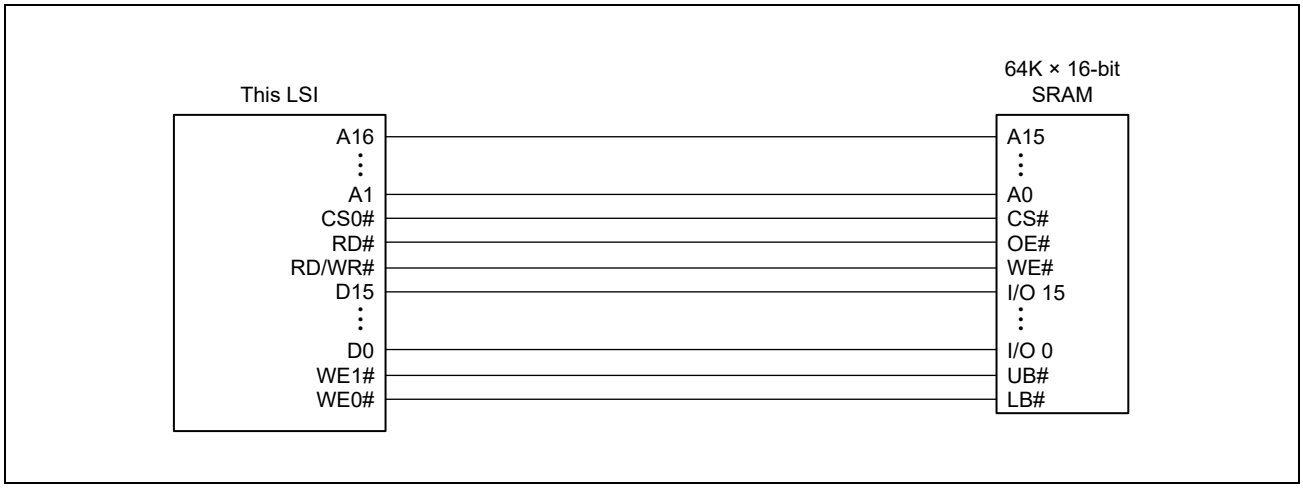

Figure 3.6-13 Example of Connection with 16-Bit Data-Width SRAM with Byte Selection

3.6.7.6 Wait between Access Cycle

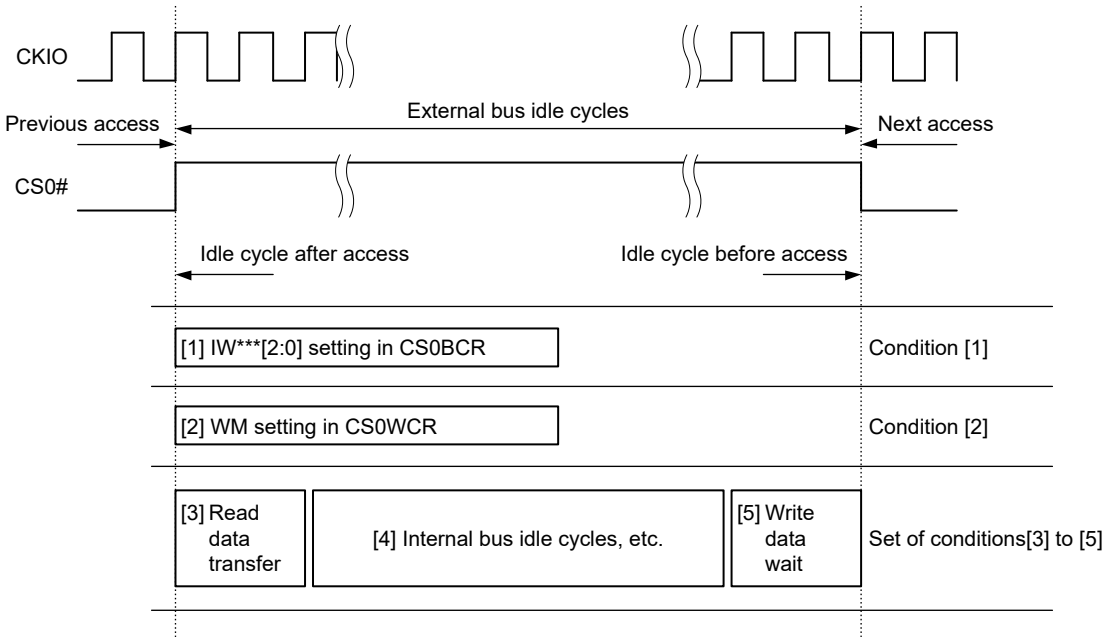
As the operating frequency of LSIs becomes higher, the off-operation of the data buffer often collides with the next data access when the read operation from devices with slow access speed is completed. As a result of these collisions, the reliability of the device is low and malfunctions may occur. A function that avoids data collisions by inserting idle (wait) cycles between continuous access cycles has been newly added.

The number of wait cycles between access cycles can be set by the WM bit in C0WCR, bits IWW2 to IWW0, IWRWS2 to IWRWS0, and IWRRS2 to IWRRS0 in CS0BCR.

The conditions for setting the idle cycles between access cycles are shown below.

1. Continuous access cycles are write-read or write-write
2. Continuous access cycles are read-write for the same space
3. Continuous access cycles are read-read for the same space

For the specification of the number of idle cycles between access cycles described above, refer to the description of each register.



Besides the idle cycles between access cycles specified by the registers, idle cycles must be inserted to interface with the internal bus or to obtain the minimum pulse width for a multiplexed pin (WEn#). The following gives detailed information about the idle cycles and describes how to estimate the number of idle cycles.

The number of idle cycles on the external bus from CS0# negation to CS0# assertion is described below. There are five conditions that determine the number of idle cycles on the external bus as shown in **Table 3.6-7**. The effects of these conditions are shown in **Figure 3.6-14**.

Table 3.6-7 Conditions for Determining Number of Idle Cycles

No.	Condition	Description	Range	Note
[1]	IW***[2:0] in CS0BCR	These bits specify the number of idle cycles for access. The number of idle cycles can be specified independently for each combination of the previous and next cycles. This condition is effective only for access cycles other than single address transfer and generates idle cycles after the access is completed.	0 to 12	Do not set 0 for the number of idle cycles between memory types which are not allowed to be accessed successively.
[2]	WM in CS0WCR	This bit enables or disables external WAIT# pin input for the memory types. When this bit is cleared to 0 (external WAIT# enabled), one idle cycle is inserted to check the external WAIT# pin input after the access is completed. When this bit is set to 1 (disabled), no idle cycle is generated.	0 or 1	
[3]	Read data transfer cycle	One idle cycle is inserted after a read access is completed. This idle cycle is not generated for the first or middle cycles in divided access cycles. This is neither generated when the HW[1:0] bits in CS0WCR are not B'00.	0 or 1	
[4]	Internal bus idle cycles, etc.	External bus access requests from the CPU or the direct memory access controller and their results are passed through the internal bus. The external bus enters idle state during internal bus idle cycles or while a bus other than the external bus is being accessed. This condition is not effective for divided access cycles, which are generated by the external bus state controller when the access size is larger than the external data bus width.	0 or larger	The number of internal bus idle cycles may not become 0 depending on the CPU: internal bus: CKIO
[5]	Write data wait cycles	During write access, a write cycle is executed on the external bus only after the write data becomes ready. This write data wait period generates idle cycles before the write cycle. Note that when the previous cycle is a write cycle and the internal bus idle cycles are shorter than the previous write cycle, write data can be prepared in parallel with the previous write cycle and therefore, no idle cycle is generated (write buffer effect).	0 or 1	For write → write or write → read access cycles, successive access cycles without idle cycles may be available due to the write buffer effect described in the left column. If successive access cycles without idle cycles are not allowed, specify the minimum number of idle cycles between access cycles through CS0BCR.

In the above conditions, a total of three conditions, that is, condition [1], condition [2], a set of conditions [3] to [5] (these are generated successively, and therebefore the sum of them should be taken as one set of idle cycles) are generated at the same time. The maximum number of idle cycles among these four conditions become the number of idle cycles on the external bus. To ensure the minimum idle cycles, be sure to make register settings for condition [1].

Note: A total of three conditions (condition [1], conditions [2], a set of condition [3] to [5]) generate at the same time. Accordingly, the maximum number of cycles among these three conditions become the number of idle cycles.

Figure 3.6-14 Idle Cycle Conditions

3.6.8 Usage Notes

3.6.8.1 Caution on Write Buffer

Since the external bus state controller incorporates a one-stage write buffer, it can execute an access via the internal bus before the previous external bus cycle is completed in a write cycle. If the on-chip module is read or written after the external low- speed memory is written, the on-chip module can be accessed before the completion of the external low-speed memory write cycle.

In read cycles, the CPU is placed in the wait state until read operation has been completed. To continue the process after the data write to the device has been completed, perform a dummy read to the same address to check for completion of the write before the next process to be executed.

The write buffer of the external bus state controller functions in the same way for an access by a bus master other than the CPU such as the direct memory access controller. Accordingly, to perform DMA transfers, the next read cycle is initiated before the previous write cycle is completed. Note, however, that if both the DMA source and destination addresses exist in external memory space, the next read cycle will not be initiated until the previous write cycle is completed.

Changing the registers in this module while the write buffer is operating may disrupt correct write access. Therefore, do not change the registers in this module immediately after a write access. If this change becomes necessary, do it after executing a dummy read of the write data.

3.6.8.2 Usage Note on Changing CKIO Clock Selections

The CKIO clock can be selected and switched between 12.5 MHz and 133.3 MHz, but it cannot be switched while CS0 external address space is being accessed. (Setting of CKIO select register (CPG_BSC_DSEL) is prohibited while external address space is being accessed.)

It is also prohibited to access the CS0 external address space from a bus master other than the CPU such as the direct memory access controller while switching the CKIO clock.

SECTION 4 SYSTEM

4.1 System Overview

This section describes the units that control the overall system of this LSI.

■ Pin Function Controller (PFC) (See 4.2)

Controls the external pins (GPIO control, switching of multi-function pins, setting of drive strength, etc.) of this LSI.

■ System Controller (SYS) (See 4.3)

Controls each unit (TZC control, address extension, setting of each unit, etc.).

■ Clock Pulse Generator (CPG) (See 4.4)

Performs clock/reset control, boot control, and low power control for each unit.

■ Low Power Management (LPM) (See 4.5)

This LSI has several functions to achieve low power consumption. By combining with power supply isolation, further power consumption can be reduced.

■ Interrupt Controller (See 4.6)

The interrupt controller decides the priority of interrupt sources and controls interrupt requests to the CPU.

In this section, GIC and MHU function details will also be described.

■ DMA Controller (DMAC) (See 4.7)

The LSI contains a total of 32 channels of DMAC. See the ICU description for DMAC allocation.

■ Renesas Secure IP (RSIP-E50B) (See 4.8)

Controls security of this LSI.

■ Debug Interface (See 4.9)

This LSI equips Arm® CoreSight™. The CST unit controls the debugger connection.

■ Battery Backup Function (See 4.10)

Backup power supplied by a battery can keep the realtime clock (RTC) operating and retain the important data while the VCC power is turned off. The tamper detection function can be used to erase the backed-up data in cases where an intrusion to the system has been detected.

■ **Real Time Clock (See 4.11)**

The RTC has two types of counting modes: calendar count mode and binary count mode.

SECTION 4 SYSTEM

4.2 Pin Function Controller (PFC)

4.2.1 Overview

4.2.1.1 General Purpose Input Output Port (GPIO)

General-purpose input/output ports (GPIOs) provide general-purpose ports that can be configured as inputs or outputs.

When set as an output, it can be written to an internal register to control the state driven by the output pin. When set as an input, you can read the state of the input by reading the state of the internal registers. You can also generate interrupts using the GPIO input pin.

- GPIO Output Control (Port Register [P_m])
- GPIO Input, Output Enable (Port Mode Register [PM_m])
- GPIO Input Monitor (Port Input Register [PIN_m])
- Interrupt used the GPIO input (Interrupt Enable Control Register [ISEL_m])

Also, it able to control the following on some ports

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Pull-up/Pull-down Switching for each port
- Digital noise filter control for each port

4.2.1.2 Port Function Control

Switching of each port function can be controlled by the following register settings.

- GPIO function and peripheral function selection (Port Mode Control Register [PMC_m])
- Selection of each peripheral function (Port Function Control Register [PFC_m]) [Function0 to 15]

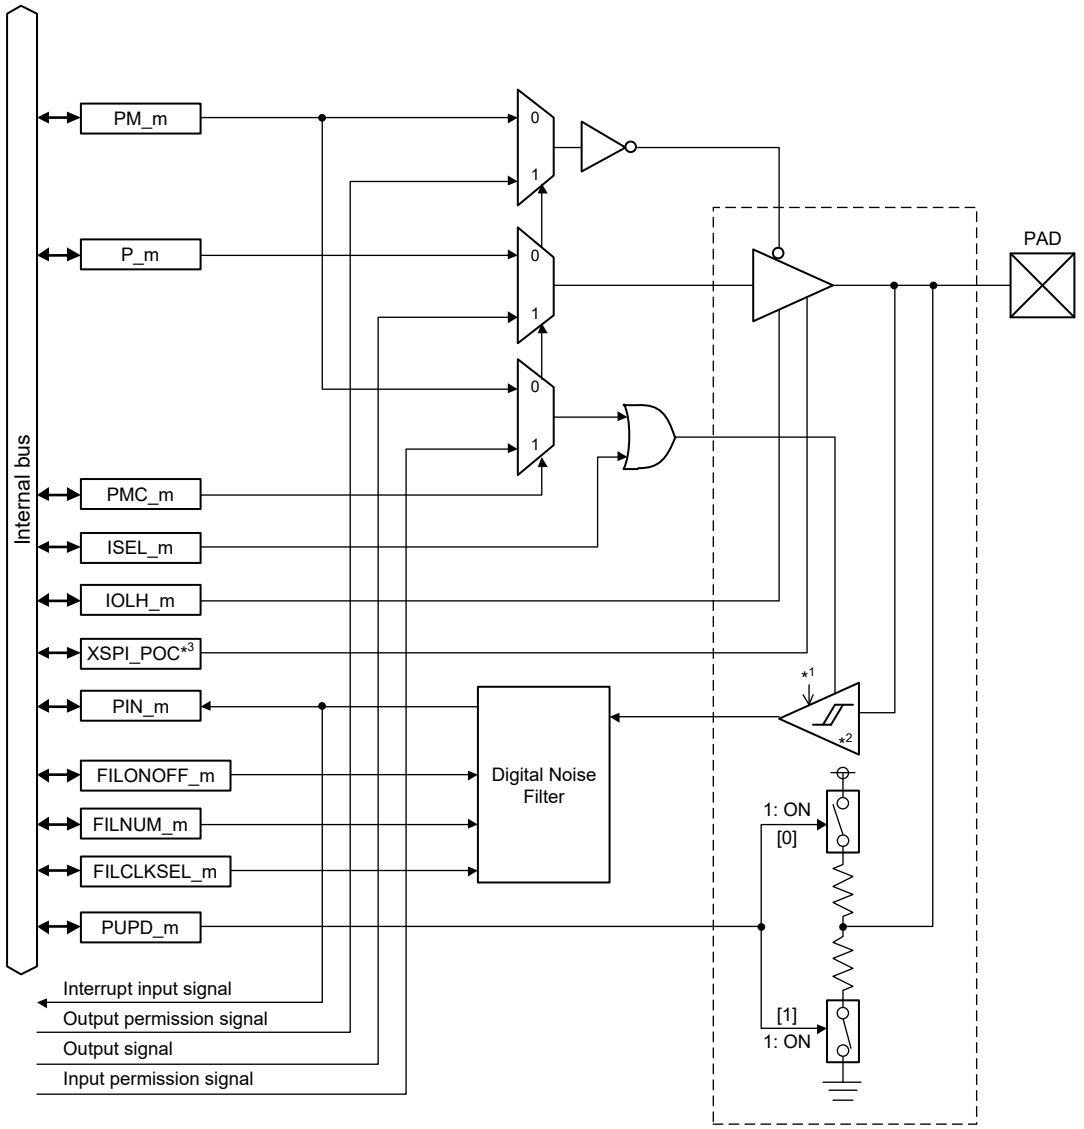
NOTE

Please refer to another excel file for the pin function for the peripheral functions that can be selected.
Please refer to above excel file for the “Pin function list” described in each chapter.
Do not select the same peripheral function for multiple different external terminals.

4.2.1.3 Special Purpose Port Function Control

The settings of the following specific ports can be controlled by registers.

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Digital noise filter control for each port



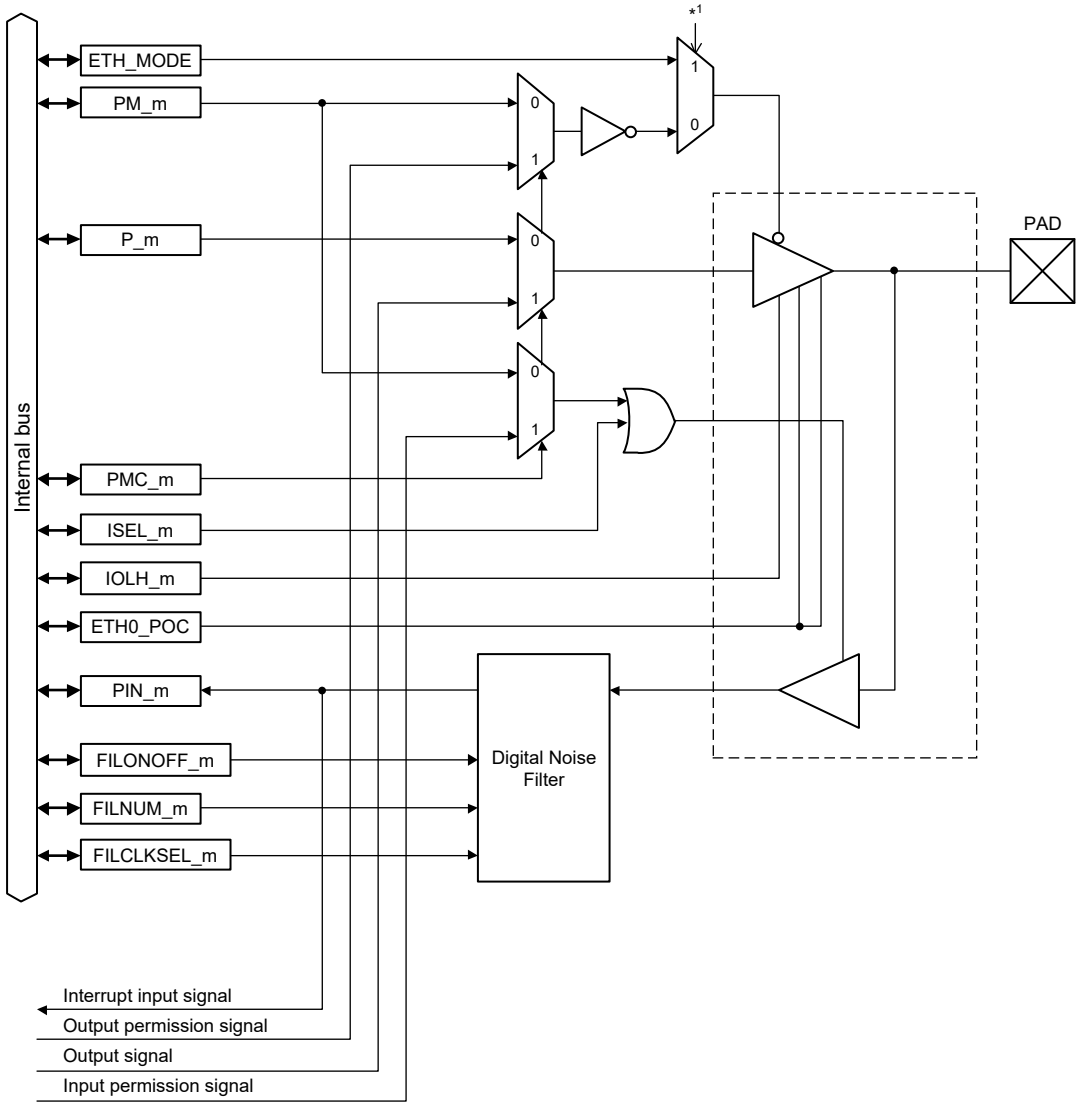
The specific ports shown below are targeted.

- Target Functions: SDHI ch0, SCIF ch0
- Target Signals: WDT_OVF_PERROUT#, VBAT_RTC_WKUP

4.2.1.4 General Purpose Input Output Port Configuration

The configuration of the general-purpose I/O port is shown in **Figure 4.2-1** to **Figure 4.2-5**.

In addition, the configuration of the multiplexed Ether ch0/ch1 is also included in the configuration diagram of the general-purpose I/O port.



Note 1. When RIIC * is selected as the peripheral module, the Schmitt trigger circuit is enabled.

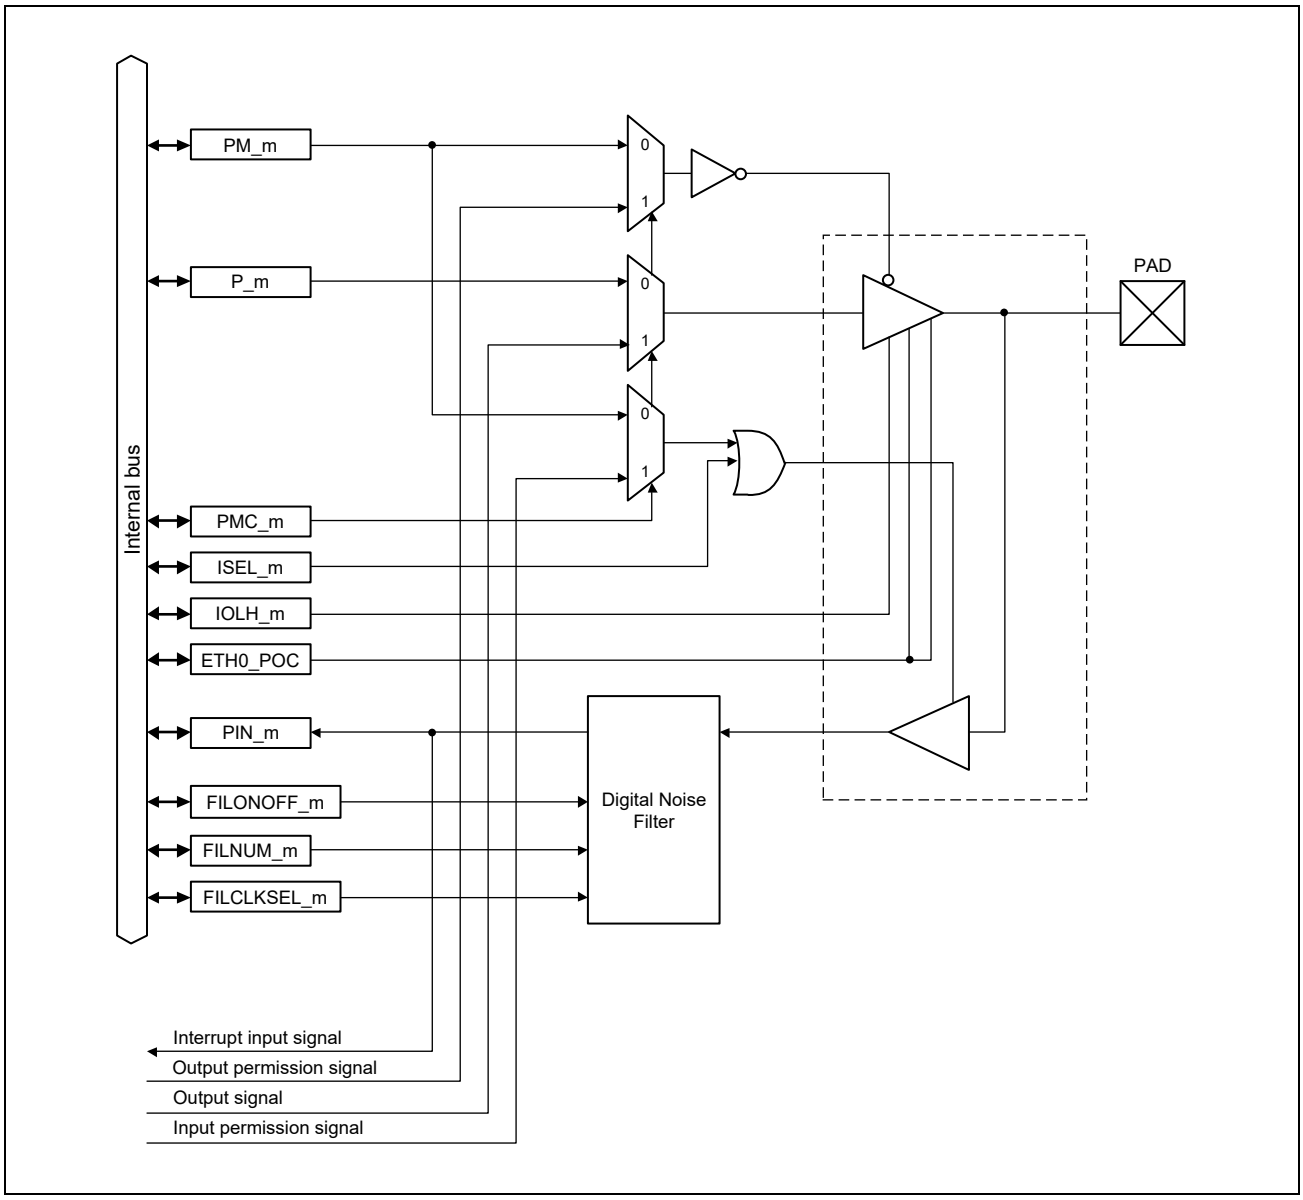
Note 2. Schmidtt trigger function is supported on PS0, PJ0 to PJ4 and P30 to P36.

Note 3. XSPI_POC register is available on PL0 to PL4 and PM0 to PM7.

Figure 4.2-1 PS0, PJ0 to PJ4, P30 to P36, PG0 to PG7, PH0 to PH5, PK0 to PK3, P50 to P56, P60 to P66, P70 to P77, P80 to P85 (Multiplexed Peripheral Functions)

Note 1. When ETH0 is selected as the peripheral module, the ETH_MODE register output is selected.

Figure 4.2-2 PB1 (Multiplexed Ether Ch0)



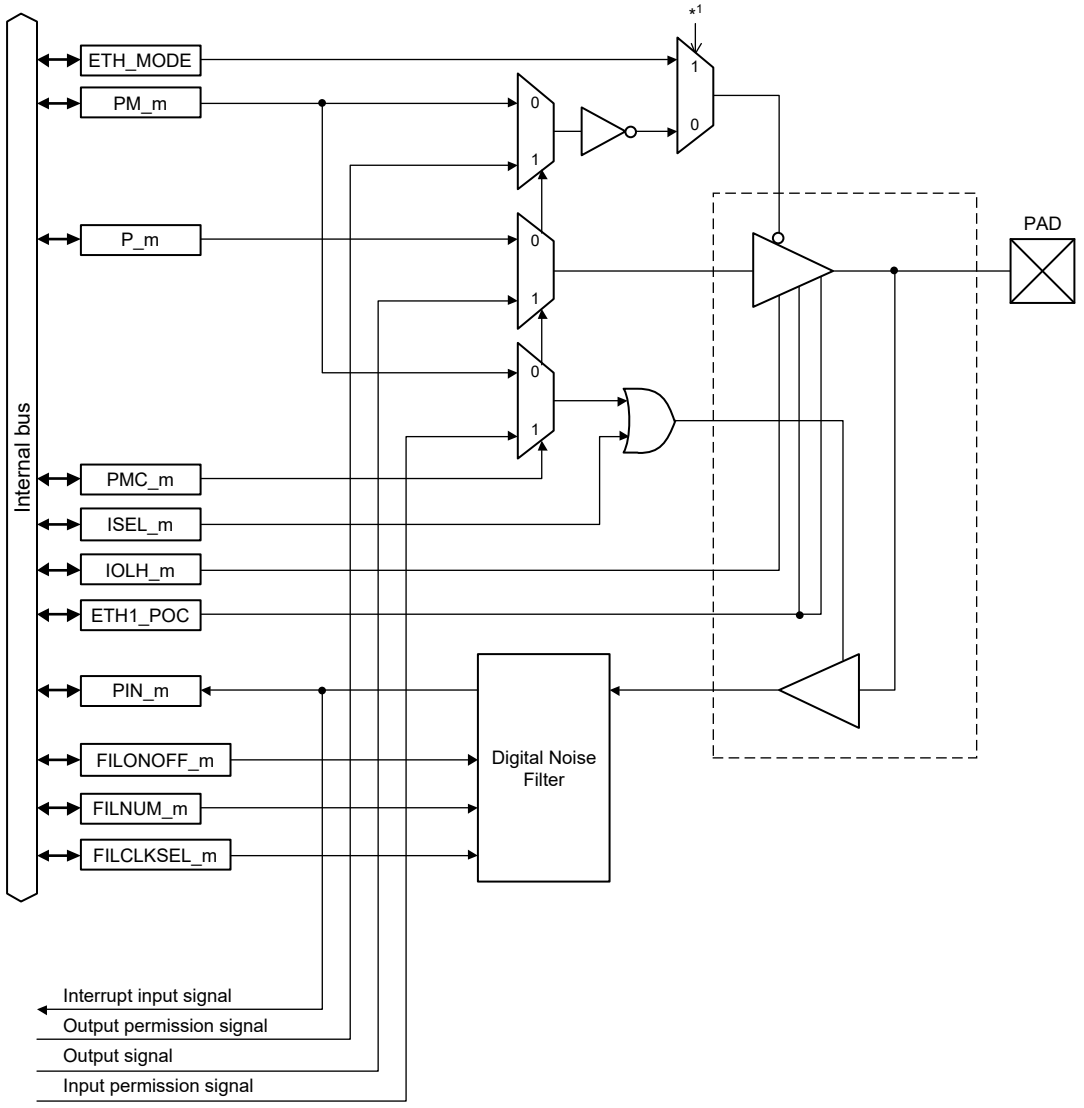


Figure 4.2-3 PA0 to PA7, PB0, PB2 to PB7, PC0 to PC2 (Multiplexed Ether Ch0)

Note 1. When ETH1 is selected as the peripheral module, the ETH_MODE register output is selected.

Figure 4.2-4 PE1 (Multiplexed Ether Ch1)

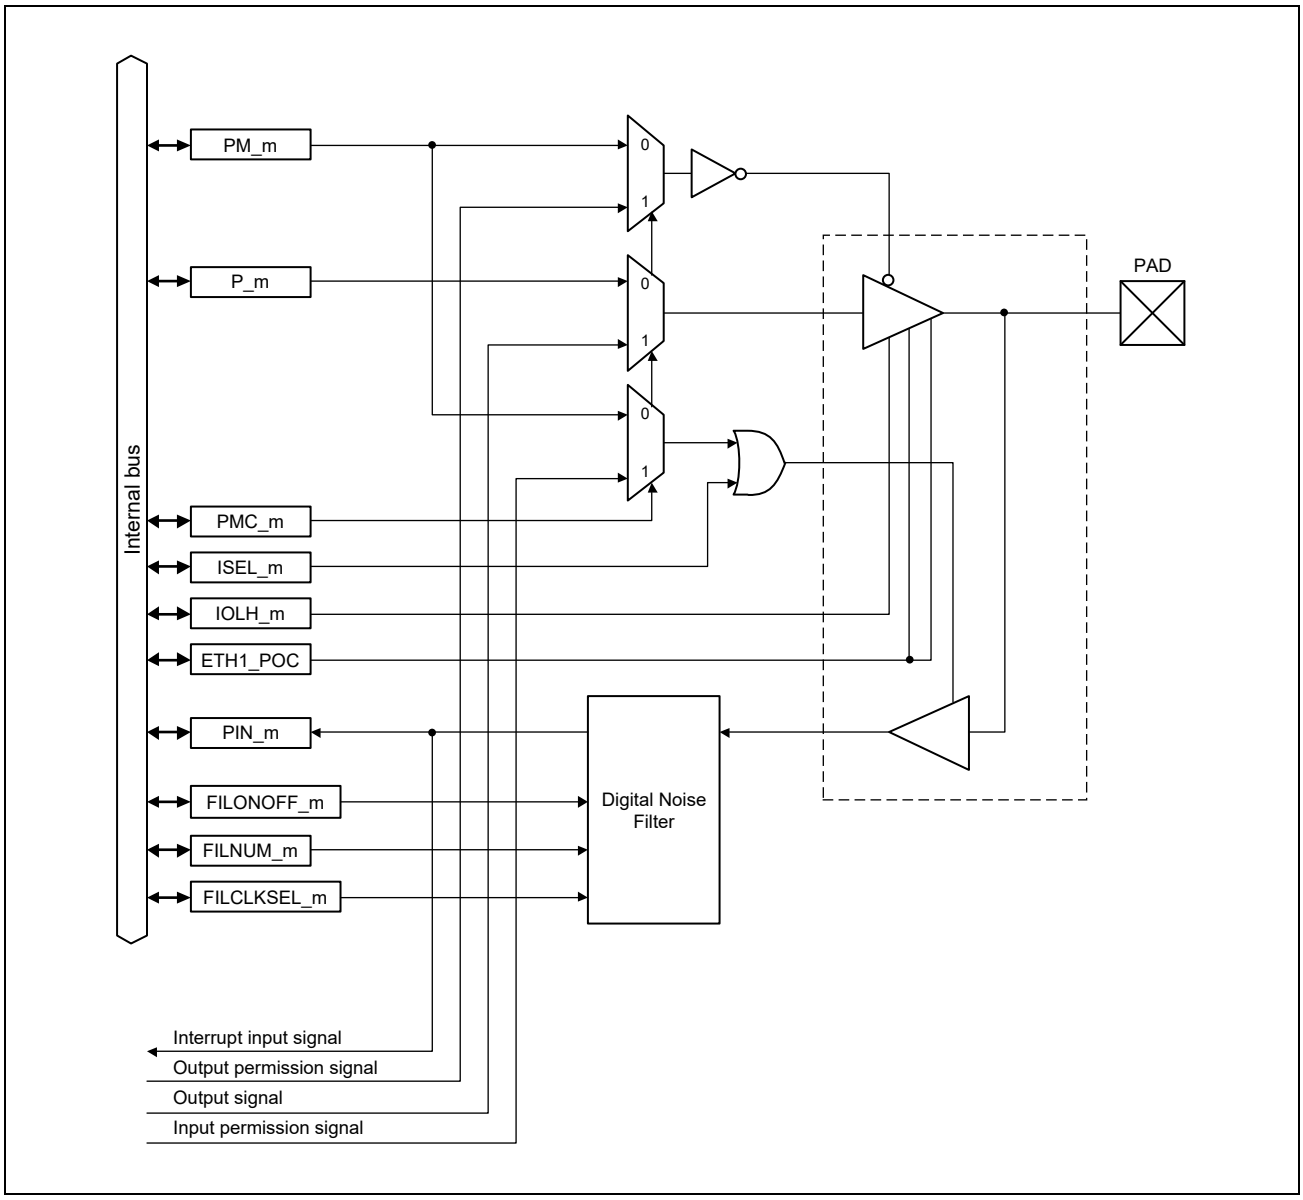

Figure 4.2-5 PD0 to PD7, PE0, PE2 to PE7, PF0 to PF2 (Multiplexed Ether Ch1)

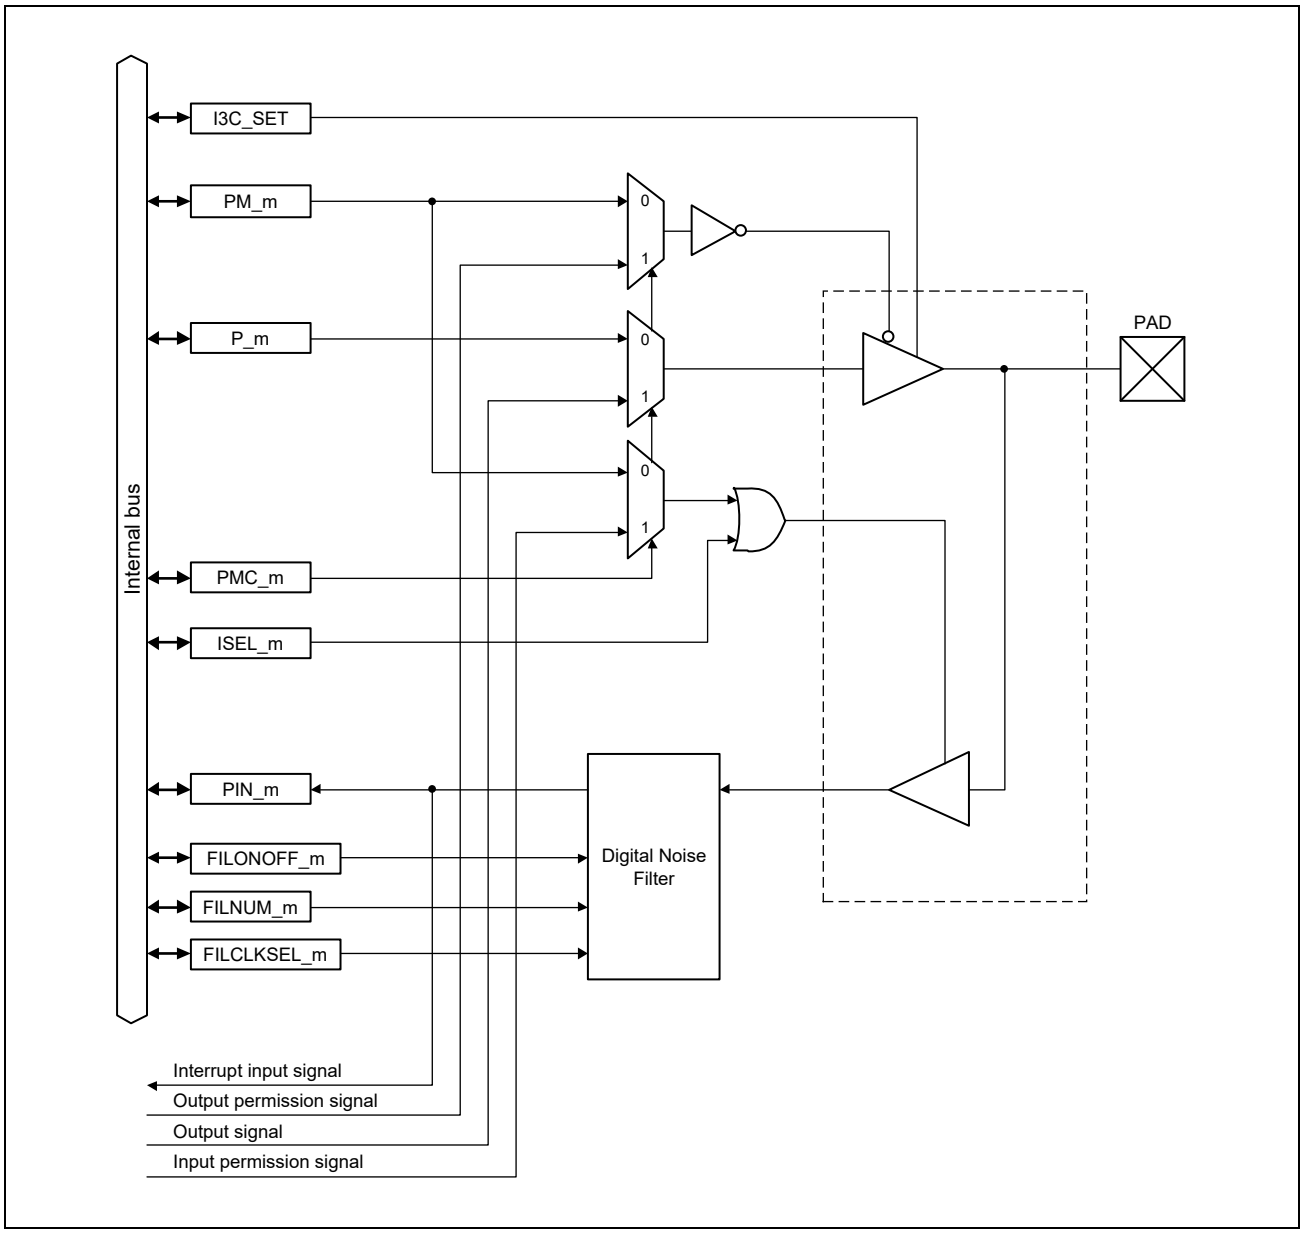

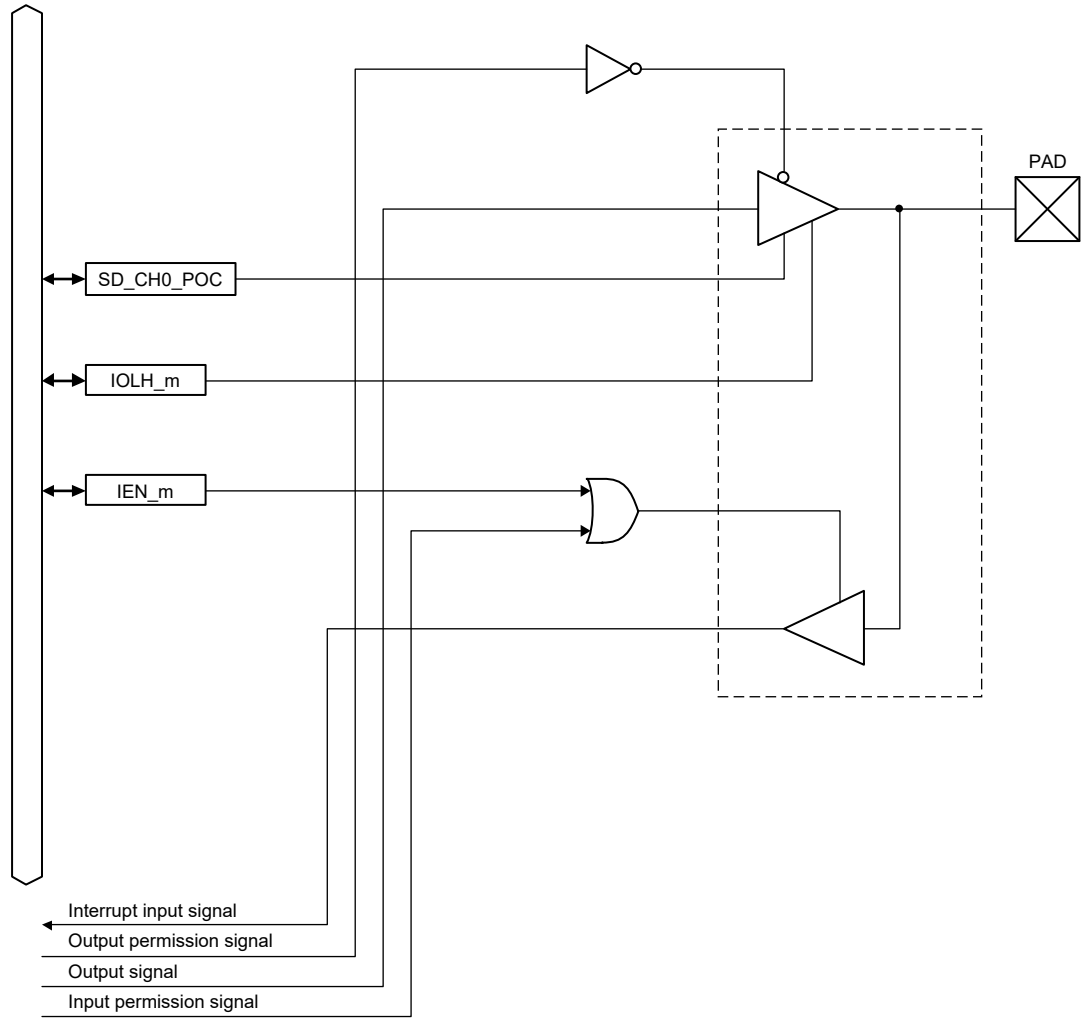

Figure 4.2-6 P20, P21 (Multiplexed I3C)

4.2.1.5 Special Purpose Port Configuration

The functions and the signal of configurations shown below are shown in **Figure 4.2-7** to **Figure 4.2-6**.

- Target Functions: SDHI ch0, SCIF ch0
- Target Signals: WDT_OVF_PERROUT#, VBAT_RTC_WKUP

Note: The IEN_m registers do not exist at the SD0_CLK and SD0_RST# pins.

Figure 4.2-7 SDHI Ch0 (SD0_CLK, SD0_CMD, SD0_RST#, SD0_DATA[7:0])

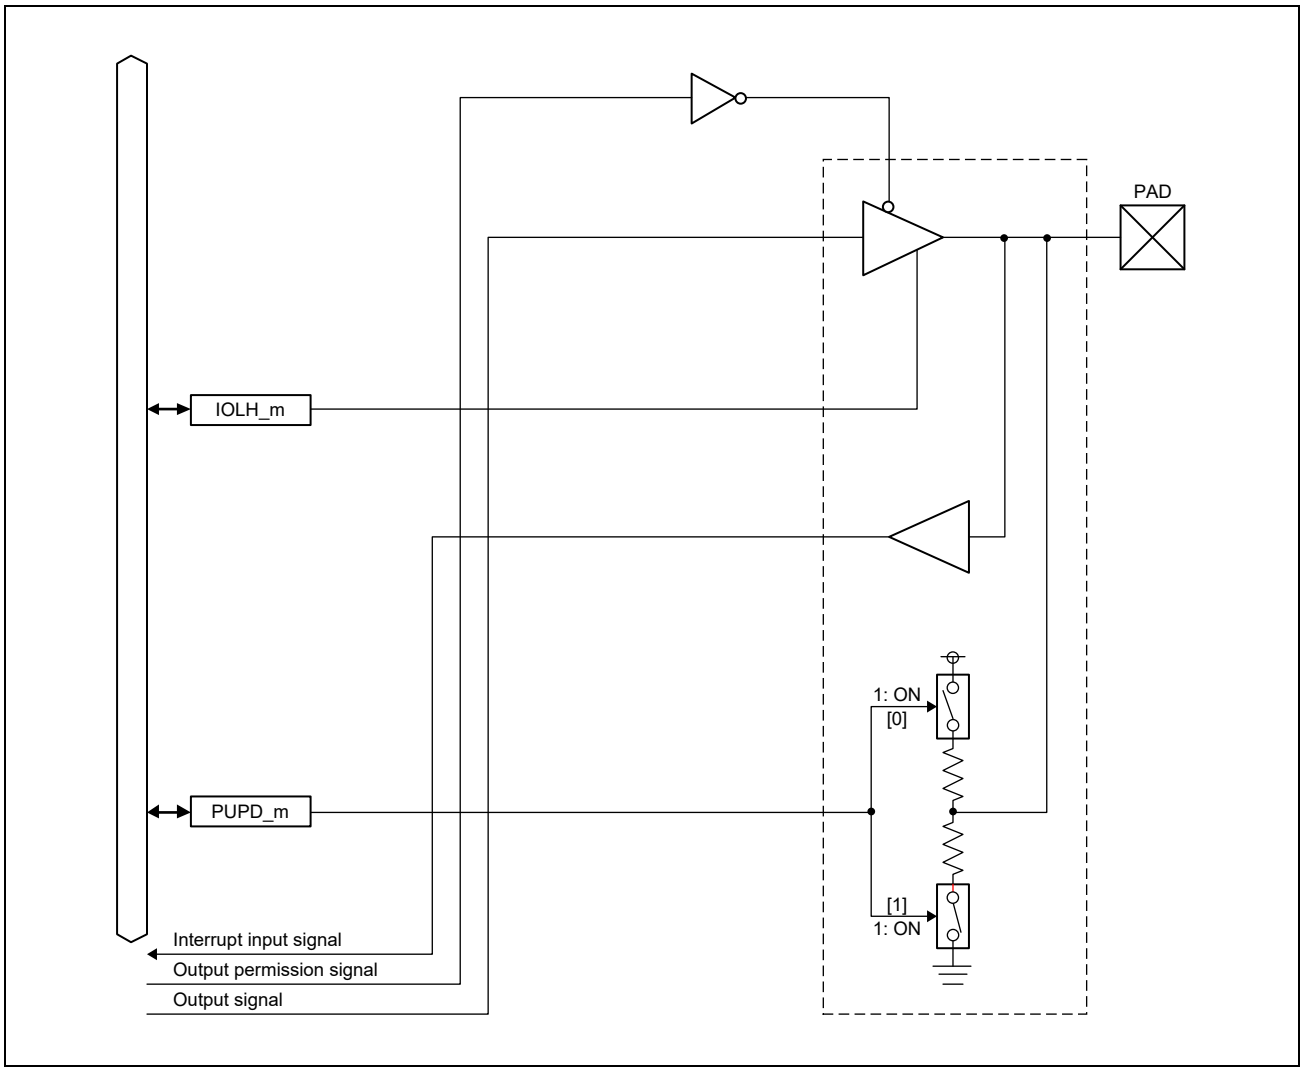

Figure 4.2-8 SCIF Ch0

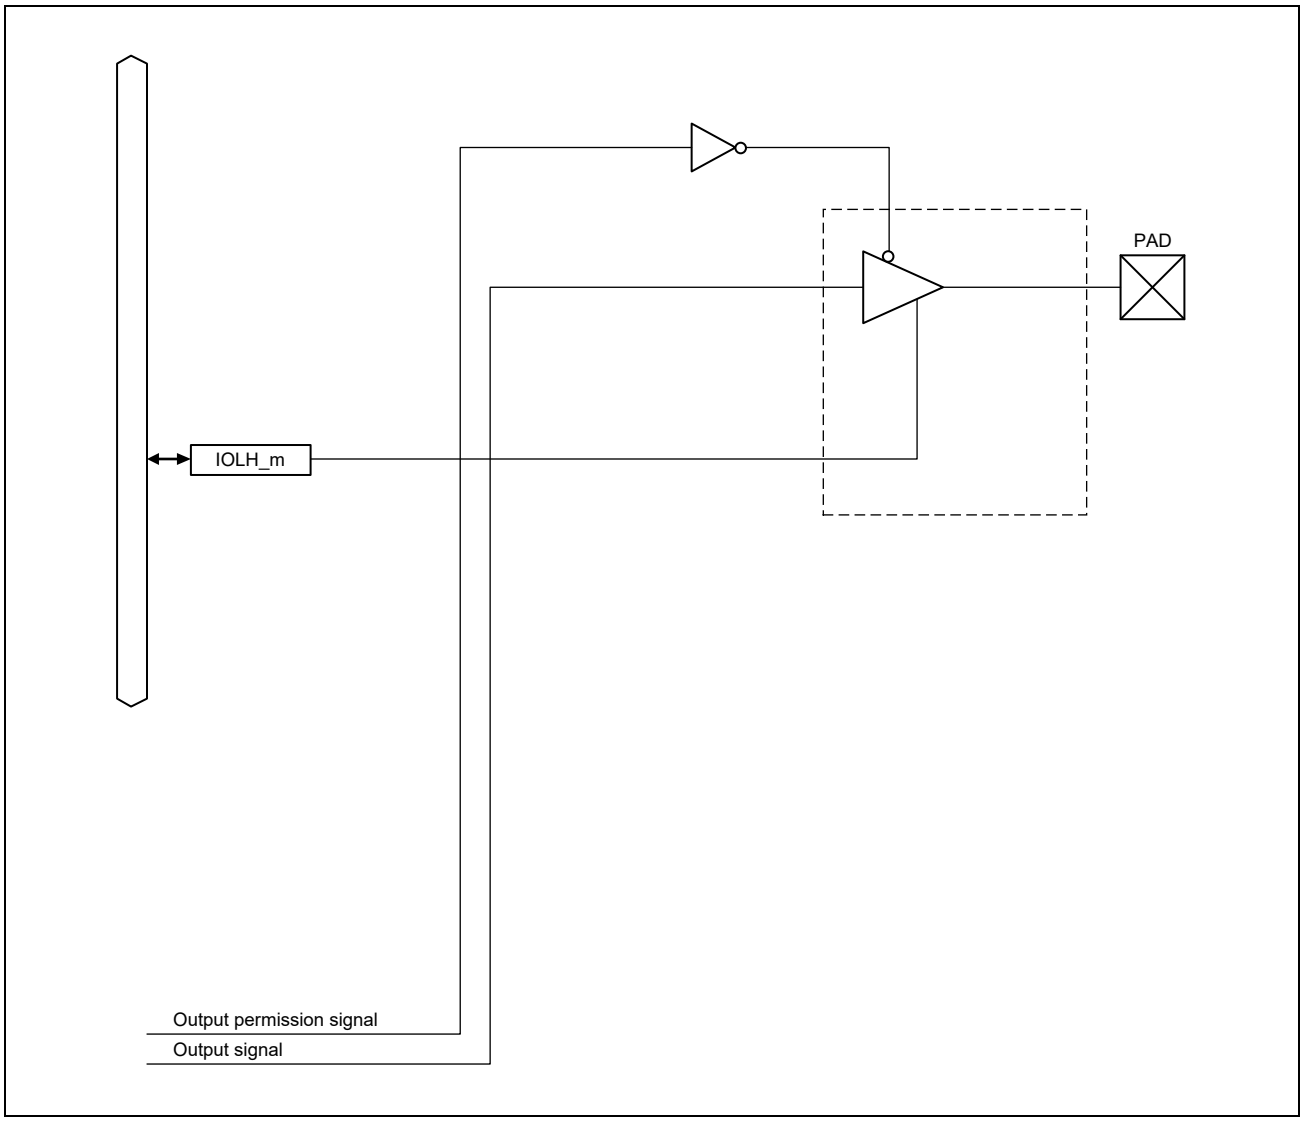

Figure 4.2-9 WDT_OVF_PERROUT#

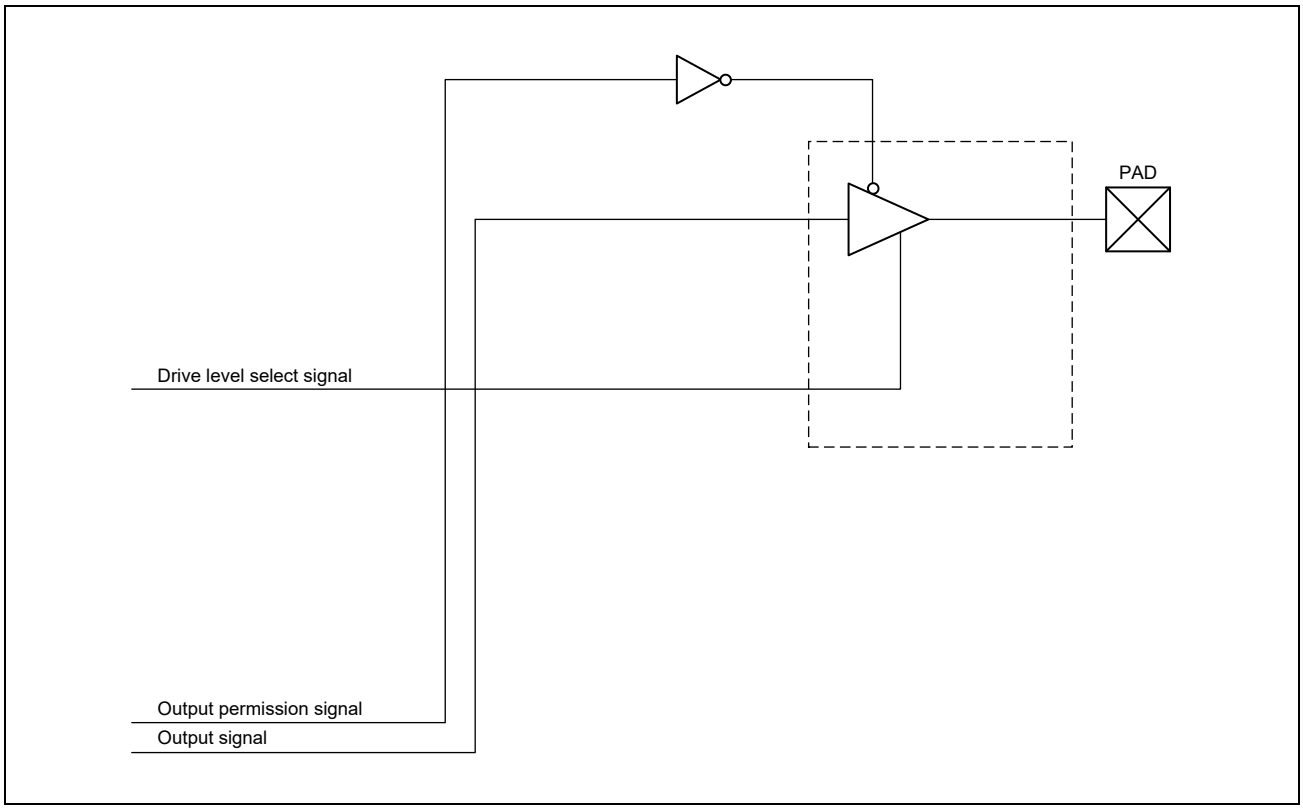

Figure 4.2-10 VBAT_RTC_WKUP

4.2.2 Register Configuration

The base address is shown below.

Base address: H'0_1103_0000 (Cortex-A55 Address Space)
Base address: H'4103_0000 (Cortex-M33 Address Space Non-Secure)
Base address: H'5103_0000 (Cortex-M33 Address Space Secure)

The register addresses shown in the following chapters will be offset addresses from the above base address.

NOTE

Access to areas for which Offset address is not defined in the register map is prohibited.

Please align the addresses according to the access size.

4.2.2.1 Port Register (P_m)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
PORT REGISTER 22	P_22	R/W	H'00	H'22	8
PORT REGISTER 23	P_23	R/W	H'00	H'23	8
PORT REGISTER 25	P_25	R/W	H'00	H'25	8
PORT REGISTER 26	P_26	R/W	H'00	H'26	8
PORT REGISTER 27	P_27	R/W	H'00	H'27	8
PORT REGISTER 28	P_28	R/W	H'00	H'28	8
PORT REGISTER 2A	P_2A	R/W	H'00	H'2A	8
PORT REGISTER 2B	P_2B	R/W	H'00	H'2B	8
PORT REGISTER 2C	P_2C	R/W	H'00	H'2C	8
PORT REGISTER 2D	P_2D	R/W	H'00	H'2D	8
PORT REGISTER 2E	P_2E	R/W	H'00	H'2E	8
PORT REGISTER 2F	P_2F	R/W	H'00	H'2F	8
PORT REGISTER 30	P_30	R/W	H'00	H'30	8

PORT MODE CONTROL REGISTER 35	PMC_35	R/W	H'xx	H'0235	8
PORT MODE CONTROL REGISTER 36	PMC_36	R/W	H'xx	H'0236	8
PORT MODE CONTROL REGISTER 3C	PMC_3C	R/W	H'xx	H'023C	8

4.2.2.4 Port Function Control Register (PFC_m)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
PORT FUNCTION CONTROL REGISTER 22	PFC_22	R/W	H'0000_0000	H'0488	8/16/32
PORT FUNCTION CONTROL REGISTER 23	PFC_23	R/W	H'0000_0000	H'048C	8/16/32
PORT FUNCTION CONTROL REGISTER 25	PFC_25	R/W	H'0000_0000	H'0494	8/16/32
PORT FUNCTION CONTROL REGISTER 26	PFC_26	R/W	H'0000_0000	H'0498	8/16/32
PORT FUNCTION CONTROL REGISTER 27	PFC_27	R/W	H'0000_0000	H'049C	8/16/32
PORT FUNCTION CONTROL REGISTER 28	PFC_28	R/W	H'0000_0000	H'04A0	8/16/32
PORT FUNCTION CONTROL REGISTER 2A	PFC_2A	R/W	H'0000_0000	H'04A8	8/16/32
PORT FUNCTION CONTROL REGISTER 2B	PFC_2B	R/W	H'0000_0000	H'04AC	8/16/32
PORT FUNCTION CONTROL REGISTER 2C	PFC_2C	R/W	H'0000_0000	H'04B0	8/16/32
PORT FUNCTION CONTROL REGISTER 2D	PFC_2D	R/W	H'0000_0000	H'04B4	8/16/32
PORT FUNCTION CONTROL REGISTER 2E	PFC_2E	R/W	H'0000_0000	H'04B8	8/16/32
PORT FUNCTION CONTROL REGISTER 2F	PFC_2F	R/W	H'0000_0000	H'04BC	8/16/32
PORT FUNCTION CONTROL REGISTER 30	PFC_30	R/W	H'0000_0000	H'04C0	8/16/32
PORT FUNCTION CONTROL REGISTER 31	PFC_31	R/W	H'0000_0000	H'04C4	8/16/32
PORT FUNCTION CONTROL REGISTER 33	PFC_33	R/W	H'0000_0000	H'04CC	8/16/32
PORT FUNCTION CONTROL REGISTER 34	PFC_34	R/W	H'0000_0000	H'04D0	8/16/32
PORT FUNCTION CONTROL REGISTER 35	PFC_35	R/W	H'0000_0000	H'04D4	8/16/32
PORT FUNCTION CONTROL REGISTER 36	PFC_36	R/W	H'0000_0000	H'04D8	8/16/32
PORT FUNCTION CONTROL REGISTER 3C	PFC_3C	R/W	H'0000_0000	H'04F0	8/16/32

4.2.2.5 Port Input Register (PIN_m)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
PORT INPUT REGISTER 22	PIN_22	R	H'xx	H'0822	8
PORT INPUT REGISTER 23	PIN_23	R	H'xx	H'0823	8
PORT INPUT REGISTER 25	PIN_25	R	H'xx	H'0825	8
PORT INPUT REGISTER 26	PIN_26	R	H'xx	H'0826	8
PORT INPUT REGISTER 27	PIN_27	R	H'xx	H'0827	8
PORT INPUT REGISTER 28	PIN_28	R	H'xx	H'0828	8
PORT INPUT REGISTER 2A	PIN_2A	R	H'xx	H'082A	8
PORT INPUT REGISTER 2B	PIN_2B	R	H'xx	H'082B	8
PORT INPUT REGISTER 2C	PIN_2C	R	H'xx	H'082C	8
PORT INPUT REGISTER 2D	PIN_2D	R	H'xx	H'082D	8
PORT INPUT REGISTER 2E	PIN_2E	R	H'xx	H'082E	8
PORT INPUT REGISTER 2F	PIN_2F	R	H'xx	H'082F	8
PORT INPUT REGISTER 30	PIN_30	R	H'xx	H'0830	8
PORT INPUT REGISTER 31	PIN_31	R	H'xx	H'0831	8
PORT INPUT REGISTER 33	PIN_33	R	H'xx	H'0833	8
PORT INPUT REGISTER 34	PIN_34	R	H'xx	H'0834	8
PORT INPUT REGISTER 35	PIN_35	R	H'xx	H'0835	8
PORT INPUT REGISTER 36	PIN_36	R	H'xx	H'0836	8
PORT INPUT REGISTER 3C	PIN_3C	R	H'xx	H'083C	8

4.2.2.6 Interrupt Enable Control Register (ISEL_m)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
INTERRUPT ENABLE CONTROL REGISTER 22	ISEL_22	R/W	H'0000_0000	H'2D10	8/16/32
INTERRUPT ENABLE CONTROL REGISTER 23_L	ISEL_23_L	R/W	H'0000_0000	H'2D18	8/16/32
INTERRUPT ENABLE CONTROL REGISTER 23_H	ISEL_23_H	R/W	H'0000_0000	H'2D1C	8/16/32
INTERRUPT ENABLE CONTROL REGISTER 25_L	ISEL_25_L	R/W	H'0000_0000	H'2D28	8/16/32

4.2.3 Register Descriptions

4.2.3.1 Port Register (P_m)

The P_m register sets the GPIO output value.

For the offset address, refer to **4.2.2.1 Port Register (P_m)**.

Bit	7	6	5	4	3	2	1	0
	P_m7	P_m6	P_m5	P_m4	P_m3	P_m2	P_m1	P_m0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	P_m7	0b	R/W	These bits set the value of the GPIO pin. 0b: Low is output. 1b: High is output. Please refer to the table below for the correspondence of each terminal.
6	P_m6	0b	R/W	
5	P_m5	0b	R/W	
4	P_m4	0b	R/W

4.2.3.3 Port Mode Control Register (PMC_m)

The PMC_m register switches the mode for the multiplexed pins of GPIO.

For the offset address, refer to **4.2.2.3 Port Mode Control Register (PMC_m)**.

Bit	Bit Name	Initial Value	R/W	Description
7	PMC_m7	*1	R/W	These bits switch the mode for the multiplexed pin of the GPIO pin. 0b: Port Mode (GPIO) 1b: Peripheral Function Mode (Peripheral Function) Please refer to the table below for the correspondence of each terminal.
6	PMC_m6	*1	R/W	
5	PMC_m5	*1	R/W	
4	PMC_m4	*1	R/W	
3	PMC_m3	*1	R/W	
2	PMC_m2	*1	R/W	
1	PMC_m1	*1	R/W	
0	PMC_m0	*1	R/W	

Note 1. 1b: applies to terminals of PS*, PJ*, PL* and PM*.
0b: applies to other terminals except for PS*, PJ*, PL* and PM*.

4.2.3.4 Port Function Control Register (PFC_m)

The PFCm register sets multiplexed functions.

This register can be write-protected by the PWPR register.

For the offset address, refer to **4.2.2.4 Port Function Control Register (PFC_m)**.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	PFC_m7	0000b	R/W	These bits set the multiplexed function of the GPIO pin. 0000b: Function0 0001b: Function1 0010b: Function2 0011b: Function3 0100b: Function4 0101b: Function5 0110b: Function6 0111b: Function7 1000b: Function8 1001b: Function9 1010b: Function10 1011b: Function11 1100b: Function12 1101b: Function13 1110b: Function14 1111b: Function15 Please refer to the table below for the correspondence of each terminal.
27 to 24	PFC_m6	0000b	R/W	
23 to 20	PFC_m5	0000b	R/W	
19 to 16	PFC_m4	0000b	R/W	
15 to 12	PFC_m3	0000b	R/W	
11 to 8	PFC_m2	0000b	R/W	
7 to 4	PFC_m1	0000b	R/W	
3 to 0	PFC_m0	0000b	R/W	

Note: Please refer to “Pin function list” for the function of Function (0 to 15).

4.2.3.5 Port Input Register (PIN_m)

The PIN_m register is a read-only register to monitor input values of input pins.

For the offset address, refer to **4.2.2.5 Port Input Register (PIN_m)**.

Bit	7	6	5	4	3	2	1	0

4.2.3.6 Interrupt Enable Control Register (ISEL_m)

The ISEL_m register controls whether to enable or disable interrupts.

The pin set as the GPIO input port can be used as an external interrupt input. Controls whether this feature is enabled or disabled. When enabled, this pin can be used as an interrupt by setting the interrupt controller.

For the offset address, refer to **4.2.2.6 Interrupt Enable Control Register (ISEL_m)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ISEL_m3	—	—	—	—	—	—	—	ISEL_m2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ISEL_m1	—	—	—	—	—	—	—	ISEL_m0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25, 23 to 17, 15 to 9, 7 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
24	ISEL_m3	0b	R/W	The ISEL register controls whether to enable or disable interrupts. 0b: Disabled (Initial value) 1b: Enabled Please refer to the table below for the correspondence of each terminal.
16	ISEL_m2	0b	R/W	
8	ISEL_m1	0b	R/W	
0	ISEL_m0	0b	R/W	

Note: Before setting this register, disable interrupt detection in the Interrupt Controller.
If PMCn bit = 1, ISEL bit = 1 is prohibited.

Note: WDTOVF_N bit in IOLH_m register is reset by the assertion of RST_WDTOVFN signal from CPG.

4.2.3.8 Pull-Up/Pull-Down Switching Register (PUPD_m)

The PUPD register sets pull-up and pull-down of the GPIO pins and the special purpose pins.

For the offset address, refer to **4.2.2.8 Pull-Up/Pull-Down Switching Register (PUPD_m)**.

FILCLKSEL_3C	—	—	—	PS0

The timing chart of the digital noise filter operation example is shown below.

(1) When the digital noise filter is disabled (FILONOFF = 0)

The timing chart of FILONOFF = 0 (OFF), FILNUM [1: 0] = “00” (FF 4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.

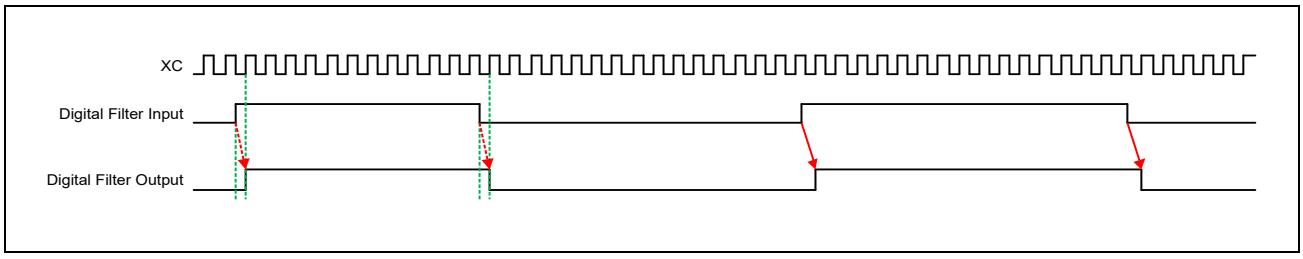

Figure 4.2-11 Digital Noise Filter (FILONOFF = 0) Timing Chart

If the digital filter input is greater than or equal to the period of XC (SYSCLK_TXTAL_XIN), the digital filter output is shifted from the digital filter input by one period of XC.

(2) When the digital noise filter is enabled (FILONOFF = 1)

The timing chart of FILONOFF = 1 (ON), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (1/9000 divide) and the width of the digital filter input is less than the number of stages set by FILNUM register is shown below.

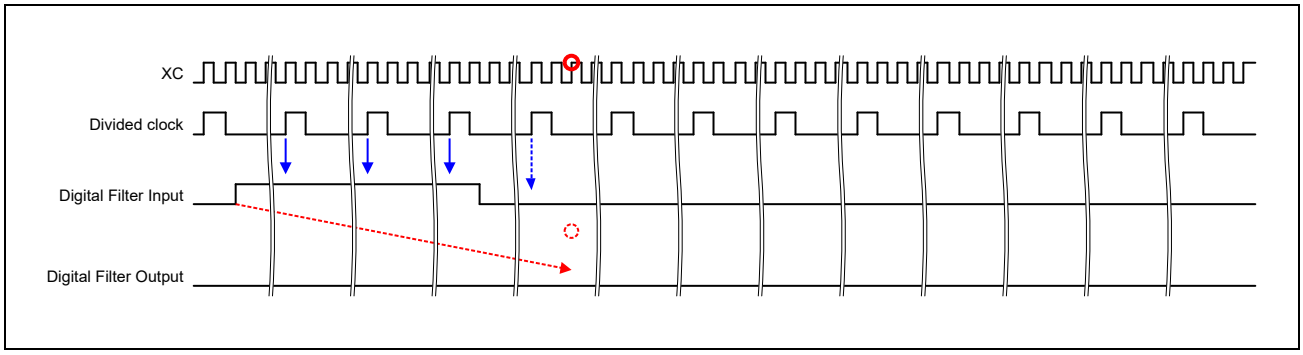

Figure 4.2-12 Digital Noise Filter (FILONOFF = 1) Timing Chart (1)

If the width of the digital filter input is less than the number of stages set by FILNUM register, the digital noise filter disables the digital filter input.

The timing chart of FILONOFF=1(ON), FILNUM[1:0]="00" (FF 4 sttages), FILCLKSEL[1:0]="01" (1/9000 divide), and the width of the digital filter input meets the number of stages set by FILNUM register is shown below.

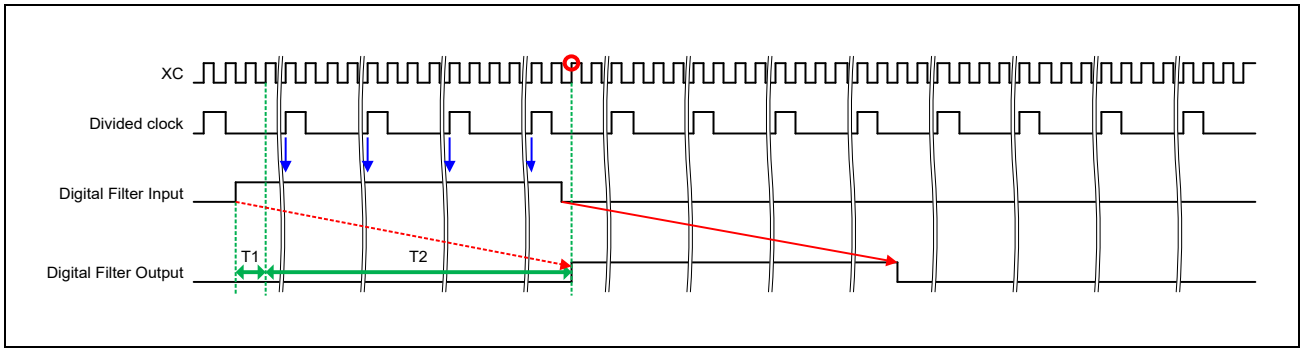

Figure 4.2-13 Digital Noise Filter (FILONOFF = 1) Timing Chart (2)

If the width of the digital filter input satisfies the number of columns set by FILNUM register, the ditigal filter is output.

The digital filter output shifts from the digital filter input by the following sum:

T1: Filter input synchronization: XC 2 stages
T2: Sampling period of FILCLKSEL setting (number of stages set by FILNUM register) + XC 2 stages

4.2.3.13 Ether Ch0 Voltage Mode Control Register (ETH0_POC)

This register is sets the IO voltage mode control of Ether ch0.

For the offset address, refer to **4.2.2.13 Ether Ch0 IO Voltage Mode Control Register (ETH0_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ETH0_POC[1]	ETH0_POC[0]
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	ETH0_POC[1]	0b	R/W	These bits set the IO voltage mode.
0	ETH0_POC[0]	0b	R/W	

Bit 1	Bit 0	IO Voltage
0	0	3.3 V (Initial value)
0	1	1.8 V
1	0	2.5 V
1	1	Setting prohibited

- For the IO voltage mode of PA0_ISO to PC2_ISO, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch0 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_ET0_ISO) to be used.

  When Function2 to Function15, a function other than Ether ch0 is selected, so set the value of this register to IO voltage mode (1.8 V or 3.3 V).

  For each peripheral function, refer to Function1 to Function15 in the Pin function List.

  When using function0 (GPIO function is selected), this register can be set 3.3 V or 1.8 V according to power supply voltage of VDD182533_ET0_ISO.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3 V and the register is set to 1.8 V, the reliability of this LSI will be affected.

4.2.3.14 Ether Ch1 Voltage Mode Control Register (ETH1_POC)

This register sets the IO voltage mode control for Etherch1.

For the offset address, refer to **4.2.2.14 Ether Ch1 IO Voltage Mode Control Register (ETH1_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	ETH1_POC[1]	0b	R/W	These bits set the IO voltage mode.
0	ETH1_POC[0]	0b	R/W	

Bit 1	Bit 0	IO Voltage
0	0	3.3 V (Initial value)
0	1	1.8 V
1	0	2.5 V
1	1	Setting prohibited

- For the IO voltage mode of PD0_ISO to PF2_ISO, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch1 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_ET1_ISO) to be used.

  When Function2 to Function15, a function other than Ether ch1 is selected, so set the value of this register to IO voltage mode (1.8 V or 3.3 V).

  For each peripheral function, refer to Function1 to Function15 in the Pin function List.

  When using function0 (GPIO function is selected), this register can be set 3.3 V, 2.5 V or 1.8 V according to power supply voltage of VDD182533_ET1_ISO.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3 V and the register is set to 1.8 V, the reliability of this LSI will be affected.

4.2.3.15 Ether Mode Control Register (ETH_MODE)

This register controls the direction (input/output) of IO blocks related to Ether RMII/RGMII mode.

This register is valid only for Function 1.

For the offset address, refer to **4.2.2.15 Ether Mode Control Register (ETH_MODE)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OEN1	OEN0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	OEN1	1b	R/W	0b = The Direction of the IO buffer is Output. 1b = The Direction of the IO buffer is Input. (Initial value) <Bit> <Terminal name (Terminal name when using Function1)> OEN1: PE1_ISO (ETH1_TXC_REF_CLK)*1 OEN0: PB1_ISO (ETH0_TXC_REF_CLK)*1
0	OEN0	1b	R/W	

Note 1. If not using the terminal (e.g. RGMII mode), it is necessary to set OEN bit to 0 (direction is output)

Note: By setting this register, the direction of some pins when using Ether's RMII or RGMII can be selected.
Refer to **6.3 Gigabit Ethernet Interface** for switching between RMII and RGMII of Ether.

4.2.3.16 SD Ch0 IO Voltage Mode Control Register (SD_CH0_POC)

This register sets the IO voltage mode control of SD ch0.

For the offset address, refer to **4.2.2.16 SD Ch0 IO Voltage Mode Control Register (SD_CH0_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SD0_POC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Note 1. In Boot Mode 1 and Boot Mode 2, R/W is R (Read Only).

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SD0_POC	0b*1	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage 1.8V 0b: I/O domain voltage 3.3V (Initial value)

Note 1. The initial value of this register

- The IO voltage mode of SD0_CLK, SD0_CMD, SD0_DS, SD0_DAT[7-0], SD0_RST# is set by selecting each mode of this register and MD_BOOT[2: 0].
  - When Boot Modes 1 is not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Modes 1 is selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

MD_BOOT[2:0]			Mode	Selection Function	Selection Device	Control Method
0	0	1	Boot Mode 1	SD/eMMC ch0	eMMC (IO voltage is 3.3 V.)	By Hardware
1	0	1	Boot Mode 5	SD/eMMC ch0	eMMC (IO voltage is 1.8 V.)	By Hardware
Other			SD_ch0 Control by Register			

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3 V and the register is set to 1.8 V, the reliability of this LSI will be affected.

4.2.3.17 SD Ch1 IO Voltage Mode Control Register (SD_CH1_POC)

This register sets the IO voltage mode control of SD ch1.

For the offset address, refer to **4.2.2.17 SD Ch1 IO Voltage Mode Control Register (SD_CH1_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SD1_POC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SD1_POC	0b	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage 1.8V 0b: I/O domain voltage 3.3V (Initial value)

Note: The IO voltage mode of SD1_CLK, SD1_CMD, SD1_DAT[3-0] is set by this register.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3 V and the register is set to 1.8 V, the reliability of this LSI will be affected.

4.2.3.18 XSPI IO Voltage Mode Control Register (XSPI_POC)

This register sets the IO voltage mode control of XSPI.

For the offset address, refer to **4.2.2.18 XSPI IO Voltage Mode Control Register (XSPI_POC)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	XSPI_POC[1]	XSPI_POC[0]
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Note 1. In Boot Mode 2, R/W is R (Read Only).

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1,0	XSPI_POC [1:0]	00b*1	R/W	This bit sets the IO voltage mode. 00b: I/O domain voltage 3.3 V (Initial value)*1 01b: I/O domain voltage 1.8 V 10b: I/O domain voltage 2.5 V 11b: Setting prohibitted

Note 1. The initial value of this register

- The IO voltage of XSPI_CKP, XSPI_CS0# to CS1#, XSPI_DS, XSPI_IO0 to IO7, XSPI_RST0# is set by each mode of this register and MD_BOOT[2:0].
  - When Boot Mode 2 is not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Mode 2 is selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

MD_BOOT[2:0]			Mode	Selection Function	Selection Device	Control method
0	1	0	Boot Mode 2	XSPI I/O Bus Controller	Serial flash memory (IO voltage is 3.3 V.)	By Hardware
1	1	0	Boot Mode 6		Serial flash memory (IO voltage is 1.8 V.)	By Hardware
Other			XSPI Control by register			

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 1.8 V and the register is set to 3.3 V, the reliability of this LSI will be affected.

4.2.3.19 Input Enable Control Register (IEN_m)

This register is a register that controls the input of the special purpose port.

For the offset address, refer to **4.2.2.19 Input Enable Control Register (IEN_m)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	IEN_m3	—	—	—	—	—	—	—	IEN_m2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

4.2.3.20 I3C Control Register (I3C_SET)

This register is a register that controls I3C Interface.

For the offset address, refer to **4.2.2.20 I3C Control Register (I3C_SET)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	POC	—	STBN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3, 1	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	POC	0	R/W	Set the voltage mode of I3C Interface. 0b: I/O domain voltage 1.8 V (Initial value) 1b: I/O domain voltage 1.2 V
0	STBN	1	R/W	Control the standby mode of I3C Interface. 0b: Standby mode*1 1b: Normal mode (Initial value)

Note 1. The output is fixed at Hi-Z and no data is transmitted to the inside even if data is input from outside. “Standby mode” is available when using I^2C mode only. (Not available when using I3C mode)

4.2.3.21 XSPI Output Enable Control Register (XSPI Hi-Z)

This register is a register that controls the output enable of XSPI I/O buffer.

For the offset address, refer to **4.2.2.21 XSPI Output Enable Control Register (XSPI Hi-Z)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SORST_N
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SORST_N	0	R/W	Control the output enable of XSPI Interface (XSPI_xxx pins). 0b: Control to Hi-Z (output disable) 1b: Unlock Hi-Z*1

Note 1. In this case, status of output enable (Active Low) is Low or depends on status of XSPI controller.

Only when the XSPI function is selected, the OEN of the corresponding IO block is controlled. When a function other than XSPI is selected, the control does not extend to the IO block. For details, see the table below.

Pin Function	Control OEN by IP	Control Mode					
		Function 0	Function 2	Function 7	Function 8	Function 9	Function 10
XSPI_CKP	×	PL0	—	—	—	—	—
XSPI_RST0#	×	PL4	—	—	—	—	—
XSPI_RST1#	×	-	—	—	—	P82	P74
XSPI_DS	O	PL3	—	—	—	—	—
XSPI_CS0#	×	PL1	—	—	—	—	—
XSPI_CS1#	×	PL2	—	—	—	—	—
XSPI_WP0#	×	—	—	P85	PL2, P75	PG7, PK3	P80
XSPI_WP1#	×	—	PG7	P83	—	PL2, P75, P80	PK3
XSPI_IO0	O	PM0	—	—	—	—	—
XSPI_IO1	O	PM1	—	—	—	—	—
XSPI_IO2	O	PM2	—	—	—	—	—
XSPI_IO3	O	PM3	—	—	—	—	—
XSPI_IO4	O	PM4	—	—	—	—	—
XSPI_IO5	O	PM5	—	—	—	—	—
XSPI_IO6	O	PM6	—	—	—	—	—
XSPI_IO7	O	PM7	—	—	—	—	—

Register control and IO pin output status are described in the following table.

SORST_N	OEN of IO Pins (Low Active)		Output Status of IO Pins
	Control OEN by IP: ○	Control OEN by IP: ×	
0	1		Output Disabled (Hi-Z)
1	IP Control	0	IP Control or Output Enabled

4.2.3.22 SD Ch2 IO Voltage Mode Control Register (SD_CH2_POC)

This register sets the IO voltage mode control of SD ch2.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SD2_POC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SD2_POC	0b	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8 V 0b: I/O domain voltage ≥ 3.3 V (Initial value)

4.2.3.23 OTHER IO Voltage Mode Control Register (OTHER_POC)

This register sets the POC when there are multiple voltage definitions that are not controlled by the following voltage control registers.

-> SD_CH0_POC, SD_CH1_POC, SD_CH2_POC, XSPI_POC, ETH0_POC, ETH1_POC, I3C_SET.POC

If the voltage definition is single, it is a fixed control and is not subject to register control.

Register bits are prepared for IO Power Domain of the Pin Function Table.

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTOVF_N_POC	PVDD1833_OTH_ISO_POC	PVDD1833_OTH_AWO_POC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	WDTOVF_N_POC	0b	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8 V 0b: I/O domain voltage ≥ 3.3 V (Initial value)
1	PVDD1833_OTH_ISO_POC	0b	R/W	This bit sets the IO voltage mode.*1 1b: I/O domain voltage ≤ 1.8 V 0b: I/O domain voltage ≥ 3.3 V (Initial value)
0	PVDD1833_OTH_AWO_POC	0b	R/W	This bit sets the IO voltage mode.*2 1b: I/O domain voltage ≤ 1.8 V 0b: I/O domain voltage ≥ 3.3 V (Initial value)

Note: WDTOVF_N_POC bit is reset by the assertion of RST_WDTOVFN signal from CPG.

Note 1. Target terminal name: PG6 to PG7, PK0 to PK3, P50 to P56, P60 to P66, P70 to P77 and P80 to P85

Note 2. Target terminal name: SCIF_RXD, SCIF_TXD and P30 to P36
SCIF download mode can operate regrardless of I/O domain voltage mode.

4.2.4 Operation

The operating procedure for the general-purpose I/O port function and the operating procedure for peripheral functions are shown below.

4.2.4.1 Operation for GPIO Function

(1) Set the PMC_m register to “0” (initial value = 0).

(2) Set the GPIO input/output with the PM_m register.*1

(3) Set the GPIO output value in the P_m register.*1

(4) The input value of the input terminal can be detected by the PIN_m register.

(5) When setting the interrupt input using the GPIO input pin, set the ISEL_m register to “1”.

- Set the FILONOFF_m, IOLH_m and PUPD_m registers between (1) and (2) as necessary.
- Set the FILONOFF_m register when using GPIO to set a digital noise filter for interrupt input and GPIO input.
- Set the FILNUM_m and FILCLKSEL_m registers according to the purpose of use.

Note 1. For applications that require glitch-free operation, configure PM_m register to output only after P_m register has been set.

4.2.4.2 Operation for Peripheral Function

(1) Set SYS_IPCONT_SEL_CLONECH register as necessary

(2) Set the PWPR register to allow writing to the PFC_m register.

After setting the PWPR.B0WI bit to “0” (initial value = 1), set the PWPR.PFCWE bit to “1” (initial value = 0).

Select the required function from Functions 0-15. (Hereafter, Function1 setting example)

(3) Set PFC_m = 0001b and switch to Function1.

(4) Set the PMC_m register to “1” (initial value = 0).

(5) Set the PFC_m register to write-protected. After setting the PWPR.PFCWE bit to “0”, set the PWPR.B0WI bit to “1”.

- Set the FILONOFF_m, IOLH_m and PUPD_m registers according to the purpose of use.
- Set the FILONOFF_m register when using GPIO to set a digital noise filter for the IRQ[0-15].
- Set the FILNUM_m and FILCLKSEL_m registers according to the purpose of use. And also, the NMI input can set the noise filter by the same registers.

SECTION 4 SYSTEM

4.3 System Controller (SYSC)

4.3.1 Overview

4.3.1.1 Features

SYSC is a unit that performs system control of this LSI and has the following functions.

- Product information, external terminal state capture function
  - Management of product information of this LSI, and external terminal status
- Security control function
  - Re-setting the security attribute of transaction from each bus master
  - Judgement the security level of each bus slave (access management)
- 34-bit address space access function (see **1.7.3.2.1 34-Bit Address Space Access** for details)
  - If the bus master address is 32bit, do a 2bit extension to access the 34bit address space
- Low power consumption control (see **4.5 Low Power Management** for details)
  - Control the transition of this LSI to each mode of low power consumption
  - Setting cancellation conditions and confirming factors at the time of cancellation
- WDT stop control
  - Control WDT stop from CoreSight
  - Stop control of specified channel of WDT from CPU

4.3.2 Block Diagram of SYSC

The block diagram of SYSC is shown in **Figure 4.3-1**.

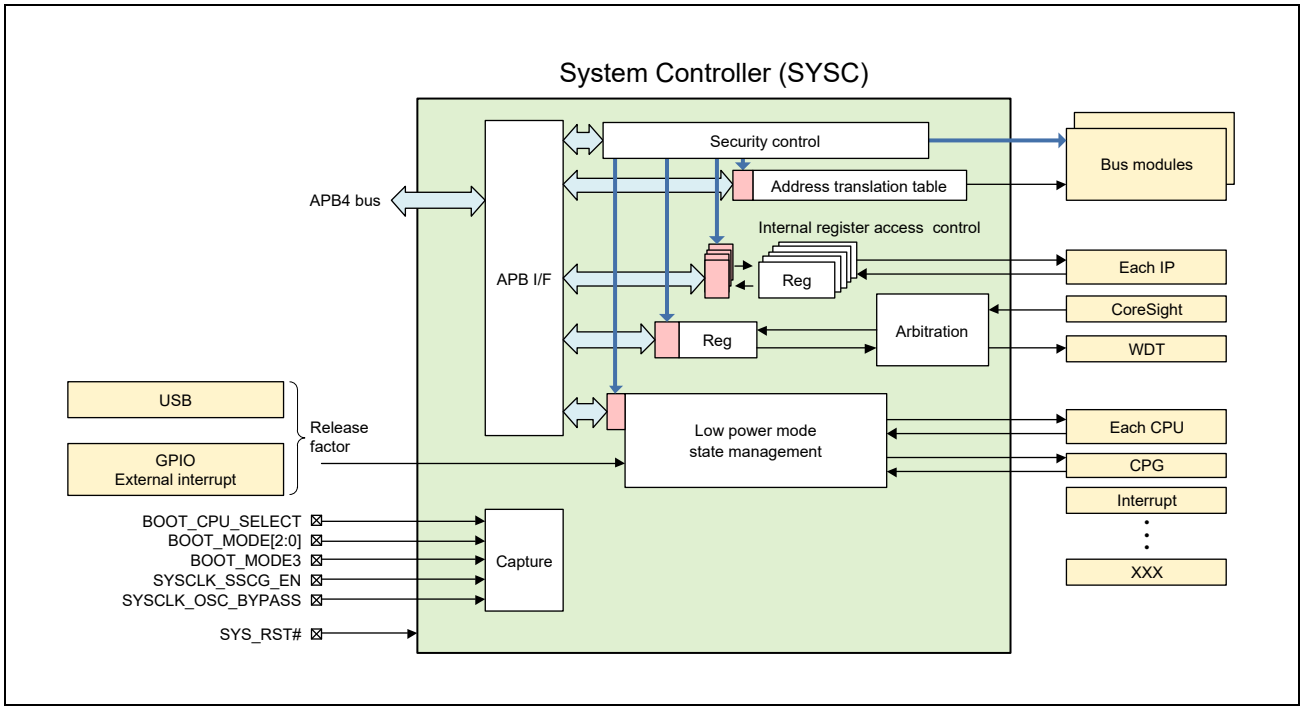

Figure 4.3-1 SYSC Block Diagram

4.3.3 Registers

SYSC base address is as follows:

SYSC base address: H'0_1102_0000 (Overall Address Space)
SYSC base address: H'5102_0000 (Cortex-M33 Address Space Non-Secure)
SYSC base address: H'4102_0000 (Cortex-M33 Address Space Secure)

4.3.3.1 Register Configuration

Table 4.3-1 shows the register configuration of SYSC. The address of the SYSC register is represented by the offset address from the base address.

Table 4.3-1 SYSC Register Configuration (1/3)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
Master Access Control Register0	SYS_MSTACCCTL0	R/W	H'00AA_AA00	H'0000	32
Master Access Control Register1	SYS_MSTACCCTL1	R/W	H'AAAA_AAAA	H'0004	32

4.3.3.2 Register Descriptions

4.3.3.2.1 Master Access Control Register 0 (SYS_MSTACCCTL0)

This register sets the secure attribute and privilege attribute of transactions from DMAC and GE3D.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GPU_ARSEL	—	GPU_ARNS	GPU_ARPU	GPU_AWSEL	—	GPU_AWNS	GPU_AWPU
Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	1	0	1	0

R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	GPU_ARSEL	1	R/W	GPU read access secure attribute source selection The value of this register is always 1. The read value is always 1. For access from GPU, ARPROT [1: 0] is always 10b.
22	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	GPU_ARNS	1	R/W	GPU read access secure attribute*1 0: Secure 1: Non- Secure
20	GPU_ARPU	0	R/W	GPU read access privilege attribute*1 0: Non-privileged access 1: Privileged access
19	GPU_AWSEL	1	R/W	GPU write access security attribute source selection*1 0: AWPROT[1: 0] selects the value from GPU 1: GPU_AWPU is selected for AWPROT [0], and GPU_AWNS is selected for AWPROT [1].
18	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	GPU_AWNS	1	R/W	GPU write access secure attribute*1 0: Secure 1: Non-secure
16	GPU_AWPU	0	R/W	GPU write access privilege attribute*1 0: Non-privileged access 1: Privileged access
15	DMAC1_ARSEL	1	R	Non-Secure DMAC read access secure attribute source selection The value of this register is always 1. The read value is always 1. For access from Non-Secure DMAC, ARPROT [1: 0] is always 10b.
14	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	DMAC1_ARNS	1	R	Non-Secure DMAC read access secure attribute 1: Non- Secure The value of this bit is always 1. The written value is ignored.

Bit	Bit Name	Initial Value	R/W	Description
12	DMAC1_ARPU	0	R	Non-Secure DMAC read access privilege attribute 0: Non-privileged access The value of this bit is always 0. The written value is ignored.
11	DMAC1_AWSEL	1	R	Non-Secure DMAC write access security attribute source selection The value of this register is always 1. The read value is always 1 For access from Non-Secure DMAC, AWPROT [1: 0] is always 10b.
10	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	DMAC1_AWNS	1	R	Non-Secure DMAC write access secure attribute 1:Non- Secure The value of this bit is always 1. The written value is ignored.
8	DMAC1_AWPU	0	R	Non-Secure DMAC write access privilege attribute 0: Non-privileged access The value of this bit is always 0. The written value is ignored.
7	DMAC0_ARSEL	0	R/W	Secure DMAC read access security attribute source selection*1 0: ARPROT[1: 0] selects the value from Secure DMAC 1: DMAC0_ARPU is selected for ARPROT [0], and DMAC0_ARNS is selected for ARPROT [1].
6	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	DMAC0_ARNS	0	R/W	Secure DMAC read access secure attribute*1 0: Secure 1: Non-secure
4	DMAC0_ARPU	0	R/W	Secure DMAC read access privilege attribute*1 0: Non-privileged access 1: Privileged access
3	DMAC0_AWSEL	0	R/W	Secure DMAC write access security attribute source selection*1 0: AWPROT[1: 0] selects the value from Secure DMAC 1: DMAC0_AWPU is selected for AWPROT [0], and DMAC0_AWNS is selected for AWPROT [1].
2	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DMAC0_AWNS	0	R/W	Secure DMAC write access secure attribute*1 0: Secure 1: Non-secure
0	DMAC0_AWPU	0	R/W	Secure DMAC write access privilege attribute*1 0: Non-privileged access 1: Privileged access

Note 1. This register setting is prohibited changing the setting while the target master is operating. Change it before the master initiates access.

4.3.3.2.2 Master Access Control Register 1 (SYS_MSTACCCTL1)

This register sets the secure attribute and privilege attribute of transactions from GbEthernet and SDHI/eMMC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	GEther1_AWNS	1	R/W	GbEthernet (channel 1) write access secure attribute*1 0: Secure 1: Non-secure
24	GEther1_AWPU	0	R/W	GbEthernet (channel 1) write access privilege attribute*1 0: Non-privileged access 1: Privileged access
23	GEther0_ARSEL	1	R/W	GbEthernet (channel 0) read access security attribute source selection*1 0: ARPROT[1:0] is always 10b 1: GEther0_ARPU is selected for ARPROT [0], and GEther0_ARNS is selected for ARPROT[1].
22	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	GEther0_ARNS	1	R/W	GbEthernet (channel 0) read access secure attribute*1 0: Secure 1: Non-secure
20	GEther0_ARPU	0	R/W	GbEthernet (channel 0) read access privilege attribute*1 0: Non-privileged access 1: Privileged access

Bit	Bit Name	Initial Value	R/W	Description
19	GEther0_AWSEL	1	R/W	GbEthernet (channel 0) write access security attribute source selection*1 0: AWPROT[1:0] is always 10b 1: GEther0_AWPU is selected for AWPROT [0], and GEther0_AWNS is selected for AWPROT [1].
18	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	GEther0_AWNS	1	R/W	GbEthernet (channel 0) write access secure attribute*1 0: Secure 1: Non-secure
16	GEther0_AWPU	0	R/W	GbEthernet (channel 0) write access privilege attribute*1 0: Non-privileged access 1: Privileged access
15	SDHI1_ARSEL	1	R/W	SDHI (channel 1) read access security attributed source selection*1 0: ARPROT[1:0] is always 10b 1: SDHI1_ARPU is selected for ARPROT [0], and SDHI1_ARNS is selected for ARPROT [1].
14	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	SDHI1_ARNS	1	R/W	SDHI (channel 1) read access secure attribute*1 0: Secure 1: Non-secure
12	SDHI1_ARPU	0	R/W	SDHI (channel 1) read access privilege attribute*1 0: Non-privileged access 1: Privileged access
11	SDHI1_AWSEL	1	R/W	SDHI (channel 1) write access security attribute source selection*1 0: AWPROT[1:0] is always 10b 1: SDHI1_AWPU is selected for AWPROT [0], and SDHI1_AWNS is selected for AWPROT [1].
10	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	SDHI1_AWNS	1	R/W	SDHI (channel 1) write access secure attribute*1 0: Secure 1: Non-secure
8	SDHI1_AWPU	0	R/W	SDHI (channel 1) write access privilege attribute*1 0: Non-privileged access 1: Privileged access
7	SDHI0_ARSEL	1	R/W	SDHI/eMMC (channel 0) read access security attributed source selection*1 0: ARPROT[1:0] is always 10b 1: SDHI0_ARPU is selected for ARPROT [0], and SDHI0_ARNS is selected for ARPROT [1].
6	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	SDHI0_ARNS	1	R/W	SDHI/eMMC (channel 0) read access secure attribute*1 0: Secure 1: Non-secure
4	SDHI0_ARPU	0	R/W	SDHI/eMMC (channel 0) read access privilege attribute*1 0: Non-privileged access 1: Privileged access
3	SDHI0_AWSEL	1	R/W	SDHI/eMMC (channel 0) write access security attribute source selection*1 0: AWPROT[1:0] is always 10b 1: SDHI0_AWPU is selected for AWPROT [0], and SDHI0_AWNS is selected for AWPROT [1].

Bit	Bit Name	Initial Value	R/W	Description
2	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	SDHI0_AWNS	1	R/W	SDHI/eMMC (channel 0) write access secure attribute*1 0: Secure 1: Non-secure
0	SDHI0_AWPU	0	R/W	SDHI/eMMC (channel 0) write access privilege attribute*1 0: Non-privileged access 1: Privileged access

Note 1. This register setting is prohibited changing the setting while the target master is operating. Change it before the master initiates access.

4.3.3.2.3 Master Access Control Register 2 (SYS_MSTACCCTL2)

This register sets the secure attribute and privilege attribute of transactions from USB2.0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	SRAM1_SL [1:0]	00b	R/W	SRAM MCPU <Reg> slave access permission control Set the security level SL [1:0] for the slave SRAM MCPU <Reg>.
1, 0	SRAM0_SL [1:0]	00b	R/W	SRAM ACPU <Reg> slave access permission control Set the security level SL [1:0] for the slave SRAM ACPU <Reg>.

4.3.3.2.8 Slave Access Control Register 2 (SYS_SLVACCCTL2)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the TZC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13, 12	TZC6_SL[1:0]	10b	R/W	TZC (DDR) <Reg> slave access permission control Set the security level SL [1:0] for the slave TZC (DDR_ACPU) <Reg> and TZC (DDR_VIDEO) <Reg>. These bits can only be set to 10b or 11b. Setting them to 00b or 01b is prohibited. Operation is not guaranteed when 00b or 01b is set.
11, 10	TZC5_SL[1:0]	10b	R/W	TZC (xSPI) <Reg> slave access permission control Set the security level SL [1:0] for the slave TZC (xSPI) <Reg>. These bits can only be set to 10b or 11b. Setting them to 00b or 01b is prohibited. Operation is not guaranteed when 00b or 01b is set.
9 to 6	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5, 4	—	10b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	TZC1_SL[1:0]	10b	R/W	TZC (SRAM MCPU) <Reg> slave access permission control Set the security level SL [1:0] for the slave TZC (SRAM MCPU) <Reg>. These bits can only be set to 10b or 11b. Setting them to 00b or 01b is prohibited. Operation is not guaranteed when 00b or 01b is set.
1, 0	TZC0_SL[1:0]	10b	R/W	TZC (SRAM ACPU) <Reg> slave access permission control Set the security level SL [1:0] for the slave TZC (SRAM ACPU) <Reg>. These bits can only be set to 10b or 11b. Setting them to 00b or 01b is prohibited. Operation is not guaranteed when 00b or 01b is set.

4.3.3.2.9 Slave Access Control Register 3 (SYS_SLVACCCTL3)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the LCDC, DSI, ISU, CRU, VCPL4, GPU, MHU, GPIO, IA55/IM33, GIC, SYC, SYSC, CPG and CoreSight.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29, 28	LCDC_SL [1:0]	00b	R/W	LCDC slave access permission control Set the security level SL [1:0] for the slave LCDC.
27, 26	DSILINK_SL [1:0]	00b	R/W	DSI (Controller) slave access permission control Set the security level SL [1:0] for the slave DSI (Controller).
25, 24	DSIPHY_SL [1:0]	00b	R/W	DSP (PHY) slave access permission control Set the security level SL [1:0] for the slave DSI (PHY).
23, 22	ISU_SL[1:0]	00b	R/W	ISU slave access permission control Set the security level SL [1:0] for the slave ISU.
21, 20	CRU_SL[1:0]	00b	R/W	CRU slave access permission control Set the security level SL [1:0] for the slave CRU.
19, 18	H264_SL[1:0]	00b	R/W	VCPL4 slave access permission control Set the security level SL [1:0] for the slave VCPL4(H.264).
17, 16	GPU_SL[1:0]	00b	R/W	GPU slave access permission control Set the security level SL [1:0] for the slave GPU.
15, 14	MHU_SL[1:0]	00b	R/W	MHU slave access permission control Set the security level SL [1:0] for the slave MHU.
13, 12	GPIO_SL[1:0]	00b	R/W	GPIO slave access permission control Set the security level SL [1:0] for the slave GPIO.
11, 10	IA55_IM33_SL[1:0]	00b	R/W	IA55/IM33/IM33_FPU slave access permission control Set the security level SL [1:0] for the slave IA55/IM33.
9, 8	GIC_SL[1:0]	00b	R/W	GIC slave access permission control Set the security level SL [1:0] for the slave GIC.
7, 6	SYC_SL[1:0]	00b	R/W	SYC slave access permission control Set the security level SL [1:0] for the slave SYC.
5, 4	SYSC_SL [1:0]	11b	R	SYSC slave access permission control Reading the bits always returns 11b. Value cannot be written to these bits.
3, 2	CPG_SL[1:0]	00b	R/W	CPG slave access permission control Set the security level SL [1:0] for the slave CPG.
1, 0	CST_SL[1:0]	00b	R/W	CoreSight slave access permission control Set the security level SL [1:0] for the slave CoreSight.

4.3.3.2.10 Slave Access Control Register 4 (SYS_SLVACCCTL4)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the DMAC, GTM, WDT and RTC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29, 28	RTC_SL[1:0]	10b	R/W	RTC slave access permission control Set the security level SL [1:0] for the slave RTC.
27, 26	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25, 24	WDT2_SL [1:0]	00b	R/W	WDT2 slave access permission control Set the security level SL [1:0] for the slave WDT for CM33.
23, 22	WDT1_SL [1:0]	00b	R/W	WDT1 slave access permission control Set the security level SL [1:0] for the slave WDT for CA55 (Secure).
21, 20	WDT0_SL [1:0]	00b	R/W	WDT0 slave access permission control Set the security level SL [1:0] for the slave WDT for CA55 (Non-Secure).
19 to 10	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9, 8	OSTM2_SL [1:0]	00b	R/W	GTM channel 2 slave access permission control Set the security level SL [1:0] for the slave GTM channel 2.
7, 6	OSTM1_SL [1:0]	00b	R/W	GTM channel 1 slave access permission control Set the security level SL [1:0] for the slave GTM channel 1.
5, 4	OSTM0_SL [1:0]	00b	R/W	GTM channel 0 slave access permission control Set the security level SL [1:0] for the slave GTM channel 0.
3, 2	DMAC1_SL [1:0]	00b	R/W	Non-Secure DNAC slave access permission control Set the security level SL [1:0] for the slave Non-Secure DMAC.
1, 0	DMAC0_SL [1:0]	10b	R/W	Secure DMAC slave access permission control Set the security level SL [1:0] for the slave Secure DMAC.

4.3.3.2.11 Slave Access Control Register 5 (SYS_SLVACCCTL5)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the MTU3a, POE3, GPT, POEG and DDR <Reg>.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 10	—	0000b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9, 8	DDR_SL[1:0]	00b	R/W	DDR <Reg> slave access permission control Set the security level SL [1:0] for the slave DDR <Reg>.
7, 6	POEG_SL [1:0]	00b	R/W	POEG slave access permission control Set the security level SL [1:0] for the slave POEG.
5, 4	GPT_SL[1:0]	00b	R/W	GPT slave access permission control Set the security level SL [1:0] for the slave GPT.
3, 2	POE3_SL [1:0]	00b	R/W	POE3 slave access permission control Set the security level SL [1:0] for the slave POE3.
1, 0	MTU3A_SL [1:0]	00b	R/W	MTU3a slave access permission control Set the security level SL [1:0] for the slave MTU3a.

4.3.3.2.12 Slave Access Control Register 6 (SYS_SLVACCCTL6)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the USB2.0, SDHI/eMMC, GbEthernet and PCIe.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PCIE_SL

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17, 16	PCIE_SL[1:0]	00b	R/W	PCIe slave access permission control Set the security level SL [1:0] for the slave PCIe.
15, 14	ETH1_SL[1:0]	00b	R/W	GbEthernet channel1 slave access permission control Set the security level SL [1:0] for the slave GbEthernet channel 1.
13, 12	ETH0_SL[1:0]	00b	R/W	GbEthernet channel 0 slave access permission control Set the security level SL [1:0] for the slave GbEthernet channel 0.
11, 10	SDHI2_SL [1:0]	00b	R/W	SDHI channel 2 slave access permission control Set the security level SL [1:0] for the slave SDHI channel 2.
9, 8	SDHI1_SL [1:0]	00b	R/W	SDHI channel 1 slave access permission control Set the security level SL [1:0] for the slave SDHI channel 1.
7, 6	SDHI0_SL [1:0]	00b	R/W	SDHI/eMMC channel 0 slave access permission control Set the security level SL [1:0] for the slave SDHI/eMMC channel 0.
5, 4	USB21_SL [1:0]	00b	R/W	USB2.0 channel 1 slave access permission control Set the security level SL [1:0] for the slave USB2.0 channel 1. USB 2.0 channel 1 has a common security level for Host and Function.
3, 2	USB20_SL [1:0]	00b	R/W	USB2.0 channel 0 slave access permission control Set the security level SL [1:0] for the slave USB2.0 channel 0. USB 2.0 channel 0 has a common security level for Host and Function.
1, 0	USBT_SL [1:0]	00b	R/W	USBPHY Control slave access permission control Set the security level SL [1:0] for the slave USBPHY Control.

4.3.3.2.13 Slave Access Control Register 7 (SYS_SLVACCCTL7)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the I2C, I3C, CANFD and RSPI.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25, 24	RSCI3_SL [1:0]	00b	R/W	RSCI channel 3 slave access permission control Set the security level SL [1:0] for the slave RSCI channel 3.
23, 22	RSCI2_SL [1:0]	00b	R/W	RSCI channel 2 slave access permission control Set the security level SL [1:0] for the slave RSCI channel 2.
21, 20	RSCI1_SL [1:0]	00b	R/W	RSCI channel 1 slave access permission control Set the security level SL [1:0] for the slave RSCI channel 1.
19, 18	RSCI0_SL [1:0]	00b	R/W	RSCI channel 0 slave access permission control Set the security level SL [1:0] for the slave RSCI channel 0.
17 to 12	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11, 10	SCIF5_SL1:0]	00b	R/W	SCIF channel 5 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 5.
9, 8	SCIF4_SL1:0]	00b	R/W	SCIF channel 4 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 4.
7, 6	SCIF3_SL1:0]	00b	R/W	SCIF channel 3 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 3.
5, 4	SCIF2_SL1:0]	00b	R/W	SCIF channel 2 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 2.
3, 2	SCIF1_SL1:0]	00b	R/W	SCIF channel 1 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 1.
1, 0	SCIF0_SL1:0]	00b	R/W	SCIF channel 0 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 0.

4.3.3.2.15 Slave Access Control Register 9 (SYS_SLVACCCTL9)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the SSIF, SPDIF and PDM.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PDM_SL		SPDIF_SL		—	—	SSIF3_SL		SSIF2_SL		SSIF1_SL		SSIF0_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13, 12	PDM_SL[1:0]	00b	R/W	PDM slave access permission control Set the security level SL [1:0] for the slave PDM. PDM has a common security level for channel 0 to channel 2.
11, 10	SPDIF_SL [1:0]	00b	R/W	SPDIF slave access permission control Set the security level SL [1:0] for the slave SPDIF.
9, 8	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7, 6	SSIF3_SL [1:0]	00b	R/W	SSIF channel 3 slave access permission control Set the security level SL [1:0] for the slave SSIF channel 3.
5, 4	SSIF2_SL [1:0]	00b	R/W	SSIF channel 2 slave access permission control Set the security level SL [1:0] for the slave SSIF channel 2.
3, 2	SSIF1_SL [1:0]	00b	R/W	SSIF channel 1 slave access permission control Set the security level SL [1:0] for the slave SSIF channel 1.
1, 0	SSIF0_SL [1:0]	00b	R/W	SSIF channel 0 slave access permission control Set the security level SL [1:0] for the slave SSIF channel 0.

4.3.3.2.16 Slave Access Control Register 10 (SYS_SLVACCCTL10)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the ADC and TSU.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LSI_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	LSI_SL[1:0]	00b	R/W	SYSC <LSI Control Reg> slave access permission control Set the security level SL [1:0] for the LSI control register in SYSC.

4.3.3.2.20 Slave Access Control Register 16 (SYS_SLVACCCTL16)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the AOF control register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AOF_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	AOF_SL[1:0]	00b	R/W	SYSC <AOF Control Reg> slave access permission control Set the security level SL [1:0] for the AOF control register in SYSC.

4.3.3.2.21 Slave Access Control Register 17 (SYS_SLVACCCTL17)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the Low Power Mode control register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LP_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	LP_SL[1:0]	00b	R/W	SYSC <Low Power Mode Control Reg> slave access permission control Set the security level SL [1:0] for the Low Power Mode control register in SYSC.

4.3.3.2.22 Slave Access Control Register 18 (SYS_SLVACCCTL18)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the general purpose register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GPREG_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	GPREG_SL [1:0]	00b	R/W	SYSC <GPREG> slave access permission control Set the security level SL [1:0] for the General purpose register(GPREG) in SYSC.

4.3.3.2.23 Slave Access Control Register 20 (SYS_SLVACCCTL20)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the general purpose register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IPCONT_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	IPCONT_SL [1:0]	00b	R/W	SYSC <IPCONT> slave access permission control Set the security level SL [1:0] for the General purpose register(IPCONT) in SYSC.

4.3.3.2.24 ECCRAM0 ECC Setting Register (SYS_RAM0_ECC)

This register is a register that enables and disables the ECC function of ECCRAM0 (SRAM ACPU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VECCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	VECCEN	0	R/W	Set enable or disable error correction for ECCRAM0 (SRAM ACPU) 0: ECC function disabled 1: ECC function enabled

4.3.3.2.25 ECCRAM0 Access Control Register (SYS_RAM0_EN)

This register is a register that controls access to ECCRAM0 (SRAM ACPU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLWEN	VCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	VLWEN	1	R/W	Set enable or disable writes to ECCRAM0 (SRAM ACPU) 0: Write disabled 1: Write enabled
0	VCEN	1	R/W	Set enable or disable access to ECCRAM0 (SRAM ACPU) 0: Access disabled 1: Access enabled

4.3.3.2.26 ECCRAM1 ECC Setting Register (SYS_RAM1_ECC)

This register is a register that enables and disables the ECC function of ECCRAM1 (SRAM MCPU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VECCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	VECCEN	0	R/W	Set enable or disable error correction for ECCRAM1 (SRAM MCPU) 0: ECC function disabled 1: ECC function enabled

4.3.3.2.27 ECCRAM1 Access Control Register (SYS_RAM1_EN)

This register is the register that controls access to ECCRAM1 (SRAM MCPU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLWEN	VCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	VLWEN	1	R/W	Set enable or disable writes to ECCRAM1 (SRAM MCPU) 0: Write disabled 1: Write enabled
0	VCEN	1	R/W	Set enable or disable access to ECCRAM1 (SRAM MCPU) 0: Access disabled 1: Access enabled

4.3.3.2.28 WDT0 Control Register (SYS_WDT0_CTRL)

This register is the register that set the count control of WDT0 for CA55 Non-Secure.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	WDTSTOPMASK	0	R/W	Controls the stop function of WDT0 (for Cortex-A55 Non-Secure) from CoreSight during debugging. 0: Stops WDT0 counting during debugging. 1: Not stop WDT0 counting during debugging.
15 to 1	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
0	WDTSTOP	0	R/W	Set whether the WDT0 (for Cortex-A55 Non-Secure) counter is forced to stop 0: Continue counting 1: Stop counting and hold the counter value

4.3.3.2.29 WDT1 Control Register (SYS_WDT1_CTRL)

This register is the register that set the count control of WDT1 for CA55 Secure.

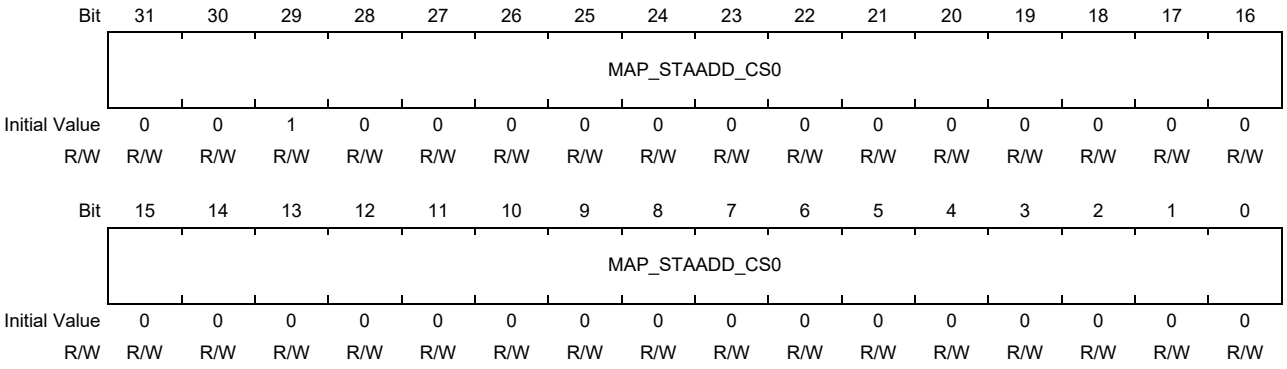
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	WDTSTOPMASK	0	R/W	Controls the stop function of WDT1 (for Cortex-A55 Secure) from CoreSight during debugging. 0: Stops WDT1 counting during debugging. 1: Not stop WDT1 counting during debugging.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	WDTSTOP	0	R/W	Set whether the WDT1 (for Cortex-A55 Secure) counter is forced to stop 0: Continue counting 1: Stop counting and hold the counter value

4.3.3.2.30 WDT2 Control Register (SYS_WDT2_CTRL)

This register is the register that set the count control of WDT2 for CM33.

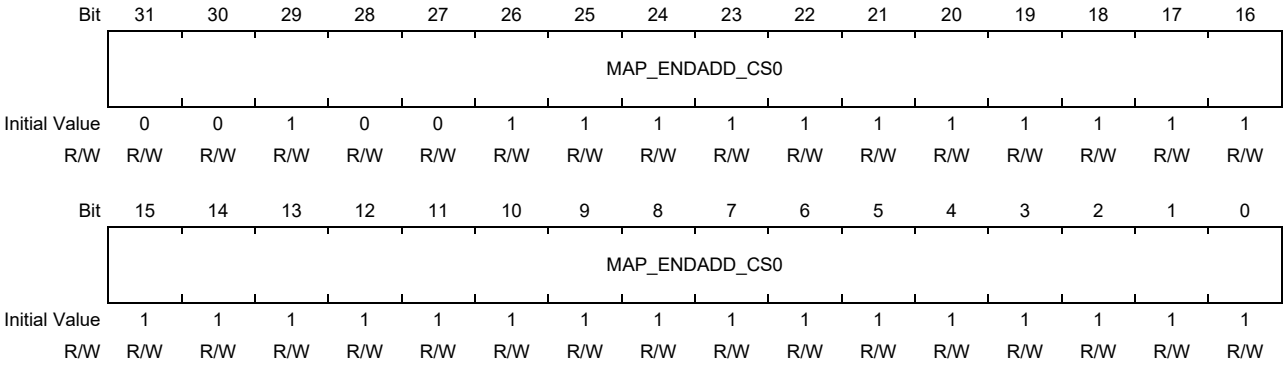


Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	WDTSTOPMASK	0	R/W	Controls the stop function of WDT2 (for Cortex-M33) from CoreSight during debugging. 0: Stops WDT2 counting during debugging. 1: Not stop WDT2 counting during debugging.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	WDTSTOP	0	R/W	Set whether the WDT2 (for Cortex-M33) counter is forced to stop 0: Continue counting 1: Stop counting and hold the counter value

4.3.3.2.31 XSPI CS0 Start Address Register (SYS XSPI_MAP_STAADD_CS0)



This register is the register that indicates the start address of xSPI CS0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MAP_STAADD_CS0	H'2000_0000	R/W	Start Address for xSPI CS0

4.3.3.2.32 XSPI CS0 End Address Register (SYS XSPI_MAP_ENDADD_CS0)

This register is the register that indicates the end address of xSPI CS0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MAP_ENDADD_CS0	H'27FF_FFFF	R/W	End Address for xSPI CS0

4.3.3.2.33 XSPI CS1 Start Address Register (SYS XSPI_MAP_STAADD_CS1)

This register is the register that indicates the start address of xSPI CS1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MAP_STAADD_CS1															
Initial Value	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MAP_STAADD_CS1															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MAP_STAADD_CS1	H'2800_0000	R/W	Start Address for xSPI CS1

4.3.3.2.34 XSPI CS1 End Address Register (SYS XSPI_MAP_ENDADD_CS1)

This register is the register that indicates the end address of xSPI CS1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MAP_ENDADD_CS1															
Initial Value	0	0	1	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MAP_ENDADD_CS1															
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MAP_ENDADD_CS1	H'2FFF_FFFF	R/W	End Address for xSPI CS1

4.3.3.2.35 GEther0 Config Register (SYS_GETH0_CFG)

This register is the register that indicates the state of Ether ch0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PHY_INTF_SEL_I			—	—	MAC_SPEED		—	—	—	—
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10 to 8	PHY_INTF_SEL_I[2:0]	001b	R/W	PHY Interface Select 001: RGMII 100: RMII
7, 6	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5, 4	MAC_SPEED[1:0]	00b	R	Indicates the mode of speed for Ether ch0 00: 1 Gbps mode 01: 2.5 Gbps mode 10: 10 Mbps mode 11: 100 Mbps mode
3 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

4.3.3.2.36 Gether1 Config Register (SYS_GETH1_CFG)

This register is the register that indicates the state of Ether ch1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PHY_INTF_SEL_I			—	—	MAC_SPEED		—	—	—	—
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	H'00000004	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
10 to 8	PHY_INTF_SEL_I[2:0]	001b	R/W	PHY Interface Select 001: RGMII 100: RMII
7, 6	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5, 4	MAC_SPEED[1:0]	00b	R	Indicates the mode of speed for Ether ch1 00: 1 Gbps mode 01: 2.5 Gbps mode 10: 10 Mbps mode 11: 100 Mbps mode
3 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

4.3.3.2.37 PCIe Config Register (SYS_PCIE_CFG)

This register is the register that set configuration of PCIe.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ALLOW_ENTER_L1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
8	ALLOW_ENTER_L1	1	R/W	Control transition to L1 state. 0: Suppress transition to L1 state 1: Allow transition to L1 state
7 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

4.3.3.2.38 PCIe Monitor Register (SYS_PCIE_MON)

This register is a register that shows PCIe power, clock and device status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	D_STATE_OUT_F0		—	—	—	PMU_POWEROFF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5, 4	D_STATE_OUT_F0	00b	R	These bits show the value of PowerState bits of PCI_CFG_PMSC register. 00b: D0 01b: D1 10b: D2 11b: D3hot
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	—	—	R	Reserved When read, the value is indefinite value. The written value will be ignored.
0	PMU_POWEROFF	0	R	Power Off information in L2 state. 0: Not POWEROFF state by transition to L2 state 1: POWEROFF state by transition to L2 state

4.3.3.2.39 PCIe PHY Register (SYS_PCIE_PHY)

This register is a register that set the receiver termination setting of PCIe.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MODE_RXTERMINATION
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	MODE_RXTERMINATION	1	R/W	Set Receiver termination setting. 0: Hi-Z 1: 50 ohms to GND

4.3.3.2.40 I2C0 Config Register (SYS_I2C0_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (RIIC0_SDA, RIIC0_SCL) of I2C ch0. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

4.3.3.2.41 I2C1 Config Register (SYS_I2C1_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (RIIC1_SDA, RIIC1_SCL) of I2C ch1. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

4.3.3.2.42 I2C2 Config Register (SYS_I2C2_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch2.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (RIIC2_SDA, RIIC2_SCL) of I2C ch2. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

4.3.3.2.43 I2C3 Config Register (SYS_I2C3_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch3.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (RIIC3_SDA, RIIC3_SCL) of I2C ch3. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

4.3.3.2.44 I3C Config Register (SYS_I3C_CFG)

This register is a register that set the bypass mode of the analog filter of I3C.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (I3C_SDA, I3C_SCL) of I3C. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

4.3.3.2.45 CA55 Core0 Reset Vector Address Low Configuration Register (SYS_CA55_CFG_RVAL0)

This register is a register that set the reset vector address of Cortex-A55 core0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDRL0[31:2]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDRL0[31:2]														—	—
Initial Value	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDRL0[31:2]	H'0000_1000	R/W	Represent bottom bit 31 to bit 2 of the reset vector address of Cortex-A55 Core0. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **2.2.1 Processors Cortex-A55** for the sequence of each reset.
1, 0	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

4.3.3.2.46 CA55 Core0 Reset Vector Address High Configuration Register (SYS_CA55_CFG_RVAH0)

This register is a register that set the reset vector address of Cortex-A55 core0.

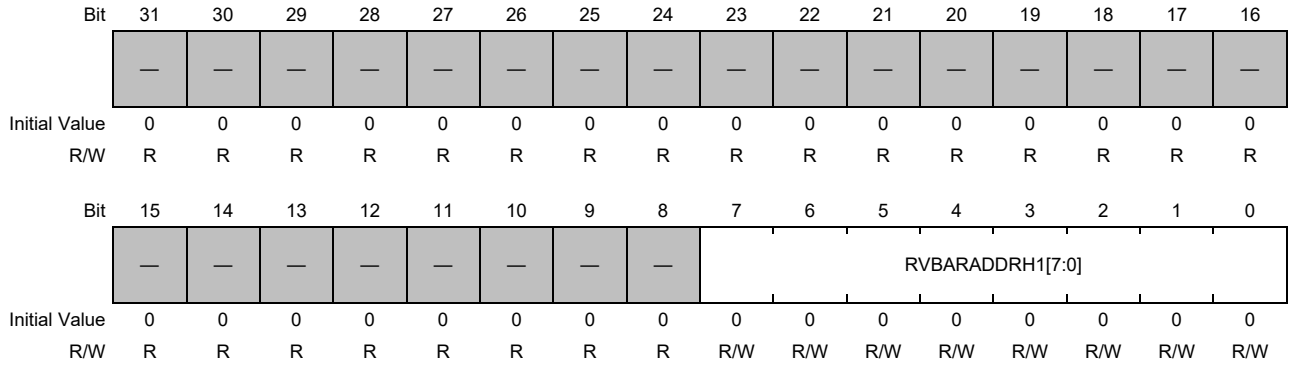
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RVBARADDRH0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	RVBARADDRH0[7:0]	H'00	R/W	Represent upper bit 39 to bit 32 of the reset vector address of Cortex-A55 Core0. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **2.2.1 Processors Cortex-A55** for the sequence of each reset.

4.3.3.2.47 CA55 Core1 Reset Vector Address Low Configuration Register (SYS_CA55_CFG_RVAL1)

This register is a register that set the reset vector address of Cortex-A55 core1.

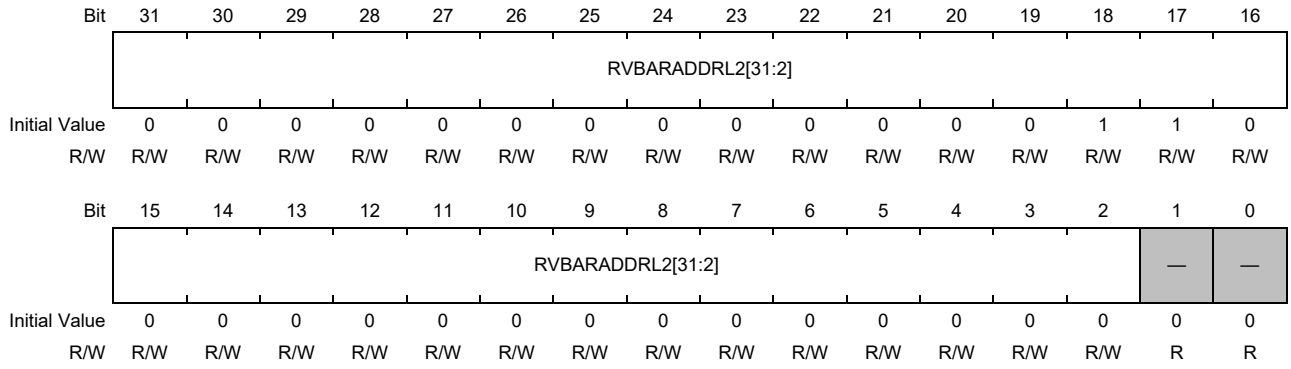


Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDRL1[31:2]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDRL1[31:2]														—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDRL1[31:2]	H'0001_8000	R/W	Represent bottom bit 31 to bit 2 of the reset vector address of Cortex-A55 Core1. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **2.2.1 Processors Cortex-A55** for the sequence of each reset.
1, 0	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

4.3.3.2.48 CA55 Core1 Reset Vector Address High Configuration Register (SYS_CA55_CFG_RVAH1)



This register is a register that set the reset vector address of Cortex-A55 core1.

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	RVBARADDRH1[7:0]	H'00	R/W	Represent upper bit 39 to bit 32 of the reset vector address of Cortex-A55 Core1. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **2.2.1 Processors Cortex-A55** for the sequence of each reset.

4.3.3.2.49 CA55 Core2 Reset Vector Address Low Configuration Register (SYS_CA55_CFG_RVAL2)

This register is a register that set the reset vector address of Cortex-A55 core2.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDRL2[31:2]	H'0001_8000	R/W	Represent bottom bit 31 to bit 2 of the reset vector address of Cortex-A55 Core2. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **2.2.1 Processors Cortex-A55** for the sequence of each reset.
1, 0	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

4.3.3.2.50 CA55 Core2 Reset Vector Address High Configuration Register (SYS_CA55_CFG_RVAH2)

This register is a register that set the reset vector address of Cortex-A55 core2.

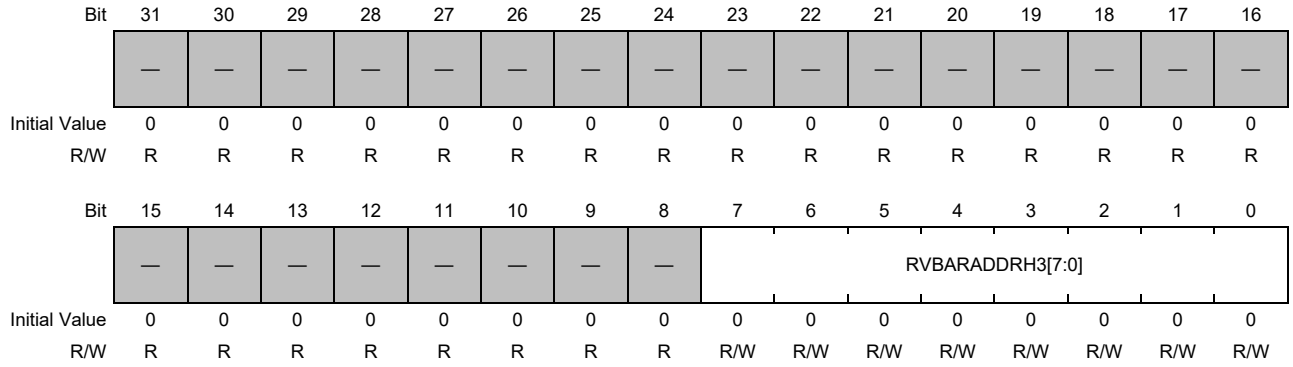
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RVBARADDRH2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	RVBARADDRH2[7:0]	H'00	R/W	Represent upper bit 39 to bit 32 of the reset vector address of Cortex-A55 Core2. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **2.2.1 Processors Cortex-A55** for the sequence of each reset.

4.3.3.2.51 CA55 Core3 Reset Vector Address Low Configuration Register (SYS_CA55_CFG_RVAL3)

This register is a register that set the reset vector address of Cortex-A55 core3.

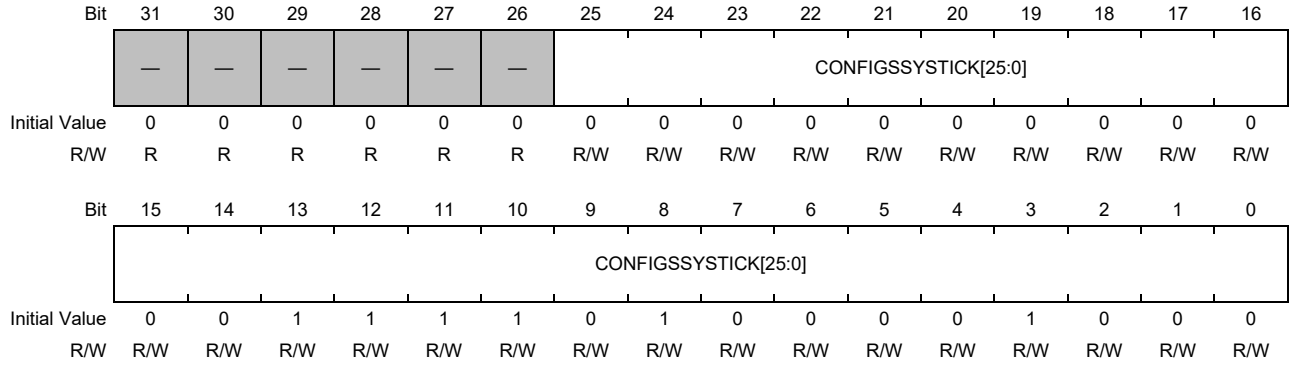


Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDRL3[31:2]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDRL3[31:2]														—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDRL3[31:2]	H'0001_8000	R/W	Represent bottom bit 31 to bit 2 of the reset vector address of Cortex-A55 Core3. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **2.2.1 Processors Cortex-A55** for the sequence of each reset.
1, 0	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

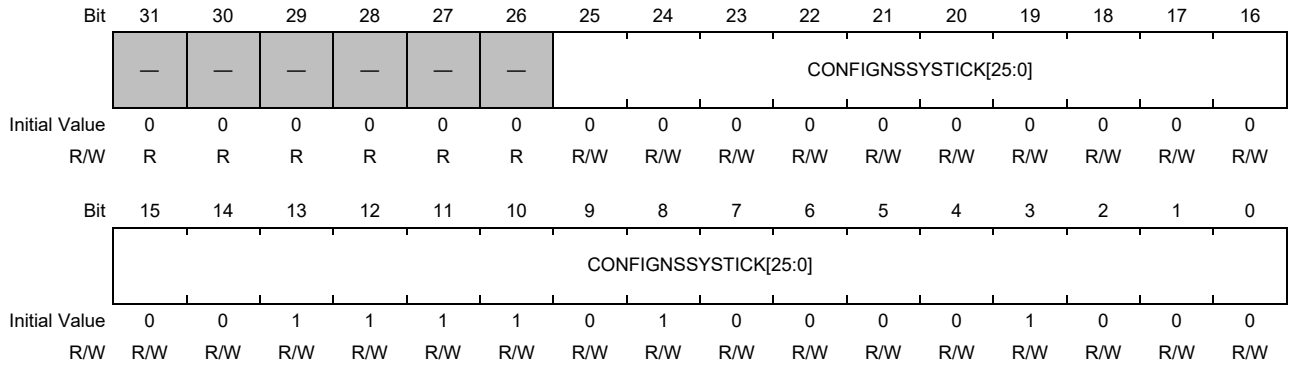
4.3.3.2.52 CA55 Core3 Reset Vector Address High Configuration Register (SYS_CA55_CFG_RVAH3)



This register is a register that set the reset vector address of Cortex-A55 core3.

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	RVBARADDRH3[7:0]	H'00	R/W	Represent upper bit 39 to bit 32 of the reset vector address of Cortex-A55 Core3. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **2.2.1 Processors Cortex-A55** for the sequence of each reset.

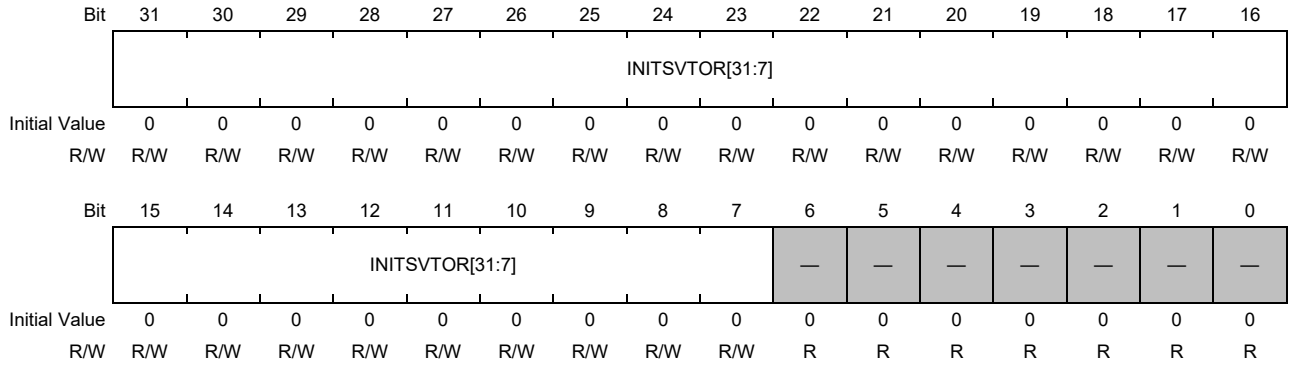
4.3.3.2.53 CM33 Config Register0 (SYS_CM33_CFG0)



This register is the register that set the secure Systick of Cortex-M33.

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 0	CONFIGSSYSTICK[25:0]	H'000_3D08	R/W	Configuration register for secure Systick. The value must be determined before the cold reset of Cortex-M33 is released. See the Cortex-M33 chapter for more information on settings.

4.3.3.2.54 CM33 Config Register1 (SYS_CM33_CFG1)



This register is the register that set cortex-M33 non-secure Systick.

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 0	CONFIGNSSYSTICK[25:0]	H'000_3D08	R/W	Configuration register for non-secure Systick. The value must be determined before the cold reset of Cortex-M33 is released. See the Cortex-M33 chapter for more information on settings.

4.3.3.2.55 CM33 Config Register2 (SYS_CM33_CFG2)

This register is the register that set the secure vector address of Cortex-M33.

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	INITSVTOR[31:7]	H'000_0000	R/W	A register that indicates the secure vector address. The address value must be determined before the Cortex-M33 cold reset is released.
6 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

4.3.3.2.56 CM33 Config Register3 (SYS_CM33_CFG3)

This register is the register that set the non-secure vector address of Cortex-M33.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INITNSVTOR[31:7]															
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INITNSVTOR[31:7]									—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	INITNSVTOR[31:7]	H'020_0C00	R/W	A register that indicates the non-secure vector address. The address value must be determined before the Cortex-M33 cold reset is released.
6 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

4.3.3.2.57 CM33 Lock Register (SYS_CM33_LOCK)

This register is a register that set the vector-address change permission of Cortex-M33.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LOCKNSVTOR	LOCKSVTAIRCR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	LOCKNSVTOR	0	R/W	Control the non-secure vector address change permission. 0: Changeable 1: Cannot be changed
0	LOCKSVTAIRCR	0	R/W	Control changing permission of the Secure Vector address, and the PRIS bit and the BFHFNMINS bit of the AIRCR register of Cortex-M33. 0: Changeable 1: Cannot be changed

4.3.3.2.58 LSI Mode Signal Register (SYS_LSI_MODE)

This register indicates the state of the BOOT_CPU_SELECT terminal, the MD_BOOT terminal, the BOOT_MODE3 terminal, the SYSCLK_SSCG_EN terminal, and the SYSCLK_OSC_BYPASS terminal.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STAT_SEC_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	STAT_MD_BYPASS	STAT_MD_CLKS	—	—	STAT_DEBUGEN	—	—	STAT_MD_BOOT[2:0]			—	—	—	STAT_BOOTCPUSEL
Initial Value	0	0	—	—	0	0	—	—	0	—	—	—	0	0	0	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	STAT_SEC_EN	—	R	Indicates whether this LSI support the security function or not. 0: Not supported 1: Available
15, 14	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	STAT_MD_BYPASS	—	R	Indicates the terminal state of the external terminal SYSCLK_OSC_BYPASS. The value is updated at the rising edge of SYS_RST#. If a reset occurs inside the LSI, this register is not updated.
12	STAT_MD_CLKS	—	R	Indicates the terminal state of the external terminal SYSCLK_SSCG_EN. The value is updated at the rising edge of SYS_RST#. If a reset occurs inside the LSI, this register is not updated.
11, 10	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	STAT_DEBUGEN	—	R	Indicates the terminal state of the external terminal BOOT_MODE3. The value is updated at the rising edge of SYS_RST#. If a reset occurs inside the LSI, this register is not updated.
8	—	—	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	STAT_MD_BOOT[2:0]	—	R	Indicates the terminal state of the external terminal BOOT_MODE[2:0]. The value is updated at the rising edge of SYS_RST#. If a reset occurs inside the LSI, this register is not updated.
3 to 1	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	STAT_BOOTCPUSEL	—	R	Indicates the terminal state of the external terminal BOOT_CPU_SELECT. The value is updated at the rising edge of SYS_RST#. If a reset occurs inside the LSI, this register is not updated.

4.3.3.2.59 LSI Device ID Register (SYS_LSI_DEVID)

This register indicates the product specific device ID.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEV_ID[31:28]				DEV_ID[27:0]											
Initial Value	—	—	—	—	1	0	0	0	0	1	1	1	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEV_ID[27:0]															
Initial Value	1	0	0	1	0	1	0	0	0	1	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DEV_ID [31:28]	—	R	Indicates the product revision.
27 to 0	DEV_ID[27:0]	H'87D_9447	R	Indicates the product specific fixed value. *Note*: RZ/G3L and RZ/G3SE are the same value. If identification between RZ/G3L and RZ/G3SE is needed, read the value of address H'0_1186_1560. Bit[2] of the read value = 0: RZ/G3L Bit[2] of the read value = 1: RZ/G3SE

4.3.3.2.60 LSI Product Register (SYS_LSI_PRR)

This register indicates information about product options.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	—	0	0	0	—	0	0	0	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	—	—	—	—	0	0	0	0	0	0	0	—	0	0	0	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
23 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
19 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16 to 12	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
11 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.

4.3.3.2.61 SYS_AOF1

This register is an address offset register for accessing the 34-bit address space from Ether ch0/ch1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFS11_SXGIGE_1				OFS10_SXGIGE_1				OFS01_SXGIGE_1				OFS00_SXGIGE_1			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXGIGE_0				OFS10_SXGIGE_0				OFS01_SXGIGE_0				OFS00_SXGIGE_0			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	OFS11_SXGIGE_1	0011b	R/W	Conversion value to address [33:30] when Ether ch1 address [31:30] = 11*1
27 to 24	OFS10_SXGIGE_1	0010b	R/W	Conversion value to address [33:30] when Ether ch1 address [31:30] = 10*1
23 to 20	OFS01_SXGIGE_1	0001b	R/W	Conversion value to address [33:30] when Ether ch1 address [31:30] = 01*1
19 to 16	OFS00_SXGIGE_1	0000b	R/W	Conversion value to address [33:30] when Ether ch1 address [31:30] = 00*1
15 to 12	OFS11_SXGIGE_0	0011b	R/W	Conversion value to address [33:30] when Ether ch0 address [31:30] = 11*1
11 to 8	OFS10_SXGIGE_0	0010b	R/W	Conversion value to address [33:30] when Ether ch0 address [31:30] = 10*1
7 to 4	OFS01_SXGIGE_0	0001b	R/W	Conversion value to address [33:30] when Ether ch0 address [31:30] = 01*1
3 to 0	OFS00_SXGIGE_0	0000b	R/W	Conversion value to address [33:30] when Ether ch0 address [31:30] = 00*1

Note 1. Master Ether ch0/ch1 are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

4.3.3.2.62 SYS_AOF2

This register is an address offset register for accessing the 34-bit address space from USB2.0 ch0 Host/Function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFS11_SXUSB2_0_F				OFS10_SXUSB2_0_F				OFS01_SXUSB2_0_F				OFS00_SXUSB2_0_F			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXUSB2_0_H				OFS10_SXUSB2_0_H				OFS01_SXUSB2_0_H				OFS00_SXUSB2_0_H			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	OFS11_SXUSB2_0_F	0011b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 11*1
27 to 24	OFS10_SXUSB2_0_F	0010b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 10*1
23 to 20	OFS01_SXUSB2_0_F	0001b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 01*1
19 to 16	OFS00_SXUSB2_0_F	0000b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 00*1
15 to 12	OFS11_SXUSB2_0_H	0011b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 11*1
11 to 8	OFS10_SXUSB2_0_H	0010b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 10*1
7 to 4	OFS01_SXUSB2_0_H	0001b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 01*1
3 to 0	OFS00_SXUSB2_0_H	0000b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 00*1

Note 1. Master USB2.0 ch0 Host/Function are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

4.3.3.2.63 SYS_AOF3

This register is an address offset register for accessing the 34-bit address space from USB2.0 ch1 Host/Function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	OFS11_SXUSB2_1_F	0011b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Function address [31:30] = 11*1
27 to 24	OFS10_SXUSB2_1_F	0010b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Function address [31:30] = 10*1
23 to 20	OFS01_SXUSB2_1_F	0001b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Function address [31:30] = 01*1
19 to 16	OFS00_SXUSB2_1_F	0000b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Function address [31:30] = 00*1
15 to 12	OFS11_SXUSB2_1_H	0011b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 11*1
11 to 8	OFS10_SXUSB2_1_H	0010b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 10*1
7 to 4	OFS01_SXUSB2_1_H	0001b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 01*1
3 to 0	OFS00_SXUSB2_1_H	0000b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 00*1

Note 1. Master USB2.0 ch1 Host/Function is the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

4.3.3.2.64 SYS_AOF4

This register is an address offset register for accessing the 34-bit address space from FCPCS and DSI.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
24	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
16	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	SYSRESETREQ	—	R	Warm reset request from Cortex-M33 0: No request 1: Requested
8	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
7 to 5	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	SLEEPDEEP	—	R	Cortex-M33 SLEEPDEEP status 0: Cortex-M33 is not in the Sleep Mode 1: Cortex-M33 is either in the Sleep Mode For more information, see **2.2.3 System CPU Cortex-M33**.
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SLEEPMODE	—	R	Cortex-M33 Sleep mode status 0: Not in the Sleep Mode. 1: In the Sleep Mode Asserted in multiple modes. For more information, see **2.2.3 System CPU Cortex-M33**.

4.3.3.2.73 SYS_LP_CA55CK_CTL1

This register controls the low power mode of Cortex-A55.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PDBGCLKQACTIVE	GICCLKQACTIVE	ATCLKQACTIVE	PCLKQACTIVE	—	—	—	PMCLKQACTIVE	PSCLKQACTIVE	AMCLKQACTIVE	ASCLKQACTIVE	—
Initial Value	0	0	0	0	—	—	—	—	0	0	0	—	—	—	—	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	PDBGCLKQACTIVE	—	R	Represents the status of a QACTIVE signal from the PDBGCLK domain of Cortex-A55 cluster.*1
10	GICCLKQACTIVE	—	R	Represents the status of a QACTIVE signal from the GICCLK domain of Cortex-A55 cluster.*1
9	ATCLKQACTIVE	—	R	Represents the status of a QACTIVE signal from the ATCLK domain of Cortex-A55 cluster.*1
8	PCLKQACTIVE	—	R	Represents the status of a QACTIVE signal from the PCLK domain of Cortex-A55 cluster.*1
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	PMCLKQACTIVE	—	R	Represents the state of the QACTIVE signal from cortex-A55 PP asynchronous bridge Master Interface.*1
3	PSCLKQACTIVE	—	R	Represents the state of the QACTIVE signal from the Cortex-A55 PP asynchronous bridge Slave Interface.*1
2	AMCLKQACTIVE	—	R	Represents the state of the QACTIVE signal from cortex-A55 ACE asynchronous bridge Master Interface.*1
1	ASCLKQACTIVE	—	R	Represents the state of the QACTIVE signal from the Cortex-A55 ACE asynchronous bridge Slave Interface.*1
0	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Note 1. The state of this register is used to determine whether subsequent Q-channel controls will start clock stop operations. For more information about QACTIVE signal specifications, see AMBA® Low Power Interface ARM® Q-Channel and P-Channel Interfaces.

4.3.3.2.74 SYS_LP_CA55CK_CTL2

This register controls the low power mode of Cortex-A55.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PDBGCLKQREQn	GICCLKQREQn	ATCLKQREQn	PCLKQREQn	—	—	—	PMCLKQREQn	PSCLKQREQn	AMCLKQREQn	ASCLKQREQn	—
Initial Value	0	0	0	0	1	1	1	1	0	0	1	1	1	1	1	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	PDBGCLKQREQn	1b	R/W	Set the level of the QREQn signal to the PDBGCLK domain of the Cortex-A55 cluster. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with PDBGCLKQACCEPTn and PDBGCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
10	GICCLKQREQn	1b	R/W	Set the level of the QREQn signal to the GICCLK domain of the Cortex-A55 cluster. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with GICCLKQACCEPTn and GICCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
9	ATCLKQREQn	1b	R/W	Set the level of the QREQn signal to the ATCLK domain of the Cortex-A55 cluster. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with ATCLKQACCEPTn and ATCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
8	PCLKQREQn	1b	R/W	Set the level of the QREQn signal to the PCLK domain of the Cortex-A55 cluster. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with PCLKQACCEPTn and PCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
7, 6	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	—	1b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
4	PMCLKQREQn	1b	R/W	Set the level of the QREQn signal to the PP asynchronous bridge Master Interface on cortex-A55. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with PMCLKQACCEPTn and PMCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.

Bit	Bit Name	Initial Value	R/W	Description
3	PSCLKQREQn	1b	R/W	Set the level of the QREQn signal to the PP asynchronous bridge Slave Interface on cortex-A55. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with PSCLKQACCEPTn and PSCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
2	AMCLKQREQn	1b	R/W	Set the level of the QREQn signal to the ACE asynchronous bridge Master Interface on cortex-A55. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with AMCLKQACCEPTn and AMCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
1	ASCLKQREQn	1b	R/W	Set the level of the QREQn signal to the ACE asynchronous bridge Slave Interface on cortex-A55. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with ASCLKQACCEPTn and ASCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
0	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

4.3.3.2.75 SYS_LP_CA55CK_CTL3

This register controls the low power mode of Cortex-A55.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	PDBGCLKQDENY	GICCLKQDENY	ATCLKQDENY	PCLKQDENY	—	—	—	PMCLKQDENY	PSCLKQDENY	AMCLKQDENY	ASCLKQDENY	CA55_COREINSTRRUN[1]
Initial Value	0	0	0	0	—	—	—	—	0	0	0	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PDBGCLKQACCEPTn	GICCLKQACCEPTn	ATCLKQACCEPTn	PCLKQACCEPTn	—	—	—	PMCLKQACCEPTn	PSCLKQACCEPTn	AMCLKQACCEPTn	ASCLKQACCEPTn	CA55_COREINSTRRUN[0]
Initial Value	0	0	0	0	—	—	—	—	0	0	0	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	PDBGCLKQDENY	—	R	Represents the status of the QDENY signal from the PDBGCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with PDBGCLKQREQn and PDBGCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
26	GICCLKQDENY	—	R	Represents the status of the QDENY signal from the GICCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with GICCLKQREQn and GICCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
25	ATCLKQDENY	—	R	Represents the status of the QDENY signal from the ATCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with ATCLKQREQn and ATCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
24	PCLKQDENY	—	R	Represents the status of the QDENY signal from the PCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with PCLKQREQn and PCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
23 to 21	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	PMCLKQDENY	—	R	Represents the status of the QDENY signal from the PP asynchronous bridge Master Interface on cortex-A55. This register represents the state of the Q-channel in combination with PMCLKQREQn and PMCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.

Bit	Bit Name	Initial Value	R/W	Description
19	PSCLKQDENY	—	R	Represents the status of the QDENY signal from the PP asynchronous bridge Slave Interface on cortex-A55. This register represents the state of the Q-channel in combination with PSCLKQREQn and PSCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
18	AMCLKQDENY	—	R	Represents the status of the QDENY signal from the ACE asynchronous bridge Master Interface on cortex-A55. This register represents the state of the Q-channel in combination with AMCLKQREQn and AMCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
17	ASCLKQDENY	—	R	Represents the status of the QDENY signal from the ACE asynchronous bridge Slave Interface on cortex-A55. This register represents the state of the Q-channel in combination with ASCLKQREQn and ASCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
16	CA55_COREINSTRRUN[1]	—	R	Indicates that Cortex-A55 Core1 has transitioned to the WFI/WFE state. 0: Transitioned or OFF state 1: Normal operation
15 to 12	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	PDBGCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the PDBGCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with PDBGCLKQREQn and PDBGCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
10	GICCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the GICCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with GICCLKQREQn and GICCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
9	ATCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the ATCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with ATCLKQREQn and ATCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
8	PCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the PCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with PCLKQREQn and PCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
7 to 5	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	PMCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the PP asynchronous bridge Master Interface on cortex-A55. This register represents the state of the Q-channel in combination with PMCLKQREQn and PMCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.

Bit	Bit Name	Initial Value	R/W	Description
3	PSCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the PP asynchronous bridge Slave Interface on cortex-A55. This register represents the state of the Q-channel in combination with PSCLKQREQn and PSCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
2	AMCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the ACE asynchronous bridge Master Interface on cortex-A55. This register represents the state of the Q-channel in combination with AMCLKQREQn and AMCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
1	ASCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the ACE asynchronous bridge Slave Interface on cortex-A55. This register represents the state of the Q-channel in combination with ASCLKQREQn and ASCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
0	CA55_COREINSTRRUN[0]	—	R	Indicates that Cortex-A55 Core0 has transitioned to the WFI/WFE state. 0: Transitioned or OFF state 1: Normal operation

4.3.3.2.76 SYS_LP_CA55CK_CTL4

This register controls the low power mode of Cortex-A55.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	PD_ISOVCC_ISORSTN	—	—	—	—	—	—	—	PD_ISOVCC_ISOEN
Initial Value	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 9	—	All 1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
8	PD_ISOVCC_ISORSTN	1b	R/W	Reset Controls isolation cell in the PD_ISOVCC region 0: Reset Force Assert 1: Reset Normal Control
7 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	PD_ISOVCC_ISOEN	0b	R/W	Controls isolation cell in the PD_ISOVCC region 0: Isolation Cell OFF (PD_ISOVCC power supply) 1: Isolation Cell ON (PD_ISOVCC power off)

4.3.3.2.78 Isolation Region IO Buffer SE18 Control Register (SYS_ISO_IOBUF_SE18_CTRL)

This register is SE18 of IO buffer in the isolation region control register.

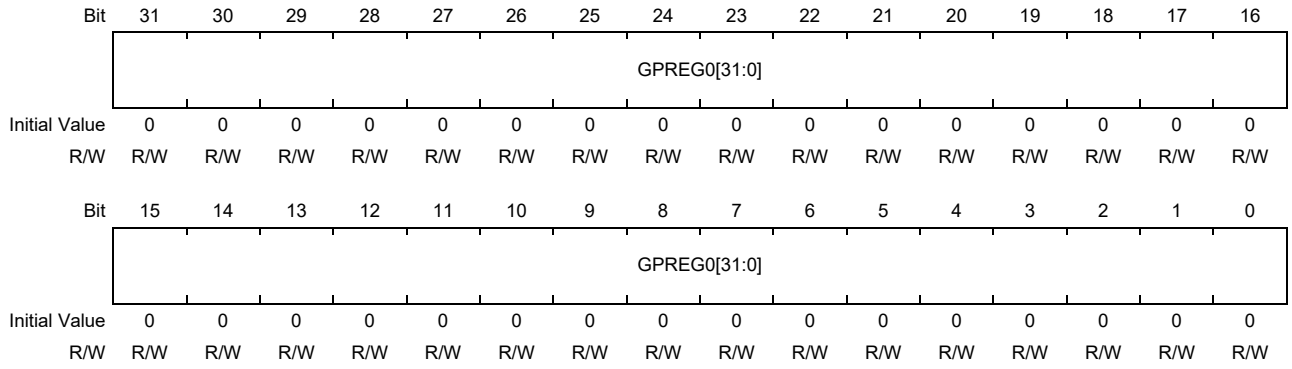
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ISO_IOBUF_SE18
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	ISO_IOBUF_SE18	1b	R/W	Controls SE18 of IO buffer in the isolation region 0: Controls SE18=0 1: Controls SE18=1

4.3.3.2.79 PWRRDY Register (SYS_PWRRDY_N)

This register is PWERRDY terminal of control register for USB, DSI and CSI.

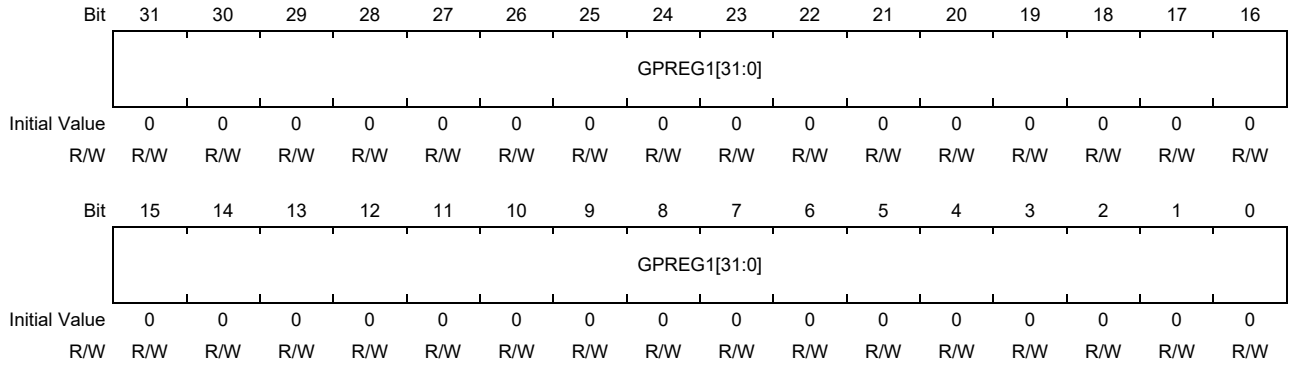


Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PWRRDY_N		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	PWRRDY_N [2:0]	000b	R/W	Controls PWRRDY terminal of USB, DSI and CSI 0: PWRRDY 1: PWRRDY down [2]: 0: When turning off the CSI region power, set this bit to 1. 1: When turning on the CSI region power, set this bit to 0 [1]: 0: When turning off the DSI region power, set this bit to 1. 1: When turning on the DSI region power, set this bit to 0 [0]: 0: When turning off the USB region power, set this bit to 1. 1: When turning on the USB region power, set this bit to 0

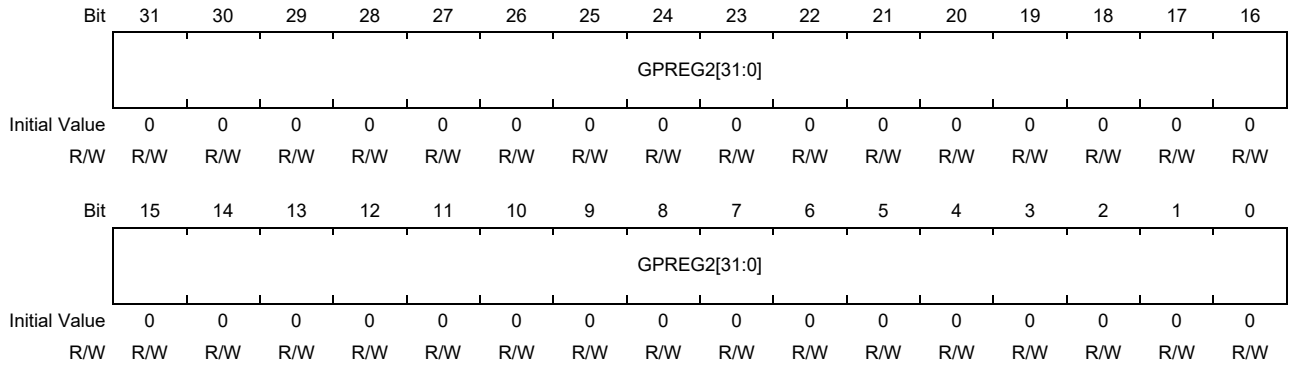
4.3.3.2.80 General Register0 (SYS_GPREG_0)



This register is a general-purpose register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREG0 [31:0]	H'0000_0000	R/W	General-purpose register 0 It is a 32-bit register. It is possible to write any value, read the written value.

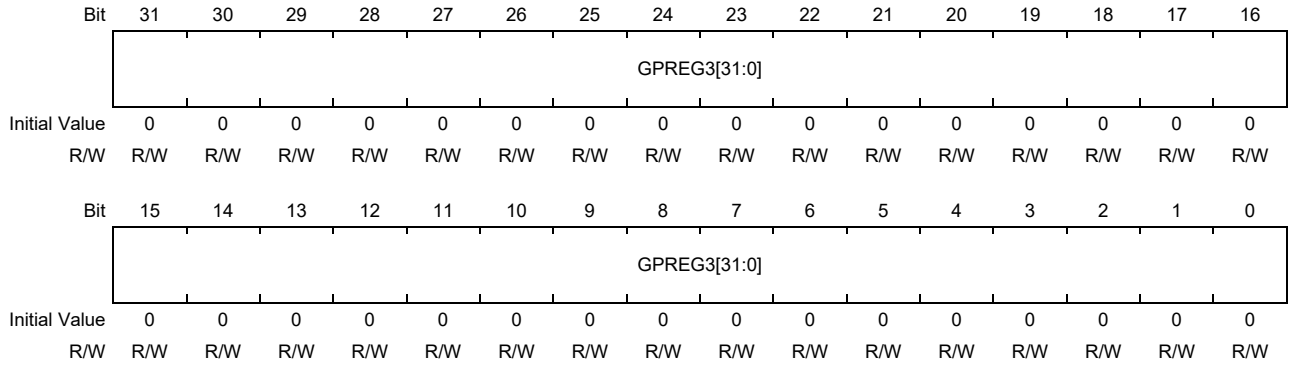
4.3.3.2.81 General Register1 (SYS_GPREG_1)



This register is a general-purpose register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREG1 [31:0]	H'0000_0000	R/W	General-purpose register 1 It is a 32-bit register. It is possible to write any value, read the written value.

4.3.3.2.82 General Register2 (SYS_GPREG_2)



This register is a general-purpose register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREG2 [31:0]	H'0000_0000	R/W	General-purpose register 2 It is a 32-bit register. It is possible to write any value, read the written value.

4.3.3.2.83 General Register3 (SYS_GPREG_3)

This register is a general-purpose register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREG3 [31:0]	H'0000_0000	R/W	General-purpose register 3 It is a 32-bit register. It is possible to write any value, read the written value.

4.3.3.2.84 CM33 Address Space Definition Register (SYS_IPCONT_ IDAUZERONS)

This register is Cortex-M33 Address Space definition register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IDAUZERONS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	IDAUZERONS	0b	R/W	Non-Secure area and Secure area definition of Cortex-M33 Address Space 0: Secure (lower), Non-Secure (upper) 1: Secure (upper), Non-Secure (lower)

4.3.3.2.85 Clone Channel ControlRegister (SYS_IPCONT_SEL_CLONECH)

This register is clone channel control register.

Refer to **4.2.4.2 Operation for Peripheral Function** for the setting timing of this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IPCONT_SEL_CLONECH															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	IPCONT_SEL_CLONECH [15:0]	All 0	R/W	Controls the clone channel of the IP corresponding to each bit. 		1	5 / 6*1	{P61_ISO, P62_ISO, P63_ISO, P64_ISO}, {P72_ISO, P73_ISO, P74_ISO, P75_ISO}, {P82_ISO, P83_ISO, P84_ISO, P85_ISO}

Note 1. PFC = 5 shared pins or PFC = 6 shared pins are used according to RSCI mode.

4.3.4 Operation

4.3.4.1 External Terminal State Capture Function

Captures the state of the following five external terminals at the rising edge of SYS_RST# terminal and holds them into the SYS_LSI_MODE register. The value is not updated by a reset that occurs inside the LSI.

- BOOT_CPU_SELECT
- BOOT_MODE[2:0]
- BOOT_MODE3
- SYSCLK_SSCG_EN
- SYSCLK_OSC_BYPASS

4.3.4.2 WDT Stop Control Function

By writing 1 to the WDTSTOP bit of the SYS_WDTn_CTRL register (n: 0, 1, 2), the following WDT corresponding to n is forcibly stopped and the count value is retained.

Also, by writing 1 to the WDTSTOPMASK bit of the SYS_WDTn_CTRL register (n: 0, 1, 2), the following WDT count corresponding to n can be continued even during debugging. If 0 is written, the WDT count will stop during debugging.

n	Stop WDT
0	WDT0 (for Cortex-A55 Non-Secure)
1	WDT1 (for Cortex-A55 Secure)
2	WDT2 (for Cortex-M33)

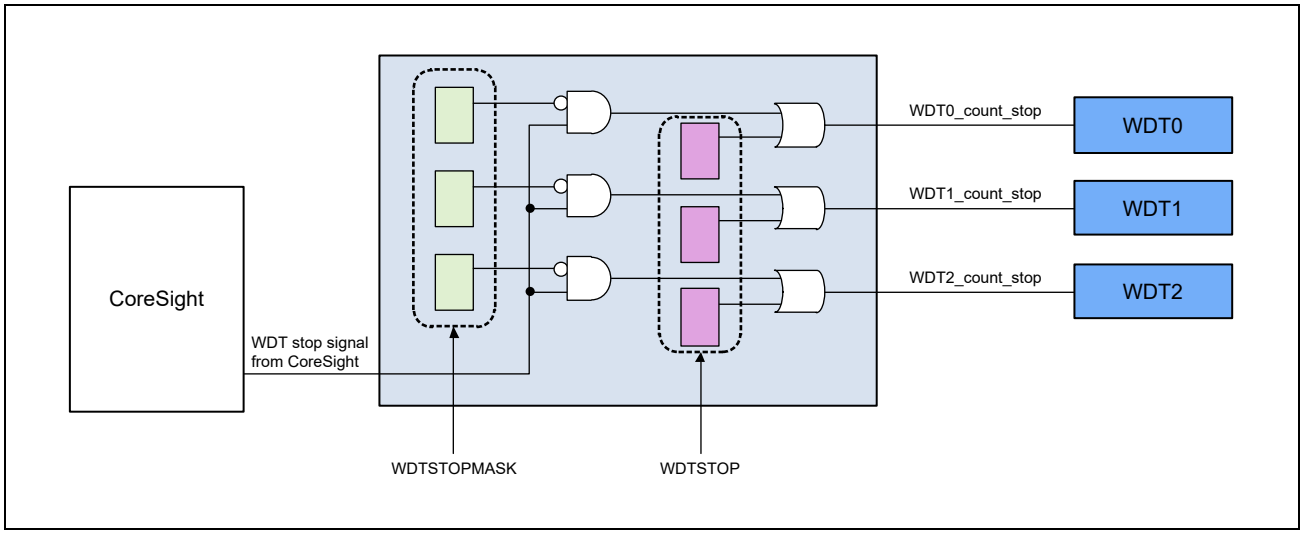

Figure 4.3-2 Overview of WDT Stop Function

SECTION 4 SYSTEM

4.4 Clock Pulse Generator (CPG)

This section describes the clock pulse generator (CPG) of this LSI chip.

4.4.1 Overview

The CPG mainly handles the generation and control of clock signals for the IP modules, the generation and control of resets.

Table 4.4-1 Overview

Function	Description
Generation and control of clock signals	Clock control
Generation and control of resets	Reset control
Control over low power consumption	Control over handshaking with the CPUs and the stopping of clock signals

4.4.1.1 Functions for the Generation and Control of Clock Signals

- Generation of clock signals to be supplied to the various units from an externally input clock signal or PLL output clock signal
- Frequency selection by register settings
- Selection of clock supply routes by register settings that set up the use of the clock selectors
- Control of turning clock supplies on and off by register settings
- Control by register settings of the spread spectrum clock generator (SSCG), the multiplication factor settings for the PLL clock signals, and turning the clock signals on and off

- The roles of each PLL are as follows.
  - PLL1 (the level on the external SYSCLK_SSCG_EN pin determines the default SSCG setting):
    For the CA55
  - PLL2 (default SSCG setting: fixed to off):
    For the system bus in the AWO domain IP and SSCG non-configurable IP
  - PLL3 (the level on the external SYSCLK_SSCG_EN pin determines the default SSCG setting):
    For the system bus and various units for which the SSCG function is available
  - PLL4 (default SSCG setting: on):
    For the DDR
  - PLL6 (default SSCG setting: off):
    For the GBETH
  - PLL7 (default SSCG setting: off):
    For the DSI, LCDC, and LVDS

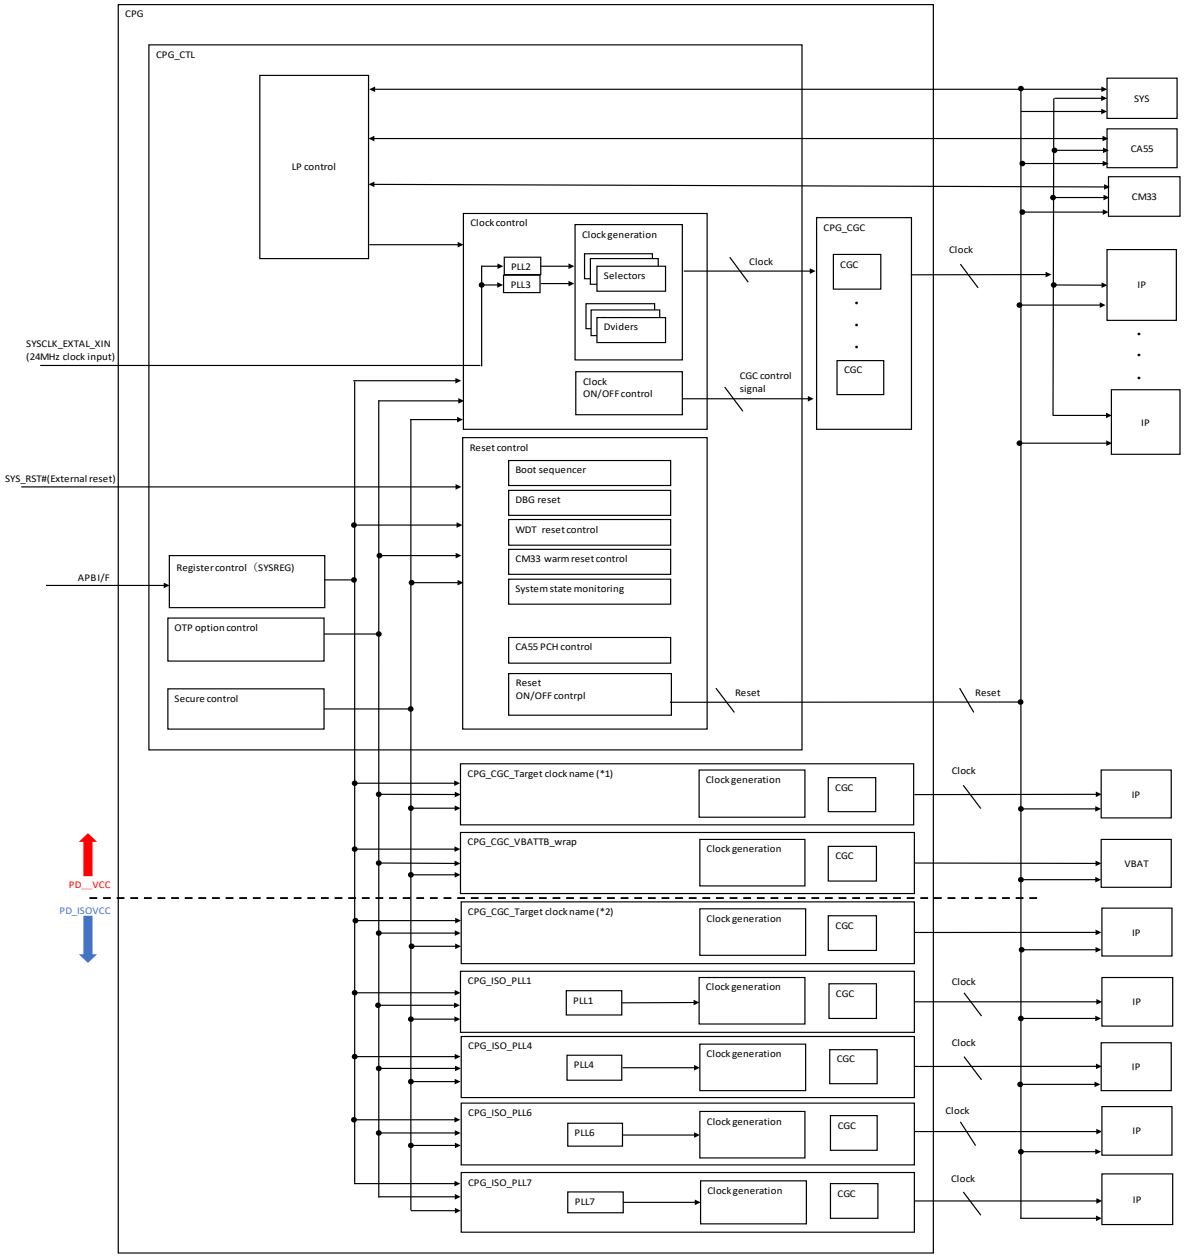
- Initial value of SSCG for each PLL (PLL3 is fixed).
  - Spread: Down spread (PLL1, PLL3, PLL4 and PLL6), Center spread (PLL7)
  - Fmod: 30.0 (PLL1), 30.3 kHz (PLL3, PLL4, PLL6 and PLL7)
  - Modulation depth: −2.00% (PLL1, PLL3 and PLL6), −1.00% (PLL4), ±1.00% (PLL7)

4.4.1.2 Function for the Generation and Control of Resets

The CPG generates reset signals in response to each of the reset source factors. The types of reset are described below.

- System reset (external pin)
- Software reset (reset control of each module)
- WDT reset
- CA55 warm reset control (control by software)
- CM33 warm reset control
- Control over switching the resetting of individual units off and on

4.4.1.3 Function for the Control of Booting



The CPG controls booting of the system. The following four boot modes are available.

- CM33 boot (normal mode)
- CM33 boot (debug mode)
- CA55 boot (normal mode)
- CA55 boot (debug mode)

4.4.1.4 Function for the Control over Low Power Consumption

- The CPG controls low power consumption for the system.
  The CPG controls handshaking with the CPUs in some low-power-consumption modes.
- The types of low-power-consumption mode are described below.
  - Module standby mode
  - Low-frequency mode
  - CA55 sleep mode
  - CM33 sleep mode
  - VBATT mode

4.4.1.5 Functional Block Diagram

Target clock name *1: reg_top, mcpu_top, xspi_top
Target clock name *2: peri_top_mcpu, peri_top_hpb0, rzg3l_top_Iso, rzg3l_ddrtop, video_top_upper, video_top_lower, com_top_upper, com_top_lower

Figure 4.4-1 Functional Block Diagram

4.4.1.6 Pin Description

The table below shows a list of CPG pins.

Table 4.4-2 Pin List

Name	Pin Name	Input/ Output	Functions
Mode control pin	BOOT_MODE0	Input	Set the operating mode. Do not change during SYS_RST# pin asserts and after negating until the operating mode is confirmed.
	BOOT_MODE1	Input	
	BOOT_MODE2	Input	
	SYSCLK_SSCG_EN	Input	Set ON / OFF of SSCG circuit operation of PLL1 and PLL3. Do not change during SYS_RST# terminal asserts and after negating until the operating mode is confirmed.
OSC clock switching pin	SYSCLK_OSC_BYPASS	Input	This pin is used to switch between the crystal oscillator and the external clock. 0: crystal oscillator 1: external clock (bypass) Do not change during SYS_RST# pin asserts and after negating until the operating mode is confirmed.
Crystal oscillator input/output pin	SYSCLK_EXTAL_XIN	Input	These are pins to connect the 24 MHz crystal oscillator. For external clock (bypass), connect the external clock to the SYSCLK_EXTAL_XIN and open the SYSCLK_XOUT.
	SYSCLK_XOUT	Output	
Power on reset input pin	SYS_RST#	Input	When this pin becomes low level, it will be in the power on reset state.

4.4.2 Clock List

Please refer to another file for the clock list.

(Please double-click the icon on the right side) 

4.4.3 Registers

The base addresses for the CPG registers (SYSREG) are given below.

Table 4.4-3 Register Base Addresses

Base Address Name	Base Address
<CPG_base>	0_1101_0000h (5101_0000h*1, 4101_0000h*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

NOTE

- The initial values of these registers are those before forcibly modifying them by hardware (initial values following a reset). For the bits to be forcibly modified by hardware, the note “The setting is to be forcibly modified by hardware,” is added in the following sections.
- Write the values read from reserved bits to them by using a read–modify–write operation.
- When writing to a bit with a write enable bit, set the corresponding xxxx_WEN bit to 1 at the same time.

Table 4.4-4 Register Address Space

Classification	Offset Address
SSCG PLL Control Registers (PLL1, 2, 3, 4, 6, 7)	H’000 to H’103
Reserved	H’104 to H’1FF
Frequency Dynamic Change Control Registers	H’200 to H’3FF
Frequency Static Change Control Registers	H’400 to H’4FF
Clock Control Registers	H’500 to H’67F
Clock Monitor Registers	H’680 to H’7FF
Reset Control Registers	H’800 to H’97F
Reset Monitor Registers	H’980 to H’AFF
Other Registers	H’B00 to H’FFF

The CPG registers are listed in the table below.

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
PLL1 (SSCG) Standby Control Register	CPG_PLL1_STBY	0000_0000h	0000h	32
PLL1 (SSCG) Output Clock Setting Register 1	CPG_PLL1_CLK1	0458_E001h	0004h	32
PLL1 (SSCG) Output Clock Setting Register 2	CPG_PLL1_CLK2	0000_0023h	0008h	32
PLL1 (SSCG) Monitor Register	CPG_PLL1_MON	0000_0000h	000Ch	32
PLL2 (SSCG) Monitor Register	CPG_PLL2_MON	0000_0000h	001Ch	32
PLL3 (SSCG) Monitor Register	CPG_PLL3_MON	0000_0000h	002Ch	32
PLL4 (SSCG) Standby Control Register	CPG_PLL4_STBY	0000_0004h	0030h	32
PLL4 (SSCG) Output Clock Setting Register 1	CPG_PLL4_CLK1	04A1_3557h	0034h	32
PLL4 (SSCG) Output Clock Setting Register 2	CPG_PLL4_CLK2	0000_0002h	0038h	32
PLL4 (SSCG) Monitor Register	CPG_PLL4_MON	0000_0000h	003Ch	32
PLL6 (SSCG) Standby Control Register	CPG_PLL6_STBY	0000_0000h	0050h	32
PLL6 (SSCG) Output Clock Setting Register 1	CPG_PLL6_CLK1	048F_8000h	0054h	32
PLL6 (SSCG) Output Clock Setting Register 2	CPG_PLL6_CLK2	0000_0003h	0058h	32
PLL6 (SSCG) Monitor Register	CPG_PLL6_MON	0000_0000h	005Ch	32
Reserve	-	-	0060h to 007Fh	-
PLL7 (SSCG) Standby Control Register	CPG_PLL7_STBY	0000_0010h	0080h	32
PLL7 (SSCG) Output Clock Setting Register 1	CPG_PLL7_CLK1	00AE_C001h	0084h	32
PLL7 (SSCG) Output Clock Setting Register 2	CPG_PLL7_CLK2	0000_0003h	0088h	32
PLL7 (SSCG) Monitor Register	CPG_PLL7_MON	0000_0000h	008Ch	32
Reserve	-	-	0090h to 00FFh	-
PLL1_SEL_SETTING Register	CPG_PLL1_SETTING	0000_0001h	0100h	32
Reserve	-	-	0104h to 01FFh	-
Division Ratio Setting (PLL1) Register	CPG_PL1_DDIV	0000_0000h	0200h	32
Division Ratio Setting (PLL2) Register	CPG_PL2_DDIV	0000_0000h	0204h	32
Division Ratio Setting (PLL3) Register	CPG_PL3_DDIV	0000_0000h	0208h	32
Reserve	-	-	020Ch to 0217h	-
Division Ratio Setting (SDHI) Register	CPG_SDHI_DDIV	0000_0222h	0218h	32
Reserve	-	-	021Ch to 021Fh	-
Division Ratio Setting (xSPI) Register	CPG_XSPI_DDIV	0000_0007h	0220h	32
Division Ratio Setting (GE3D) Register	CPG_GE3D_DDIV	0000_0000h	0224h	32
Division Ratio Setting (DSI) Register	CPG_DSI_DDIV	0000_0000h	0228h	32
Division Ratio Setting (PDM) Register	CPG_PDM_DDIV	0000_0000h	022Ch	32
Division Ratio Setting (BSC) Register	CPG_BSC_DDIV	0000_0000h	0230h	32

4.4.3.1 PLLn (SSCG) Standby Control Register (CPG_PLLn_STBY) (n = 1, 4, 6 or 7)

This register is used to control the power-saving mode and standby state and enable or disable the SSCG.

Remark Except for PLL7, use SSC_MODE = 0b.
In the case of MIPI-DSI, SSC is disabled. (set SSC_EN=0b)
For LVDS, the upper limit of the clock rate must not exceed 87 MHz.

Access Size : 32 bits
Address : <CPG_base> + 0000h
Initial Value : Undefined

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	SSC_MODE_WEN	0h	R0W1	pllname write enable for SSC_MODE
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	SSC_EN_WEN	0h	R0W1	pllname write enable for SSC_EN
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	RESETB_WEN	0h	R0W1	pllname write enable for RESETB
15 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	SSC_MODE	0h	RW	SSC Center/Down Spread setting 0b: Down spread 1b: Center spread
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	SSC_EN	x	RW	pllname SSCG on/off setting 0b: SSCG off 1b: SSCG on
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RESETB	x	RW	pllname reset setting 0b: Reset state 1b: Active (reset released state))

x: Undefined value

Note: Regarding the initial value, refer to **Table 4.4-5**.

For details on the registers such as offset addresses, refer to the table below.

Table 4.4-5 Details on the CPG_PLLn_STBY Registers such as Offset Addresses

Register Name	Offset Address	Initial Value	SSC_EN Bit
CPG_PLL1_STBY	000h	0000_0000h	Depends on SYSCLK_SSCG_EN
CPG_PLL4_STBY	030h	0000_0004h	Enable
CPG_PLL6_STBY	050h	0000_0000h	Disable
CPG_PLL7_STBY	080h	0000_0010h	Disable

Table 4.4-6 Mode Setting Table

Mode		Bit Name		
		RESETB	SSC_EN	SSC_MODE
Reset state		0	—	—
SSCG disabled		1	0	—
SSCG enabled	Down spread		1	0b
	Center spread			1b

4.4.3.2 PLLn (SSCG) Output Clock Setting Register 1 (CPG_PLLn_CLK1) (n = 1, 4, 6 or 7)

This register is used to specify the frequency division values RANGESEL, nf, ni, mr and pr for SSCG PLLn (n = 1, 4, 6 or 7).

Access Size : 32 bits
Address : <CPG_base> + 0004h
Initial Value : Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28 to 26	DIV_P[2:0]	x	RW	Divider P is a bit for configuration.*3 You can set the value of 1, 2, 4, 8, 16 (decimal). 111, 100: Division Ratio “pr” = 16 011: Division Ratio “pr” = 8 010: Division Ratio “pr” = 4 001: Division Ratio “pr” = 2 000: Division Ratio “pr” = 1
25 to 22	DIV_M[3:0]	x	RW	Pre-Divider is a bit for configuration.*3 It can be set within the range of values of 1 to 12 (decimal) and within the range that satisfies the constraints of Note 1 and Note 2. 1111 to 1100: Setting prohibited 1011: Division Value “mr” = 12 1010: Division Value “mr” = 11 ⋮ 0001: Division Value “mr” = 2 0000: Division Value “mr” = 1
21 to 13	DIV_NI[8:0]	x	RW	Main-Divider is a bit for configuration.*3 It can be set within the range of values of 56 to 375 (decimal) and within the range that satisfies the constraints of Note 1 and Note 2. 1_1111_1111 to 1_0111_0111: Setting prohibited 1_0111_0110: Division Value “nir” = 375 1_0111_0101: Division Value “nir” = 374 ⋮ 0_0011_1000: Division Value “nir” = 57 0_0011_0111: Division Value “nir” = 56 0_0011_0110 to 0_0000_0000: Setting prohibited
12 to 1	DIV_NF[11:0]	x	RW	Delta-Signa Modulator(DSM) is a bit for configuration.*3 It can be set within the range of values of 0 to 4095 (decimal) and within the range that satisfies the constraint of Note 1. 1111_1111_1111: Division Value “nfr” = 4095 1111_1111_1110: Division Value “nfr” = 4094 ⋮ 0000_0000_0001: Division Value “nfr” = 1 0000_0000_0000: Division Value “nfr” = 0
0	RANGESEL	x	RW	Register for Setting PLL Oscillation Frequency (DCO) Range.*3 This register selects the range of the PLL oscillation frequency based on its value. 0: 900 MHz ≤ DCO ≤ 2000 MHz 1: 2000 MHz ≤ DCO ≤ 3000 MHz

x: Undefined value

Note: Regarding the initial value, refer to **Table 4.4-7**.

For details on the registers such as offset addresses, refer to the table below.

Table 4.4-7 Details on the CPG_PLLn_CLK1 Registers such as Offset Addresses

Register Name	Offset Address	Initial Value
CPG_PLL1_CLK1	004h	0458_E001h
CPG_PLL4_CLK1	034h	04A1_3557h*1
CPG_PLL6_CLK1	054h	048F_8000h
CPG_PLL7_CLK1	084h	00AE_C001h

Note 1. Be sure to change the initial value according to the speed of the DDR to be connected.
Setting CPG_PLL4_CLK1 = 0090_8000h for DDR4/LPDDR 2133.
Setting CPG_PLL4_CLK1 = 0498_E000h for DDR4/LPDDR 1600.

Note 2. The PLL oscillation frequency (fdco) and output frequency (fout) can be calculated by the following equations.

- Equations (fstd = Input frequency)

  nr = $nir + nfr / 4096$

  fdco = $(nr \times fstd) / mr$

  fout = $(nr \times fstd) / (mr \times pr)$

- Restrictions

8 MHz ≤	*fstd*	≤ 192 MHz
8 MHz ≤	*fstd / mr*	≤ 16 MHz
56.25 ≤	*nr*	≤ 375
0.293 ≤	*nr / (mr × pr)*	≤ 375
900 MHz ≤	*fdco*	≤ 2,000 MHz @RANGESEL = 0
2,000 MHz ≤	*fdco*	≤ 3,000 MHz @RANGESEL = 1

Note 3. Specify DIV_P, DIV_M, DIV_NI, DIV_NF, and RANGESEL within the allowable ranges of fdco and fout for each PLL shown below.

SSCG PLL	fout Min.	Default fout Setting	fout Max.
PLL1	1,200 MHz	1,200 MHz	1,200 MHz
PLL4	800 MHz	1067 MHz	1067 MHz
PLL6	500 MHz	500 MHz	500 MHz
PLL7	3000MHz	3000MHz	3000MHz

Note 4. The PLL should be reset after the PLL settings are modified. For details, refer to **4.4.6.5 Procedure for Setting PLLs**.

4.4.3.3 PLLn (SSCG) Output Clock Setting Register 2 (CPG_PLLn_CLK2) (n = 1, 4, 6 or 7)

This register is used to specify the frequency division value s and SSCG modulation values mfr and mrr for SSCG PLLn (n = 1, 4, 6 or 7).

Access Size : 32 bits
Address : <CPG_base> + 0008h
Initial Value : Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	SELMFREQ[4:0]					SELMPERCENT[2:0]		
Initial Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
7 to 3	SELMFREQ[4:0]	x	RW	This is a bit for setting the modulation frequency. If you change the settings, you will need to reset the PLL.
2 to 0	SELMPERCENT [2:0]	x	RW	This is a bit for setting the modulation rate. If you change the settings, you will need to reset the PLL.

x: Undefined value

Note: Regarding the initial value, refer to **Table 4.4-8**.

For details on the registers such as offset addresses, refer to the table below.

Table 4.4-8 Details on the CPG_PLLn_CLK2 Registers such as Offset Addresses

Register Name	Offset Address	Initial Value
CPG_PLL1_CLK2	008h	0000_0023h
CPG_PLL4_CLK2	038h	0000_0002h
CPG_PLL6_CLK2	058h	0000_0003h
CPG_PLL7_CLK2	088h	0000_0003h

Note 1. The modulation frequency (MF) and modulation ratio (pk-pk) (MR) can be calculated by the following equations.

- Equations

  MF = PFD input frequency / (Divided ratio × 4)

  Note: PFD input frequency (fpfd): Input frequency (fstd)/mr

- Modulation frequency

SELMFREQ [4:0]	Divided Ratio	PFD Input Frequency (fpfd) [MHz]							
		8	9	10	11	12	13	14	15
00000	66	30.30	34.09	37.88	41.67	45.45	49.24	53.03	56.82

- Modulation ratio

SELMPERCENT [2:0]	Down Spread	Center Spread
000	−0.25%	±0.125%
001	−0.5%	±0.25%
010	−1.0%	±0.5%
011	−2.0%	±1.0%
100	−3.0%	±1.5%
101	Invalid	Invalid
110	Invalid	Invalid
111	Invalid	Invalid

Important:

For the procedures for setting up the PLL, see **4.4.6.5 Procedure for Setting PLLs**.

Initial Values:

The initial values of the registers for PLL1, PLL4, PLL6 and PLL7 output clocks are shown below.

- Initial values of registers

	CPG_PLLn_STBY (n = 1, 4, 6 or 7)		
	SSC_MODE	SSC_EN	RESETB
PLL	Bit 4	Bit 2	Bit 0
PLL1	H'0 (Down spread)	Depends on SYSCLK_SSCG_EN	0 (Reset state)
PLL4	H'0 (Down spread)	1 (SSCG is enabled)	0 (Reset state)
PLL6	H'0 (Down spread)	0 (SSCG is disabled)	0 (Reset state)
PLL7	H'1 (Center spread)	0 (SSCG is disabled)	0 (Reset state)

	CPG_PLLn_CLK1 (n = 1, 4, 6 or 7)					CPG_PLLn_CLK2 (n = 1, 4, 6 or 7)	
	DIV_P	DIV_M	DIV_NI	DIV_NF	RANGESEL	SELMFREQ	SELMPERCENT
PLL	Bits 28 to 26	Bits 25 to 22	Bits 21 to 13	Bits 12 to 1	Bit 0	Bits 7 to 3	Bits 2 to 0
PLL1	H'1 (pr = 2)	H'1 (mr = 2)	H'0C7 (nir = 200)	H'000 (nfr = 0)	1	H'04	H'3
PLL4	H'1 (pr = 2)	H'2 (mr = 3)	H'109 (nir = 266)	H'AAB (nfr = 2,731)	1	H'00	H'2
PLL6	H'1 (pr = 2)	H'2 (mr = 3)	H'07C (nir = 125)	H'000 (nfr = 0)	0	H'00	H'3
PLL7	H'0 (pr = 1)	H'2 (mr = 3)	H'176 (nir = 375)	H'000 (nfr = 0)	1	H'00	H'3

- Output clocks (initial values)

PLL	PLL Operating Mode	Frequency (fout) [MHz]	SSCG	Fmod [kHz]	Spread	Modulation Depth [%]
PLL1	Reset state	1,200	*1	30.0	Down spread	−2.00
PLL4	Reset state	1067	Enabled	30.3	Down spread	−1.00
PLL6	Reset state	500	Disabled	30.3	Down spread	−2.00
PLL7	Reset state	3,000	Disabled	30.3	Center spread	±1.00

Note 1. The SSCG for PLL1 depends on the SYSCLK_SSCG_EN.

4.4.3.4 PLLn (SSCG) Monitor Register (CPG_PLLn_MON) (n = 1, 2, 3, 4, 6 or 7)

This register is used to monitor the state of the PLLn (n = 1, 2, 3, 4, 6 or 7).

Access Size : 32 bits
Address : <CPG_base> + 000Ch
Initial Value : Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	x	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	PLLn_LOCK	x	R	SSCG PLL lock state monitoring 0: PLL is not locked. 1: PLL is locked.
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PLLn_RESETB	x	R	SSCG PLL operating mode monitoring 1: Normal mode 0: Reset state (standby mode)

For details on the registers such as offset addresses, refer to the table below.

Table 4.4-9 CPG_PLLn_MON Offset Addresses

Register Name	Offset Address
CPG_PLL1_MON	00Ch
CPG_PLL2_MON	01Ch
CPG_PLL3_MON	02Ch
CPG_PLL4_MON	03Ch
CPG_PLL6_MON	05Ch
CPG_PLL7_MON	08Ch

4.4.3.5 PLL1_SEL_SETTING Register (CPG_PLL1_SETTING)

This register is used to specify the frequency of PLL1.

Access Size : 32 bits

Address : <CPG_base> + 0100h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PLL1_SEL_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	PLL1_SEL_WEN	0h	R0W1	Flag for enabling the writing to the PLL1_SEL bit. This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PLL1_SEL	1h	RW	0: Use the CPG_PLL1_CLK1 and CPG_PLL1_CLK2 settings. 1: Use the 1.2 GHz setting.

4.4.3.6 Division Ratio Setting (PLL1) Register (CPG_PL1_DDIV)

This register is used to set the division ratio of the clock for the Cortex-A55.

The PLL1 (1,200 MHz) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

Access Size : 32 bits

Address : <CPG_base> + 0200h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	DIV_PLL1_A_WEN	0h	R0W1	Flag for enabling the writing to the DIV_PLL1_A_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2 to 0	DIV_PLL1_A_SET[2:0]	0h	RW	DIV_CA55 division ratio setting 000b: 1/1 (1,200 MHz) 001b: 1/2 (600 MHz) 010b: 1/4 (300 MHz) 011b: 1/8 (150 MHz) 100b: 1/16 (75 MHz) 101b: 1/32 (37.5 MHz) Other: Setting prohibited

4.4.3.7 Division Ratio Setting (PLL2) Register (CPG_PL2_DDIV)

This register is used to set the division ratios of the clocks for the system bus and the IP modules that cannot use SSCG clocks.

The PLL2 (up to 1,600 MHz) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

Access Size : 32 bits

Address : <CPG_base> + 0204h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	RW	RW	R	R	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	DIV_CLKQSPI_WEN	0h	R0W1	Flag for enabling the writing to the DIV_CLKQSPI_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	DIV_PLL2_B_WEN	0h	R0W1	Flag for enabling the writing to the DIV_PLL2_B_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	DIV_PLL2_A_WEN	0h	R0W1	Flag for enabling the writing to the DIV_PLL2_A_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
9, 8	DIV_CLKQSPI_SET[1:0]	0h	RW	DIV_PLL2_QSPI division ratio setting 000b: 1/4 (200 MHz) 001b: 1/8 (100 MHz) 010b: 1/16 (50 MHz) 011b: 1/128 (6.25 MHz)
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5, 4	DIV_PLL2_B_SET[1:0]	0h	RW	DIV_PLL2_100 division ratio setting 000b: 1/8 (100 MHz) 001b: 1/16 (50 MHz) 010b: 1/32 (25 MHz) 011b: 1/256 (3.125 MHz) When OSTM or WDT is used, 2'b00 should be set.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	DIV_PLL2_A_SET[1:0]	0h	RW	DIV_PLL2_200 division ratio setting 000b: 1/4 (200 MHz) 001b: 1/8 (100 MHz) 010b: 1/16 (50 MHz) 011b: 1/128 (6.25 MHz)

4.4.3.8 Division Ratio Setting (PLL3) Register (CPG_PL3_DDIV)

This register is used to set the division ratios of the clocks for the system bus and the IP modules that can use SSCG clocks.

The clock obtained by dividing the output of PLL3 is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

Access Size : 32 bits

Address : <CPG_base> + 0208h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1, 0	DIV_PLL3_A_S ET[1:0]	0h	RW	DIV_PLL3_200 division ratio setting 000b: 1/4 (200 MHz) 001b: 1/8 (100 MHz) 010b: 1/16 (50 MHz) 011b: 1/128 (6.25 MHz)

4.4.3.9 Division Ratio Setting (SDHI) Register (CPG_SDHI_DDIV)

This register is used to set the division ratio of the clock for the SDHI.

SEL_SDHIn (n = 0, 1 and 2) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

If 800 MHz is selected in the CPG_SDHI_DSEL, 1/1 setting is prohibited.

Access Size : 32 bits

Address : <CPG_base> + 0218h

Initial Value : 0000_0222h

1, 0	DIVSDHI0_SET [1:0]	2h	RW	DIV_SDHI0 division ratio setting 00b: 1/1 01b: 1/2 10b: 1/4 Other: Setting prohibited

4.4.3.10 Division Ratio Setting (xSPI) Register (CPG_XSPI_DDIV)

This register is used to set the division ratio of the clock for the SPI.

SEL_SPI output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

If 800 MHz is selected in the CPG_XSPI_SSEL, 1/1 setting is prohibited.

Access Size : 32 bits

Address : <CPG_base> + 0220h

Initial Value : 0000_0003h

1, 0	DIV_DSI_SET [1:0]	0h	RW	DIV_CLK266FIXC_DIV16to128 division ratio setting 00b: 1/16 01b: 1/32 10b: 1/64 11b: 1/128

4.4.3.13 Division Ratio Setting (PDM) Register (CPG_PDM_DDIV)

This is the PDM source clock switching register.

It can be selected from 1/3 of the OSC (24 MHz) output and 1/5 of the OSC (24 MHz) output.

Access Size : 32 bits

Address : <CPG_base> + 022Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DIV_PDM_WEN

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	DIV_PDM_WEN	0h	R0W1	Flag for enabling the writing to the DIV_PDM_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	DIV_PDM_SET	0h	RW	DIV_CLK24_SEL division ratio setting 0b: 1/3 1b: 1/5

4.4.3.14 Division Ratio Setting (BSC) Register (CPG_BSC_DDIV)

This register is used to set the division ratio of the clock for the BSC.

SEL_BSC output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

Access Size : 32 bits

Address : <CPG_base> + 0230h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	DIV_BSC_WEN	0h	R0W1	Flag for enabling the writing to the DIV_BSC_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1, 0	DIV_BSC_SET [1:0]	0h	RW	DIV_BSC division ratio setting 00b: 1/2 01b: 1/4 10b: 1/8 11b: 1/16

4.4.3.15 Division Ratio Setting (CA55CORE) Register (CPG_CA55CORE_DDIV)

This register is used to set the division ratio of the clock for the CA55CORE.

PLL1(1,200 MHz) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

Access Size : 32 bits

Address : <CPG_base> + 0234h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
14 to 12	DIV_CORE3_SET[2:0]	0h	RW	DIV_CA55_CORE3 division ratio setting 000b: 1/1 001b: 1/2 010b: 1/4 011b: 1/8 100b: 1/16 101b: 1/32 Other: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10 to 8	DIV_CORE2_SET[2:0]	0h	RW	DIV_CA55_CORE2 division ratio setting 000b: 1/1 001b: 1/2 010b: 1/4 011b: 1/8 100b: 1/16 101b: 1/32 Other: Setting prohibited
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
6 to 4	DIV_CORE1_SET[2:0]	0h	RW	DIV_CA55_CORE1 division ratio setting 000b: 1/1 001b: 1/2 010b: 1/4 011b: 1/8 100b: 1/16 101b: 1/32 Other: Setting prohibited
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2 to 0	DIV_CORE0_SET[2:0]	0h	RW	DIV_CA55_CORE0 division ratio setting 000b: 1/1 001b: 1/2 010b: 1/4 011b: 1/8 100b: 1/16 101b: 1/32 Other: Setting prohibited

4.4.3.16 Division Ratio Setting (RSCI) Register (CPG_RSCI_DDIV)

This register is used to set the division ratio of the clock for the RSCI.

SEL_RSCIn (n = 0 to 3) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

Access Size : 32 bits

Address : <CPG_base> + 0238h

Initial Value : 0000_0000h

Initial Value	0	0	0	0	0	1	0	0	0	0	0	1	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	RW	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
26	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
22	SEL_PLL4_WEN	0h	R0W1	Flag for enabling the writing to the SEL_PLL4_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

Bit	Bit Name	Initial Value	R/W	Description
12	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	-	1h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
6	SEL_PLL4_SET	0h	RW	SEL_PLL4 clock switching setting. 0b: OSC 1/1000th of a divide-by-clock 1b: PLL4 Clock
5	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	-	1h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	-	1h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	-	1h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

4.4.3.19 Source Clock Setting (SDHI) Register (CPG_SDHI_DSEL)

This register is used to switch the clocks for the SDHI.

The setting of this register can be dynamically modified while the clock is operating.

Access Size : 32 bits

Address : <CPG_base> + 0244h

Initial Value : 0000_0333h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

16	SEL_SDHI0_WEN	0h	R0W1	Flag for enabling the writing to the SEL_SDHI0_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
9, 8	SEL_SDHI2_SET[1:0]	3h	RW	SEL_SDHI2 clock switching setting. 00b: 800.00MHz 01b: 600.00MHz 10b: 500.00MHz 11b: 266.667MHz
7, 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5, 4	SEL_SDHI1_SET[1:0]	3h	RW	SEL_SDHI1 clock switching setting. 00b: 800.00MHz 01b: 600.00MHz 10b: 500.00MHz 11b: 266.667MHz
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1, 0	SEL_SDHI0_SET[1:0]	3h	RW	SEL_SDHI0 clock switching setting. 00b: 800.00MHz 01b: 600.00MHz 10b: 500.00MHz 11b: 266.667MHz

4.4.3.20 Source Clock Setting (BSC) Register (CPG_BSC_DSEL)

This register is used to switch the clocks for the BSC.

Access Size : 32 bits

Address : <CPG_base> + 0248h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEL_BSC_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEL_BSC_SET [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	SEL_BSC_WEN	0h	R0W1	Flag for enabling the writing to the SEL_BSC_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1, 0	SEL_BSC_SET [1:0]	1h	RW	SEL_BSC clock switching setting. 00b: 320.00MHz 01b: 266.00MHz 10b: 228.57MHz 11b: 200.00MHz

4.4.3.21 Clock Status Monitor Register (CPG_CLKDIVSTATUS)

This register is used to monitor whether clock switching is completed in the dynamically modifiable frequency dividers and selectors.

Access Size : 32 bits
Address : <CPG_base> + 0280h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DIVBSC_STS	0h	R	DIV_BSC clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
30	DIVPDM_STS	0h	R	DIV_PDM clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
29	DIVXSPI_STS	0h	R	DIV_XSPI clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
28	DIVDSI_STS	0h	R	DIV_CLK266FIXC_DIV16to128 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
27	DIVGE3D_STS	0h	R	DIV_GE3D clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
26	DIVSDHI2_STS	0h	R	DIV_SDHI2 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
25	DIVSDHI1_STS	0h	R	DIV_SDHI1 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
24	DIVSDHI0_STS	0h	R	DIV_SDHI0 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
23	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
22	DIVRSPI2_STS	0h	R	DIV_RSPI2 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
21	DIVRSPI1_STS	0h	R	DIV_RSPI1 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
20	DIVRSPI0_STS	0h	R	DIV_RSPI0 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
19	DIVRSCI3_STS	0h	R	DIV_RSCI3 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).

Bit	Bit Name	Initial Value	R/W	Description
18	DIVRSCI2_STS	0h	R	DIV_RSCI2 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
17	DIVRSCI1_STS	0h	R	DIV_RSCI1 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
16	DIVRSCI0_STS	0h	R	DIV_RSCI0 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
15	DIVCA55CORE3_STS	0h	R	DIV_CORE3 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
14	DIVCA55CORE2_STS	0h	R	DIV_CORE2 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
13	DIVCA55CORE1_STS	0h	R	DIV_CORE1 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
12	DIVCA55CORE0_STS	0h	R	DIV_CORE0 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
11, 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
9	DIVPL3B_STS	0h	R	DIV_PLL3_100 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
8	DIVPL3A_STS	0h	R	DIV_PLL3_200 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
7	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
6	DIVCLKQSPI_STS	0h	R	DIV_PLL2_QSPI clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
5	DIVPL2B_STS	0h	R	DIV_PLL2_100 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
4	DIVPL2A_STS	0h	R	DIV_PLL2_200 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
3 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	DIVPL1_STS	0h	R	DIV_PLL1_CA55 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).

4.4.3.22 Clock Status (Selector Setting) Monitor Register (CPG_CLKSELSTATUS)

This is a dynamically modifiable selector clock switching completion status monitor register.

Access Size : 32 bits

Address : <CPG_base> + 0284h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	SEL_BSC_STS	-	SEL_SDHI2_STS	SEL_SDHI1_STS	SEL_SDHI0_STS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	SEL_PLL6_STS	-	-	-	SEL_PLL4_STS	-	SEL_PLL3_STS	-	SEL_PLL2_STS	-	SEL_PLL1_STS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	SEL_BSC_STS	0h	R	SEL_BSC clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	SEL_SDHI2_STS	0h	R	SEL_SDHI2 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
17	SEL_SDHI1_STS	0h	R	SEL_SDHI1 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
16	SEL_SDHI0_STS	0h	R	SEL_SDHI0 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	SEL_PLL6_STS	0h	R	SEL_PLL6 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
9 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
6	SEL_PLL4_STS	0h	R	SEL_PLL4 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
5	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	SEL_PLL3_STS	0h	R	SEL_PLL3 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	SEL_PLL2_STS	0h	R	SEL_PLL2 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

Bit	Bit Name	Initial Value	R/W	Description
0	SEL_PLL1_STS	0h	R	SEL_PLL1 clock switch completion state 0: Switching is completed. 1: Switching is not completed (busy).

4.4.3.23 Source Clock Setting (xSPI) Register (CPG_XSPI_SSEL)

This is the xSPI source clock switching register.

Access Size : 32 bits
Address : <CPG_base> + 0404h
Initial Value : 0000_0002h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEL_XSPI_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEL_XSPI_SET [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	SEL_XSPI_WEN	0h	R0W1	Flag for enabling the writing to the SEL_XSPI_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1, 0	SEL_XSPI_SET [1:0]	2h	RW	SEL_XSPI clock switching setting. 00b: 800.00MHz 01b: 600.00MHz 10b: 533.00MHz 11b: 500.00MHz

4.4.3.24 Source Clock Setting (DSI) Register (CPG_DSI_SSEL)

This is the DSI source clock switching register.

Access Size : 32 bits
Address : <CPG_base> + 0408h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEL_DSI_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEL_DSI_SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	SEL_DSI_WEN	0h	R0W1	Flag for enabling the writing to the SEL_DSI_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	SEL_DSI_SET	0h	RW	SEL_DSI clock switching setting. 0b: DIV_DSI_DIV1to2_LVDS/7 – Setting used when LVDS is enabled. 1b: DIV_DSI_DIV1to16_VCLK – Setting used when MIPI-DSI or DPI is enabled.

4.4.3.25 Source Clock Setting (GE3D) Register (CPG_GE3D_SSEL)

This is the GE3D source clock switching register.

Access Size : 32 bits

Address : <CPG_base> + 040Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEL_GE3D_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SEL_GE3D_SET [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	SEL_GE3D_WEN	0h	R0W1	Flag for enabling the writing to the SEL_GE3D_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1, 0	SEL_GE3D_SET [1:0]	0h	RW	SEL_GE3D clock switching setting. 00b: 600.00MHz 01b: 533.33MHz 10b: 500.00MHz 11b: 400.00MHz

4.4.3.26 Source Clock Setting (Ether) Register (CPG_ETH_SSEL)

This is the Ether source clock switching register.

Access Size : 32 bits

Address : <CPG_base> + 0410h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	SEL_ ETH1E _WEN	SEL_ ETH1D _WEN	SEL_ ETH1C _WEN	SEL_ ETH1B _WEN	SEL_ ETH1A _WEN	-	-	-	SEL_ ETH0E _WEN	SEL_ ETH0D _WEN	SEL_ ETH0C _WEN	SEL_ ETH0B _WEN	SEL_ ETH0A _WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	SEL_E TH1E_ SET	SEL_E TH1D_ SET	SEL_E TH1C_ SET	SEL_E TH1B_ SET	SEL_E TH1A_ SET	-	-	-	SEL_E TH0E_ SET	SEL_E TH0D_ SET	SEL_E TH0C_ SET	SEL_E TH0B_ SET	SEL_E TH0A_ SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28	SEL_ ETH1E_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH1E_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	SEL_ ETH1D_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH1D_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	SEL_ ETH1C_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH1C_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	SEL_ ETH1B_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH1B_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	SEL_ ETH1A_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH1A_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	SEL_ ETH0E_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH0E_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	SEL_ ETH0D_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH0D_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	SEL_ ETH0C_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH0C_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
17	SEL_ ETH0B_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH0B_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	SEL_ ETH0A_WEN	0h	R0W1	Flag for enabling the writing to the SEL_ETH0A_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
12	SEL_ETH1E_SE T	0h	RW	SEL_ETH1_CLK_RX_I clock switching setting. 0b: Normal Mode 1b: RMII Mode
11	SEL_ETH1D_SE T	0h	RW	SEL_ETH1_CLK_TX_I clock switching setting. 0b: Normal Mode 1b: RMII Mode
10	SEL_ETH1C_SE T	0h	RW	SEL_ETH1_RM clock switching setting. 0b: PLL6/10 (50MHz) 1b: ETH1_RXC_RX_CLK_IN
9	SEL_ETH1B_SE T	0h	RW	SEL_ETH1_RX clock switching setting. 0b: DIV_ETH1_TR 1b: ETH1_RXC_RX_CLK_IN
8	SEL_ETH1A_SE T	0h	RW	SEL_ETH1_TX clock switching setting. 0b: DIV_ETH1_TR 1b: ETH1_TXC_TX_CLK_IN
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	SEL_ETH0E_SE T	0h	RW	SEL_ETH0_CLK_RX_I clock switching setting. 0b: Normal Mode 1b: RMII Mode
3	SEL_ETH0D_SE T	0h	RW	SEL_ETH0_CLK_TX_I clock switching setting. 0b: Normal Mode 1b: RMII Mode
2	SEL_ETH0C_SE T	0h	RW	SEL_ETH0_RM clock switching setting. 0b: PLL6/10 (50MHz) 1b: ETH0_RXC_RX_CLK_IN
1	SEL_ETH0B_SE T	0h	RW	SEL_ETH0_RX clock switching setting. 0b: DIV_ETH0_TR 1b: ETH0_RXC_RX_CLK_IN
0	SEL_ETH0A_SE T	0h	RW	SEL_ETH0_TX clock switching setting. 0b: DIV_ETH0_TR 1b: ETH0_TXC_TX_CLK_IN

4.4.3.27 Source Clock Setting (RSCI) Register (CPG_RSCI_SSEL)

This is the RSCI source clock switching register.

Access Size : 32 bits

Address : <CPG_base> + 0414h

Initial Value : 0000_00FFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4.4.3.28 Source Clock Setting (RSPI) Register (CPG_RSPI_SSEL)

This is the RSPI source clock switching register.

Access Size : 32 bits

Address : <CPG_base> + 0418h

Initial Value : 0000_003Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	SEL_ RSPI2_ WEN	-	SEL_ RSPI1_ WEN	-	SEL_ RSPI0_ WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W1	R	R0W1	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	SEL_RSPI2_SE T[1:0]		SEL_RSPI1_SE T[1:0]		SEL_RSPI0_SE T[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	SEL_ RSPI2_WEN	0h	R0W1	Flag for enabling the writing to the SEL_RSPI2_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	SEL_ RSPI1_WEN	0h	R0W1	Flag for enabling the writing to the SEL_RSPI1_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	SEL_ RSPI0_WEN	0h	R0W1	Flag for enabling the writing to the SEL_RSPI0_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5, 4	SEL_RSPI2_SE T[1:0]	3h	RW	SEL_RSPI2 clock switching setting. 00b: 320.00MHz 01b: 266.00MHz 10b: 228.57MHz 11b: 200.00MHz
3, 2	SEL_RSPI1_SE T[1:0]	3h	RW	SEL_RSPI1 clock switching setting. 00b: 320.00MHz 01b: 266.00MHz 10b: 228.57MHz 11b: 200.00MHz
1, 0	SEL_RSPI0_SE T[1:0]	3h	RW	SEL_RSPI0 clock switching setting. 00b: 320.00MHz 01b: 266.00MHz 10b: 228.57MHz 11b: 200.00MHz

4.4.3.29 Division Ratio Static Setting (DSI) Register (CPG_DSI_SDIV)

This register is used to set the division ratio of the clock for the DSI.

PLL7 (3,000 MHz) output is used as the source clock.

The setting of this register can be changed statically when the clock is not operating.

Access Size : 32 bits

Address : <CPG_base> + 0430h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	DIV_DSI_C_WEN	-	-	-	DIV_DSI_B_WEN	-	-	-	DIV_DSI_A_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R	R	R	R0W1	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DIV_DSI_C_SET	DIV_DSI_B_SET[3:0]				-	DIV_DSI_A_SET[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	DIV_DSI_C_WEN	0h	R0W1	Flag for enabling the writing to the DIV_DSI_C_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	DIV_DSI_B_WEN	0h	R0W1	Flag for enabling the writing to the DIV_DSI_B_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	DIV_DSI_A_WEN	0h	R0W1	Flag for enabling the writing to the DIV_DSI_A_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	DIV_DSI_C_SET	0h	RW	DIV_DSI_DIV1to2_LVDS division ratio setting 0b: 1/1 1b: 1/2

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	DIV_DSI_B_SET [3:0]*2	0h	RW	DIV_DSI_DIV1to16_VCLK division ratio setting 0000b: 1/1 0001b: 1/2 0010b: 1/3 0011b: 1/4 0100b: 1/5 0101b: 1/6 0110b: 1/7 0111b: 1/8 1000b: 1/9 1001b: 1/10 1010b: 1/11 1011b: 1/12 1100b: 1/13 1101b: 1/14 1110b: 1/15 1111b: 1/16
3	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2 to 0	DIV_DSI_A_SET [2:0]*1	0h	RW	DIV_DSI_DIV1to32_VCLK division ratio setting 000b: 1/1 001b: 1/2 010b: 1/4 011b: 1/8 100b: 1/16 101b: 1/32 Other: Setting prohibited

Note 1. When the output frequency of PLL7 satisfies 1500 MHz < PLL7 ≤ 3000 MHz, or when DPI is used, the available division ratios are as follows: 1/2, 1/4, 1/8, 1/16, 1/32

Note 2. When DPI is used, the following division ratio is available: 1/1

4.4.3.30 Division Ratio Setting (ETH) Register (CPG_ETH_SDIV)

This register is used to set the division ratio of the clock for the Ether.

The setting of this register can be changed statically when the clock is not operating.

Access Size : 32 bits

Address : <CPG_base> + 0434h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	RW	R	R	RW	RW	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28	DIV_ETH_D_WEN	0h	R0W1	Flag for enabling the writing to the DIV_ETH_D_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	DIV_ETH_C_WEN	0h	R0W1	Flag for enabling the writing to the DIV_ETH_C_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	DIV_ETH_B_WEN	0h	R0W1	Flag for enabling the writing to the DIV_ETH_B_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	DIV_ETH_A_WEN	0h	R0W1	Flag for enabling the writing to the DIV_ETH_A_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
12	DIV_ETH_D_SET	0h	RW	DIV_ETH1_RM division ratio setting 0b: 1/2 1b: 1/20
11, 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
9, 8	DIV_ETH_C_SET[1:0]	0h	RW	DIV_ETH1_TR division ratio setting 00b: 1/4 01b: 1/20 10b: 1/200 Others: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	DIV_ETH_B_SET	0h	RW	DIV_ETH0_RM division ratio setting 0b: 1/2 1b: 1/20
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1, 0	DIV_ETH_A_SET[1:0]	0h	RW	DIV_ETH0_TR division ratio setting 00b: 1/4 01b: 1/20 10b: 1/200 Others: Setting prohibited

4.4.3.31 Clock Control Register Cortex-A55 (CPG_CLKON_CA55)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0500h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
25	CLK9_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	CLK7_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
9	CLK9_ON	0h	RW	The CA55_CORECLK3 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_ON	0h	RW	The CA55_CORECLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_ON	0h	RW	The CA55_CORECLK1 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	0h	RW	The CA55_CORECLK0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	0h	RW	The CA55_TSCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0h	RW	The CA55_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The CA55_GICCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The CA55_ATCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The CA55_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The CA55_SCLK/CA55_PERICLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.32 Clock Control Register Cortex-M33 (CPG_CLKON_CM33)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0504h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	0h	RW	The CM33_TSCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The CM33_CLKIN clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.33 Clock Control Register ACPU (CPG_CLKON_SRAM_ACPU)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0508h

Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	1h	RW	The SRAM_ACPU_ACLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1h	RW	The SRAM_ACPU_ACLK1 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The SRAM_ACPU_ACLK0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.34 Clock Control Register MCPU (CPG_CLKON_SRAM_MCPU)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 050Ch
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	1h	RW	The SRAM_MCPU_ACLK1 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The SRAM_MCPU_ACLK0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.35 Clock Control Register GIC600 (CPG_CLKON_GIC600)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0514h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The GIC600_GICCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.36 Clock Control Register IA55 (CPG_CLKON_IA55)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0518h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	1h	RW	The IA55_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The IA55_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.37 Clock Control Register IM33 (CPG_CLKON_IM33)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 051Ch
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	1h	RW	The IM33_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The IM33_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.38 Clock Control Register MHU (CPG_CLKON_MHU)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0520h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The MHU_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.39 Clock Control Register CST (CPG_CLKON_CST)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0524h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	CLK14_ONWEN	-	-	-	CLK10_ONWEN	CLK9_ONWEN	CLK8_ONWEN	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R0W1	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	CLK14_ON	-	-	-	CLK10_ON	CLK9_ON	CLK8_ON	CLK7_ON	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
30	CLK14_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK14_ON bit (bit 14) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
29 to 27	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
26	CLK10_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	CLK9_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	CLK7_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
14	CLK14_ON	0h	RW	The CST_ATB_CST_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
13 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	CLK10_ON	0h	RW	The CST_AXI_ETR_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_ON	0h	RW	The CST_AXI_SB_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_ON	0h	RW	The CST_ATB_CM33_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_ON	0h	RW	The CST_ATB_CA55_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	0h	RW	The CST_AHB_ATH_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	0h	RW	The CST_AHB_CM33_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0h	RW	The CST_APB_CA55_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The CST_APB_CM33_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The CST_APB_SB_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The CST_TS_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The CST_CS_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.40 Clock Control Register SYC (CPG_CLKON_SYC)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0528h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The SYC_CNT_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.41 Clock Control Register DMAC_REG (CPG_CLKON_DMAC_REG)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 052Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	0h	RW	The DMAC_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The DMAC_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.42 Clock Control Register GTM (CPG_CLKON_GTM)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0534h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	0h	RW	The GTM2_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The GTM1_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The GTM0_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.43 Clock Control Register MTU (CPG_CLKON_MTU)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0538h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The MTU_X_MCK_MTU3 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.44 Clock Control Register POE3 (CPG_CLKON_POE3)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 053Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The POE3_CLKM_POE clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.45 Clock Control Register GPT (CPG_CLKON_GPT)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0540h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The GPT_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.46 Clock Control Register POEG (CPG_CLKON_POEG)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0544h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_ON	0h	RW	The POEG_D_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The POEG_C_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The POEG_B_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The POEG_A_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.47 Clock Control Register WDT (CPG_CLKON_WDT)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0548h

Initial Value : 0000_003Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	CLK5_ON	1h	RW	The WDT2_CLK (for CM33) clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	1h	RW	The WDT2_PCLK (for CM33) clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	1h	RW	The WDT1_CLK (for Secure CA55) clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	1h	RW	The WDT1_PCLK (for Secure CA55) clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
1	CLK1_ON	1h	RW	The WDT0_CLK (for Non-Secure CA55) clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The WDT0_PCLK (for Non-Secure CA55) clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.48 Clock Control Register DDR (CPG_CLKON_DDR)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 054Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	CLK5_ON	0h	RW	The DDR_AXI3_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0h	RW	The DDR_AXI2_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The DDR_AXI1_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The DDR_AXI0_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
1	CLK1_ON	0h	RW	The DDR_REG_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The DDR_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.49 Clock Control Register xSPI (CPG_CLKON_XSPI)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0550h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_ON	0h	RW	The XSPI_CLKX2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The XSPI_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The XSPI_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The XSPI_HCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.50 Clock Control Register SDHI (CPG_CLKON_SDHI)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0554h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	CLK14_ONWEN	CLK13_ONWEN	CLK12_ONWEN	CLK11_ONWEN	CLK10_ONWEN	CLK9_ONWEN	CLK8_ONWEN	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	CLK14_ON	CLK13_ON	CLK12_ON	CLK11_ON	CLK10_ON	CLK9_ON	CLK8_ON	CLK7_ON	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
30	CLK14_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK14_ON bit (bit 14) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
29	CLK13_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK13_ON bit (bit 13) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
28	CLK12_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK12_ON bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	CLK11_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	CLK10_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	CLK9_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	CLK7_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
14	CLK14_ON	0h	RW	The SDHI2_IACLKM clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
13	CLK13_ON	0h	RW	The SDHI1_IACLKM clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
12	CLK12_ON	0h	RW	The SDHI0_IACLKM clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
11	CLK11_ON	0h	RW	The SDHI2_IACLKS clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
10	CLK10_ON	0h	RW	The SDHI2_CLK_HS clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_ON	0h	RW	The SDHI2_IMCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_ON	0h	RW	The SDHI2_IMCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_ON	0h	RW	The SDHI1_IACLKS clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	0h	RW	The SDHI1_CLK_HS clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	0h	RW	The SDHI1_IMCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0h	RW	The SDHI1_IMCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The SDHI0_IACLKS clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
2	CLK2_ON	0h	RW	The SDHI0_CLK_HS clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The SDHI0_IMCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The SDHI0_IMCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.51 Clock Control Register GE3D (CPG_CLKON_GE3D)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0558h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	0h	RW	The GE3D_ACE_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The GE3D_AXI_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The GE3D_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.52 Clock Control Register ISU2 (CPG_CLKON_ISU2)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 055Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	0h	RW	The ISU_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The ISU_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.53 Clock Control Register H264 (CPG_CLKON_H264)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0560h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	0h	RW	The H264_CLK_P clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The H264_CLK_A clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.54 Clock Control Register CRU (CPG_CLKON_CRU)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0564h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_ON	0h	RW	The CRU_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The CRU_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The CRU_VCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The CRU_SYSCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.55 Clock Control Register MIPI_DSI (CPG_CLKON_MIPI_DSI)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0568h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	CLK5_ON	0h	RW	The MIPI_DSI_LPCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0h	RW	The MIPI_DSI_VCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The MIPI_DSI_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The MIPI_DSI_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The MIPI_DSI_SYSCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.56 Clock Control Register LCDC (CPG_CLKON_LCDC)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 056Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	0h	RW	The LCDC_CLK_P clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The LCDC_CLK_D clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The LCDC_CLK_A clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.57 Clock Control Register SSI (CPG_CLKON_SSI)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0570h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CLK7_ON	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
23	CLK7_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
7	CLK7_ON	0h	RW	The SSI3_PCLK_SFR clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
6	CLK6_ON	0h	RW	The SSI3_PCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	0h	RW	The SSI2_PCLK_SFR clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0h	RW	The SSI2_PCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The SSI1_PCLK_SFR clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The SSI1_PCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The SSI0_PCLK_SFR clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The SSI0_PCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.58 Clock Control Register USB (CPG_CLKON_USB)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0578h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	CLK4_ON	0h	RW	The USB_U2P1_EXR_CPUCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The USB_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The USB_U2P0_EXR_CPUCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The USB_U2H1_HCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The USB_U2H0_HCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.59 Clock Control Register ETH (CPG_CLKON_ETH)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 057Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	CLK13_ONWEN	CLK12_ONWEN	CLK11_ONWEN	CLK10_ONWEN	CLK9_ONWEN	CLK8_ONWEN	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	CLK13_ON	CLK12_ON	CLK11_ON	CLK10_ON	CLK9_ON	CLK8_ON	CLK7_ON	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
29	CLK13_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK13_ON bit (bit 13) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
28	CLK12_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK12_ON bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	CLK11_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	CLK10_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	CLK9_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	CLK7_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13	CLK13_ON	0h	RW	The ETH1_TX_I(RMII Mode)/ETH1_RX_I(RMII Mode) clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
12	CLK12_ON	0h	RW	The ETH0_TX_I(RMII Mode)/ETH0_RX_I(RMII Mode) clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
11	CLK11_ON	0h	RW	The ETH1_RMII_I clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
10	CLK10_ON	0h	RW	The ETH0_RMII_I clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_ON	0h	RW	The ETH1_PTP_REF_I clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_ON	0h	RW	The ETH0_PTP_REF_I clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_ON	0h	RW	The ETH1_RX_I(Normal Mode)/RX_180_I clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	0h	RW	The ETH0_RX_I(Normal Mode)/RX_180_I clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	0h	RW	The ETH1_TX_I(Normal Mode)/TX_180_I clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0h	RW	The ETH0_TX_I(Normal Mode)/TX_180_I clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The ETH1_CLK_CHI clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The ETH0_CLK_CHI clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The ETH1_CLK_AXI clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The ETH0_CLK_AXI clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.60 Clock Control Register I2C (CPG_CLKON_I2C)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0580h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_ON	0h	RW	The I2C3_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The I2C2_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The I2C1_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The I2C0_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.61 Clock Control Register SCIF (CPG_CLKON_SCIF)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0584h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	CLK5_ON	0h	RW	The SCIF5_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0h	RW	The SCIF4_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0h	RW	The SCIF3_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The SCIF2_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
1	CLK1_ON	0h	RW	The SCIF1_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The SCIF0_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.62 Clock Control Register RSPI (CPG_CLKON_RSPI)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0590h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	CLK10_ONWEN	CLK9_ONWEN	CLK8_ONWEN	-	-	-	-	-	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R0W1	R0W1	R0W1	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CLK10_ON	CLK9_ON	CLK8_ON	-	-	-	-	-	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
26	CLK10_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	CLK9_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	CLK10_ON	0h	RW	The RSPI2_TCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_ON	0h	RW	The RSPI1_TCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_ON	0h	RW	The RSPI0_TCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	0h	RW	The RSPI2_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The RSPI1_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The RSPI0_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.63 Clock Control Register CANFD (CPG_CLKON_CANFD)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0594h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	0h	RW	The CANFD_CLK_RAM clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The CANFD_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.64 Clock Control Register GPIO (CPG_CLKON_GPIO)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0598h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The GPIO_HCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.65 Clock Control Register ADC (CPG_CLKON_ADC)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05A8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_ON	0h	RW	The ADC1_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The ADC1_ADCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The ADC0_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The ADC0_ADCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.66 Clock Control Register TSU (CPG_CLKON_TSU)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05ACh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The TSU_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.67 Clock Control Register AXI_ACPU_BUS (CPG_CLKON_AXI_ACPU_BUS)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05B4h

Initial Value : 0000_01EAh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	CLK8_ONWEN	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	-	CLK3_ONWEN	-	CLK1_ONWEN	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R	R0W1	R	R0W1	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CLK8_ON	CLK7_ON	CLK6_ON	CLK5_ON	-	CLK3_ON	-	CLK1_ON	-
Initial Value	0	0	0	0	0	0	0	1	1	1	1	0	1	0	1	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	R	RW	R	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	CLK7_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_ON	1h	RW	The BUS_ACPU_CLK100CG_MCP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_ON	1h	RW	The BUS_ACPU_CLK200CG_MCP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	1h	RW	The BUS_ACPU_PCLK_TZC_SRAM_A2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
5	CLK5_ON	1h	RW	The BUS_ACPU_PCLK_TZC_SRAM_A1 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_ON	1h	RW	The BUS_ACPU_PCLK_TZC_SRAM_A0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	1h	RW	The BUS_ACPU_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.68 Clock Control Register AXI_MCPU_BUS (CPG_CLKON_AXI_MCPU_BUS)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05B8h

Initial Value : 0000_F5FEh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CLK15_ONWEN	CLK14_ONWEN	CLK13_ONWEN	CLK12_ONWEN	-	CLK10_ONWEN	-	CLK8_ONWEN	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R0W1	R0W1	R0W1	R0W1	R	R0W1	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLK15_ON	CLK14_ON	CLK13_ON	CLK12_ON	-	CLK10_ON	-	CLK8_ON	CLK7_ON	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	-
Initial Value	1	1	1	1	0	1	0	1	1	1	1	1	1	1	1	0
R/W	RW	RW	RW	RW	R	RW	R	RW	RW	RW	RW	RW	RW	RW	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31	CLK15_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK15_ON bit (bit 15) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
30	CLK14_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK14_ON bit (bit 14) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
29	CLK13_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK13_ON bit (bit 13) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
28	CLK12_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK12_ON bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
26	CLK10_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	CLK7_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
15	CLK15_ON	1h	RW	The BUS_MCPU_PCLK_TZC_XSPI clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
14	CLK14_ON	1h	RW	The BUS_MCPU_CLK80DF clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
13	CLK13_ON	1h	RW	The BUS_MCPU_CLK66DF clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
12	CLK12_ON	1h	RW	The BUS_MCPU_CLK24 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	CLK10_ON	1h	RW	The BUS_MCPU_CLK100CG_MCP_FIX clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_ON	1h	RW	The BUS_MCPU_PCLK_TZC_SRAM_M1 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_ON	1h	RW	The BUS_MCPU_PCLK_TZC_SRAM_M0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	1h	RW	The BUS_MCPU_CLK100CG_ISO clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	1h	RW	The BUS_MCPU_CLK200CG_ISO clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	1h	RW	The BUS_MCPU_CLK200DG_MCP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	1h	RW	The BUS_MCPU_CLK200CG_MCP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	1h	RW	The BUS_MCPU_CLK100CG_MCP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1h	RW	The BUS_MCPU_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.69 Clock Control Register AXI_COM_BUS (CPG_CLKON_AXI_COM_BUS)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05BCh

Initial Value : 0000_0101h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	CLK8_ONWEN	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CLK8_ON	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_ON	1h	RW	The BUS_COM1_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The BUS_COM0_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.70 Clock Control Register AXI_VIDEO_BUS (CPG_CLKON_AXI_VIDEO_BUS)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05C0h

Initial Value : 0000_0105h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	CLK8_ONWEN	-	-	-	-	-	CLK2_ONWEN	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R	R	R	R	R	R0W1	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CLK8_ON	-	-	-	-	-	CLK2_ON	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_ON	1h	RW	The BUS_VIDEO1_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	1h	RW	The BUS_VIDEO0_CLK300DG_ISU clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The BUS_VIDEO0_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.71 Clock Control Register PERI_COM (CPG_CLKON_PERI_COM)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05C4h

Initial Value : 0000_0101h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	CLK8_ONWEN	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CLK8_ON	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_ON	1h	RW	The BUS_PERI_COM1_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The BUS_PERI_COM0_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.72 Clock Control Register REG1_BUS (CPG_CLKON_REG1_BUS)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 05C8h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	1h	RW	The BUS_REG1_CLK100 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The BUS_REG1_CLK200 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.73 Clock Control Register REG0_BUS (CPG_CLKON_REG0_BUS)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05CCh

Initial Value : 0000_000Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ONWEN	CLK2_ONWEN	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_ON	CLK2_ON	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_ON	1h	RW	The BUS_REG0_PCLK100 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	1h	RW	The BUS_REG0_HCLK100 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	-	1h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	CLK0_ON	1h	RW	The BUS_REG0_CLK100 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.74 Clock Control Register PERI_CPU (CPG_CLKON_PERI_CPU)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05D0h

Initial Value : 0000_009Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	CLK7_ONWEN	-	-	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R0W1	R	R	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CLK7_ON	-	-	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	1	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	RW	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
23	CLK7_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22, 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
7	CLK7_ON	1h	RW	The BUS_PERI_CPU0_CLKACPU clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6, 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	CLK4_ON	1h	RW	The BUS_PERI_CPU1_CLK100 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	1h	RW	The BUS_PERI_CPU1_CLKACPU clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
2	CLK2_ON	1h	RW	The BUS_PERI_CPU1_CLKMCPU clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1h	RW	The BUS_PERI_CPU0_CLK24 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The BUS_PERI_CPU0_CLK100 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.75 Clock Control Register PERI_VIDEO (CPG_CLKON_PERI_VIDEO)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05D4h

Initial Value : 0000_0F05h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	CLK11_ONWEN	CLK10_ONWEN	CLK9_ONWEN	CLK8_ONWEN	-	-	-	-	-	CLK2_ONWEN	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R	R	R	R	R	R0W1	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	CLK11_ON	CLK10_ON	CLK9_ON	CLK8_ON	-	-	-	-	-	CLK2_ON	-	CLK0_ON
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	0	1	0	1
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
27	CLK11_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	CLK10_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	CLK9_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
11	CLK11_ON	1h	RW	The BUS_PERI_VIDEO1_CLK66DF clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
10	CLK10_ON	1h	RW	The BUS_PERI_VIDEO1_CLK100DG_ACP_FIX clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
9	CLK9_ON	1h	RW	The BUS_PERI_VIDEO1_CLK100DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_ON	1h	RW	The BUS_PERI_VIDEO1_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	1h	RW	The BUS_PERI_VIDEO0_CLK200DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The BUS_PERI_VIDEO0_CLK100DG_ACP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.76 Clock Control Register PERI_DDR (CPG_CLKON_PERI_DDR)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05D8h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The BUS_PERI_DDR_CLK100 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.77 Clock Control Register AXI_TZCDDR (CPG_CLKON_AXI_TZCDDR)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 05DCh

Initial Value : 0000_007Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
22	CLK6_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
6	CLK6_ON	1h	RW	The BUS_TZCDDR_CLK200CG_MCP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	1h	RW	The BUS_TZCDDR_CLK100CG_MCP_PCLK1 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
4	CLK4_ON	1h	RW	The BUS_TZCDDR_CLK200DG_ACP_ACLK3 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	1h	RW	The BUS_TZCDDR_CLK200DG_ACP_ACLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	1h	RW	The BUS_TZCDDR_CLK200DG_ACP_ACLK1 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1h	RW	The BUS_TZCDDR_CLK200DG_ACP_ACLK0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The BUS_TZCDDR_CLK100CG_MCP_PCLK0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.78 Clock Control Register PDM (CPG_CLKON_PDM)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0604h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	0h	RW	The PDM_CCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The PDM_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.79 Clock Control Register PCI (CPG_CLKON_PCI)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0608h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ONWEN	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ON	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	0h	RW	The PCI_CLK_PMU clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The PCI_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.80 Clock Control Register SPDIF (CPG_CLKON_SPDIF)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 060Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The SPDIF_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.81 Clock Control Register I3C (CPG_CLKON_I3C)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0610h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	0h	RW	The I3C_TCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The I3C_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.82 Clock Control Register VBAT (CPG_CLKON_VBAT)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0614h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The VBAT_BCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.83 Clock Control Register RSCI (CPG_CLKON_RSCI)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0618h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	CLK11_ONWEN	CLK10_ONWEN	CLK9_ONWEN	CLK8_ONWEN	-	-	-	-	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	CLK11_ON	CLK10_ON	CLK9_ON	CLK8_ON	-	-	-	-	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
27	CLK11_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	CLK10_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	CLK9_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	CLK8_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	CLK3_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

Bit	Bit Name	Initial Value	R/W	Description
11	CLK11_ON	0h	RW	The RSCI3_TCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
10	CLK10_ON	0h	RW	The RSCI2_TCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_ON	0h	RW	The RSCI1_TCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_ON	0h	RW	The RSCI0_TCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_ON	0h	RW	The RSCI3_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0h	RW	The RSCI2_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0h	RW	The RSCI1_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The RSCI0_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.84 Clock Control Register LVDS (CPG_CLKON_LVDS)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 061Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	CLK1_ON	0h	RW	The LVDS_CLK_DOT0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0h	RW	The LVDS_PLLCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.85 Clock Control Register BSC (CPG_CLKON_BSC)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0620h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	0h	RW	The BSC_X_BCK_BSC clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.86 Clock Control Register MCPU_PERI (CPG_CLKON_MCPU_PERI)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0624h

Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	CLK2_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_ON	1h	RW	The BUS_MCPU_PERI_CLK100CG_MCP_FIX clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1h	RW	The BUS_MCPU_PERI_CLK100CG_ISO clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The BUS_MCPU_PERI_CLK200CG_ISO clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.87 Clock Control Register PERI_HPB (CPG_CLKON_PERI_HPB)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0628h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_ON	1h	RW	The BUS_PERI_HPB0_CLK100CG_ISO clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.88 Clock Control Register QSPI_BUS (CPG_CLKON_QSPI_BUS)

This register is used to supply or stop clocks for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 062Ch
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	CLK1_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0h	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_ON	1h	RW	The BUS_QSPI_CLK200CG_MCP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1h	RW	The BUS_QSPI_CLK200DG_MCP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.89 Clock Monitor Register Cortex-A55 (CPG_CLKMON_CA55)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0680h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	CLK9_MON	CLK8_MON	CLK7_MON	CLK6_MON	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
9	CLK9_MON	0h	R	The state of the CA55_CORECLK3 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_MON	0h	R	The state of the CA55_CORECLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_MON	0h	R	The state of the CA55_CORECLK1 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_MON	0h	R	The state of the CA55_CORECLK0 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_MON	0h	R	The state of the CA55_TSCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	0h	R	The state of the CA55_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the CA55_GICCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the CA55_ATCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the CA55_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the CA55_SCLK/CA55_PERICLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.90 Clock Monitor Register Cortex-M33 (CPG_CLKMON_CM33)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0684h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	0h	R	The state of the CM33_TSCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the CM33_CLKIN clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.91 Clock Monitor Register SRAM_ACPU (CPG_CLKMON_SRAM_ACPU)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0688h
Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	1h	R	The state of the SRAM_ACPU_ACLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	1h	R	The state of the SRAM_ACPU_ACLK1 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the SRAM_ACPU_ACLK0 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.92 Clock Monitor Register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 068Ch

Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	1h	R	The state of the SRAM_MCPU_ACLK1 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the SRAM_MCPU_ACLK0 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.93 Clock Monitor Register GIC600 (CPG_CLKMON_GIC600)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0694h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the GIC600_GICCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.94 Clock Monitor Register IA55 (CPG_CLKMON_IA55)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0698h

Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	1h	R	The state of the IA55_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the IA55_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.95 Clock Monitor Register IM33 (CPG_CLKMON_IM33)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 069Ch

Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	1h	R	The state of the IM33_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the IM33_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.96 Clock Monitor Register MHU (CPG_CLKMON_MHU)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06A0h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the MHU_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.97 Clock Monitor Register CST (CPG_CLKMON_CST)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06A4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	CLK14_MON	-	-	-	CLK10_MON	CLK9_MON	CLK8_MON	CLK7_MON	CLK6_MON	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
14	CLK14_MON	0h	R	The state of the CST_ATB_CST_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
13 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	CLK10_MON	0h	R	The state of the CST_AXI_ETR_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_MON	0h	R	The state of the CST_AXI_SB_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_MON	0h	R	The state of the CST_ATB_CM33_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_MON	0h	R	The state of the CST_ATB_CA55_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_MON	0h	R	The state of the CST_AHB_ATH_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_MON	0h	R	The state of the CST_AHB_CM33_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	0h	R	The state of the CST_APB_CA55_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the CST_APB_CM33_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the CST_APB_SB_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the CST_TS_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the CST_CS_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.98 Clock Monitor Register SYC (CPG_CLKMON_SYC)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06A8h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the SYC_CNT_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.99 Clock Monitor Register DMAC_REG (CPG_CLKMON_DMAC_REG)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06ACh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	0h	R	The state of the DMAC_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the DMAC_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.100 Clock Monitor Register GTM (CPG_CLKMON_GTM)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06B4h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	0h	R	The state of the GTM2_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the GTM1_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the GTM0_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.101 Clock Monitor Register MTU (CPG_CLKMON_MTU)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06B8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the MTU_X_MCK_MTU3 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.102 Clock Monitor Register POE3 (CPG_CLKMON_POE3)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06BCh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the POE3_CLKM_POE clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.103 Clock Monitor Register GPT (CPG_CLKMON_GPT)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06C0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the GPT_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.104 Clock Monitor Register POEG (CPG_CLKMON_POEG)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06C4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_MON	0h	R	The state of the POEG_D_CLKP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the POEG_C_CLKP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the POEG_B_CLKP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the POEG_A_CLKP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.105 Clock Monitor Register WDT (CPG_CLKMON_WDT)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06C8h

Initial Value : 0000_003Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	CLK5_MON	1h	R	The state of the WDT2_CLK (for CM33) clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	1h	R	The state of the WDT2_PCLK (for CM33) clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	1h	R	The state of the WDT1_CLK (for Secure CA55) clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	1h	R	The state of the WDT1_PCLK (for Secure CA55) clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	1h	R	The state of the WDT0_CLK (for Non-Secure CA55) clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the WDT0_PCLK (for Non-Secure CA55) clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.106 Clock Monitor Register DDR (CPG_CLKMON_DDR)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06CCh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	CLK5_MON	0h	R	The state of the DDR_AXI3_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	0h	R	The state of the DDR_AXI2_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the DDR_AXI1_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the DDR_AXI0_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the DDR_REG_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the DDR_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.107 Clock Monitor Register xSPI (CPG_CLKMON_XSPI)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06D0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_MON	0h	R	The state of the XSPI_CLKX2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the XSPI_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the XSPI_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the XSPI_HCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.108 Clock Monitor Register SDHI (CPG_CLKMON_SDHI)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06D4h

Initial Value : 0000_0000h

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
14	CLK14_MON	0h	R	The state of the SDHI2_IACLKM clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
13	CLK13_MON	0h	R	The state of the SDHI1_IACLKM clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
12	CLK12_MON	0h	R	The state of the SDHI0_IACLKM clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
11	CLK11_MON	0h	R	The state of the SDHI2_IACLKS clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
10	CLK10_MON	0h	R	The state of the SDHI2_CLK_HS clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_MON	0h	R	The state of the SDHI2_IMCLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_MON	0h	R	The state of the SDHI2_IMCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_MON	0h	R	The state of the SDHI1_IACLKS clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_MON	0h	R	The state of the SDHI1_CLK_HS clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_MON	0h	R	The state of the SDHI1_IMCLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	0h	R	The state of the SDHI1_IMCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the SDHI0_IACLKS clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the SDHI0_CLK_HS clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
1	CLK1_MON	0h	R	The state of the SDHI0_IMCLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the SDHI0_IMCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.109 Clock Monitor Register GE3D (CPG_CLKMON_GE3D)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06D8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	0h	R	The state of the GE3D_ACE_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the GE3D_AXI_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the GE3D_CLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.110 Clock Monitor Register ISU2 (CPG_CLKMON_ISU2)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06DCh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	0h	R	The state of the ISU_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the ISU_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.111 Clock Monitor Register H264 (CPG_CLKMON_H264)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06E0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	0h	R	The state of the H264_CLK_P clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the H264_CLK_A clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.112 Clock Monitor Register CRU (CPG_CLKMON_CRU)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06E4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_MON	0h	R	The state of the CRU_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the CRU_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the CRU_VCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the CRU_SYSCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.113 Clock Monitor Register MIPI_DSI (CPG_CLKMON_MIPI_DSI)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06E8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	CLK5_MON	0h	R	The state of the MIPI_DSI_LPCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	0h	R	The state of the MIPI_DSI_VCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the MIPI_DSI_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the MIPI_DSI_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the MIPI_DSI_SYSCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.114 Clock Monitor Register LCDC (CPG_CLKMON_LCDC)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 06ECh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	0h	R	The state of the LCDC_CLK_Pclock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the LCDC_CLK_D clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the LCDC_CLK_A clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.115 Clock Monitor Register SSI (CPG_CLKMON_SSI)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06F0h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CLK7_MON	CLK6_MON	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
7	CLK7_MON	0h	R	The state of the SSI3_PCLK_SFR clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_MON	0h	R	The state of the SSI3_PCLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_MON	0h	R	The state of the SSI2_PCLK_SFR clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	0h	R	The state of the SSI2_PCLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the SSI1_PCLK_SFR clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the SSI1_PCLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the SSI0_PCLK_SFR clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the SSI0_PCLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.116 Clock Monitor Register USB (CPG_CLKMON_USB)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06F8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	CLK4_MON	0h	R	The state of the USB_U2P1_EXR_CPUCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the USB_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the USB_U2P0_EXR_CPUCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the USB_U2H1_HCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the USB_U2H0_HCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.117 Clock Monitor Register ETH (CPG_CLKMON_ETH)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 06FCh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	CLK13_MON	CLK12_MON	CLK11_MON	CLK10_MON	CLK9_MON	CLK8_MON	CLK7_MON	CLK6_MON	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13	CLK13_MON	0h	R	The state of the ETH1_TX_I(RMII Mode)/ETH1_RX_I(RMII Mode) clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
12	CLK12_MON	0h	R	The state of the ETH0_TX_I(RMII Mode)/ETH0_RX_I(RMII Mode) clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
11	CLK11_MON	0h	R	The state of the ETH1_RMII_I clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
10	CLK10_MON	0h	R	The state of the ETH0_RMII_I clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_MON	0h	R	The state of the ETH1_PTP_REF_I clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_MON	0h	R	The state of the ETH0_PTP_REF_I clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_MON	0h	R	The state of the ETH1_RX_I(Normal Mode)/RX_180_I clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_MON	0h	R	The state of the ETH0_RX_I(Normal Mode)/RX_180_I clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_MON	0h	R	The state of the ETH1_TX_I(Normal Mode)/TX_180_I clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	0h	R	The state of the ETH0_TX_I(Normal Mode)/TX_180_I clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the ETH1_CLK_CHI clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the ETH0_CLK_CHI clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
1	CLK1_MON	0h	R	The state of the ETH1_CLK_AXI clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the ETH0_CLK_AXI clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.118 Clock Monitor Register I2C (CPG_CLKMON_I2C)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0700h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_MON	0h	R	The state of the I2C3_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the I2C2_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the I2C1_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the I2C0_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.119 Clock Monitor Register SCIF (CPG_CLKMON_SCIF)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0704h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	CLK5_MON	0h	R	The state of the SCIF5_CLK_PCK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	0h	R	The state of the SCIF4_CLK_PCK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	0h	R	The state of the SCIF3_CLK_PCK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the SCIF2_CLK_PCK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the SCIF1_CLK_PCK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the SCIF0_CLK_PCK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.120 Clock Monitor Register RSPI (CPG_CLKMON_RSPI)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0710h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CLK10_MON	CLK9_MON	CLK8_MON	-	-	-	-	-	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	CLK10_MON	0h	R	The state of the RSPI2_TCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_MON	0h	R	The state of the RSPI1_TCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_MON	0h	R	The state of the RSPI0_TCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	0h	R	The state of the RSPI2_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the RSPI1_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the RSPI0_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.121 Clock Monitor Register CANFD (CPG_CLKMON_CANFD)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0714h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	0h	R	The state of the CANFD_CLK_RAM clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the CANFD_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.122 Clock Monitor Register GPIO (CPG_CLKMON_GPIO)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0718h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the GPIO_HCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.123 Clock Monitor Register ADC (CPG_CLKMON_ADC)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0728h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_MON	0h	R	The state of the ADC1_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the ADC1_ADCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the ADC0_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the ADC0_ADCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.124 Clock Monitor Register TSU (CPG_CLKMON_TSU)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 072Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the TSU_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.125 Clock Monitor Register AXI_ACPU_BUS (CPG_CLKMON_AXI_ACPU_BUS)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0734h

Initial Value : 0000_01EAh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CLK8_MON	CLK7_MON	CLK6_MON	CLK5_MON	-	CLK3_MON	-	CLK1_MON	-
Initial Value	0	0	0	0	0	0	0	1	1	1	1	0	1	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_MON	1h	R	The state of the BUS_ACPU_CLK100CG_MCP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_MON	1h	R	The state of the BUS_ACPU_CLK200CG_MCP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_MON	1h	R	The state of the BUS_ACPU_PCLK_TZC_SRAM_A2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_MON	1h	R	The state of the BUS_ACPU_PCLK_TZC_SRAM_A1 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_MON	1h	R	The state of the BUS_ACPU_PCLK_TZC_SRAM_A0 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	1h	R	The state of the BUS_ACPU_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.126 Clock Monitor Register AXI_MCPU_BUS (CPG_CLKMON_AXI_MCPU_BUS)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0738h

Initial Value : 0000_F5FEh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLK15_MON	CLK14_MON	CLK13_MON	CLK12_MON	-	CLK10_MON	-	CLK8_MON	CLK7_MON	CLK6_MON	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	-
Initial Value	1	1	1	1	0	1	0	1	1	1	1	1	1	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
15	CLK15_MON	1h	R	The state of the BUS_MCPU_PCLK_TZC_XSPI clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
14	CLK14_MON	1h	R	The state of the BUS_MCPU_CLK80DF clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
13	CLK13_MON	1h	R	The state of the BUS_MCPU_CLK66DF clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
12	CLK12_MON	1h	R	The state of the BUS_MCPU_CLK24 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
11	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	CLK10_MON	1h	R	The state of the BUS_MCPU_CLK100CG_MCP_FIX clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
9	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_MON	1h	R	The state of the BUS_MCPU_PCLK_TZC_SRAM_M1 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_MON	1h	R	The state of the BUS_MCPU_PCLK_TZC_SRAM_M0 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_MON	1h	R	The state of the BUS_MCPU_CLK100CG_ISO clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_MON	1h	R	The state of the BUS_MCPU_CLK200CG_ISO clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	1h	R	The state of the BUS_MCPU_CLK200DG_MCP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	1h	R	The state of the BUS_MCPU_CLK200CG_MCP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	1h	R	The state of the BUS_MCPU_CLK100CG_MCP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
1	CLK1_MON	1h	R	The state of the BUS_MCPU_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.127 Clock Monitor Register AXI_COM_BUS (CPG_CLKMON_AXI_COM_BUS)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 073Ch

Initial Value : 0000_0101h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CLK8_MON	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_MON	1h	R	The state of the BUS_COM1_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the BUS_COM0_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.128 Clock Monitor Register AXI_VIDEO_BUS (CPG_CLKMON_AXI_VIDEO_BUS)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0740h

Initial Value : 0000_0105h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CLK8_MON	-	-	-	-	-	CLK2_MON	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_MON	1h	R	The state of the BUS_VIDEO1_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	1h	R	The state of the BUS_VIDEO0_CLK300DG_ISU clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the BUS_VIDEO0_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.129 Clock Monitor Register PERI_COM (CPG_CLKMON_PERI_COM)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0744h

Initial Value : 0000_0101h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CLK8_MON	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	CLK8_MON	1h	R	The state of the BUS_PERI_COM1_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the BUS_PERI_COM0_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.130 Clock Monitor Register REG1_BUS (CPG_CLKMON_REG1_BUS)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0748h

Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	1h	R	The state of the BUS_REG1_CLK100 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the BUS_REG1_CLK200 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.131 Clock Monitor Register REG0_BUS (CPG_CLKMON_REG0_BUS)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 074Ch

Initial Value : 0000_000Dh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CLK3_MON	CLK2_MON	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_MON	1h	R	The state of the BUS_REG0_PCLK100 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	1h	R	The state of the BUS_REG0_HCLK100 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	CLK0_MON	1h	R	The state of the BUS_REG0_CLK100 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.132 Clock Monitor Register PERI_CPU (CPG_CLKMON_PERI_CPU)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0750h

Initial Value : 0000_009Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CLK7_MON	-	-	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	1	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
7	CLK7_MON	1h	R	The state of the BUS_PERI_CPU0_CLKACPU clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
6, 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	CLK4_MON	1h	R	The state of the BUS_PERI_CPU1_CLK100 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	1h	R	The state of the BUS_PERI_CPU1_CLKACPU clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	1h	R	The state of the BUS_PERI_CPU1_CLKMCPU clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	1h	R	The state of the BUS_PERI_CPU0_CLK24 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the BUS_PERI_CPU0_CLK100 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.133 Clock Monitor Register PERI_VIDEO (CPG_CLKMON_PERI_VIDEO)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0754h

Initial Value : 0000_0F05h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	CLK11_MON	CLK10_MON	CLK9_MON	CLK8_MON	-	-	-	-	-	CLK2_MON	-	CLK0_MON
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
11	CLK11_MON	1h	R	The state of the BUS_PERI_VIDEO1_CLK66DF clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
10	CLK10_MON	1h	R	The state of the BUS_PERI_VIDEO1_CLK100DG_ACP_FIX clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_MON	1h	R	The state of the BUS_PERI_VIDEO1_CLK100DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_MON	1h	R	The state of the BUS_PERI_VIDEO1_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	1h	R	The state of the BUS_PERI_VIDEO0_CLK200DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the BUS_PERI_VIDEO0_CLK100DG_ACP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.134 Clock Monitor Register PERI_DDR (CPG_CLKMON_PERI_DDR)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0758h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the BUS_PERI_DDR_CLK100 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.135 Clock Monitor Register AXI_TZCDDR (CPG_CLKMON_AXI_TZCDDR)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 075Ch
Initial Value : 0000_007Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	CLK6_MON	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
6	CLK6_MON	1h	R	The state of the BUS_TZCDDR_CLK200CG_MCP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_MON	1h	R	The state of the BUS_TZCDDR_CLK100CG_MCP_PCLK1 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_MON	1h	R	The state of the BUS_TZCDDR_CLK200DG_ACP_ACLK3 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_MON	1h	R	The state of the BUS_TZCDDR_CLK200DG_ACP_ACLK2 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	1h	R	The state of the BUS_TZCDDR_CLK200DG_ACP_ACLK1 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	1h	R	The state of the BUS_TZCDDR_CLK200DG_ACP_ACLK0 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the BUS_TZCDDR_CLK100CG_MCP_PCLK0 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.136 Clock Monitor Register PDM (CPG_CLKMON_PDM)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0784h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	0h	R	The state of the PDM_CCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the PDM_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.137 Clock Monitor Register PCI (CPG_CLKMON_PCI)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0788h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_MON	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	0h	R	The state of the PCI_CLK_PMU clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the PCI_ACLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.138 Clock Monitor Register SPDIF (CPG_CLKMON_SPDIF)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 078Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the SPDIF_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.139 Clock Monitor Register I3C (CPG_CLKMON_I3C)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0790h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	0h	R	The state of the I3C_TCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the I3C_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.140 Clock Monitor Register VBAT (CPG_CLKMON_VBAT)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0794h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the VBAT_BCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.141 Clock Monitor Register RSCI (CPG_CLKMON_RSCI)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0798h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	CLK11_MON	CLK10_MON	CLK9_MON	CLK8_MON	-	-	-	-	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
11	CLK11_MON	0h	R	The state of the RSCI3_TCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
10	CLK10_MON	0h	R	The state of the RSCI2_TCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_MON	0h	R	The state of the RSCI1_TCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_MON	0h	R	The state of the RSCI0_TCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	CLK3_MON	0h	R	The state of the RSCI3_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_MON	0h	R	The state of the RSCI2_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	0h	R	The state of the RSCI1_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the RSCI0_PCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.142 Clock Monitor Register LVDS (CPG_CLKMON_LVDS)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 079Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	CLK1_MON	0h	R	The state of the LVDS_CLK_DOT0 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	0h	R	The state of the LVDS_PLLCLK clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.143 Clock Monitor Register BSC (CPG_CLKMON_BSC)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits
Address : <CPG_base> + 07A0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	0h	R	The state of the BSC_X_BCK_BSC clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.144 Clock Monitor Register MCPU_PERI (CPG_CLKMON_MCPU_PERI)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 07A4h

Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	CLK2_MON	1h	R	The state of the BUS_MCPU_PERI_CLK100CG_MCP_FIX clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_MON	1h	R	The state of the BUS_MCPU_PERI_CLK100CG_ISO clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the BUS_MCPU_PERI_CLK200CG_ISO clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.145 Clock Monitor Register PERI_HPB (CPG_CLKMON_PERI_HPB)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 07A8h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	CLK0_MON	1h	R	The state of the BUS_PERI_HPB0_CLK100CG_ISO clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.146 Clock Monitor Register QSPI_BUS (CPG_CLKMON_QSPI_BUS)

This register is used to monitor the state of the clocks supplied to individual modules.

Access Size : 32 bits

Address : <CPG_base> + 07ACh

Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	CLK1_MON	1h	R	The state of the BUS_QSPI_CLK200CG_MCP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_MON	1h	R	The state of the BUS_QSPI_CLK200DG_MCP clock is monitored. 0: Clock is stopped. 1: Clock is supplied.

4.4.3.147 Reset Control Register Cortex-A55_1 (CPG_RST_CA55_1)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0800h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	UNIT13_RST_WEN	UNIT12_RST_WEN	UNIT11_RST_WEN	UNIT10_RST_WEN	UNIT9_RST_WEN	UNIT8_RST_WEN	UNIT7_RST_WEN	UNIT6_RST_WEN	UNIT5_RST_WEN	UNIT4_RST_WEN	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	UNIT13_RSTB	UNIT12_RSTB	UNIT11_RSTB	UNIT10_RSTB	UNIT9_RSTB	UNIT8_RSTB	UNIT7_RSTB	UNIT6_RSTB	UNIT5_RSTB	UNIT4_RSTB	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
29	UNIT13_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT13_RSTB bit (bit 13) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
28	UNIT12_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT12_RSTB bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	UNIT11_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT11_RSTB bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	UNIT10_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT10_RSTB bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	UNIT9_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT9_RSTB bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	UNIT8_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT8_RSTB bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	UNIT7_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT7_RSTB bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	UNIT6_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT6_RSTB bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	UNIT5_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT5_RSTB bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
20	UNIT4_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13	UNIT13_RSTB	0h	RW	The CA55_RST13 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
12	UNIT12_RSTB	0h	RW	The CA55_RST12 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
11	UNIT11_RSTB	0h	RW	The CA55_RST11 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
10	UNIT10_RSTB	0h	RW	The CA55_RST10 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
9	UNIT9_RSTB	0h	RW	The CA55_RST9 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
8	UNIT8_RSTB	0h	RW	The CA55_RST8 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
7	UNIT7_RSTB	0h	RW	The CA55_RST4_3 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
6	UNIT6_RSTB	0h	RW	The CA55_RST4_2 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
5	UNIT5_RSTB	0h	RW	The CA55_RST4_1 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
4	UNIT4_RSTB	0h	RW	The CA55_RST4_0 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	0h	RW	The CA55_RST0_3 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The CA55_RST0_2 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The CA55_RST0_1 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The CA55_RST0_0 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.148 Reset Control Register Cortex-M33 (CPG_RST_CM33)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0804h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	0h	RW	The CM33_MISCRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The CM33_NSYSRESET reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The CM33_NPORESET reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.149 Reset Control Register SRAM_ACPU (CPG_RST_SRAM_ACPU)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0808h

Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	1h	RW	The SRAM_ACPU_ARESETN2 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	1h	RW	The SRAM_ACPU_ARESETN1 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The SRAM_ACPU_ARESETN0 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.150 Reset Control Register SRAM_MCPU (CPG_RST_SRAM_MCPU)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 080Ch
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	1h	RW	The SRAM_MCPU_ARESETN1 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The SRAM_MCPU_ARESETN0 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.151 Reset Control Register GIC600 (CPG_RST_GIC600)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0814h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	1h	RW	The GIC600_DBG_GICRESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The GIC600_GICRESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.152 Reset Control Register IA55 (CPG_RST_IA55)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0818h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The IA55_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.153 Reset Control Register IM33 (CPG_RST_IM33)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 081Ch

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The IM33_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.154 Reset Control Register MHU (CPG_RST_MHU)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0820h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The MHU_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.155 Reset Control Register SYC (CPG_RST_SYC)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0828h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The SYC_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.156 Reset Control Register DMAC (CPG_RST_DMAC)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 082Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	0h	RW	The DMAC_RST_ASYNC reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The DMAC_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.157 Reset Control Register GTM (CPG_RST_GTM)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0834h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	0h	RW	The GTM2_PRESETZ reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The GTM1_PRESETZ reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The GTM0_PRESETZ reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.158 Reset Control Register MTU (CPG_RST_MTU)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0838h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The MTU_X_PRESET_MTU3 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.159 Reset Control Register POE3 (CPG_RST_POE3)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 083Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The POE3_RST_M_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.160 Reset Control Register GPT (CPG_RST_GPT)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0840h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The GPT_RST_C reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.161 Reset Control Register POEG (CPG_RST_POEG)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0844h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	UNIT3_RSTB	0h	RW	The POEG_D_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The POEG_C_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The POEG_B_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The POEG_A_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.162 Reset Control Register WDT (CPG_RST_WDT)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0848h

Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	UNIT2_RSTB	1h	RW	The WDT2_PRESETN (for CM33) reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	1h	RW	The WDT1_PRESETN (for Secure CA55) reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The WDT0_PRESETN (for Non-Secure CA55) reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.163 Reset Control Register DDR (CPG_RST_DDR)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 084Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	UNIT8_RST_WEN	UNIT7_RST_WEN	UNIT6_RST_WEN	UNIT5_RST_WEN	UNIT4_RST_WEN	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	UNIT8_RSTB	UNIT7_RSTB	UNIT6_RSTB	UNIT5_RSTB	UNIT4_RSTB	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	UNIT8_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT8_RSTB bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	UNIT7_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT7_RSTB bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	UNIT6_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT6_RSTB bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	UNIT5_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT5_RSTB bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	UNIT4_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	UNIT8_RSTB	0h	RW	The DDR_PWROKIN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Bit	Bit Name	Initial Value	R/W	Description
7	UNIT7_RSTB	0h	RW	The DDR_RESET reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
6	UNIT6_RSTB	0h	RW	The DDR_REG_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
5	UNIT5_RSTB	0h	RW	The DDR_AXI3_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
4	UNIT4_RSTB	0h	RW	The DDR_AXI2_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	0h	RW	The DDR_AXI1_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The DDR_AXI0_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The DDR_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.164 Reset Control Register xSPI (CPG_RST_XSPI)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0850h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	0h	RW	The XSPI_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The XSPI_HRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.165 Reset Control Register SDHI (CPG_RST_SDHI)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0854h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	UNIT8_RST_WEN	UNIT7_RST_WEN	UNIT6_RST_WEN	UNIT5_RST_WEN	UNIT4_RST_WEN	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	UNIT8_RSTB	UNIT7_RSTB	UNIT6_RSTB	UNIT5_RSTB	UNIT4_RSTB	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
24	UNIT8_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT8_RSTB bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	UNIT7_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT7_RSTB bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	UNIT6_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT6_RSTB bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	UNIT5_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT5_RSTB bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	UNIT4_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	UNIT8_RSTB	0h	RW	The SDHI2_IXRSTAXIS reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
7	UNIT7_RSTB	0h	RW	The SDHI2_IXRSTAXIM reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
6	UNIT6_RSTB	0h	RW	The SDHI1_IXRSTAXIS reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
5	UNIT5_RSTB	0h	RW	The SDHI1_IXRSTAXIM reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
4	UNIT4_RSTB	0h	RW	The SDHI0_IXRSTAXIS reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	0h	RW	The SDHI0_IXRSTAXIM reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The SDHI2_IXRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The SDHI1_IXRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The SDHI0_IXRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.166 Reset Control Register GE3D (CPG_RST_GE3D)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0858h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	0h	RW	The GE3D_ACE_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The GE3D_AXI_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The GE3D_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.167 Reset Control Register ISU2 (CPG_RST_ISU2)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 085Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	0h	RW	The ISU_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The ISU_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.168 Reset Control Register H264 (CPG_RST_H264)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0860h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	0h	RW	The H264_CP_PRESET_P reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The H264_X_RESET_VCP reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.169 Reset Control Register CRU (CPG_RST_CRU)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0864h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	0h	RW	The CRU_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The CRU_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The CRU_CMN_RSTB reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.170 Reset Control Register MIPI_DSI (CPG_RST_MIPI_DSI)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0868h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	0h	RW	The MIPI_DSI_PRESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The MIPI_DSI_ARESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The MIPI_DSI_CMN_RSTB reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.171 Reset Control Register LCDC (CPG_RST_LCDC)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 086Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The LCDC_RESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.172 Reset Control Register SSIF (CPG_RST_SSIF)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0870h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN

R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	UNIT3_RSTB	0h	RW	The SSI3_RST_M2_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The SSI2_RST_M2_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The SSI1_RST_M2_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The SSI0_RST_M2_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.173 Reset Control Register USB (CPG_RST_USB)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0878h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	UNIT4_RST_WEN	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	UNIT4_RSTB	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
20	UNIT4_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	UNIT4_RSTB	0h	RW	The USB_U2P1_EXL_SYSRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	0h	RW	The USB_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The USB_U2P0_EXL_SYSRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The USB_U2H1_HRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The USB_U2H0_HRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.174 Reset Control Register ETH (CPG_RST_ETH)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 087Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	0h	RW	The ETH1_ARESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The ETH0_ARESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.175 Reset Control Register I2C (CPG_RST_I2C)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0880h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	UNIT3_RSTB	0h	RW	The I2C3_MRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The I2C2_MRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The I2C1_MRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The I2C0_MRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.176 Reset Control Register SCIF (CPG_RST_SCIF)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0884h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	UNIT5_RST_WEN	UNIT4_RST_WEN	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	UNIT5_RSTB	UNIT4_RSTB	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21	UNIT5_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT5_RSTB bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	UNIT4_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	UNIT5_RSTB	0h	RW	The SCIF5_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
4	UNIT4_RSTB	0h	RW	The SCIF4_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	0h	RW	The SCIF3_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The SCIF2_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Bit	Bit Name	Initial Value	R/W	Description
1	UNIT1_RSTB	0h	RW	The SCIF1_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The SCIF0_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.177 Reset Control Register RSPI (CPG_RST_RSPI)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0890h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	UNIT10_RST_WEN	UNIT9_RST_WEN	UNIT8_RST_WEN	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R0W1	R0W1	R0W1	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	UNIT10_RSTB	UNIT9_RSTB	UNIT8_RSTB	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
26	UNIT10_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT10_RSTB bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	UNIT9_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT9_RSTB bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	UNIT8_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT8_RSTB bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	UNIT10_RSTB	0h	RW	The RSPI2_TRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
9	UNIT9_RSTB	0h	RW	The RSPI1_TRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
8	UNIT8_RSTB	0h	RW	The RSPI0_TRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	0h	RW	The RSPI2_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The RSPI1_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The RSPI0_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.178 Reset Control Register CANFD (CPG_RST_CANFD)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0894h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	0h	RW	The CANFD_RSTC_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The CANFD_RSTP_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.179 Reset Control Register GPIO (CPG_RST_GPIO)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0898h

Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	1h	RW	The GPIO_SPARE_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	1h	RW	The GPIO_PORT_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The GPIO_RSTN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.180 Reset Control Register ADC (CPG_RST_ADC)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 08A8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	UNIT3_RSTB	0h	RW	The ADC1_ADRST_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The ADC1_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The ADC0_ADRST_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The ADC0_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.181 Reset Control Register TSU (CPG_RST_TSU)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 08ACh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The TSU_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.182 Reset Control Register AXI_ACPU_BUS (CPG_RST_AXI_ACPU_BUS)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 08B4h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The BUS_ACPU_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.183 Reset Control Register AXI_MCPU_BUS (CPG_RST_AXI_MCPU_BUS)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 08B8h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The BUS_MCPU_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.184 Reset Control Register AXI_COM_BUS (CPG_RST_AXI_COM_BUS)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 08BCh
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	1h	RW	The BUS_COM1_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The BUS_COM0_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.185 Reset Control Register AXI_VIDEO_BUS (CPG_RST_AXI_VIDEO_BUS)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 08C0h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	1h	RW	The BUS_VIDEO1_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The BUS_VIDEO0_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.186 Reset Control Register PERI_COM (CPG_RST_PERI_COM)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 08C4h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	1h	RW	The BUS_PERI_COM1_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The BUS_PERI_COM0_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.187 Reset Control Register REG1_BUS (CPG_RST_REG1_BUS)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 08C8h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The BUS_REG1_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.188 Reset Control Register REG0_BUS (CPG_RST_REG0_BUS)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 08CCh

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The BUS_REG0_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.189 Reset Control Register PERI_CPU (CPG_RST_PERI_CPU)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 08D0h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	1h	RW	The BUS_PERI_CPU1_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The BUS_PERI_CPU0_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.190 Reset Control Register PERI_VIDEO (CPG_RST_PERI_VIDEO)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 08D4h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	1h	RW	The BUS_PERI_VIDEO1_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The BUS_PERI_VIDEO0_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.191 Reset Control Register PERI_DDR (CPG_RST_PERI_DDR)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 08D8h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The BUS_PERI_DDR_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.192 Reset Control Register AXI_TZCDDR (CPG_RST_AXI_TZCDDR)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 08DCh

Initial Value : 0000_003Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	UNIT5_RST_WEN	UNIT4_RST_WEN	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	UNIT5_RSTB	UNIT4_RSTB	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21	UNIT5_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT5_RSTB bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	UNIT4_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	UNIT5_RSTB	1h	RW	The BUS_TZCDDR_PRESET1N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
4	UNIT4_RSTB	1h	RW	The BUS_TZCDDR_ARESET3N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	1h	RW	The BUS_TZCDDR_ARESET2N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	1h	RW	The BUS_TZCDDR_ARESET1N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Bit	Bit Name	Initial Value	R/W	Description
1	UNIT1_RSTB	1h	RW	The BUS_TZCDDR_ARESET0N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1h	RW	The BUS_TZCDDR_PRESET0N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.193 Reset Control Register PDM (CPG_RST_PDM)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0904h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The PDM_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.194 Reset Control Register PCI (CPG_RST_PCI)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0908h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The PCI_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.195 Reset Control Register SPDIF (CPG_RST_SPDIF)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 090Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The SPDIF_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.196 Reset Control Register I3C (CPG_RST_I3C)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0910h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	UNIT1_RSTB	0h	RW	The I3C_TRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The I3C_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.197 Reset Control Register VBAT (CPG_RST_VBAT)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0914h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The VBAT_BRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.198 Reset Control Register RSCI (CPG_RST_RSCI)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0918h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	UNIT11_RST_WEN	UNIT10_RST_WEN	UNIT9_RST_WEN	UNIT8_RST_WEN	-	-	-	-	UNIT3_RST_WEN	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	UNIT11_RSTB	UNIT10_RSTB	UNIT9_RSTB	UNIT8_RSTB	-	-	-	-	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
27	UNIT11_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT11_RSTB bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	UNIT10_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT10_RSTB bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	UNIT9_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT9_RSTB bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	UNIT8_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT8_RSTB bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	UNIT3_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

Bit	Bit Name	Initial Value	R/W	Description
11	UNIT11_RSTB	0h	RW	The RSCI3_TRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
10	UNIT10_RSTB	0h	RW	The RSCI2_TRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
9	UNIT9_RSTB	0h	RW	The RSCI1_TRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
8	UNIT8_RSTB	0h	RW	The RSCI0_TRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	UNIT3_RSTB	0h	RW	The RSCI3_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0h	RW	The RSCI2_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The RSCI1_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The RSCI0_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.199 Reset Control Register LVDS (CPG_RST_LVDS)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 091Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The LVDS_RESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.200 Reset Control Register BSC (CPG_RST_BSC)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0920h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	0h	RW	The BSC_X_PRESET_BSC reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.201 Reset Control Register MCPU_PERI (CPG_RST_MCPU_PERI)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0924h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The BUS_MCPU_PERI_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.202 Reset Control Register PERI_HPB (CPG_RST_PERI_HPB)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0928h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The BUS_PERI_HPB0_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.203 Reset Control Register QSPI_BUS (CPG_RST_QSPI_BUS)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 092Ch

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	UNIT0_RSTB	1h	RW	The BUS_QSPI_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.204 Reset Control Register Cortex-A55_2 (CPG_RST_CA55_2)

This register is used to control the reset signals for individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0930h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RST_WEN	UNIT1_RST_WEN	UNIT0_RST_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	UNIT2_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST_WEN	0h	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	UNIT2_RSTB	0h	RW	The CA55_RST16 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0h	RW	The CA55_RST15 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0h	RW	The CA55_RST14 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

4.4.3.205 Reset Monitor Register Cortex-CA55_1 (CPG_RSTMON_CA55_1)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0980h

Initial Value : 0000_3FFFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	RST13_MON	RST12_MON	RST11_MON	RST10_MON	RST9_MON	RST8_MON	RST7_MON	RST6_MON	RST5_MON	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13	RST13_MON	1h	R	The state of the CA55_RST13 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
12	RST12_MON	1h	R	The state of the CA55_RST12 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
11	RST11_MON	1h	R	The state of the CA55_RST11 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
10	RST10_MON	1h	R	The state of the CA55_RST10 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
9	RST9_MON	1h	R	The state of the CA55_RST9 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
8	RST8_MON	1h	R	The state of the CA55_RST8 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
7	RST7_MON	1h	R	The state of the CA55_RST4_3 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
6	RST6_MON	1h	R	The state of the CA55_RST4_2 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
5	RST5_MON	1h	R	The state of the CA55_RST4_1 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
4	RST4_MON	1h	R	The state of the CA55_RST4_0 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	1h	R	The state of the CA55_RST0_3 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the CA55_RST0_2 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the CA55_RST0_1 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

Bit	Bit Name	Initial Value	R/W	Description
0	RST0_MON	1h	R	The state of the CA55_RST0_0 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.206 Reset Monitor Register Cortex-M33 (CPG_RSTMON_CM33)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0984h
Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	1h	R	The state of the CM33_MISCRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the CM33_NSYSRESET reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the CM33_NPORESET reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.207 Reset Monitor Register SRAM_ACPU (CPG_RSTMON_SRAM_ACPU)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0988h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	0h	R	The state of the SRAM_ACPU_ARESETN2 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	0h	R	The state of the SRAM_ACPU_ARESETN1 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the SRAM_ACPU_ARESETN0 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.208 Reset Monitor Register SRAM_MCPU (CPG_RSTMON_SRAM_MCPU)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 098Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	0h	R	The state of the SRAM_MCPU_ARESETN1 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the SRAM_MCPU_ARESETN0 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.209 Reset Monitor Register GIC600 (CPG_RSTMON_GIC600)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0994h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	0h	R	The state of the GIC600_DBG_GICRESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the GIC600_GICRESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.210 Reset Monitor Register IA55 (CPG_RSTMON_IA55)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0998h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the IA55_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.211 Reset Monitor Register IM33 (CPG_RSTMON_IM33)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 099Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the IM33_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.212 Reset Monitor Register MHU (CPG_RSTMON_MHU)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09A0h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the MHU_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.213 Reset Monitor Register SYC (CPG_RSTMON_SYC)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09A8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the SYC_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.214 Reset Monitor Register DMAC (CPG_RSTMON_DMAC)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 09ACh

Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	1h	R	The state of the DMAC_RST_ASYNC reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the DMAC_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.215 Reset Monitor Register GTM (CPG_RSTMON_GTM)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09B4h
Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	1h	R	The state of the GTM2_PRESETZ reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the GTM1_PRESETZ reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the GTM0_PRESETZ reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.216 Reset Monitor Register MTU (CPG_RSTMON_MTU)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09B8h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the MTU_X_PRESET_MTU3 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.217 Reset Monitor Register POE3 (CPG_RSTMON_POE3)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09BCh
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the POE3_RST_M_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.218 Reset Monitor Register GPT (CPG_RSTMON_GPT)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09C0h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the GPT_RST_C reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.219 Reset Monitor Register POEG (CPG_RSTMON_POEG)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09C4h
Initial Value : 0000_000Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	RST3_MON	1h	R	The state of the POEG_D_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the POEG_C_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the POEG_B_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the POEG_A_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.220 Reset Monitor Register WDT (CPG_RSTMON_WDT)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09C8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	RST2_MON	0h	R	The state of the WDT2_PRESETN (for CM33) reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	0h	R	The state of the WDT1_PRESETN (for Secure CA55) reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the WDT0_PRESETN (for Non-Secure CA55) reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.221 Reset Monitor Register DDR (CPG_RSTMON_DDR)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 09CCh

Initial Value : 0000_01FEh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	RST8_MON	RST7_MON	RST6_MON	RST5_MON	RST4_MON	RST3_MON	RST2_MON	RST1_MON	-
Initial Value	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	RST8_MON	1h	R	The state of the DDR_PWROKIN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
7	RST7_MON	1h	R	The state of the DDR_RESET reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
6	RST6_MON	1h	R	The state of the DDR_REG_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
5	RST5_MON	1h	R	The state of the DDR_AXI3_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
4	RST4_MON	1h	R	The state of the DDR_AXI2_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	1h	R	The state of the DDR_AXI1_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the DDR_AXI0_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the DDR_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.222 Reset Monitor Register xSPI (CPG_RSTMON_XSPI)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09D0h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	1h	R	The state of the XSPI_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the XSPI_HRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.223 Reset Monitor Register SDHI (CPG_RSTMON_SDHI)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 09D4h

Initial Value : 0000_01FFh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	RST8_MON	RST7_MON	RST6_MON	RST5_MON	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
8	RST8_MON	1h	R	The state of the SDHI2_IXRSTAXIS reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
7	RST7_MON	1h	R	The state of the SDHI2_IXRSTAXIM reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
6	RST6_MON	1h	R	The state of the SDHI1_IXRSTAXIS reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
5	RST5_MON	1h	R	The state of the SDHI1_IXRSTAXIM reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
4	RST4_MON	1h	R	The state of the SDHI0_IXRSTAXIS reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	1h	R	The state of the SDHI0_IXRSTAXIM reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the SDHI2_IXRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the SDHI1_IXRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the SDHI0_IXRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.224 Reset Monitor Register GE3D (CPG_RSTMON_GE3D)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09D8h
Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	1h	R	The state of the GE3D_ACE_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the GE3D_AXI_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the GE3D_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.225 Reset Monitor Register ISU2 (CPG_RSTMON_ISU2)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09DCh
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	1h	R	The state of the ISU_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the ISU_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.226 Reset Monitor Register H264 (CPG_RSTMON_H264)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09E0h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	1h	R	The state of the H264_CP_PRESET_P reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the H264_X_RESET_VCP reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.227 Reset Monitor Register CRU (CPG_RSTMON_CRU)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09E4h
Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	1h	R	The state of the CRU_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the CRU_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the CRU_CMN_RSTB reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.228 Reset Monitor Register MIPI_DSI (CPG_RSTMON_MIPI_DSI)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09E8h
Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	1h	R	The state of the MIPI_DSI_PRESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the MIPI_DSI_ARESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the MIPI_DSI_CMN_RSTB reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.229 Reset Monitor Register LCDC (CPG_RSTMON_LCDC)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09ECh
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the LCDC_RESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.230 Reset Monitor Register SSIF (CPG_RSTMON_SSIF)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09F0h
Initial Value : 0000_000Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	RST3_MON	1h	R	The state of the SSI3_RST_M2_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the SSI2_RST_M2_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the SSI1_RST_M2_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the SSI0_RST_M2_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.231 Reset Monitor Register USB (CPG_RSTMON_USB)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 09F8h

Initial Value : 0000_001Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
4	RST4_MON	1h	R	The state of the USB_U2P1_EXL_SYSRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	1h	R	The state of the USB_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the USB_U2P0_EXL_SYSRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the USB_U2H1_HRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the USB_U2H0_HRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.232 Reset Monitor Register ETH (CPG_RSTMON_ETH)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 09FCh
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	1h	R	The state of the ETH1_ARESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the ETH0_ARESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.233 Reset Monitor Register I2C (CPG_RSTMON_I2C)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A00h
Initial Value : 0000_000Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	RST3_MON	1h	R	The state of the I2C3_MRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the I2C2_MRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the I2C1_MRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the I2C0_MRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.234 Reset Monitor Register SCIF (CPG_RSTMON_SCIF)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0A04h

Initial Value : 0000_003Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	RST5_MON	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	RST5_MON	1h	R	The state of the SCIF5_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
4	RST4_MON	1h	R	The state of the SCIF4_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	1h	R	The state of the SCIF3_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the SCIF2_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the SCIF1_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the SCIF0_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.235 Reset Monitor Register RSPI (CPG_RSTMON_RSPI)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0A10h

Initial Value : 0000_0707h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	RST10_MON	RST9_MON	RST8_MON	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	RST10_MON	1h	R	The state of the RSPI2_TRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
9	RST9_MON	1h	R	The state of the RSPI1_TRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
8	RST8_MON	1h	R	The state of the RSPI0_TRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
7 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	1h	R	The state of the RSPI2_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the RSPI1_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the RSPI0_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.236 Reset Monitor Register CANFD (CPG_RSTMON_CANFD)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A14h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	1h	R	The state of the CANFD_RSTC_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the CANFD_RSTP_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.237 Reset Monitor Register GPIO (CPG_RSTMON_GPIO)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0A18h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	0h	R	The state of the GPIO_SPARE_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	0h	R	The state of the GPIO_PORT_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the GPIO_RSTN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.238 Reset Monitor Register ADC (CPG_RSTMON_ADC)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A28h
Initial Value : 0000_000Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	RST3_MON	1h	R	The state of the ADC1_ADRST_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the ADC1_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the ADC0_ADRST_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the ADC0_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.239 Reset Monitor Register TSU (CPG_RSTMON_TSU)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A2Ch
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the TSU_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.240 Reset Monitor Register AXI_ACPU_BUS (CPG_RSTMON_AXI_ACPU_BUS)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A34h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the BUS_ACPU_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.241 Reset Monitor Register AXI_MCPU_BUS (CPG_RSTMON_AXI_MCPU_BUS)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A38h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the BUS_MCPU_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.242 Reset Monitor Register AXI_COM_BUS (CPG_RSTMON_AXI_COM_BUS)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A3Ch
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	0h	R	The state of the BUS_COM1_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the BUS_COM0_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.243 Reset Monitor Register AXI_VIDEO_BUS (CPG_RSTMON_AXI_VIDEO_BUS)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A40h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	0h	R	The state of the BUS_VIDEO1_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the BUS_VIDEO0_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.244 Reset Monitor Register PERI_COM (CPG_RSTMON_PERI_COM)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A44h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	0h	R	The state of the BUS_PERI_COM1_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the BUS_PERI_COM0_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.245 Reset Monitor Register REG1_BUS (CPG_RSTMON_REG1_BUS)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A48h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the BUS_REG1_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.246 Reset Monitor Register REG0_BUS (CPG_RSTMON_REG0_BUS)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0A4Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the BUS_REG0_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.247 Reset Monitor Register PERI_CPU (CPG_RSTMON_PERI_CPU)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0A50h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	0h	R	The state of the BUS_PERI_CPU1_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the BUS_PERI_CPU0_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.248 Reset Monitor Register PERI_VIDEO (CPG_RSTMON_PERI_VIDEO)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0A54h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	0h	R	The state of the BUS_PERI_VIDEO1_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the BUS_PERI_VIDEO0_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.249 Reset Monitor Register PERI_DDR (CPG_RSTMON_PERI_DDR)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A58h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the BUS_PERI_DDR_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.250 Reset Monitor Register AXI_TZCDDR (CPG_RSTMON_AXI_TZCDDR)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0A5Ch

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	RST5_MON	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
5	RST5_MON	0h	R	The state of the BUS_TZCDDR_PRESET1N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
4	RST4_MON	0h	R	The state of the BUS_TZCDDR_ARESET3N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	0h	R	The state of the BUS_TZCDDR_ARESET2N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	0h	R	The state of the BUS_TZCDDR_ARESET1N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	0h	R	The state of the BUS_TZCDDR_ARESET0N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0h	R	The state of the BUS_TZCDDR_PRESET0N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.251 Reset Monitor Register PDM (CPG_RSTMON_PDM)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A84h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the PDM_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.252 Reset Monitor Register PCI (CPG_RSTMON_PCI)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A88h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the PCI_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.253 Reset Monitor Register SPDIF (CPG_RSTMON_SPDIF)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A8Ch
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the SPDIF_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.254 Reset Monitor Register I3C (CPG_RSTMON_I3C)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A90h
Initial Value : 0000_0003h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	RST1_MON	1h	R	The state of the I3C_TRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the I3C_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.255 Reset Monitor Register VBAT (CPG_RSTMON_VBAT)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A94h
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the VBAT_BRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.256 Reset Monitor Register RSCI (CPG_RSTMON_RSCI)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0A98h

Initial Value : 0000_0F0Fh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	RST11_MON	RST10_MON	RST9_MON	RST8_MON	-	-	-	-	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
11	RST11_MON	1h	R	The state of the RSCI3_TRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
10	RST10_MON	1h	R	The state of the RSCI2_TRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
9	RST9_MON	1h	R	The state of the RSCI1_TRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
8	RST8_MON	1h	R	The state of the RSCI0_TRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
7 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	RST3_MON	1h	R	The state of the RSCI3_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1h	R	The state of the RSCI2_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the RSCI1_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the RSCI0_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.257 Reset Monitor Register LVDS (CPG_RSTMON_LVDS)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0A9Ch
Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the LVDS_RESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.258 Reset Monitor Register BSC (CPG_RSTMON_BSC)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0AA0h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	1h	R	The state of the BSC_X_PRESET_BSC reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.259 Reset Monitor Register MCPU_PERI (CPG_RSTMON_MCPU_PERI)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0AA4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the BUS_MCPU_PERI_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.260 Reset Monitor Register PERI_HPB (CPG_RSTMON_PERI_HPB)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0AA8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the BUS_PERI_HPB0_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.261 Reset Monitor Register QSPI_BUS (CPG_RSTMON_QSPI_BUS)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0AACh
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RST0_MON	0h	R	The state of the BUS_QSPI_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.262 Reset Monitor Register Cortex-CA55_2 (CPG_RSTMON_CA55_2)

This register is used to monitor the reset signals of individual modules.

Access Size : 32 bits
Address : <CPG_base> + 0AB0h
Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	RST2_MON	1h	R	The state of the CA55_RST16 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1h	R	The state of the CA55_RST15 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1h	R	The state of the CA55_RST14 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

4.4.3.263 WDT Overflow System Reset Register (CPG_WDTOVF_RST)

After the release from a system reset applied by the WDT reset circuit in response to a reset request such as a WDT overflow, this register can be used to identify the WDT channel that generated the reset request. If a system reset is not applied according to the WDTRSTSEL register setting, the WDT is not reset and the source of the reset request can be identified by checking the interrupt from the WDT and the status register.

Access Size : 32 bits

Address : <CPG_base> + 0B10h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	WDTOVF2_WEN	WDTOVF1_WEN	WDTOVF0_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	WDTOVF2	WDTOVF1	WDTOVF0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
19	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
18	WDTOVF2_WEN	0h	R0W1	Flag for enabling the writing to the WDTOVF2 bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	WDTOVF1_WEN	0h	R0W1	Flag for enabling the writing to the WDTOVF1 bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	WDTOVF0_WEN	0h	R0W1	Flag for enabling the writing to the WDTOVF0 bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
3	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	WDTOVF2	0h	RW	The system reset generated by WDT channel 2 for the Cortex-M33 is indicated. 0: System reset has not been generated by WDT channel 2 for the Cortex-M33. 1: System reset has been generated by WDT channel 2 for the Cortex-M33. Note: This bit is cleared by writing 1.
1	WDTOVF1	0h	RW	The system reset generated by WDT channel 1 for the Cortex-A55(Secure) is indicated. 0: System reset has not been generated by WDT channel 1 for the Cortex-A55(Secure). 1: System reset has been generated by WDT channel 1 for the Cortex-A55(Secure). Note: This bit is cleared by writing 1.
0	WDTOVF0	0h	RW	The system reset generated by WDT channel 0 for the Cortex-A55(Non-Secure) is indicated. 0: System reset has not been generated by WDT channel 0 for the Cortex-A55(Non-Secure). 1: System reset has been generated by WDT channel 0 for the Cortex-A55(Non-Secure). Note: This bit is cleared by writing 1.

4.4.3.264 WDT Reset Selector Register (CPG_WDTRST_SEL)

This register is used to mask reset requests from the WDT.

Access Size : 32 bits

Address : <CPG_base> + 0B14h

Initial Value : 0000_0088h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	WDTRSTSEL10_WEN	WDTRSTSEL9_WEN	WDTRSTSEL8_WEN	-	WDTRSTSEL6_WEN	WDTRSTSEL5_WEN	WDTRSTSEL4_WEN	-	WDTRSTSEL2_WEN	WDTRSTSEL1_WEN	WDTRSTSEL0_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R0W1	R0W1	R0W1	R	R0W1	R0W1	R0W1	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	WDTRSTSEL10	WDTRSTSEL9	WDTRSTSEL8	-	WDTRSTSEL6	WDTRSTSEL5	WDTRSTSEL4	-	WDTRSTSEL2	WDTRSTSEL1	WDTRSTSEL0
Initial Value	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
26	WDTRSTSEL10_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL10 bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	WDTRSTSEL9_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL9 bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	WDTRSTSEL8_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL8 bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
22	WDTRSTSEL6_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL6 bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	WDTRSTSEL5_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL5 bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	WDTRSTSEL4_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL4 bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
18	WDTRSTSEL2_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL2 bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
17	WDTRSTSEL1_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL1 bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	WDTRSTSEL0_WEN	0h	R0W1	Flag for enabling the writing to the WDTRSTSEL0 bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 11	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
10	WDTRSTSEL10	0h	RW	Whether to mask the reset request by WDT channel 2 is specified. 0: Cold reset of the Cortex-M33 is masked. 1: Cold reset of the Cortex-M33 is enabled.
9	WDTRSTSEL9	0h	RW	Whether to mask the reset request by WDT channel 1 is specified. 0: Cold reset of the Cortex-A55 is masked. 1: Cold reset of the Cortex-A55 is enabled.
8	WDTRSTSEL8	0h	RW	Whether to mask the reset request by WDT channel 0 is specified. 0: Cold reset of the Cortex-A55 is masked. 1: Cold reset of the Cortex-A55 is enabled.
7	-	1h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	WDTRSTSEL6	0h	RW	Whether to mask the assertion of WDTOVFOUT due to a request from WDT channel2 for the Cortex-M33 is specified. 0: Assertion of WDTOVFOUT is masked. 1: Assertion of WDTOVFOUT is enabled.
5	WDTRSTSEL5	0h	RW	Whether to mask the assertion of WDTOVFOUT due to a request from WDT channel1 for the Cortex-A55 (Secure) is specified. 0: Assertion of WDTOVFOUT is masked. 1: Assertion of WDTOVFOUT is enabled.
4	WDTRSTSEL4	0h	RW	Whether to mask the assertion of WDTOVFOUT due to a request from WDT channel0 for the Cortex-A55 (Non-Secure) is specified. 0: Assertion of WDTOVFOUT is masked. 1: Assertion of WDTOVFOUT is enabled.
3	-	1h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	WDTRSTSEL2	0h	RW	Whether to mask WDTSYSREST[2] due to a request from WDT channel 2 for the Cortex-M33 is specified. 0: System reset is masked. 1: System reset is enabled.
1	WDTRSTSEL1	0h	RW	Whether to mask WDTSYSREST[1] due to a request from WDT channel 1 for the Cortex-A55 (Secure) is specified. 0: System reset is masked. 1: System reset is enabled.
0	WDTRSTSEL0	0h	RW	Whether to mask WDTSYSREST[0] due to a request from WDT channel 0 for the Cortex-A55 (Non-Secure) is specified. 0: System reset is masked. 1: System reset is enabled.

4.4.3.265 Cortex-A55 Cluster Power Status Monitor Register (CPG_CLUSTER_PCHMON)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is monitored by the CPU for software control of the handshake.

Access Size : 32 bits

Address : <CPG_base> + 0B30h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PDENY_MON	PACCEPT_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	PDENY_MON	0h	R	Signal indicating the denial of power mode transition in the cluster
0	PACCEPT_MON	0h	R	Signal indicating the acceptance of power mode transition in the cluster

4.4.3.266 Cortex-A55 Cluster Power Status Control Register (CPG_CLUSTER_PCHCTL)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is used for software control of the handshake.

Access Size : 32 bits

Address : <CPG_base> + 0B34h

Initial Value : 0048_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	PSTATE_SET[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PREQ_SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
22 to 16	PSTATE_SET [6:0]	48h	RW	Destination power mode of the cluster 100_1000b: ON 000_0000b: OFF
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PREQ_SET	0h	RW	Signal for indicating a request of power mode transition in the cluster

4.4.3.267 Cortex-A55 Core 0 Power Status Monitor Register (CPG_CORE0_PCHMON)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55 Core 0.

This register is monitored by the CPU for software control of the handshake.

Access Size : 32 bits

Address : <CPG_base> + 0B38h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PDENY0_MON	PACCEPT0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	PDENY0_MON	0h	R	Signal indicating the denial of power mode transition in the core 0
0	PACCEPT0_MON	0h	R	Signal indicating the acceptance of power mode transition in the core 0

4.4.3.268 Cortex-A55 Core 0 Power Status Control Register (CPG_CORE0_PCHCTL)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55 Core 0.

This register is used for software control of the handshake.

Access Size : 32 bits

Address : <CPG_base> + 0B3Ch

Initial Value : 0008_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	PSTATE0_SET[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PREQ0_SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21 to 16	PSTATE0_SET[5:0]	8h	RW	Destination power mode of the core 0 00_1000b: ON 00_0001b: OFF (Emulated) 00_0000b: OFF
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PREQ0_SET	0h	RW	Signal for indicating a request of power mode transition in the core 0

4.4.3.269 Cortex-A55 Core 1 Power Status Monitor Register (CPG_CORE1_PCHMON)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55 Core 1.

This register is monitored by the CPU for software control of the handshake.

Access Size : 32 bits

Address : <CPG_base> + 0B40h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PDENY1_MON	PACCEPT1_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	PDENY1_MON	0h	R	Signal indicating the denial of power mode transition in the core 1
0	PACCEPT1_MON	0h	R	Signal indicating the acceptance of power mode transition in the core 1

4.4.3.270 Cortex-A55 Core 1 Power Status Control Register (CPG_CORE1_PCHCTL)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55 Core 1.

This register is used for software control of the handshake.

Access Size : 32 bits

Address : <CPG_base> + 0B44h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	PSTATE1_SET[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PREQ1_SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21 to 16	PSTATE1_SET [5:0]	0h	RW	Destination power mode of the core 1 00_1000b: ON 00_0001b: OFF (Emulated) 00_0000b: OFF
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PREQ1_SET	0h	RW	Signal for indicating a request of power mode transition in the core 1

4.4.3.271 Cortex-A55 Core 2 Power Status Monitor Register (CPG_CORE2_PCHMON)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55 Core 2.

This register is monitored by the CPU for software control of the handshake.

Access Size : 32 bits

Address : <CPG_base> + 0B48h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
21 to 16	PSTATE3_SET [5:0]	0h	RW	Destination power mode of the core 3 00_1000b: ON 00_0001b: OFF (Emulated) 00_0000b: OFF
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PREQ3_SET	0h	RW	Signal for indicating a request of power mode transition in the core 3

4.4.3.275 MSTOP Register ACPU (CPG_BUS_ACPU_MSTOP)

This register indicates the stop state of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0B60h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	MSTOP2_ON_WEN	MSTOP1_ON_WEN	MSTOP0_ON_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
18	MSTOP2_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	MSTOP1_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	MSTOP0_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
2	MSTOP2_ON	0h	RW	The state of BUS_ACPU_MSTOP_MXSRAM_A2 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
1	MSTOP1_ON	0h	RW	The state of BUS_ACPU_MSTOP_MXSRAM_A1 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
0	MSTOP0_ON	0h	RW	The state of BUS_ACPU_MSTOP_MXSRAM_A0 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)

4.4.3.276 MSTOP Register MCPU1 (CPG_BUS_MCPU1_MSTOP)

This register indicates the stop state of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0B64h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

2	MSTOP2_ON	0h	RW	The state of BUS_TZCDDR_MSTOP2 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
1	MSTOP1_ON	0h	RW	The state of BUS_TZCDDR_MSTOP1 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
0	MSTOP0_ON	0h	RW	The state of BUS_TZCDDR_MSTOP0 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)

4.4.3.285 MSTOP Register MHU (CPG_MHU_MSTOP)

This register indicates the stop state of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0B88h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MSTOP0_ON_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MSTOP0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	MSTOP0_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	MSTOP0_ON	0h	RW	The state of MHU_MSTOP operation is indicated. 0: Normal operation 1: Module stop state (MSTP)

4.4.3.286 MSTOP Register MCPU3 (CPG_BUS_MCPU3_MSTOP)

This register indicates the stop state of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0B90h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	MSTOP12_ON_WEN	MSTOP11_ON_WEN	MSTOP10_ON_WEN	MSTOP9_ON_WEN	MSTOP8_ON_WEN	MSTOP7_ON_WEN	MSTOP6_ON_WEN	MSTOP5_ON_WEN	MSTOP4_ON_WEN	-	-	MSTOP1_ON_WEN	-

R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
28	MSTOP12_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP12_ON bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	MSTOP11_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	MSTOP10_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	MSTOP9_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	MSTOP8_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	MSTOP7_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	MSTOP6_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	MSTOP5_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	MSTOP4_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
19, 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	MSTOP1_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16 to 13	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
12	MSTOP12_ON	0h	RW	The state of BUS_MCPU_PERI_MSTOP_MPSCI_3 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
11	MSTOP11_ON	0h	RW	The state of BUS_MCPU_PERI_MSTOP_MPSCI_2 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
10	MSTOP10_ON	0h	RW	The state of BUS_MCPU_PERI_MSTOP_MPI3C operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
9	MSTOP9_ON	0h	RW	The state of BUS_MCPU_MSTOP_MPPDM operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
8	MSTOP8_ON	0h	RW	The state of BUS_MCPU_MSTOP_MPVBATT operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
7	MSTOP7_ON	0h	RW	The state of BUS_MCPU_MSTOP_MHRTC operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
6	MSTOP6_ON	0h	RW	The state of BUS_MCPU_MSTOP_MHSPDIF operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
5	MSTOP5_ON	0h	RW	The state of BUS_PERI_HPB0_MSTOP_MHGPT_ELC operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
4	MSTOP4_ON	0h	RW	The state of BUS_PERI_HPB0_MSTOP_MHSCIF_5 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	MSTOP1_ON	0h	RW	The state of BUS_MCPU_MSTOP_MXSRAM_M1 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.287 MSTOP Register PERI_CPU2 (CPG_BUS_PERI_CPU2_MSTOP)

This register indicates the stop state of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0B94h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
29	MSTOP13_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP13_ON bit (bit 13) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
28	MSTOP12_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP12_ON bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	MSTOP11_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	MSTOP10_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	MSTOP9_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	MSTOP8_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	MSTOP7_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	MSTOP6_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	MSTOP5_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
20	MSTOP4_ON_WEN	0h	R0W1	Flag for enabling the writing to the MSTOP4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19 to 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13	MSTOP13_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MXOTFED_XSPI0 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
12	MSTOP12_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MXTZCDDR_BK operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
11	MSTOP11_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MXTZCDDR_FT operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
10	MSTOP10_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MXTZCDDR_ACPU operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
9	MSTOP9_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MPSRAM_M1 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
8	MSTOP8_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MPSRAM_A2 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
7	MSTOP7_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MPSRAM_A1 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
6	MSTOP6_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MPTZC_6 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
5	MSTOP5_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MPTZC_5 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
4	MSTOP4_ON	0h	RW	The state of BUS_PERI_CPU_MSTOP_MPTZC_4 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
3 to 0	-	0h	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.

4.4.3.288 MSTOP Register PERI_VIDEO2 (CPG_BUS_PERI_VIDEO2_MSTOP)

This register indicates the stop state of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0B98h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
29	PWRDN13_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN13_ON bit (bit 13) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
28	PWRDN12_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN12_ON bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	PWRDN11_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	PWRDN10_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	PWRDN9_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	PWRDN8_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	PWRDN7_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	PWRDN6_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	PWRDN5_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
20	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19, 18	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
17	PWRDN1_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	PWRDN0_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13	PWRDN13_ON	0h	RW	Controls power down for TSU in Power Down mode. 0: Not subject to power down 1: Subject to power down
12	PWRDN12_ON	0h	RW	Controls power down for ADC1 in Power Down mode. 0: Not subject to power down 1: Subject to power down
11	PWRDN11_ON	0h	RW	Controls power down for BSC in Power Down mode. 0: Not subject to power down 1: Subject to power down
10	PWRDN10_ON	0h	RW	Controls power down for GE3D (GPU) in Power Down mode. 0: Not subject to power down 1: Subject to power down
9	PWRDN9_ON	0h	RW	Controls power down for LCDC in Power Down mode. 0: Not subject to power down 1: Subject to power down
8	PWRDN8_ON	0h	RW	Controls power down for DSI in Power Down mode. 0: Not subject to power down 1: Subject to power down
7	PWRDN7_ON	0h	RW	Controls power down for H264 in Power Down mode. 0: Not subject to power down 1: Subject to power down
6	PWRDN6_ON	0h	RW	Controls power down for ISU2 in Power Down mode. 0: Not subject to power down 1: Subject to power down
5	PWRDN5_ON	0h	RW	Controls power down for CRU in Power Down mode. 0: Not subject to power down 1: Subject to power down
4	-	0h	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
1	PWRDN1_ON	0h	RW	Controls power down for AXI_TZCDDR in Power Down mode. 0: Not subject to power down 1: Subject to power down
0	PWRDN0_ON	0h	RW	Controls power down for DDR in Power Down mode. 0: Not subject to power down 1: Subject to power down

4.4.3.291 Power Down IP Register 3 (CPG_PWRDN_IP3)

This register indicates the stop state of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0BB8h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	PWRDN13_ON_WEN	PWRDN12_ON_WEN	PWRDN11_ON_WEN	PWRDN10_ON_WEN	PWRDN9_ON_WEN	PWRDN8_ON_WEN	PWRDN7_ON_WEN	PWRDN6_ON_WEN	PWRDN5_ON_WEN	PWRDN4_ON_WEN	PWRDN3_ON_WEN	PWRDN2_ON_WEN	PWRDN1_ON_WEN	PWRDN0_ON_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
29	PWRDN13_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN13_ON bit (bit 13) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
28	PWRDN12_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN12_ON bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	PWRDN11_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	PWRDN10_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	PWRDN9_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	PWRDN8_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	PWRDN7_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	PWRDN6_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	PWRDN5_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
20	PWRDN4_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	PWRDN3_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	PWRDN2_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	PWRDN1_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	PWRDN0_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15, 14	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
13	PWRDN13_ON	0h	RW	Controls power down for SCIF (ch5) in Power Down mode. 0: Not subject to power down 1: Subject to power down
12	PWRDN12_ON	0h	RW	Controls power down for SCIF (ch4) in Power Down mode. 0: Not subject to power down 1: Subject to power down
11	PWRDN11_ON	0h	RW	Controls power down for SCIF (ch3) in Power Down mode. 0: Not subject to power down 1: Subject to power down
10	PWRDN10_ON	0h	RW	Controls power down for SCIF (ch2) in Power Down mode. 0: Not subject to power down 1: Subject to power down
9	PWRDN9_ON	0h	RW	Controls power down for POEG (ch3) in Power Down mode. 0: Not subject to power down 1: Subject to power down
8	PWRDN8_ON	0h	RW	Controls power down for POEG (ch2) in Power Down mode. 0: Not subject to power down 1: Subject to power down
7	PWRDN7_ON	0h	RW	Controls power down for POEG (ch1) in Power Down mode. 0: Not subject to power down 1: Subject to power down
6	PWRDN6_ON	0h	RW	Controls power down for POEG (ch0) in Power Down mode. 0: Not subject to power down 1: Subject to power down
5	PWRDN5_ON	0h	RW	Controls power down for GPT (PWM) in Power Down mode. 0: Not subject to power down 1: Subject to power down
4	PWRDN4_ON	0h	RW	Controls power down for POE3 in Power Down mode. 0: Not subject to power down 1: Subject to power down
3	PWRDN3_ON	0h	RW	Controls power down for MTU3 in Power Down mode. 0: Not subject to power down 1: Subject to power down
2	PWRDN2_ON	0h	RW	Controls power down for I2C(ch3) in Power Down mode. 0: Not subject to power down 1: Subject to power down
1	PWRDN1_ON	0h	RW	Controls power down for I2C(ch2) in Power Down mode. 0: Not subject to power down 1: Subject to power down
0	PWRDN0_ON	0h	RW	Controls power down for I2C(ch1) in Power Down mode. 0: Not subject to power down 1: Subject to power down

4.4.3.292 Power Down IP Register 4 (CPG_PWRDN_IP4)

This register indicates the stop state of individual modules.

Access Size : 32 bits

Address : <CPG_base> + 0BBCh

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	PWRDN9_ON_WEN	PWRDN8_ON_WEN	PWRDN7_ON_WEN	PWRDN6_ON_WEN	PWRDN5_ON_WEN	PWRDN4_ON_WEN	PWRDN3_ON_WEN	PWRDN2_ON_WEN	PWRDN1_ON_WEN	PWRDN0_ON_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
25	PWRDN9_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	PWRDN8_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	PWRDN7_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	PWRDN6_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	PWRDN5_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	PWRDN4_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	PWRDN3_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	PWRDN2_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	PWRDN1_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
16	PWRDN0_ON_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 10	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
9	PWRDN9_ON	0h	RW	Controls power down for I3C in Power Down mode. 0: Not subject to power down 1: Subject to power down
8	PWRDN8_ON	0h	RW	Controls power down for RSCI (ch3) in Power Down mode. 0: Not subject to power down 1: Subject to power down
7	PWRDN7_ON	0h	RW	Controls power down for RSCI (ch2) in Power Down mode. 0: Not subject to power down 1: Subject to power down
6	PWRDN6_ON	0h	RW	Controls power down for RSCI (ch1) in Power Down mode. 0: Not subject to power down 1: Subject to power down
5	PWRDN5_ON	0h	RW	Controls power down for RSPI (ch2) in Power Down mode. 0: Not subject to power down 1: Subject to power down
4	PWRDN4_ON	0h	RW	Controls power down for RSPI (ch1) in Power Down mode. 0: Not subject to power down 1: Subject to power down
3	PWRDN3_ON	0h	RW	Controls power down for SSIF (ch3) in Power Down mode. 0: Not subject to power down 1: Subject to power down
2	PWRDN2_ON	0h	RW	Controls power down for SSIF (ch2) in Power Down mode. 0: Not subject to power down 1: Subject to power down
1	PWRDN1_ON	0h	RW	Controls power down for SSIF (ch1) in Power Down mode. 0: Not subject to power down 1: Subject to power down
0	PWRDN0_ON	0h	RW	Controls power down for SSIF (ch0) in Power Down mode. 0: Not subject to power down 1: Subject to power down

4.4.3.293 Power Down MSTOP Register (CPG_PWRDN_MSTOP)

It works in conjunction with the Power Down IP register to control the standstill state of the unit in Power Down mode.

Access Size : 32 bits
Address : <CPG_base> + 0BC0h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MSTOP0_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PWRDN_MSTOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	MSTOP0_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN_MSTOP bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PWRDN_MSTOP	0h	RW	Indicates the operation status of the BUS in Power Down mode. 0: Power ON state (MSTOP = 0) 1: Power off (MSTOP = 1)

4.4.3.294 Power Down CLKON Register (CPG_PWRDN_CLKON)

In conjunction with the Power Down IP register, it controls the ON/OFF of each unit clock in Power Down mode.

Access Size : 32 bits

Address : <CPG_base> + 0BC4h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLK0_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PWRDN_CLKON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	CLK0_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN_CLKON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PWRDN_CLKON	0h	RW	Controls the operation of the unit clock in Power Down mode. 0: Power ON state (CLK = ON) 1: Power off (CLK = OFF)

4.4.3.295 Power Down RST Register (CPG_PWRDN_RST)

In conjunction with the Power Down IP register, it controls the ON/OFF of each unit clock in Power Down mode.

Access Size : 32 bits
Address : <CPG_base> + 0BC8h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RST0_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PWRDN_RST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	RST0_WEN	0h	R0W1	Flag for enabling the writing to the PWRDN_RST bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	PWRDN_RST	0h	RW	Controls the reset pin in Power Down mode. 0: Power ON state (reset release) 1: Power off (reset state)

4.4.3.296 Return Func 1 Register (CPG_RET_FUNC1)

Access Size : 32 bits

Address : <CPG_base> + 0BD0h

Initial Value : 0000_0001h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RSTB_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
16	RSTB_WEN	0h	R0W1	Flag for enabling the writing to the RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	-	All 0	R	Reserved Whenever it is read, 0b is read. The written value should always be the read value.
0	RSTB	1h	RW	0: Reset ON 1: Reset OFF

4.4.3.297 Return Func 2 Register (CPG_RET_FUNC2)

Access Size : 32 bits

Address : <CPG_base> + 0BD4h

Initial Value : 0000_0007h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

4.4.4.2 Control of Turning Unit Clock Signals On and Off

Control over turning unit clock signals on and off is realized by switching clock gating cells (CGCs) on and off under various conditions for enabling. The factors of control over turning clocks on and off are listed below.

- Control over turning clocks on and off by register settings
- Control over turning clocks on at the time of forcibly supplying them in the boot sequence.
- Control over turning clocks off at the time of release from the reset state
- Control over turning debug circuits (CSTs) off in normal mode (other than debug mode)

In addition, whether the CGCs are on or off can be confirmed by monitoring the clock signals output from the CGC control circuits with the *_CLK_MON registers.

4.4.4.3 Functions for Controlling, Setting, and Monitoring PLLs

This section describes functions for controlling, setting, and monitoring PLLs. The PLLs are controlled by internal registers of the CPG. The PLL states can be monitored by the internal registers of the CPG.

The functions for controlling, setting, and monitoring PLLs are listed below. Details of each of the functions are given in the following sections.

- PLL operating mode control
- Setting output clock signals
- Monitoring the PLL states (reset, locked)

Table 4.4-10 shows the implemented PLLs with or without SSCG.

Table 4.4-10 List of PLLs with or without SSCG

PLL Name	With or Without SSCG
PLL1	With SSCG (switched by a register setting)*1
PLL2	Without SSCG (fixed to off)
PLL3	With SSCG (The default settings are defined by the state of SYSCLK_SSCG_EN pin.)
PLL4	With SSCG (on)
PLL6	Without SSCG (off)
PLL7	Without SSCG (off)

Note 1. The default settings are defined by the state of SYSCLK_SSCG_EN pin.

Figure 4.4-12 is a block diagram for controlling a PLL for which the SSCG function is available.

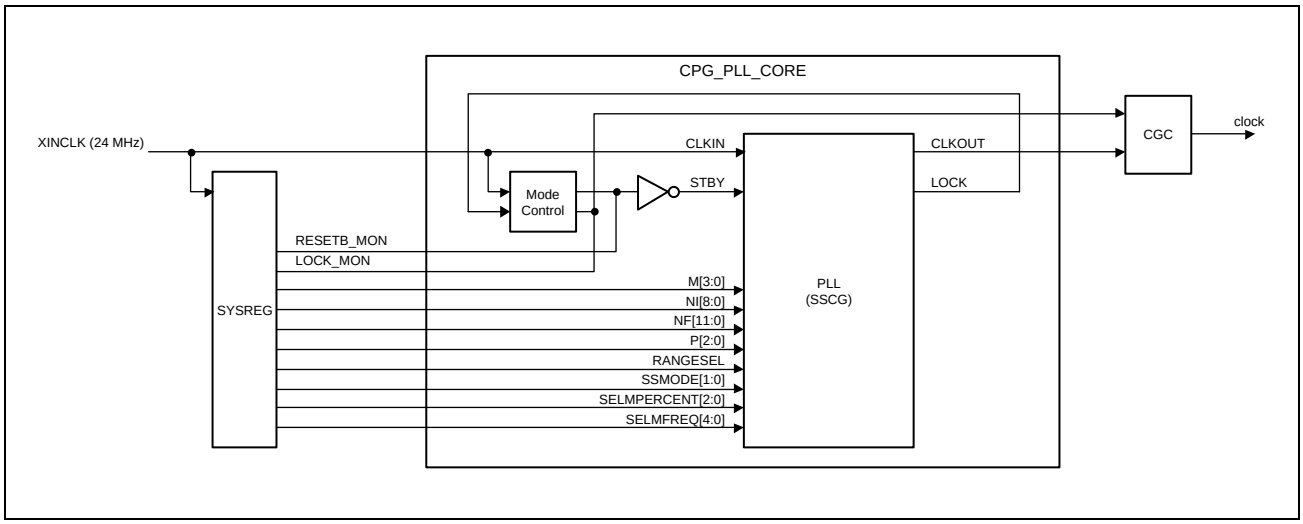

Figure 4.4-12 Block Diagram for Controlling a PLL for which the SSCG Function is Available

4.4.4.3.1 PLL operating mode control

The internal registers of the CPG are used to set the PLL operating mode and turn the SSCG on or off per PLL.

Either of the normal and standby modes is selectable as the operating mode.

The following items can be set with the internal registers of the CPG.

- Setting the operating mode (normal or standby mode)
- Turning the SSCG on or off (the setting is enabled in normal mode)

The related registers are listed in **Table 4.4-11**. For details on the settings, refer to the description of the given register.

Table 4.4-11 List of PLL Standby Control Registers

Register Name	Abbreviation	Function
PLLn (SSCG) standby control registers	CPG_PLLn_STBY (n = 1, 4, 6 or 7)	Setting the standby mode (reset state) Turning the SSCG on or off

4.4.4.3.2 Setting output clock signals

The internal registers of the CPG can be used to set the PLL output clock signal per PLL. The following item can be set.

- Setting the frequency of the output clock signal

The related registers are listed in **Table 4.4-12**.

Table 4.4-12 List of PLL Output Clock Setting Registers

Register Name	Abbreviation	Function
PLL1 output clock setting register 1	CPG_PLL1_CLK1	Setting the frequency
PLL1 SSCG modulation setting register	CPG_PLL1_CLK2	Setting the SSCG modulation
PLL4 output clock setting register 1	CPG_PLL4_CLK1	Setting the frequency
PLL4 SSCG modulation setting register	CPG_PLL4_CLK2	Setting the SSCG modulation
PLL6 output clock setting register 1	CPG_PLL6_CLK1	Setting the frequency
PLL6 SSCG modulation setting register	CPG_PLL6_CLK2	Setting the SSCG modulation
PLL7 output clock setting register 1	CPG_PLL7_CLK1	Setting the frequency
PLL7 SSCG modulation setting register	CPG_PLL7_CLK2	Setting the SSCG modulation

4.4.4.3.3 Monitoring the PLL states

The internal registers of the CPG can be used to monitor the PLL state (reset or locked) per PLL.

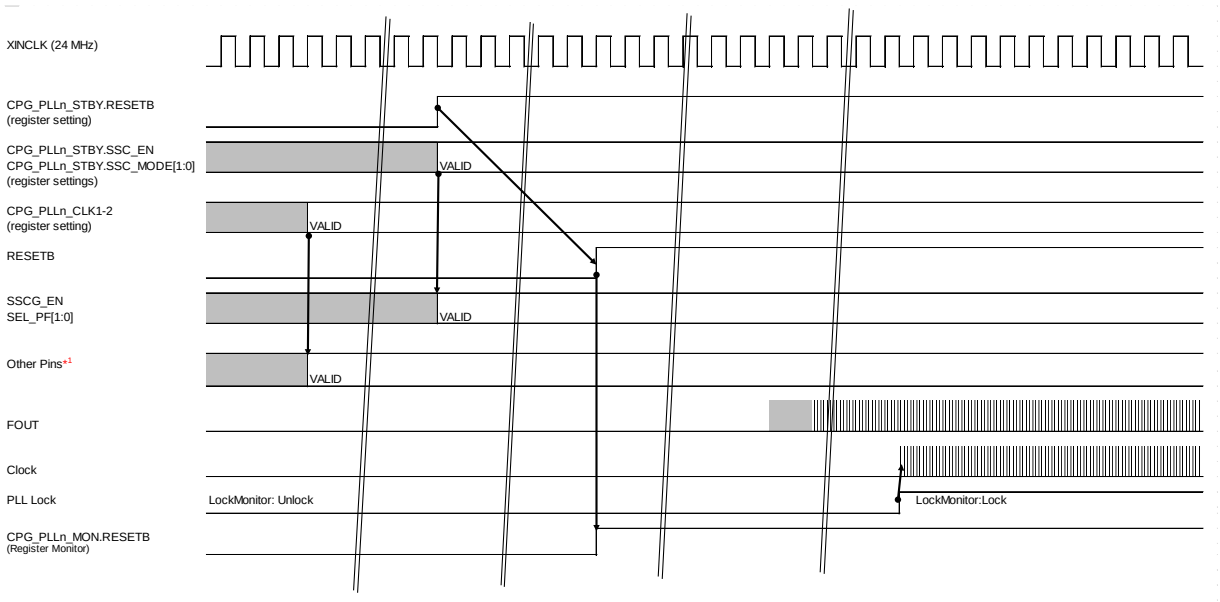
The related registers are listed in **Table 4.4-13**.

Table 4.4-13 List of PLL Monitor Registers

Register Name	Abbreviation	Function
PLL1 monitor register	CPG_PLL1_MON	Monitoring the PLL state
PLL2 monitor register	CPG_PLL2_MON	Monitoring the PLL state
PLL3 monitor register	CPG_PLL3_MON	Monitoring the PLL state
PLL4 monitor register	CPG_PLL4_MON	Monitoring the PLL state
PLL6 monitor register	CPG_PLL6_MON	Monitoring the PLL state
PLL7 monitor register	CPG_PLL7_MON	Monitoring the PLL state

4.4.4.3.4 SSCG switching in PLL3

The state of the SYSCLK_SSCG_EN signal is determined when the LSI is released from the system reset (SYS_RST#) state and the signal state does not change after the system is activated.



The SSCG enabled or disable state in PLL3 cannot be switched through register settings.

SYSCLK_SSCG_EN = 0: SSCG is disabled.

SYSCLK_SSCG_EN = 1: SSCG is enabled.

4.4.4.3.5 Timing setting

Figure 4.4-13 and **Figure 4.4-14** are timing charts in state transitions.

Note 1. Other setting: P, M, S, K, MFR, MRR

Figure 4.4-13 Timing Chart in Transitions from Standby Mode to Normal Operating Mode of PLLs

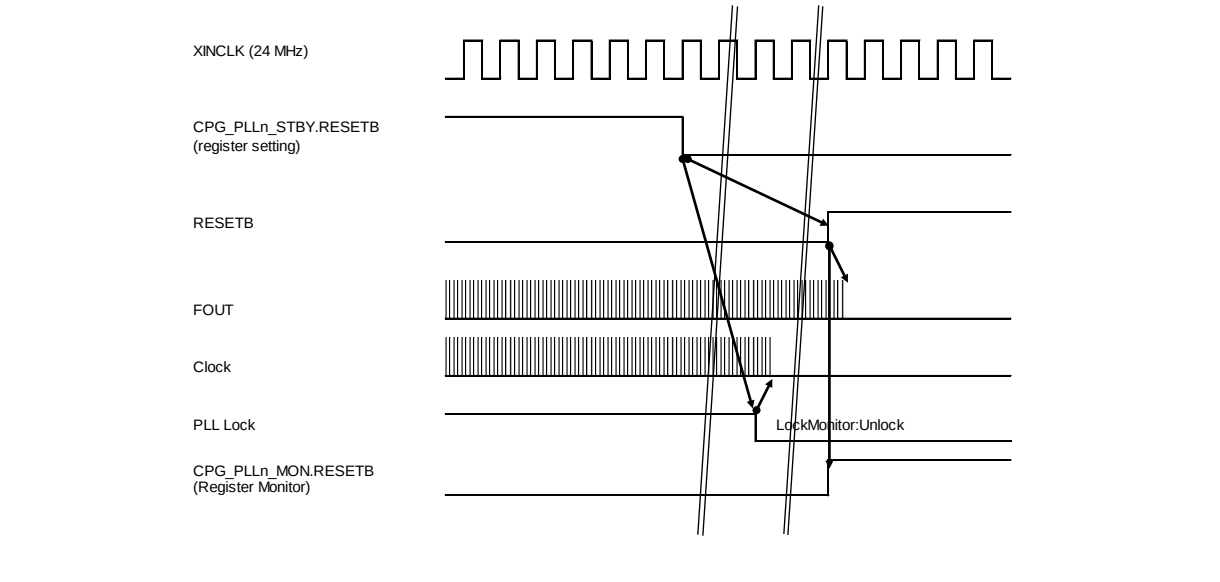


Figure 4.4-14 Timing Chart in Transitions from Normal Operating Mode to Standby Mode of PLLs

4.4.4.4 Clock Dividers and Selectors

The CPG uses several types of divider and selector to supply clock signals to suit the specifications of the individual units. The dividers and selectors are classified into two types in terms of the switching method: dynamic and static switching dividers and selectors.

- Dynamic-type: When switching clocks, there is no need to stop the clock.
- Static-type: When switching clocks, there is need to stop the clock.

The types of divider and selector are described below.

- Fixed divider
- Dynamic switching selector
- Dynamic switching variable divider (output with 50% duty cycle at the time of frequency division by an even number)
- Static switching selector
- Static switching variable divider (output with 50% duty cycle at the time of frequency division by an even number)

For details on the specifications for connections between the dividers, selectors, and PLLs, refer to **4.4.4.1 Block Diagram of the Clock System**.

There are procedures for clock switching by dividers and selectors. Refer to **4.4.4.4.1 Dynamic switching variable divider**, **4.4.4.4.2 Static switching selector** and **4.4.4.4.3 Static switching variable divider**.

4.4.4.4.1 Dynamic switching variable divider

Dynamic switching variable dividers can switch clock signals without the generation of glitches when the frequency division ratio settings are changed.

They can switch clock signals without halting the clock supply to units.

To avoid the generation of glitches in switching clock signals, clock switching takes certain time.

Figure 4.4-15 shows timing of clock switching by a dynamic switching variable divider.

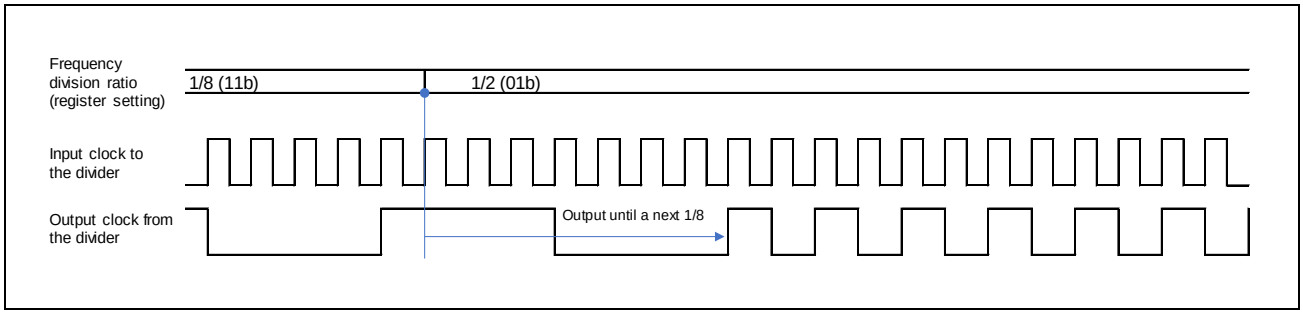

Figure 4.4-15 Timing of Clock Switching by the Dynamic Switching Variable Divider

4.4.4.4.2 Static switching selector

1) Cases where clock supply has been stopped (normal)

Therefore, to change the setting, halt the clock supply to units before doing so.

Figure 4.4-16 shows timing of clock switching by the divider (normal).

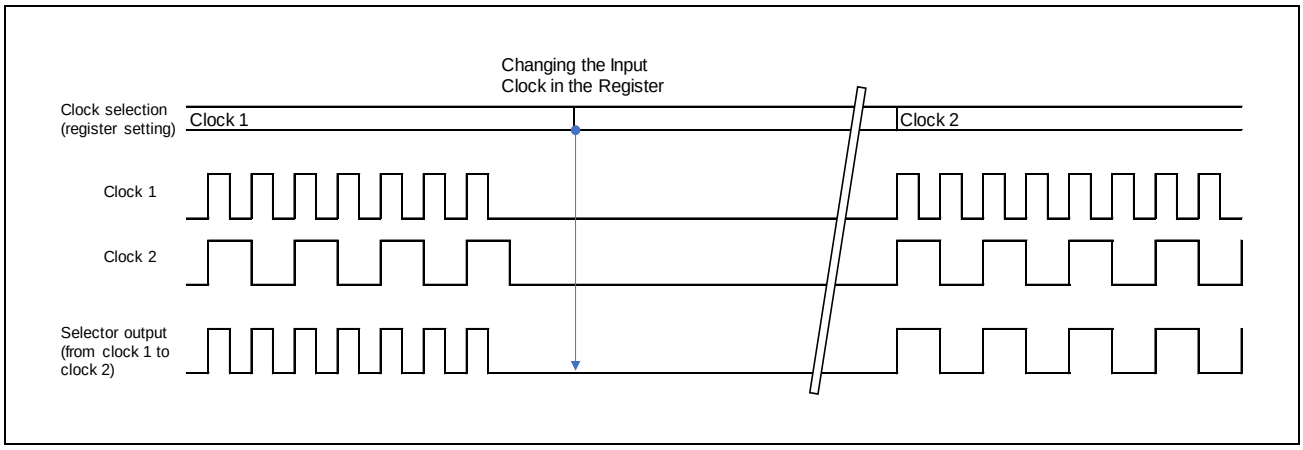

Figure 4.4-16 Timing of Clock Switching by the Static Switching Selector (normal)

2) Cases that do not stop the clock supply (irregular)

Clock output immediately reflecting the changed clock selection setting leads to the generation of glitches.

Therefore, to change the setting, halt the clock supply to units before doing so.

Figure 4.4-17 shows timing of clock switching by the selector.

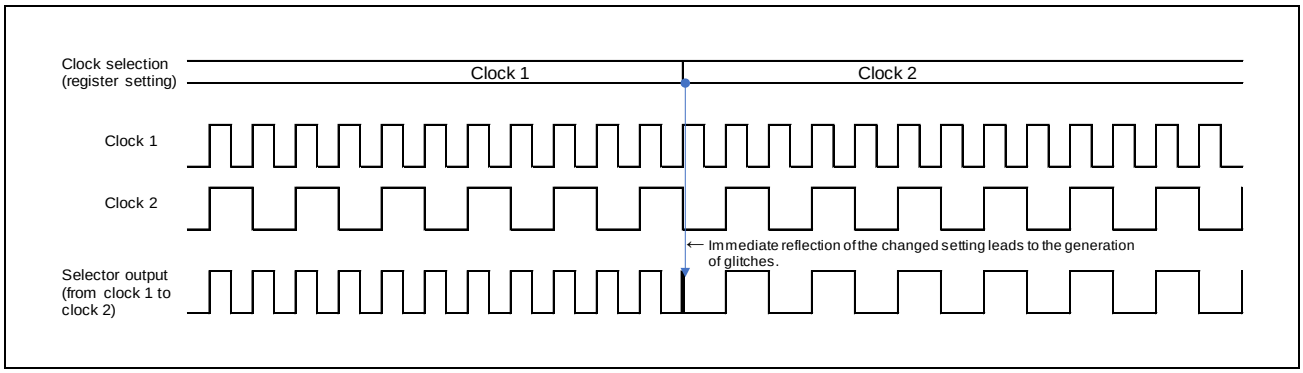

Figure 4.4-17 Timing of Clock Switching by the Static Switching Selector (irregular)

4.4.4.4.3 Static switching variable divider

1) Cases where clock supply has been stopped (normal)

Therefore, to change the frequency division ratio settings, stop the clock supply to the unit before doing so.

Figure 4.4-18 shows timing of clock switching by the divider (normal).

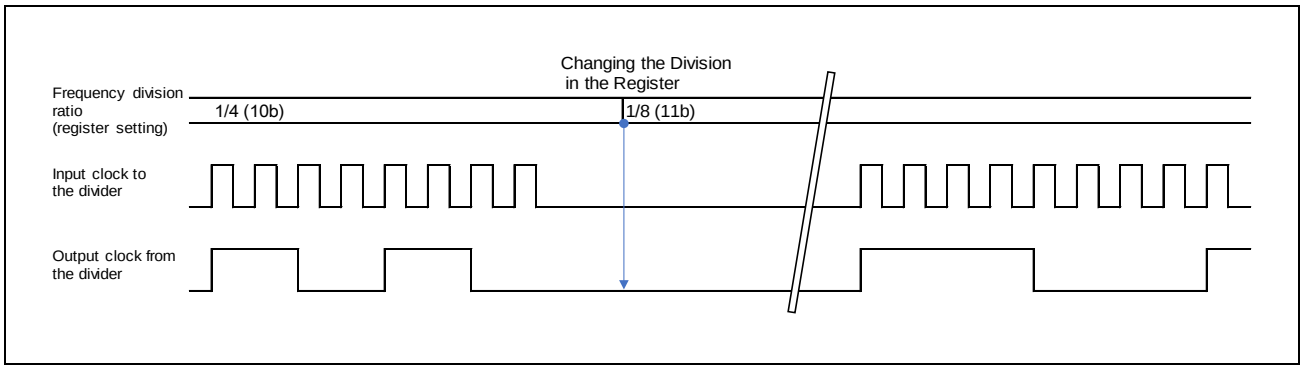

Figure 4.4-18 Timing of Clock Switching by the Static Switching Variable Divider (normal)

2) Cases that do not stop the clock supply (irregular)

Static switching variable dividers immediately switch clock output in response to changing the frequency division ratio setting. This leads to the generation of a clock with the unintended pulse width (for frequency division by an odd number, the high-level pulse width is shorter by one cycle of the source clock than the low-level pulse width).

Therefore, to change the frequency division ratio settings, stop the clock supply to the unit before doing so.

Figure 4.4-19 shows timing of clock switching by the divider.

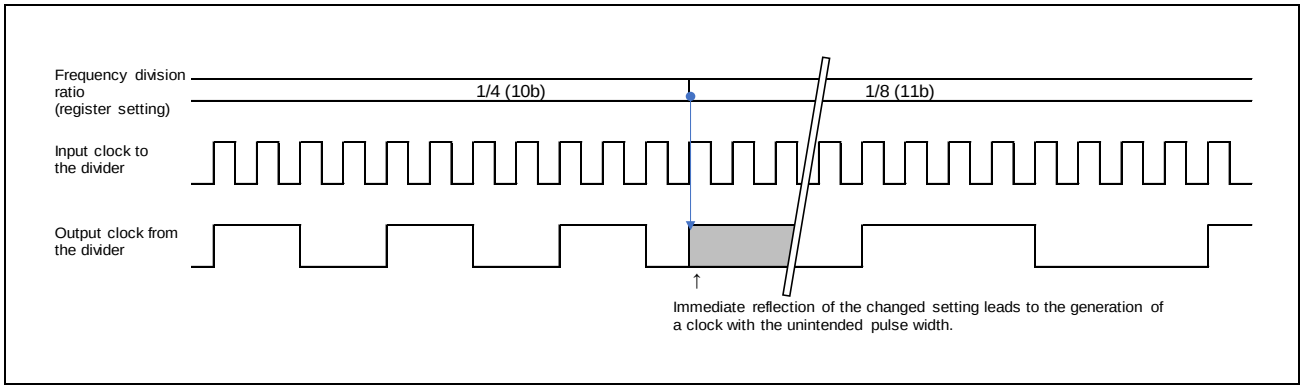

Figure 4.4-19 Timing of Clock Switching by the Static Switching Variable Divider (irregular)

4.4.5 Functions for the Generation and Control of Resets

4.4.5.1 Block Diagram of the Reset System

The block diagram of the CPG reset system is shown in the figure below.

The starting point of the generation of the following reset factors is shown by the symbols (A) to (G) in the figure.

Reset Factors Listed in **Table 4.4-14 Reset Application List**

(A) System Reset – Hardware Reset (SYS_RST#)

(B) System Reset – WDT Reset

(C) Debug Reset – Hardware Reset (JTAG_TRST#)

(D) Debug Reset – CST Software Reset

Reset Factors Listed in **4.4.5.4.1 WDT reset circuit**

(E) WDT Factor: CA55 Cold (Non-secure) Reset

(F) WDT Factor: CA55 Cold (secure) Reset

(G) WDT Factor: CM33 Cold Reset

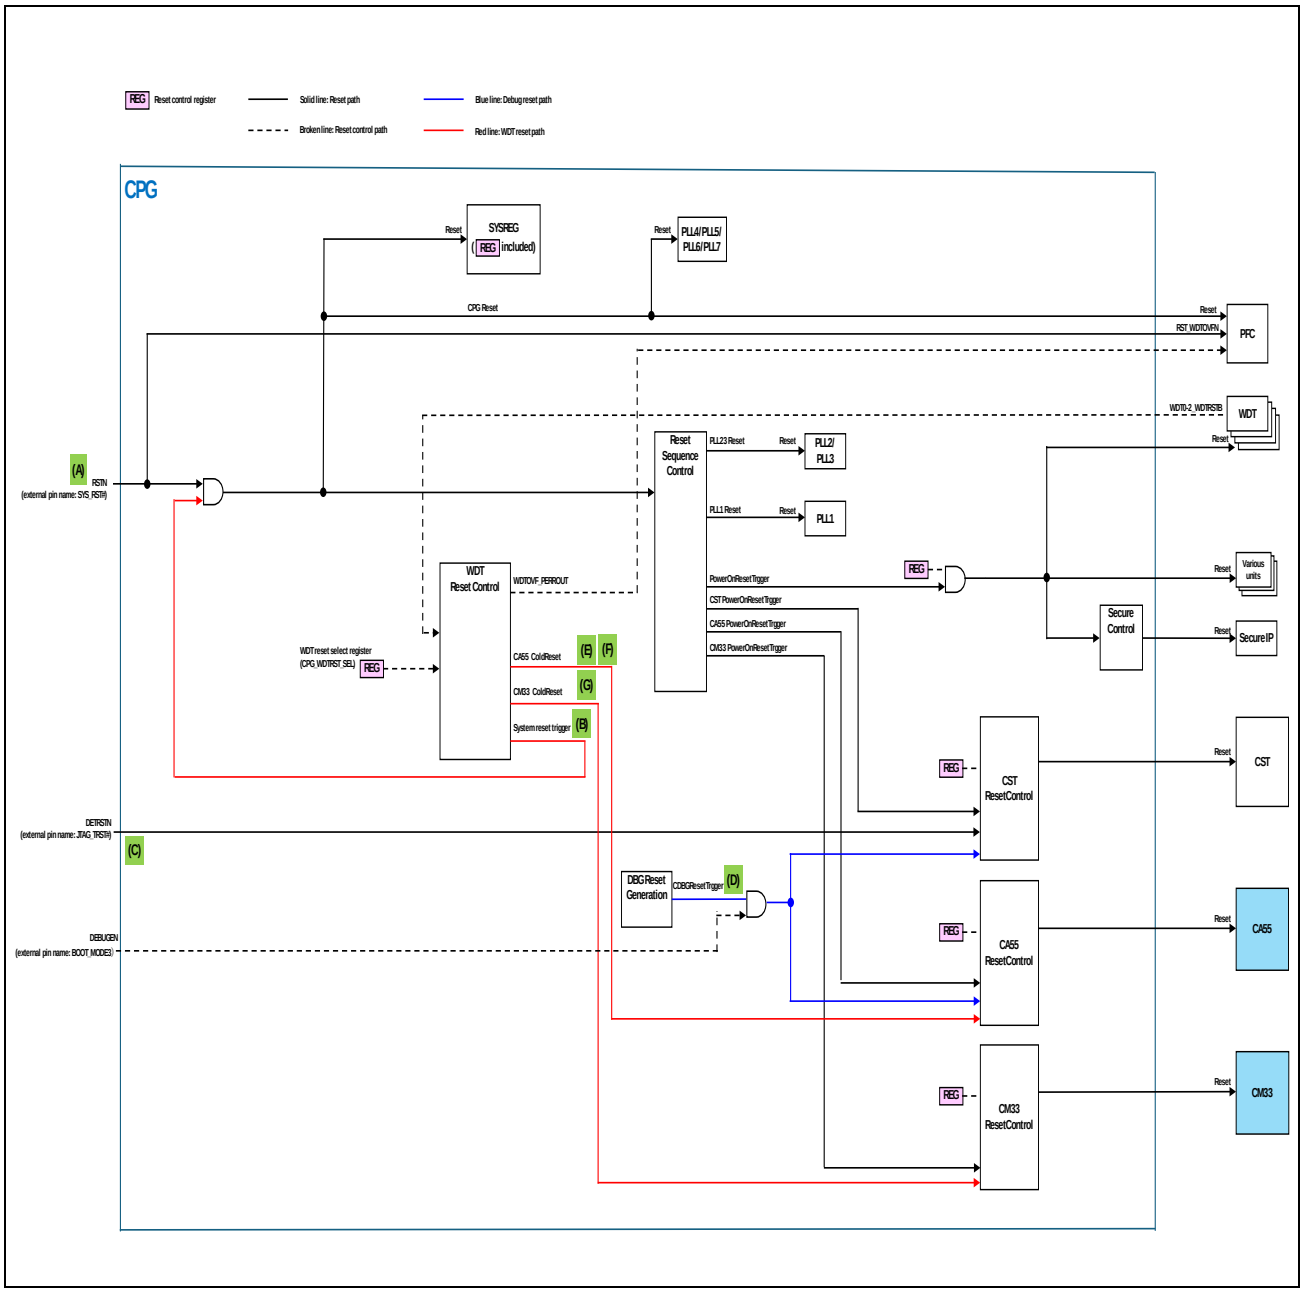

Figure 4.4-20 Block Diagram of the Reset System

4.4.5.2 Reset Application List

The scopes of application (targets) of generated resets according to the reset sources are listed below.

1) Hardware sources (SYS_RST#, JTAG_TRST#, and BOOT_MODE3)
2) WDT reset sources
3) Debugger reset sources by the CST

Table 4.4-14 Reset Application List

No.	Operating Mode	Reset Initiation Source				CST-IF		Reset Applicability				Description of Reset
		Debug Reset		System Reset		CST_DAP		Debugging related(*1)		Reset for WDTOVF Register (rst_WDTOVFn)	System Reset (rst_SYSTEMn)	
		Hardware	Software	Hardware	Software			CA55	Excludes CA55			
	BOOT_MODE3 pin	JTAG_TRST# pin	DBGRST_N(*4)	SYS_RST# pin	WDT Reset (WDTRST_N)	ntrst	npotrst	CA55 Debug Reset (rst_CA55DBGn)	CST Reset (rst_DEBUGn)			
1	0	0	X	0	X	Reset	Reset	Reset	Reset	Reset	Reset	Hardware system reset
2	0	0	X	1	0	Reset	Reset	Reset*3	Reset	Released	Reset*2	WDT system reset

14	1	1	1	1	1	Released	Released	Released	Released	Released	Released	Debug operating mode (without DAP reset)

Note: X: Don't care

Note: Setting reset combinations not listed in the table is prohibited.

Note 1. Debug-related circuits: CoreSight/Cortex-A55 debug-related circuits (Cortex-M33 is not applicable).

Note 2. It is reset when a system reset is performed on the WDTRST_SEL.

Note 3. It is reset when the CA55 is subject to reset in WDTRST_SEL.

Note 4. CST_DAP is a reset of ntrst and npotrst in AND, and since it is rate-limiting to npotrst, don't care.
ntrst = SYS_RST# & JTAG_TRST#
npotrst = SYS_RST#
rst_SYSTEMn = SYS_RST# & WDTRST_N
rst_WDTOVFn = SYS_RST#
rst_DEBUGn = (BOOT_MODE3 & SYS_RST# & WDTRST_N) & DBGRST_N

4.4.5.3 System Reset (External Pin)

Asserting the reset signal on the external SYS_RST# pin initializes the whole LSI.

4.4.5.4 WDT System Reset

This LSI has three WDT channels and the CPG issues a reset request when any of the following sources is generated.

WDT Channel	Target of Monitoring	Additional Function
Channel 0	Cortex-A55 (Non-secure)	Reset due to a parity error in Cortex-A55
Channel 1	Cortex-A55 (Secure)	Reset due to a parity error in Cortex-A55
Channel 2	Cortex-M33	Reset due to the LOCK signal in Cortex-M33

4.4.5.4.1 WDT reset circuit

The reset requests from three WDT channels can be assigned to the desired signals shown below by using the masking function specified through the settings of the WDTRSTSEL register implemented in the CPG.

If a bit in the WDTRSTSEL register is set to 1, the corresponding signal is asserted when the WDT issues a reset request.

Target of Monitoring	Function
WDT system reset	The reset request signal WDTRST# is sent to the reset generation circuit to apply a system reset.
WDTOVF_PERROUT	The WDT_OVF_PERROUT# signal is asserted to notify the external devices of the application of a system reset.
Cortex-A55 cold reset	A cold reset request is issued when either WDT channel 0 and 1 detects an error.
Cortex-M33 cold reset	A cold reset request is issued when either WDT channel 2 detects an error.

Bit	Bit Name	Initial Value	R/W	Reset Source Module	Function
0	WDTRSTSEL0	0	R/W	WDT (channel 0) Cortex-A55 (Non-Secure)	When the corresponding WDT issues a reset request due to an overflow, etc. 0: WDT system reset is masked. 1: WDT system reset is applied.
1	WDTRSTSEL1	0	R/W	WDT (channel 1) Cortex-A55 (Secure)	
2	WDTRSTSEL2	0	R/W	WDT (channel 2) Cortex-M33	
3	Reserved	1	R	—	—
4	WDTRSTSEL4	0	R/W	WDT (channel 0) Cortex-A55 (Non-Secure)	When the corresponding WDT issues a reset request due to an overflow, etc. 0: Assertion of WDTOVFOUT is masked. 1: WDTOVFOUT is asserted.
5	WDTRSTSEL5	0	R/W	WDT (channel 1) Cortex-A55 (Secure)	
6	WDTRSTSEL6	0	R/W	WDT (channel 2) Cortex-M33	
7	Reserved	1	R	—	—
8	WDTRSTSEL8	0	R/W	WDT (channel 0) Cortex-A55 (Non-Secure)	When WDT channel 0 issues a reset request 0: Cold reset of the Cortex-A55 is masked. 1: Cold reset of the Cortex-A55 is applied.
9	WDTRSTSEL9	0	R/W	WDT (channel 1) Cortex-A55 (Secure)	When WDT channel 1 issues a reset request 0: Cold reset of the Cortex-A55 is masked. 1: Cold reset of the Cortex-A55 is applied.
10	WDTRSTSEL10	0	R/W	WDT (channel 2) Cortex-M33	When WDT channel 2 issues a reset request 0: Mask paired Cortex-M33 Cold-Reset. 1: Cold reset of the Cortex-M33 is applied.

4.4.5.4.2 WDT_OVF_PERROUT# signal

This is an external signal that notifies the system that the WDT has applied a WDT system reset to this LSI.

If another WDT system reset is requested before the output of this signal pulse is completed, it is ignored.

The GPIO settings of the WDT_OVF_PERROUT# pin such as the driving capability are reset by the RST_WDTOVFN signal for the CPG_WDTOVF_RST[2:0] register bits.

The following shows the sequence of reset by the WDT.

(1) The WDT channel selected by the CPG_WDTRST_SEL[6:4] register bits generates a reset request.

(2) The CPG applies a WDT system reset.

(3) 64 cycles of the 24-MHz clock are waited.
* This is the period until the necessary settings are reflected in the entire LSI.

(4) A low pulse is output from the WDTOVF_PERROUT pin for 64 cycles of the 24-MHz clock.

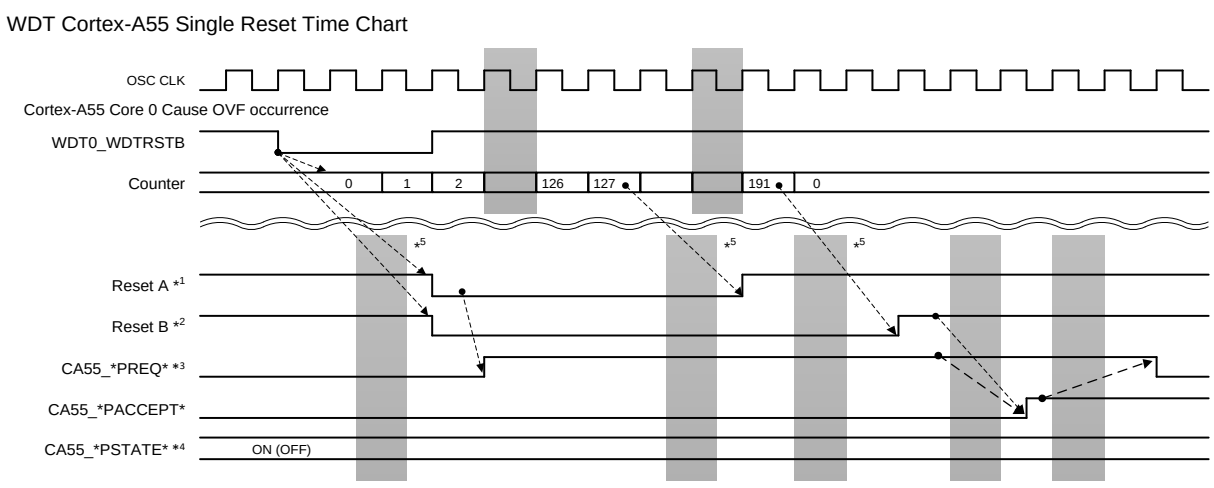
(5) 64 cycles of the 24-MHz clock are waited.

(6) The WDT system reset signal is deasserted and the boot sequence is performed.

4.4.5.4.3 WDT overflow system reset register (CPG_WDTOVF_RST)

After the release from the WDT system reset applied by the WDT system reset circuit in response to a reset request such as a WDT overflow, this register is used to identify the WDT channel that generated the reset request.

This register is not reset by the WDT system reset generated by the WDT.



If a WDT system reset is not applied according to the WDTRSTSEL register setting, the WDT is not reset and the source of the reset request can be identified by checking the interrupt from the WDT and the status register in the WDT.

Table 4.4-15 WDT Overflow System Reset Register (CPG_WDTOVF_RST)

Bit	Bit Name	Initial Value	R/W	Reset Source Module	Function
0	WDTOVF0	0	R/W	WDT (channel 0) Cortex-A55 (Non-Secure)	When a WDT channel has applied a WDT system reset, the corresponding bit is set to 1. These bits are cleared by writing 1.
1	WDTOVF1	0	R/W	WDT (channel 1) Cortex-A55 (Secure)	
2	WDTOVF2	0	R/W	WDT (channel 2) Cortex-M33	
15 to 3	Reserved	0	R	—	—
16	WDTOVF0_WEN	0	R0W1	—	Writing to the WDTOVF0 bit (bit 0) is masked. This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	WDTOVF1_WEN	0	R0W1	—	Writing to the WDTOVF1 bit (bit 1) is masked. This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	WDTOVF2_WEN	0	R0W1	—	Writing to the WDTOVF2 bit (bit 2) is masked. This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
31 to 19	Reserved	0	R	—	—

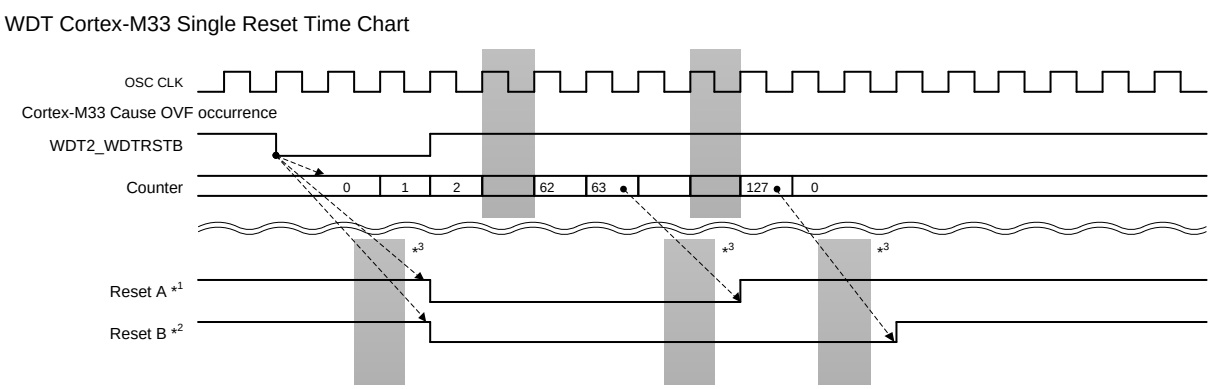
4.4.5.4.4 Timing of Cortex-A55 cold reset due to the WDT source

The following figure shows the timing of the cold reset for the Cortex-A55 alone due to the WDT source.

Note 1. CA55_RST14/CA55_RST15/CA55_RST16

Note 2. CA55_RST0_[n]/CA55_RST4_[n]/CA55_RST8/CA55_RST9/CA55_RST10/CA55_RST11/CA55_RST12/CA55_RST13
n = 0 to 3

Note 3. The SYSREG setting must be set to ‘0’.



Note 4. The SYSREG setting is ‘ON’ for Core 0/Cluster.

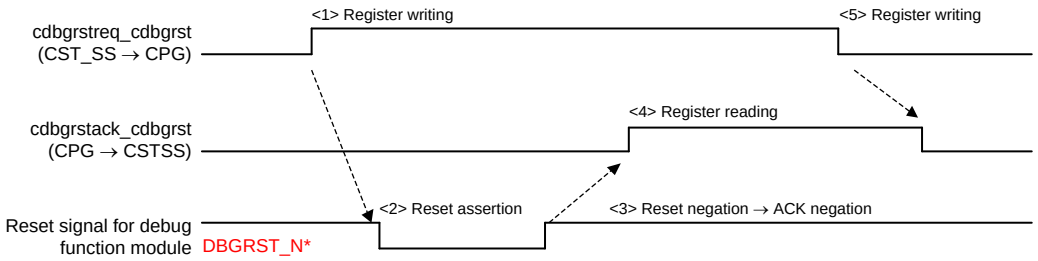
Note 5. Cortex-A55 reset generation has a certain time lag (approximately 35CLK@24MHz).

Figure 4.4-21 Timing of Cold Reset for the Cortex-A55 Alone due to the WDT Source

4.4.5.4.5 Timing of Cortex-M33 cold reset due to the WDT source

The following figure shows the timing of the cold reset for the Cortex-M33 alone due to the WDT source.

Note 1. CM33_MISCRESETN



Note 2. CA55_NPORESET/CM33_NSYSRESET

Note 3. Cortex-M33 reset generation has a certain time lag (approximately 35CLK@24MHz)

Figure 4.4-22 Timing of Cold Reset for the Cortex-M33 Alone due to the WDT Source

4.4.5.5 Debug Reset (Software Reset by CoreSight)

An interface circuit with CoreSight (CST) is implemented in the CPG and a software reset of the debugging circuit of this LSI is applied from the debugger by executing the following handshake. This is only valid while SYS_RST# = high, JTAG_TRST# = high, and BOOT_MODE3 = high. The reset targets are the circuits for a debugger reset of the CST and CA55 (CM33 is outside the scope).

<1> Control the register in the CoreSight DAP from the debugger to assert the REQ signal (cdbgrstreq_cdbgrst).

<2> The CPG asserts the reset of the debug function module.

<3> The CPG negates the reset of the debug function module and asserts the ACK signal (cdbgrstack_cdbgrst). The CoreSight DAP captures the ACK assertion in the register.

<4> The debugger reads the register in the CoreSight DAP to detect the assertion of the ACK signal (that is, detect the completion of reset execution).

<5> The debugger controls the register in the CoreSight DAP to negate REQ.

<6> The CPG negates ACK and the CoreSight DAP captures the ACK negation in the register.

Figure 4.4-23 CoreSight Register Controlled Reset

4.4.5.6 CA55 Reset

The following three types of reset corresponding to the target ranges of reset are provided for the Cortex-A55.

When the P-Channel circuit receives a request for a warm reset ((2), (3) below), the P-Channel control is required before the application of a reset to the Cortex-A55.

(1) Cold reset
(2) Cluster warm reset
(3) Warm reset

When a request to reset the Cortex-A55 alone is generated in the WDT, an error has probably occurred in the Cortex-A55, and the application of a warm reset may be difficult because the warm reset requires a handshake through the P-Channel. Therefore, a cold reset is applied to the Cortex-A55 instead of a warm reset.

- A warm reset for the Cortex-A55 is controlled by software executed in the Cortex-M33.
- After a cold reset (system reset) (normal), Cortex-A55 is automatically activated by hardware.
- Refer to **4.4.5.4.4 Timing of Cortex-A55 cold reset due to the WDT source** for the operation of a cold reset (reset requested by WDT). Reset control from CPG is performed by hardware.

4.4.5.6.1 P-Channel control for Cortex-A55 reset

A handshake through the P-Channel is necessary before the application of a warm reset to the Cortex-A55. The registers in the CPG are monitored by the CPU for software control of the handshake. Three types of P-Channel are provided corresponding to the warm reset types. The CPG incorporates the registers (shown in the next page) for the following P-Channel signals and performs a handshake triggered by the PREQ signal. After the handshake, the reset signals for the target of the warm reset should be asserted and then negated by software to apply a warm reset.

Only the negation of the PREQ signal at the release of a cold reset (a system reset or a cold reset from the WDT) is controlled by the CPG hardware.

NOTES

1. The LSI that does not incorporate the Cortex-M33 does not support the warm reset of Cortex-A55.
2. When controlling the P-Channel by software, mask the cold reset of the Cortex-A55 from the WDT so that the cold reset is not applied. The system reset from the WDT does not need to be masked (the WDT system reset takes priority over the warm reset).
3. When enabling the cold reset of the Cortex-A55 from the WDT, make the “ON” setting through the PSTATE signal in the corresponding channel so that the PREQ signal is automatically controlled after the release from the reset state.

(1) P-channel control registers in the Cortex-A55

The Cortex-A55 provides a P-Channel for power control for each of the regions — that is, the cluster region including the L3 and SCU, region.

The P-Channel is driven in the PERIPHCLK domain, and the CPG contains the registers for controlling and monitoring the P-Channel signals other than the PACTIVE signal.

The CPG performs synchronization for the PACCEPT and PDENY signals.

For the PREQ and PSTATE signals, the Cortex-A55 has a synchronization circuit; the CPG does not perform synchronization.

For the P-Channel control registers, refer to following sections.

4.4.3.265 Cortex-A55 Cluster Power Status Monitor Register (CPG_CLUSTER_PCHMON) to **4.4.3.274 Cortex-A55 Core 3 Power Status Control Register (CPG_CORE3_PCHCTL)**

(2) P-channel handshake control

The following describes the operation of the handshake through the P-Channel in the Cortex-A55.

Cold reset (System reset)

A handshake is necessary for a transition to the “ON” state.

PREQ = 1 and PSTATE = ON in the initial state. After the release from the reset state, a handshake will be performed automatically and Core 0 will be activated.

The CPG automatically clears PREQ for Core 0 to 3 after the release from the reset state.

Cold reset (Cold reset of the Cortex-A55 alone requested from the WDT)

A handshake is necessary for a transition to the “ON” state.

When the cold reset of the Cortex-A55 alone requested from the WDT is enabled, set PREQ to 0 and PSTATE to “ON” in the register in advance. After the release from the reset state, a handshake is automatically executed to activate Core 0.

The CPG automatically clears PREQ for Core 0 to 3 after the release from the reset state.

Warm reset

Although the CPG has P-Channel control registers, it does not automatically control the P-Channel when a warm reset is requested; the user should control the P-Channel by software.

Figure 4.4-24 shows a flowchart and **Figure 4.4-25** shows a timing chart of the handshake for a warm reset through the Cortex-A55 P-Channel.

To execute the handshake, the user should manipulate registers in the CPG by software.

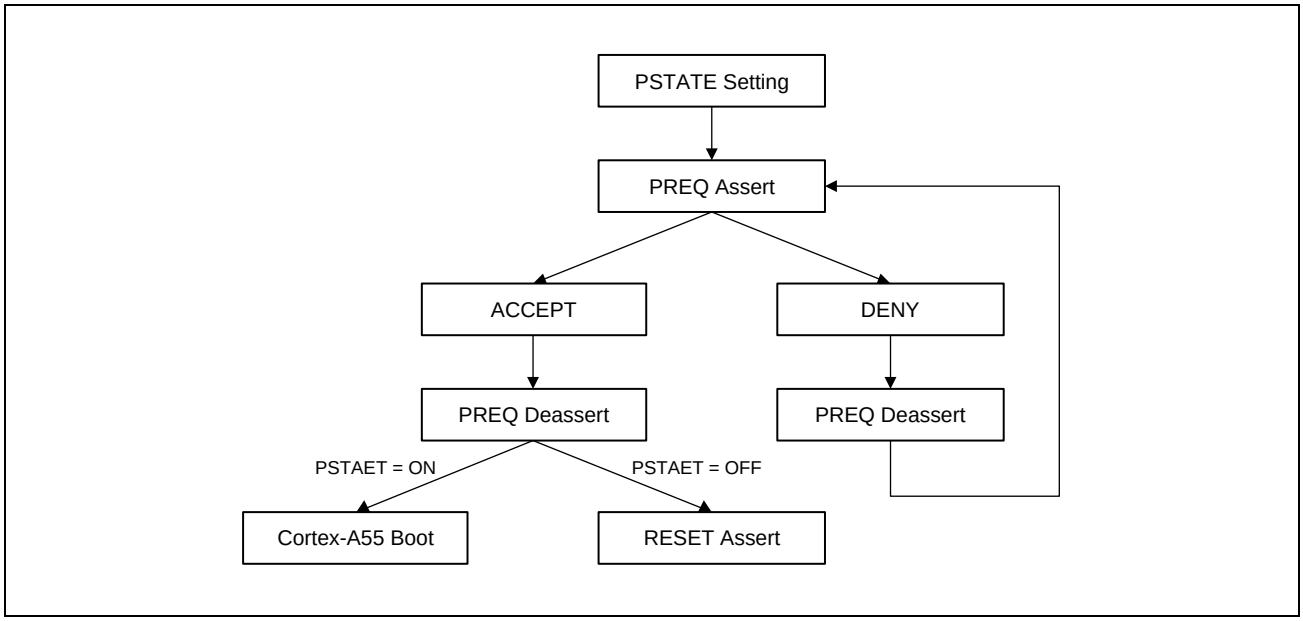


Figure 4.4-24 Flowchart of a Handshake through the Cortex-A55 P-Channel

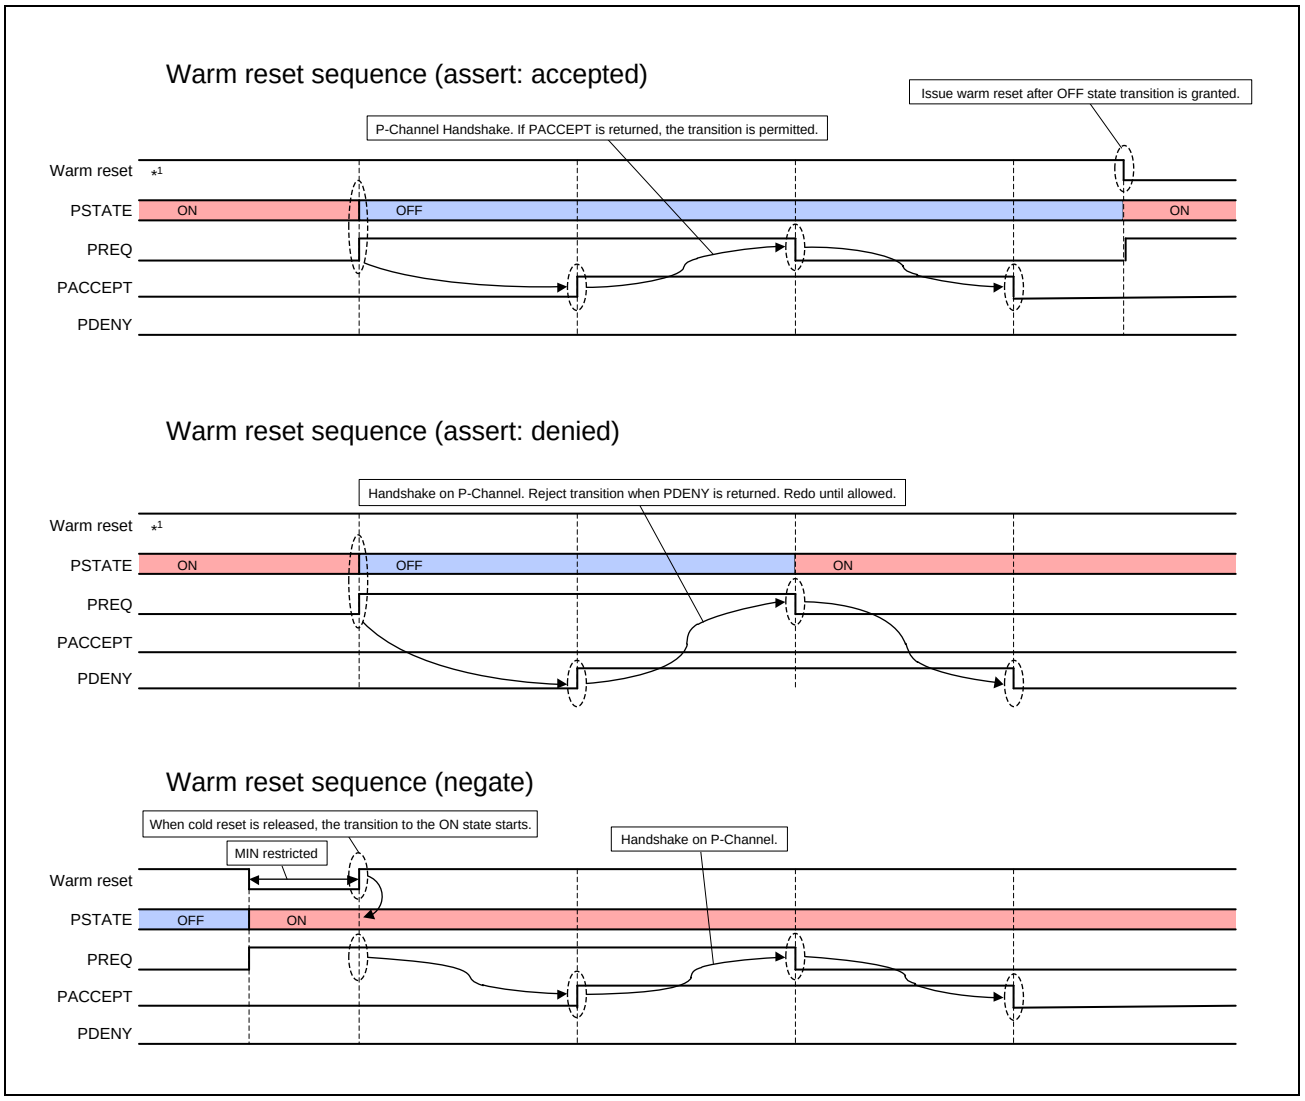

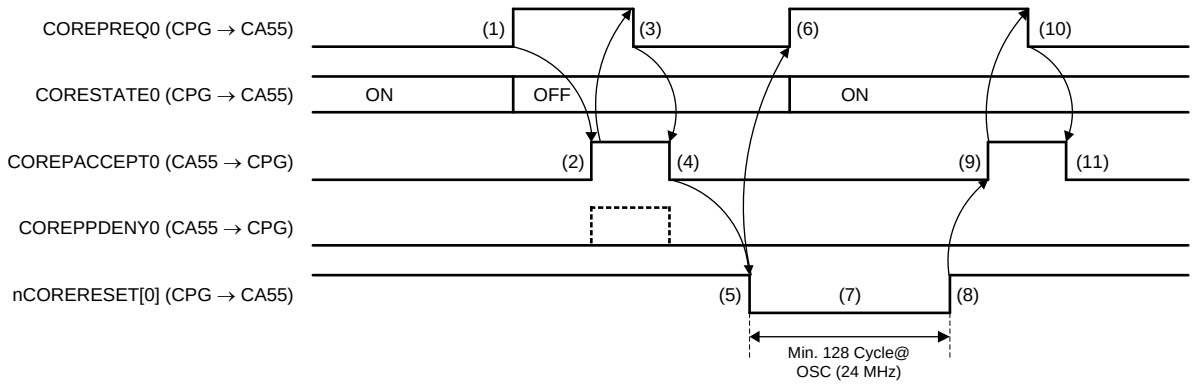

Figure 4.4-25 Timing Chart of a Handshake through the Cortex-A55 P-Channel (Warm Reset)

(3) Cortex-A55 warm reset sequence

The following describes the warm reset sequence through the P-Channel.

Figure 4.4-26 shows a waveform when a warm reset of Cortex-A55 is requested and accepted. When the request is denied, steps 1 to 4 are repeated until the request is accepted. The same sequence is used for the warm reset of the cluster and core1 to core3.

(1) The Cortex-M33 asserts COREPREQ0 according to CPG register settings (PSTATE = OFF).

(2) The Cortex-A55 asserts COREPACCEPT0.

(3) The Cortex-M33 deasserts COREPREQ0 according to CPG register settings.

(4) The Cortex-A55 deasserts COREPACCEPT0.

(5) The Cortex-M33 asserts the target reset signal (nCORERESET[0]) assigned to the warm reset of Cortex-A55 Core 0 according to CPG register settings.

(6) The Cortex-M33 asserts COREPREQ0 according to CPG register settings (PSTATE = ON).

(7) The Cortex-M33 waits for a certain period after the assertion of the reset signal.
18 cycles of the Cortex-A55 clock or 128 cycles at 24 MHz

(8) The Cortex-M33 deasserts the target reset signal (nCORERESET[0]) assigned to the warm reset of Cortex-A55 Core 0 according to CPG register settings.

(9) The Cortex-A55 asserts COREPACCEPT0.

(10) The Cortex-M33 deasserts COREPREQ0 according to CPG register settings.

(11) The Cortex-A55 deasserts COREPACCEPT0.

Figure 4.4-26 Cortex-A55 Warm Reset Sequence

4.4.5.6.2 Operation of the Cortex-A55 reset control circuit

The reset control circuit asserts the reset signal assigned to the reset request from the reset generator or software.

Reset Request Source	Reset Signal Assertion	Reset Signal Deassertion
System reset (including the reset from the WDT)	The CPG asserts the reset signal assigned to the cold reset.	The reset sequencer (boot sequencer) in the CPG releases the reset terminal assigned to the cold reset from the reset state. (The software reset register bit that corresponds to the reset terminal assigned to the cold reset indicates the reset released state in the initial state.)
Cold reset (software reset)*1	The Cortex-M33 asserts the reset signal assigned to the cold reset.	The Cortex-M33 deasserts the asserted signal so that the timing described in **4.4.5.6.3 Timing of Cortex-A55 reset**.
Cold reset (WDT)	The CPG asserts the reset signal assigned to the cold reset.	The CPG deasserts the asserted signal so that the timing described in **4.4.5.4.4 Timing of Cortex-A55 cold reset due to the WDT source**, is satisfied.
Cluster warm reset	The Cortex-M33 asserts the reset signal assigned to the cluster warm reset.	The Cortex-M33 deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed.
Core 0 to 3 warm reset	The Cortex-M33 asserts the reset signal assigned to the Core 0 to 3 warm reset.	The Cortex-M33 deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed.
Software reset*1	A software reset is applied by asserting the reset signal according to the data written to the register by software.	The CPG does not automatically deassert the reset signal. The reset signal retains the asserted state until the next access to the registers.

Note 1. The target reset signal should be controlled by software.

4.4.5.6.3 Timing of Cortex-A55 reset

There is a restriction on the timing of the release of the Cortex-A55 from the reset state.

When a reset is controlled by software, the restriction should be satisfied by software.

Hardware control is done for the system reset (including the reset from the WDT source) and the Cortex-A55 cold reset from the WDT.

The reset signals are classified into two groups:

Group (A): nCPUPORESET, nCORERESET, nSPORESET, nSRESET, nPRESET, nATRESET, nGICRESET, and nPERIPHRESET

Group (B): nARESET, nMISCRESET, and nPDBGRESET

To satisfy the restriction, the CPG deasserts group (B) after a period of 64 cycles at 24 MHz has elapsed since the deassertion of group (A).

4.4.5.7 CM33 Reset

Two types of reset corresponding to the target ranges of reset are provided for the Cortex-M33.

When a request to reset the Cortex-M33 alone is generated in the WDT, an error has probably occurred in the Cortex-M33, and the application of a warm reset may be difficult. Therefore, a cold reset is applied to the Cortex-M33 instead of a warm reset.

- For the warm reset, refer to **4.4.5.7.1 Handshake control for Cortex-M33 reset** and **4.4.5.7.2 Cortex-M33 warm reset sequence**. The reset control from the CPG is performed by hardware.
- To release the Cortex-M33 from the cold reset (system reset) state, refer to **4.4.5.7.4 Timing of Cortex-M33 reset**, and satisfy the described restriction. The reset control from the CPG needs software operation.
- The reset control from the CPG is performed by hardware.

MISCRESETn is a reset signal for the sub-system (SS) layer. This signal is used for a cold reset.
(For details, refer to the restriction on the timing of the Cortex-M33 cold reset.)

4.4.5.7.1 Handshake control for Cortex-M33 reset

Like the warm reset for the Cortex-A55, the Cortex-M33 requires a handshake process to control the warm reset. After SYSRESETREQ is set to 1 in the Cortex-M33 and the Cortex-M33 enters the WFI state, the CPG executes a handshake with the Cortex-M33 to apply a warm reset to the Cortex-M33.

4.4.5.7.2 Cortex-M33 warm reset sequence

Warm reset for Cortex-M33 by the Cortex-A55, a reset request signal nSYSRESET is issued as a result of the handshake between the CPG and the Cortex-M33, and after the signal is asserted, a signal pulse is generated in 128 cycles of the 24 MHz clock.

The nSYSRESET signal is asserted under the conditions of SYSRESETREQ = high and SLEEPING = high.

4.4.5.7.3 Operation of the Cortex-M33 reset control circuit

The reset control circuit asserts the reset signal assigned to the reset request from the reset generator or software.

Reset Request Source	Reset Signal Assertion	Reset Signal Deassertion
System reset (including the reset from the WDT)	The software reset register is set to the initial value (initial value = cold reset).	The reset state is retained until the Cortex-A55 releases it.
Cold reset (software reset)*1	The Cortex-A55 asserts the following signals assigned to the cold reset. nPORESET nSYSRESET MISCRESTn	The Cortex-A55 deasserts MISCRESETn after a period of 64 cycles at 24 MHz has elapsed since the assertion of MISCRESETn. nSYSRESET and nPORESET are deasserted after a period of 64 cycles at 24 MHz has elapsed since the deassertion of MISCRESETn.
Cold reset (WDT)	The CPG asserts the following signals assigned to the cold reset. nPORESET nSYSRESET MISCRESTn	The CPG deasserts MISCRESETn after a period of 64 cycles at 24 MHz has elapsed since the assertion of MISCRESETn. nSYSRESET and nPORESET are deasserted after a period of 128 cycles at 24 MHz has elapsed since the deassertion of MISCRESETn. (See **Figure 4.4-22 Timing of Cold Reset for the Cortex-M33 Alone due to the WDT Source**.)
Warm reset	The CPG asserts the nSYSRESET signal assigned to the Cortex-M33 warm reset according to the procedure of Cortex-M33 warm reset.	The CPG deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed.
Software reset*1	A software reset is applied by asserting the reset signal according to the data written to the register by software.	The reset signal is not deasserted. The reset signal retains the asserted state until the next access to the registers.

Note 1. The target reset signal should be controlled by software.

4.4.5.7.4 Timing of Cortex-M33 reset

There is a restriction on the timing of the release of the Cortex-M33 from the reset state.

When a reset is controlled by software, the restriction should be satisfied by software.

Hardware control is done for the Cortex-M33 cold reset from the WDT.

The reset signals are classified into two groups:

Group (A): MISCRESETn

Group (B): nPORESET and nSYSRESET

To satisfy the restriction, the CPG deasserts group (B) after a period of 64 cycles at 24 MHz has elapsed since the deassertion of group (A).

4.4.5.8 Module Reset Application Control

The application of a reset is controlled for individual modules.

In addition to a reset applied to individual modules according to register settings by software, some modules are reset in a certain reset mode.

For register setting specifications, refer to the descriptions of the reset control register *** (CPG_RST_***).

For a clock that is controlled by the corresponding CGC and is synchronized with a reset signal, the processing for stopping the clock is performed at the release of the reset state.

4.4.6 Operating

4.4.6.1 Procedures for Supplying and Stopping Module Clocks

Use the following procedures to switch between the supply and stop of the target clock for a module.

Note: Sample procedures for the SRAM_MCPU clock (SRAM_MCPU_ACLK0) are described here.

Supplying a clock:

1. Setting the register for supplying the SRAM_MCPU clock (SRAM_MCPU_ACLK0)

   Set up the following bits in the clock control register SRAM_MCPU (CPG_CLKON_SRAM_MCPU).
   — Setting for supplying the clock: Bit 0 (CLK0_ON) = 1 and bit 16 (CLK0_ONWEN) = 1

2. Confirming that the output of the SRAM_MCPU clock (SRAM_MCPU_ACLK0) has started

   Read the following bit in the clock monitor register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU) to confirm that the output of the clock has started.
   — Clock state: Bit 0 (UNIT0_CLK_MON), 1: Clock is supplied. (0: Clock is stopped.)

Stopping a clock:

1. Setting the register for stopping the SRAM_MCPU clock (SRAM_MCPU_ACLK0)

   Set up the following bits in the clock control register SRAM_MCPU (CPG_CLKON_SRAM_MCPU).
   — Setting for stopping the clock: Bit 0 (CLK0_ON) = 0 and bit 16 (CLK0_ONWEN) = 1

2. Check that the SRAM0 clock (SRAM_0_ACLK) is off.

   Read the following bit in the clock monitor register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU) to confirm that the output of the clock has been stopped.
   — Clock state: Bit 0 (UNIT0_CLK_MON), 0: Clock is stopped. (1: Clock is supplied.)

The following registers are used in the above procedures.

— 4.4.3.x Clock control registers ***** (CPG_CLKON_*****)

— 4.4.3.x Clock monitor registers ***** (CPG_CLKMON_*****)

4.4.6.2 Procedures for Supplying and Stopping Reset Signals

Use the following procedures to switch between the supply (reset state) and stop (released from the reset state) of the target reset signal for a module.

Note: Sample procedures for the SRAM_MCPU reset (SRAM_MCPU_ARESETN0) are described here.

Supplying a reset signal:

1. Setting the register for supplying the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN0)

   Set up the following bits in the reset control register SRAM_MCPU (CPG_RST_SRAM_MCPU).
   — Setting for supplying the reset signal: Bit 0 (UNIT0_RSTB) = 0 and bit 16 (UNIT0_RST WEN) = 1

2. Confirming that the output of the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN0) has been started

   Read the following bit in the reset monitor register SRAM_MCPU (CPG_RSTMON_SRAM_MCPU) to confirm that the output of the reset signal has been started.
   — Reset state: Bit 1 (UNIT0_RST_MON)
   0: Reset signal is stopped (released from the reset state)
   1: Reset signal is output.

Stopping a reset signal:

1. Setting the register for stopping the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN0)

   Set up the following bits in the reset control register SRAM_MCPU (CPG_RST_SRAM_MCPU).

   Setting for stopping the reset signal: Bit 0 (UNIT0_RSTB) = 1 and bit 16 (UNIT0_RST WEN) = 1

2. Confirming that the output of the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN0) has been stopped

   Read the following bit in the reset monitor register SRAM_MCPU (CPG_RSTMON_SRAM_MCPU) to confirm that the output of the reset signal has been stopped.
   — Reset state: Bit 0 (UNIT0_RST_MON)
   0: Reset signal is stopped (released from the reset state)
   1: Reset signal is output.

The following registers are used in the above procedures.

— 4.4.3.x Reset control registers ***** (CPG_RST_*****)

— 4.4.3.x Reset monitor registers ***** (CPG_RSTMON_*****)

For the procedures for supplying and stopping a reset signal, refer also to the section on the target module. If specific procedures for the module are described, use them.

4.4.6.3 Procedure for Activating Modules

Use the following procedure to activate an inactive module after a system reset.

For the specific procedure for activating the target module, refer to the section on the module.

1. Set up the clock control register for the clock signal connected to the target module to start the supply of the clock. Note that the PLL for the clock should be started before the clock if the PLL is stopped.

2. Read the clock monitor register to confirm that the supply of the target clock has started.
3. Set up the reset control register for the reset signal connected to the target module to release the module from the reset state.
4. Read the reset monitor register to conform that the module has been released from the reset state.

4.4.6.4 Procedure for Activating the Modules Related to PLL7

For the next module that uses the PLL7 clock, follow this flow.

Applicable modules

- DSI/LVDS
- LCDC

[Activation flow]

<Initial state>

PLL7 = stopped, PLL7_CGC = stopped, IP_CGC = stopped,
and reset signals = applied (by hardware)

Note: MIPI_DSI_PLLCLK (3 GHz operation) has no IP_CGC.

1) From the activation of PLL7 to the wait for the lock of PLL7:

PLL7 = activated (by software), PLL7_CGC = stopped, IP_CGC = stopped,
and reset signals for the target module = applied

2) From the lock of PLL7 to the supply of the clock:

When PLL7 is locked, PLL7_CGC is automatically activated.

PLL7 = activated, PLL7_CGC = activated (by hardware), IP_CGC = stopped,
and reset signals for the applicable modules = applied

3) Supplying clocks to the target module

Start the supply of the clocks to the target module by software.

PLL7 = activated, PLL7_CGC = activated, IP_CGC = activated (by software),
and reset signals for the target module = applied

4) Releasing the target module from the reset state

Release the target module from the reset state by software.

PLL7 = activated, PLL7_CGC = activated, IP_CGC = activated,
and reset signals = stopped (by software)

4.4.6.5 Procedure for Setting PLLs

4.4.6.5.1 Procedure for setting PLL normal mode (Changing the output clock and SSCG mode)

Use the following procedure to shift the PLL from the standby mode to the normal mode (change the output clock and SSCG mode).

[n = 1, 4, 6 or 7: PLL1, PLL4 or PLL6 or PLL7]

1) Confirming the PLL operating mode (confirming that the PLL is in the standby mode)

Check the following bit in the PLLn (SSCG) monitor register (CPG_PLLn_MON).

- Shift to the standby mode: Confirm that bit 0 (PLLn_RESETB) = 0 (standby mode).

Check the following bit in the PLLn (SSCG) monitor register (CPG_PLLn_MON).

- Unlock of PLL: Confirm that bit 4 (PLLn_LOCK) = 0 (PLL is not locked).

Wait until the above conditions are satisfied.

2) Setting the output clock

Modify the following bits in PLLn (SSCG) output clock setting register 1 (CPG_PLLn_CLK1).

For details of the settings, refer to **4.4.3 Registers**.

- Setting of output clock (desired setting): bit0(RANGESEL), bits 12 to 1 (DIV_NF_11 to DIV_NF_0), bits 21 to 13 (DIV_NI_8 to DIV_NI_0), bits 25 to 22 (DIV_M_3 to DIV_M_0), and bits 28 to 26 (DIV_P_2 to DIV_P_0)

3) Setting the SSCG modulation value

Modify the following bits in PLLn SSCG modulation setting register (CPG_PLLn_CLK2).

For details of the settings, refer to **4.4.3 Registers**.

- Setting of SSCG modulation value (desired setting): Bits 2 to 0 (MRR_2 to MRR_0) and bits 7 to 3 (MFR_4 to MFR_0)

4) Frequency setting of PLL1

Modify the following bits in PLL1_SEL_SETTING register (CPG_PLL1_SETTING).

- Frequency setting selection: Bit 0 (SEL_PLL1) = 0 (Use the CPG_PLL1_CLK1 and CPG_PLL1_CLK2 settings.)

5) Setting the PLL normal mode

Set up the following bits in the PLLn (SSCG) standby control register (CPG_PLLn_STBY).

- Setting of operating mode: Bit 0 (RESETB) = 1 (normal mode)
- Setting of SSCG mode: Bit 2 (SSCG_EN) = Desired setting

6) Confirming the shift to the PLL normal mode and the stable output of the clock

Check the following bit in the PLLn (SSCG) monitor register (CPG_PLLn_MON).

- Shift to standby mode: Confirm that bit 0 (PLLn_RESETB) = 1 (normal mode).

Check the following bit in the PLLn (SSCG) monitor register (CPG_PLLn_MON).

- Lock of PLL: Confirm that bit 4 (PLLn_LOCK) = 1 (PLL is locked).

Wait until the above conditions are satisfied.

NOTE

If there is no change in a parameter in step (2) or (3), the corresponding register does not need to be modified.

4.4.6.5.2 Procedure for setting the PLL for standby mode

Use the following procedure to shift the PLL from the normal standby mode to the standby mode.

[n = 1, 4, 6 or 7: PLL1, PLL4 or PLL6 or PLL7]

1) Setting the PLL standby mode

Set the following bits of the PLLn (SSCG) standby control register (CPG_PLLn_STBY).

- Operation mode setting: bit0 (RESETB) = 0 (standby mode) (other bits are “0”).

2) Confirming the shift to the PLL standby mode

Check the following bits of the PLLn (SSCG) monitor register (CPG_PLLn_MON).

- Standby mode transition confirmation: bit0 (PLLn_RESETB) = 0 (standby mode).

Check the following bits of the PLLn (SSCG) monitor register (CPG_PLLn_MON).

- Confirmation of PLL lock release: bit4 (PLLn_LOCK) = 0 (PLL is not locked).

Wait until the above conditions are satisfied.

4.4.6.6 Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers

Use the following procedure to set the division ratio of the dynamic switching frequency dividers.

* A sample procedure for DIV_PLL1 is described here.

1) Confirming the DIV_PLL1 state (checking that it is not busy)

Check the following bit in the clock status monitor register (CPG_CLKDIVSTATUS).

- DIV_PLL1 state: Confirm that bit 0 (DIVPL1_STS)) = 0 (switching is completed).

Wait until the above condition is satisfied.

2) Setting the DIV_PLL1 division ratio

Set up the following bits in the division ratio setting (PLL1) register (CPG_PL1_DDIV).

- Setting of division ratio: Bits 1 and 0 (DIVPL1_SET) = desired value and bit 16 (DIV_PLL1SET_WEN) = 1

3) Confirming the DIV_PLL1 state (checking that it is not busy)

Check the following bit in the clock status monitor register (CPG_CLKDIVSTATUS).

- DIV_PLL1 state: Confirm that bit 0 (DIVPL1_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

The above procedure applies to the following registers.

— Division Ratio Setting (PLL1) Register (CPG_PL1_DDIV)
— Division Ratio Setting (PLL2) Register (CPG_PL2_DDIV)
— Division Ratio Setting (PLL3) Register (CPG_PL3_DDIV)
— Division Ratio Setting (SDHI) Register (CPG_SDHI_DDIV)
— Division Ratio Setting (xSPI) Register (CPG_XSPI_DDIV)
— Division Ratio Setting (GE3D) Register (CPG_GE3D_DDIV)
— Division Ratio Setting (DSI) Register (CPG_DSI_DDIV)
— Division Ratio Setting (PDM) Register (CPG_PDM_DDIV)
— Division Ratio Setting (BSC) Register (CPG_BSC_DDIV)
— Division Ratio Setting (CA55CORE) Register (CPG_CA55CORE_DDIV)
— Division Ratio Setting (RSCI) Register (CPG_RSCI_DDIV)
— Division Ratio Setting (RSPI) Register (CPG_RSPI_DDIV)

The following status monitor register is used.

— Clock Status Monitor Register (CPG_CLKDIVSTATUS)

When 1 is written to a xx_WEN bit placed in the upper 16 bits of a division ratio setting register, the clock switching control begins even if the settings in the lower bits are not changed. Check the status monitor register (CPG_CLKDIVSTATUS) and wait until the switching is completed. The clock will temporarily stop at the timing of switching.

4.4.6.7 Procedure for Switching Clocks by the Dynamic Switching Frequency Selectors

Use the following procedure to switch clocks by the dynamic switching frequency selectors.

* A sample procedure for SEL_PLL4 is described here.

1) Confirming the SEL_PLL4 state (checking that it is not busy)

Check the following bit in the clock status monitor register (CPG_CLKSELSTATUS).

- SEL_PLL4 state: Confirm that bit 6 (SELPLL4_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

2) Setting the switching of the clock output from SEL_PLL4

Set up the following bits in the source clock setting (PLL) register (CPG_PLL_DSEL).

- Setting of clocks switching (switch from PLL4 to OSC_DIV1000): Bits 31 to 0 = H'0040_0000
  (switch from OSC_DIV1000 to PLL4): Bits 31 to 0 = H'0040_0040

3) Confirming the SEL_PLL4 state (checking that it is not busy)

Check the following bit in the clock status monitor register (CPG_CLKSELSTATUS).

- SEL_PLL4 state: Confirm that bit 6 (SELPLL4_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

The following registers are used in the above procedure.

— Source Clock Setting (PLL) Register (CPG_PLL_DSEL)

— Source Clock Setting (SDHI) Register (CPG_SDHI_DSEL)

— Source Clock Setting (BSC) Register (CPG_BSC_DSEL)

When 1 is written to a xx_WEN bit placed in the upper 16 bits of a source clock setting register, the clock switching control begins even if the settings in the lower bits are not changed. Check the status monitor register (CPG_CLKSELSTATUS) and wait until the switching is completed. The clock will temporarily stop at the timing of switching.

4.4.6.8 Procedure for Setting Static Switching Dividers and Selectors

Use the following procedure to set the division ratio of the static switching frequency dividers and to switch clocks by the static switching frequency selectors.

When a source clock is active: Stop the clock. → Make settings for switching clocks. → Start the clock.

When a source clock is stopped: Make settings for switching.

The above procedure applies to the following registers.

— Source Clock Setting (xSPI) Register (CPG_XSPI_SSEL)

— Source Clock Setting (DSI) Register (CPG_DSI_SSEL)

— Source Clock Setting (GE3D) Register (CPG_GE3D_SSEL)

— Source Clock Setting (ETH) Register (CPG_ETH_SSEL)

— Source Clock Setting (RSCI) Register (CPG_RSCI_SSEL)

— Source Clock Setting (RSPI) Register (CPG_RSPI_SSEL)

4.4.6.9 Boot Sequence (Normal Mode)

After the reset sequence ends, perform the following operations if necessary.

- Start PLLs.
- Set up clock selectors.
- Set up clock division ratios.
- Supply clocks to modules.
- Release modules from the reset state.

4.4.6.10 Boot Sequence (Debug Mode)

After the reset sequence (debug mode) ends, perform the following operations if necessary.

- Start PLLs.
- Set up clock selectors.
- Set up clock division ratios.
- Supply clocks to modules.
- Release modules from the reset state.

4.4.6.11 Procedure for Writing to Registers

The registers in the CPG have write-enable flags in the upper 16 bits and normal data fields in the lower 16 bits except for the registers shown below. Therefore, only the desired bit can be modified without read-modify-write operation.

To modify the value of a bit, write 1 to the write-enable flag having the target bit number + 16 and write a desired value to the target bit.

(Examples: To modify bit 0 to 1b, write H'0001_0001. To modify it to 0b, write H'0001_0000. When H'0000_xxxx is written, the value of bits 15 to 0 does not change.)

NOTE

In some registers, a single write-enable flag controls multiple data bits. Refer to the description of each register.

Registers that have data fields in the upper bits instead of write-enable flags:

— PLLn (SSCG) Output Clock Setting Register 1 (CPG_PLLn_CLK1): (n = 1, 4, 6 or 7)

— PLLn (SSCG) Output Clock Setting Register 2 (CPG_PLLn_CLK2): (n = 1, 4, 6 or 7)

— Cortex-A55 Cluster Power Status Control Register (CPG_CLUSTER_PCHCTL)

— Cortex-A55 Core 0 Power Status Control Register (CPG_CORE0_PCHCTL)

— Cortex-A55 Core 1 Power Status Control Register (CPG_CORE1_PCHCTL)

— Cortex-A55 Core 2 Power Status Control Register (CPG_CORE2_PCHCTL)

— Cortex-A55 Core 3 Power Status Control Register (CPG_CORE3_PCHCTL)

— Return Func 2 Register (CPG_RET_FUNC2)

4.4.6.12 Switching the Source Clock Setting (PLL) Register (CPG_PLL_DSEL bit6)

When switching the source clock setting (PLL) register (CPG_ PLL_DSEL bit6), wait at least 800 µs after Cortex-A55 boots during the boot sequence.

4.4.7 Restrictions

4.4.7.1 CM33 Systick Timer

When the CM33_CLK0 clock frequency is switched, the period of the CM33_CLK0EN signal for Systick timer counting is not guaranteed only for the first pulse after the clock frequency switch. Therefore, the Systick timer count register must be reset.

4.4.7.2 Restrictions on Using the Individual PLLs

PLL1 to PLL3 cannot be switched to desired clock settings by the user because these PLLs output clocks for the CPU and bus operation.

PLL1 outputs clocks dedicated to the Cortex-A55. To modify its settings after booting, the registers should be manipulated from the Cortex-M33.

The PLL2 and PLL3 settings cannot be modified after booting because these PLLs output system clocks for bus operation.

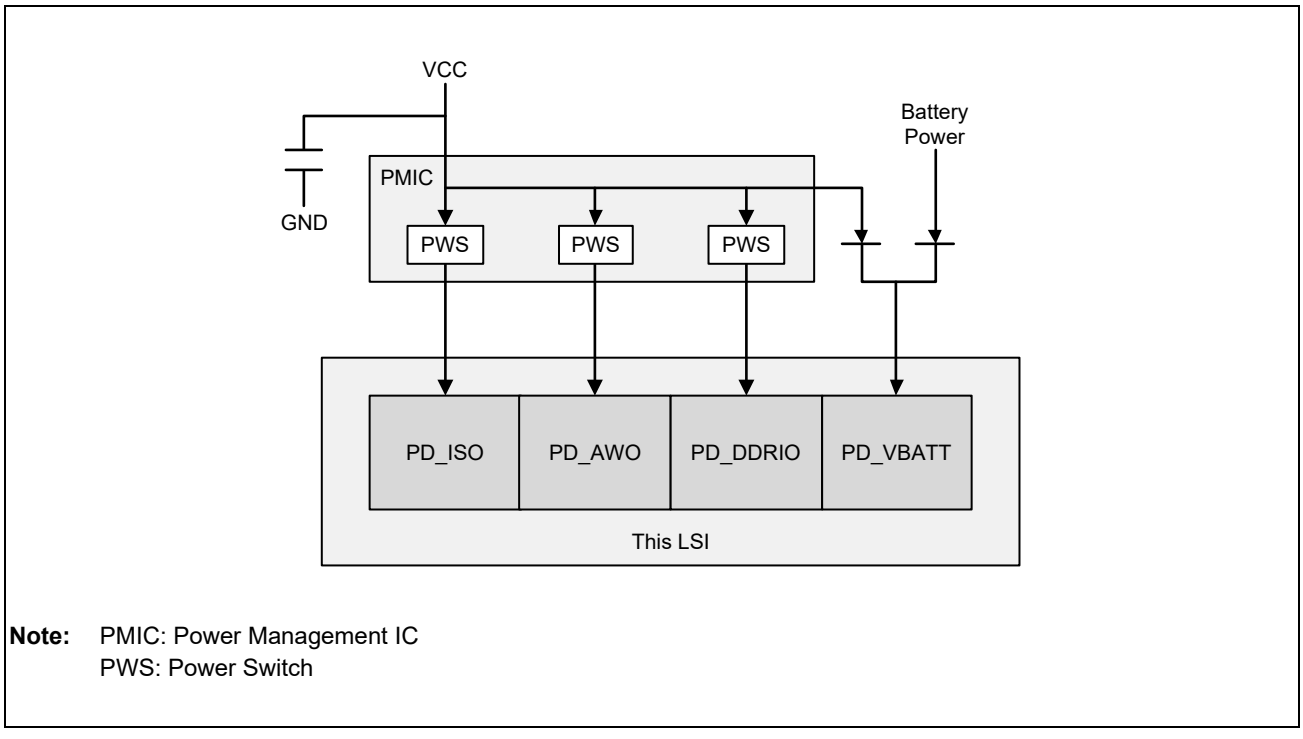
PLL4 and PLL7 can be set up, started, or stopped by the user at the desired timing under the allowable conditions of use for the IP.

SECTION 4 SYSTEM

4.5 Low Power Management

This LSI has several functions to achieve low power consumption. By combining with power supply isolation, further power consumption can be reduced.

4.5.1 Power Domain Control



4.5.1.1 Power Domain

The power domain of this LSI is divided into PD_AWO domain, PD_ISO domain, PD_DDRIO domain and PD_VBATT domain.

- PD_AWO domain always powered on area.
- PD_ISO domain is the area where the power can be turned off.
- PD_DDRIO domain is the area for DDR I/O.
- PD_VBATT domain is the area where the RTC/backup register is located, works on battery power when the power of PD_AWO and PD_ISO domain are turned off.

Refer to **1.1.5 Block Diagram** for the domain to which the module belongs.

The following figure shows one example relationship of the power domain and power supply.

Note: PMIC: Power Management IC
PWS: Power Switch

Figure 4.5-1 Power Domain and Power Supply

4.5.1.2 Power Mode

This LSI has the following four power modes depending on the power on/off combination of the power domain.

Table 4.5-1 Power Mode

Power Mode	Power Domain			
	PD_ISO	PD_AWO	PD_DDRIO	PD_VBATT
ALL_ON	ON	ON	ON	ON
AWO_DDR_RETENTION	OFF	ON	ON	ON
VBATT_DDR_RETENTION	OFF	OFF	ON	ON
VBATT	OFF	OFF	OFF	ON (battery power)
ALL_OFF	OFF	OFF	OFF	OFF

- ALL_ON mode:

  All CPUs and all function modules can be worked.

- AWO_DDR_RETENTION mode:

  DRAM is transitioned to self-refresh mode and holds programs and data such as Linux.
  Cortex-M33 and peripheral modules in PD_AWO and PD_VBATT domain can be worked.

- VBATT_DDR_RETENTION mode:

  DRAM is transitioned to self-refresh mode and holds programs and data such as Linux.
  Only RTC, tamper detection and backup registers can be worked.

- VBATT mode:

  Only RTC, tamper detection and backup registers can be worked with battery power.
  It is supported only when using battery power.

- ALL_OFF mode:

  All CPUs and all function modules cannot be worked.

The following figure shows the supported transition of power mode when operating without battery power. Regarding to the operation for the power mode transition, refer to **4.5.1.3 Operation**.

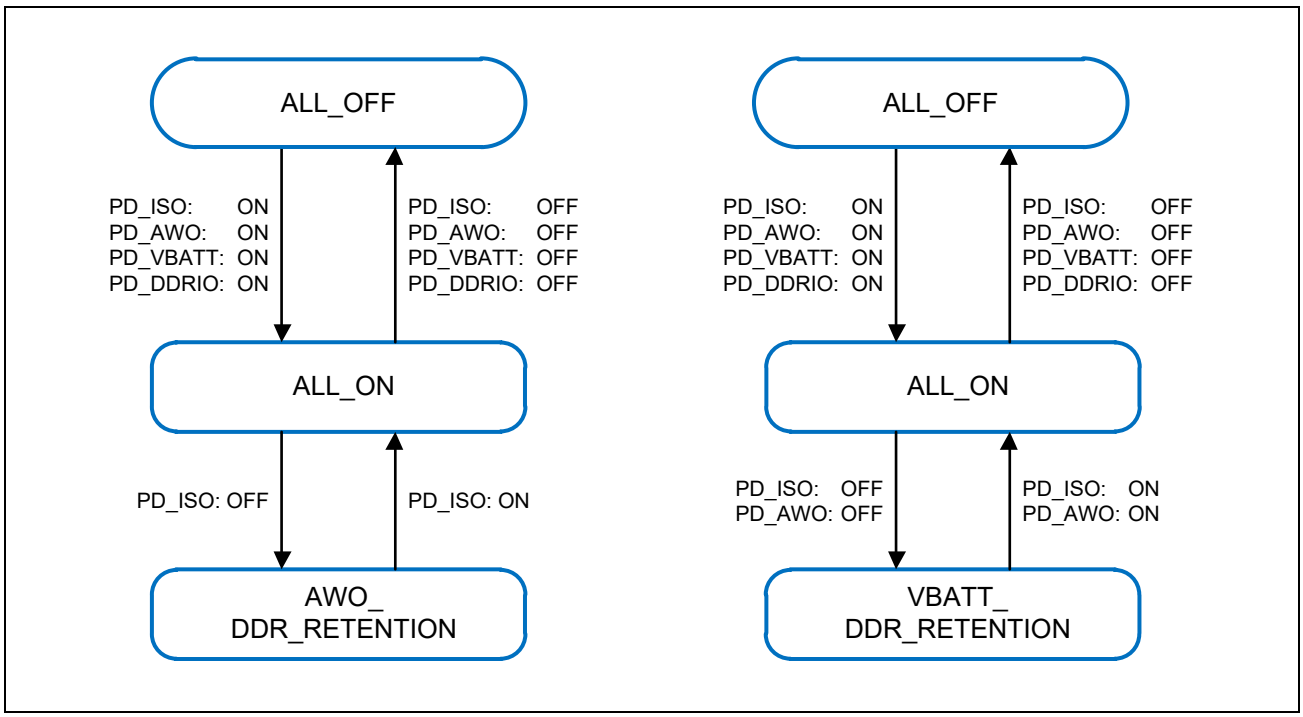


Figure 4.5-2 Supported Power Mode Transition when Operating without Battery Power

The following figure shows the supported transition of power mode when operating with battery power. VBATT mode is supported when using battery power. Regarding to the operation for the power mode transition, refer to **4.5.1.3 Operation**.

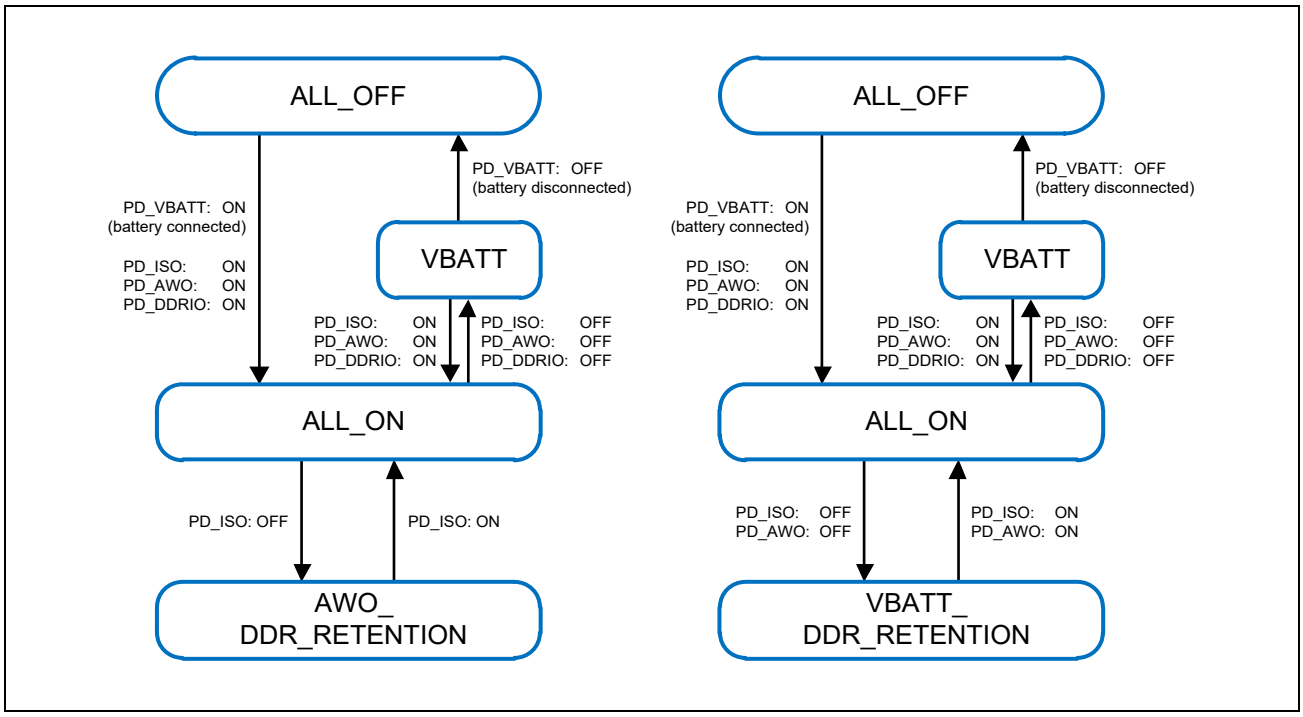

Figure 4.5-3 Supported Power Mode Transition when Operating with Battery Power

4.5.1.3 Operation

The power mode transitions are accomplished by combining the following control:

1. Internal control by register control inside this LSI.
2. Power supply control for each power domain.
3. Control flow branches considering the state before state transition and the state after transition.

As for 2 and 3, it depends on the system configuration including this LSI and power control system, so it is necessary to implement it according to the user's system.

4.5.1.3.1 ALL_ON to AWO_DDR_RETENTION

The following table shows an example transition flow outline from ALL_ON mode to AWO_DDR_RETENTION mode.

Table 4.5-2 Example Transition Flow Outline from ALL_ON mode to AWO_DDR_RETENTION mode (1/2)

Step	Controlled by	Operation	Description
1	Cortex-A55	Stop DMA transfer of all IPs.	Depend on IPs.
2	Cortex-A55	Enter DDR retention Mode.	Retention mode setting.
3	Cortex-A55	Transition to Cortex-A55 Sleep Mode.	Refer to step (1) to (3) in **2.2.2.4.1 Cortex-A55 Sleep Mode**.
4	Cortex-M33	Cortex-A55 Core P-Channel Control Cortex-A55 Cluster P-Channel Control	CPG_COREn_PCHCTL (n = 0 to 3) CPG_CLUSTER_PCHCTL

13	Cortex-M33	Reset release setting for Cortex-A55	CPG_RST_CA55_n, CPG_RSTMON_CA55_n (n = 1, 2)
14	Cortex-M33	Cortex-A55 Q-Channel Control	SYS_LP_CA55CK_CTLn (n = 2, 3)
15	Cortex-M33	Cortex-A55 Cluster P-Channel Control Cortex-A55 Core P-Channel Control	CPG_CLUSTER_PCHCTL CPG_COREn_PCHCTL (n = 0 to 3)
16	Cortex-M33	Release system boot Cortex-A55.	Check CA55 core0-3 re-boot (Mod4Core)

Table 4.5-3 Example Transition Flow Outline from AWO_DDR_RETENTION mode to ALL_ON mode (2/2)

Step	Controlled by	Operation	Description
17	Cortex-M33	Exit from DDR IO retention mode.	Setting for exiting from DDR IO retention mode.
18	Cortex-M33	Activate the other CPUs and the peripheral modules.	Depend on the user system.

4.5.1.3.3 ALL_ON to VBATT_DDR_RETENTION

The following table shows an example transition flow outline from ALL_ON mode to VBATT_DDR_RETENTION mode.

Table 4.5-4 Example Transition Flow Outline from ALL_ON mode to VBATT_DDR_RETENTION mode

Step	Controlled by	Operation	Description
1	Cortex-A55	Stop DMA transfer of all IPs.	Depend on IPs.
2	Cortex-A55	Enter DDR IO retention Mode.	IO Retention mode setting.
3	Cortex-M33	Transition to Cortex-M33 Sleep Mode. (if booting)	Refer to step (1) to (7) in **2.2.3.4.4, Cortex-M33 Sleep Mode**.
4	Cortex- A55	Activate VBATT module. (if inactive)	CPG_CLKON_VBAT, CPG_RST_VBAT
5	Cortex- A55	CSI, DSI, USB PHY Power Ready control (if using CSI, DSI, USB)	SYS_PWRRDY_N (bit [2:0] = 111b)
6	Cortex- A55	Reset assert for PCIE	CPG_RST_PCI
7	Cortex- A55	Enable the isolation cell for PD_VBATT.	ISOENPROT, ISOEN
8	Cortex- A55	Set the VBATT_RETENTION flag*1 to the external device (ex. register in PMIC) via I2C.	VBATT_RETENTION flag is used when returning to ALL_ON mode.
9	Cortex- A55	Shut down the power supply for PD_AWO and PD_ISO from PMIC via I2C.	Regarding to the power off sequence, refer to **Figure 10.1-3**.

Note 1. The implementation method of VBATT_RETENTION flag depends on the user's system.

4.5.1.3.4 VBATT_DDR_RETENTION to ALL_ON

The following table shows an example transition flow outline from VBATT_DDR_RETENTION mode to ALL_ON mode.

Table 4.5-5 Example Transition Flow Outline from VBATT_DDR_RETENTION mode to ALL_ON mode

Step	Controlled by	Operation	Description
1	External	Start the power supply for PD_AWO and PD_ISO from PMIC.	Regarding to the power on sequence, refer to **Figure 10.1-3**. The isolation cell for PD_VBATT is automatically disabled after power on.
2	External	Release system reset and boot Cortex-A55.	De-assert SYS_RST#.
3	Cortex-A55	Confirm the VBATT_RETENTION flag*1 via I2C to check if normal boot or return from VBATT mode.	The VBATT_RETENTION flag is set when transition to VBATT_DDR_RETENTION mode.
4	Cortex-A55	Exit from DDR IO retention mode.	Setting for exiting from DDR IO retention mode.
5	Cortex-A55	Activate the other CPUs and the peripheral modules.	Depend on the user system.

Note 1. The implementation method of VBATT_RETENTION flag depends on the user's system.

4.5.1.3.5 ALL_ON to VBATT

The following table shows an example transition flow outline from ALL_ON mode to VBATT mode.

Note: VBATT_mode requires battery power such as a coin-cell battery to supply voltage for PD_VBATT.

Table 4.5-6 Example Transition Flow Outline from ALL_ON mode to VBATT mode

Step	Controlled by	Operation	Description
1	Cortex-A55	Stop DMA transfer of all IPs.	Depend on IPs.
2	Cortex-A55	Transition to Cortex-A55 Sleep Mode.	Refer to step (1) to (3) in **2.2.2.4.1 Cortex-A55 Sleep Mode**.
3	Cortex-M33	Cortex-A55 Core P-Channel Control Cortex-A55 Cluster P-Channel Control	CPG_COREn_PCHCTL (n = 0 to 3) CPG_CLUSTER_PCHCTL
4	Cortex-M33	Cortex-A55 Q-Channel Control	SYS_LP_CA55CK_CTLn (n = 2, 3)
5	Cortex-M33	Clock stop setting for Cortex-A55	CPG_CLKON_CA55
6	Cortex-M33	Reset assert setting for Cortex-A55	CPG_RST_CA55_n (n = 1, 2)
7	Cortex-M33	CSI,DSI,USB PHY Power Ready control (if using CSI, DSI, USB)	SYS_PWRRDY_N
8	Cortex-M33	Reset assert for PCIE	CPG_RST_PCI
9	Cortex-M33	Confirm the VBATT flag*1 to check the transition history to VBATT mode.	VBATT flag is in the backup register (BSKRn).
10	Cortex-M33	Activate VBATT module when the VBATT flag is not set.	CPG_CLKON_VBAT, CPG_RST_VBAT
11	Cortex-M33	Setting for RTC and tamper detection when the VBATT flag is not set.	RTC registers and tamper detection registers
12	Cortex-M33	Set the VBATT flag to the backup register when the VBATT flag is not set.	BSKRn
13	Cortex-M33	Enable the isolation cell for PD_VBATT.	ISOENPROT, ISOEN
14	Cortex-M33	Shut down the power supply for PD_AWO, PD_ISO and PD_DDRIO from PMIC via I2C.	Regarding to the power off sequence, refer to **Figure 10.1-4**.

Note 1. The implementation method of VBATT flag depends on the user's system.

4.5.1.3.6 VBATT to ALL_ON

The following table shows an example transition flow outline from ALL_ON mode to VBATT mode.

Note: VBATT_mode requires battery power such as a coin-cell battery to supply voltage for PD_VBATT.

Table 4.5-7 Example Transition Flow Outline from VBATT mode to ALL_ON mode

Step	Controlled by	Operation	Description
1	External	Start the power supply for PD_AWO, PD_ISO and PD_DDRIO from PMIC.	Regarding to the power on sequence, refer to **Figure 10.1-4**. The isolation cell for PD_VBATT is automatically disabled after power on.
2	External	Release system reset and boot Cortex-A55.	De-assert SYS_RST#.
3	Cortex-A55	Activate the other CPUs and the peripheral modules.	Depend on the user system.

4.5.2 Low Frequency Mode

4.5.2.1 Overview

This mode reduces the power consumption by reducing the frequency of the clock signal supplied to the CPU and the specified peripheral module which synchronized to the system bus. Refer to **Table 4.5-2**.

Table 4.5-8 Clocks and Registers Related to Low Frequency Mode

Clock Symbol	CPG Register	Division Ratio	Related Clock*1
Iϕ	CPG_PL1_DDIV[2:0]	1/1, 1/2, 1/4, 1/8, 1/16, 1/32	Cortex-A55 main clock
IC0ϕ	CPG_CA55CORE_DDIV[2:0]	1/1, 1/2, 1/4, 1/8, 1/16, 1/32	Cortex-A55 Core0 clock
IC1ϕ	CPG_CA55CORE_DDIV[6:4]	1/1, 1/2, 1/4, 1/8, 1/16, 1/32	Cortex-A55 Core1 clock
IC2ϕ	CPG_CA55CORE_DDIV[10:8]	1/1, 1/2, 1/4, 1/8, 1/16, 1/32	Cortex-A55 Core2 clock
IC3ϕ	CPG_CA55CORE_DDIV[14:12]	1/1, 1/2, 1/4, 1/8, 1/16, 1/32	Cortex-A55 Core3 clock
P3ϕ	CPG_PL2_DDIV[1:0]	1/1, 1/2, 1/4, 1/32	Coetex-M33 main clock, Peripheral modules and related system bus clock
P0ϕ	CPG_PL2_DDIV[5:4]	1/1, 1/2, 1/4, 1/32	Peripheral modules and related system bus clock
P1ϕ	CPG_PL3_DDIV[1:0]	1/1, 1/2, 1/4, 1/32	Peripheral modules and related system bus clock
P2ϕ	CPG_PL3_DDIV[5:4]	1/1, 1/2, 1/4, 1/32	Peripheral modules and related system bus clock

Note 1. For more detailed information, refer to another file for the clock list.

4.5.2.2 Operation

It is achieved by having software control registers of the CPG to switch the frequency divisors for the various domains. Regarding to the operation of the register, refer to **4.4.6.6 Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers**.

4.5.3 Module Standby Mode

4.5.3.1 Overview

The Module Standby Mode is a mode that requests the clock stop of the module specified by the master.

The purpose of this mode is to reduce power consumption by stopping unnecessary functions.

The master which can request the clock stop is Cortex-A55 and Cortex-M33. So, Cortex-A55 and Cortex-M33 cannot be placed in the Module Standby Mode. To reduce the power consumption in the CPUs, use the CPU sleep modes to be described later.

This mode is implemented by stopping the clock supply by the CPG register and switching the MSTOP signal of the bus through CPG register settings.

If the master accesses a module that has the clock stopped and the MSTOP bit set, a bus error will occur.

The following registers are used in the Module Standby Mode.

Table 4.5-9 Module Standby Mode Related Registers

Register Name	Abbreviation	Description
Clock Control Register	CPG_CLKON_***	The detail information of each register is described in **4.3 System Controller (SYSC)** and **4.4 Clock Pulse Generator (CPG)**. The usage of these registers is described in **4.5.3.2 Operation**.
MSTOP Register	CPG_BUS_***_MSTOP CPG_MHU_STOP	

The following figure shows the block connection overview related Module Standby Mode.

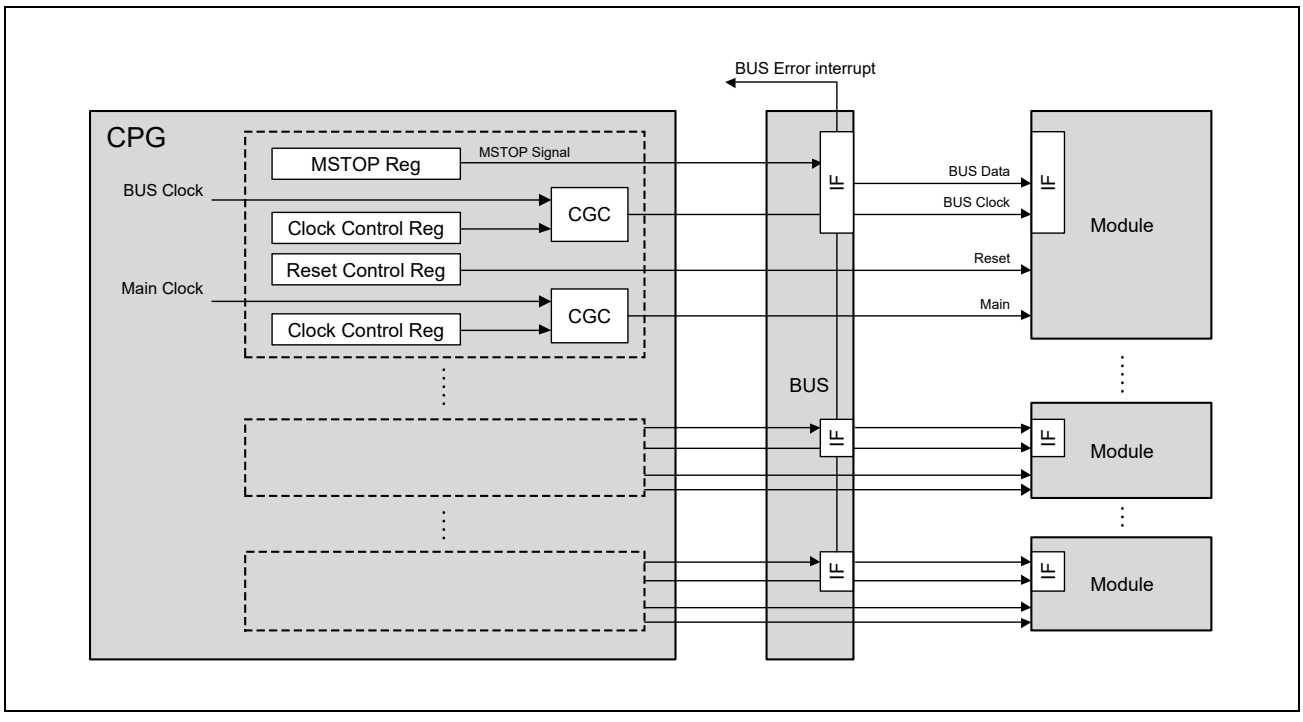

Figure 4.5-4 Block Connection Overview for Module Standby Mode

4.5.3.2 Operation

The following chart shows the procedure to enter and return from the Module Standby Mode.

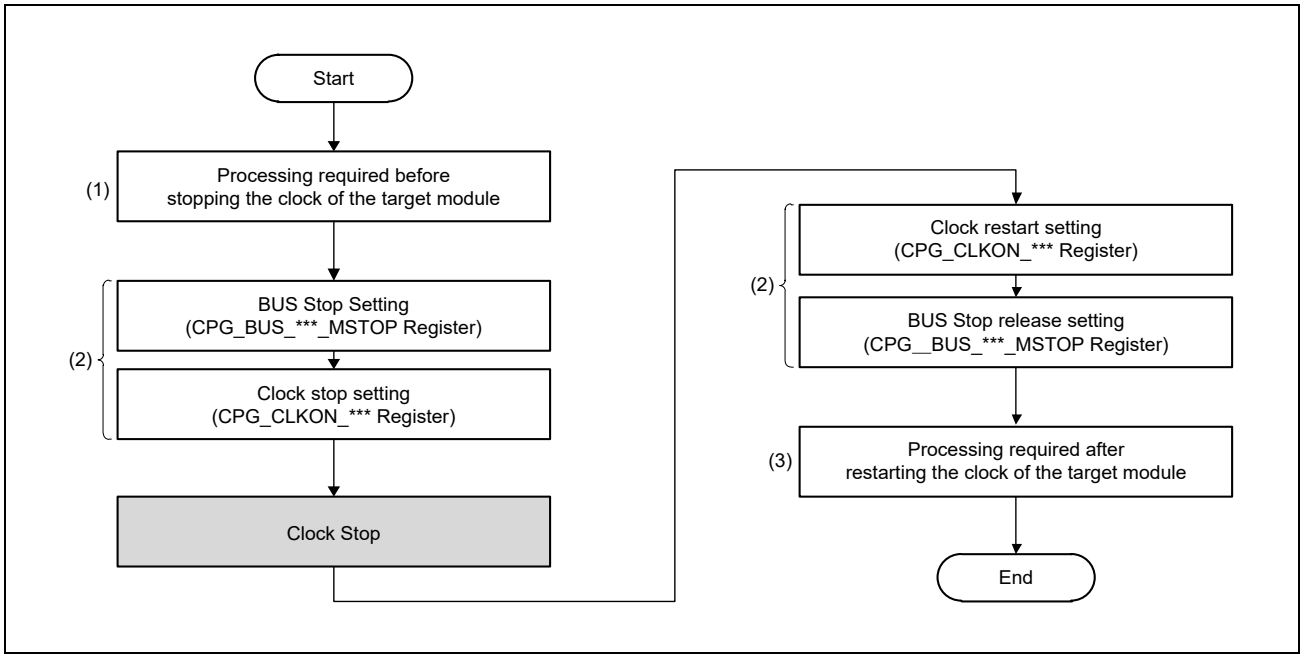

Figure 4.5-5 Module Standby Mode Procedure

(1) Depend on the module, there may be a request to stop during communication and various processing. In this case, if the managed CPU can be stopped unilaterally for each module, a stop request is immediately issued to the CPG. For those that cannot be stopped until a certain process is completed, after confirming that the managed CPU has stopped for each module, a stop request is made to the CPG.

(2) Refer to **4.5.3.2.1 Setting of Clock Control and MSTOP Register** regarding to the setting of Clock Control Register and MSTOP Register.

(3) Whether the reset control is required depends on the module; check the specifications of the target module. Set the reset control register to 0 to enter the reset state. Set 1 for the release from the reset state.

4.5.3.2.1 Setting of Clock Control and MSTOP Register

The following table shows the combination of the Clock Control register and the MSTOP register to stop the clock of the target module.

The Module Standby Mode can be applied only to the modules shown in the table below.

- When entering the Module Standby Mode:

  Set the MSTOP Register bit of the target module to 1.
  Set the Clock Control Register bit of the target module to 0.

- When exiting the Module Standby Mode:

  Set the Clock Control Register bit of the target module to 1.
  Set the MSTOP Register bit of the target module to 0.

Table 4.5-10 Registers for Module Standby Mode (1/2)

Note 1. CPG_MHU_STOP itself is the register name.

Note 2. The clock for USB2.0 PHY can only be stopped when the clock for USB2.0 ch0 and ch1 are stopped.

4.5.4 Cortex-A55 Sleep Mode

4.5.4.1 Overview

This mode puts Cortex-A55 into a low power state to reduce the power consumption.

Put into a low power state by issuing a WFI instruction.

The return factor is interrupt.

The following table shows the registers related to the Cortex-A55 Sleep Mode.

Refer to **4.3 System Controller (SYSC)** for detail.

Table 4.5-11 Cortex-A55 Sleep Mode Related Registers

Register Name	Abbreviation	Bit Name
Lowpower Sequence Control Register1	SYS_LP_CTL1	bit[27:24]: CA55SLEEP_ACK[3:0] bit[11:8]: CA55SLEEP_REQ[3:0]
Lowpower Sequence Control Register2	SYS_LP_CTL2	bit[0]: CA55_STBYCTL
Lowpower Sequence Control Register5	SYS_LP_CTL5	bit[11]: CA55SLEEP3_F bit[10]: CA55SLEEP2_F bit[9]: CA55SLEEP1_F bit[8]: CA55SLEEP0_F
Lowpower Sequence Control Register6	SYS_LP_CTL6	bit[11]: CA55SLEEP3_E bit[10]: CA55SLEEP2_E bit[9]: CA55SLEEP1_E bit[8]: CA55SLEEP0_E

4.5.4.2 Operation

4.5.4.2.1 Enter/Exit procedure for Cortex-A55 Sleep Mode

Refer to **2.2.2.4.1 Cortex-A55 Sleep Mode**.

4.5.4.2.2 Example procedure using SYSC register

The following figure is one example how to use the SYSC registers. The SYS_LP_CTL1, the SYS_LP_CTL5 and the SYS_CTL6 registers can be used to share the transition state of Cortex-A55 with Cortex-M33. Referring to these registers, Cortex-M33 can perform processing if need when Cortex-A55 enters and exits the Cortex-A55 Sleep Mode.

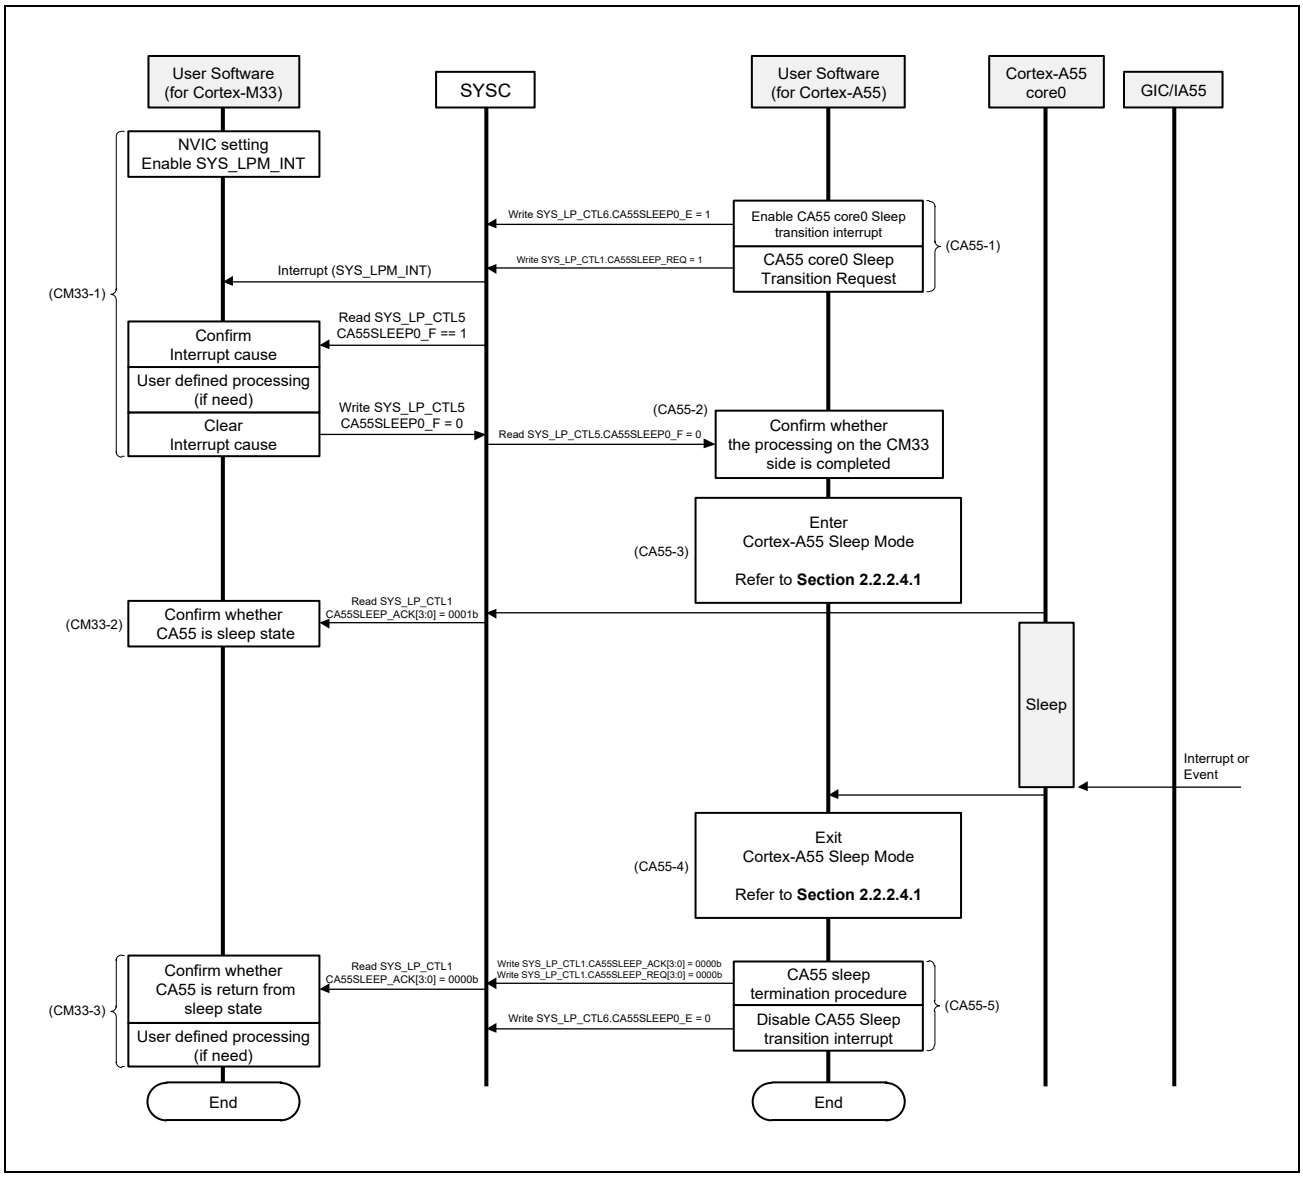

Figure 4.5-6 The Example Procedure How to Use the SYSC Registers (Cortex-A55 Sleep Mode)

(CA55-1) Set the CA55SLEEP0_E bit of the SYS_LP_CTL6 register to 1 to enable the transition request interrupt to the Cortex-A55 Sleep Mode (core0).
Setting the CA55SLEEP_REQ[3:0] bit of the SYS_LP_CTL1 register to 0001b causes a SYS_LPM_INT interrupt. The CA55SLEEP0_F bit of the SYS_LP_CTL5 register is set to 1 as an interrupt cause.

(CM33-1) When a SYS_LPM_INT interrupt is detected, the SYS_LP_CTL5 register is read to check the interrupt cause. (Enable the SYS_LPM_INT interrupt on the NVIC in advance.)
By confirming that the CA55SLEEP0_F bit is 1, the software on Cortex-M33 can know that Cortex-A55 core0 is about to transition to Sleep Mode.
Perform the process required when Cortex-A55 is the sleep mode. (if need)
And then clear the CA55SLEEP0_F bit of the SYS_LP_CTL5 register.

(CA55-2) Read the SYS_LP_CTL5 register.
By confirming that the CA55SLEEP0_F is cleared, the software on Cortex-A55 can confirm that the processing on the Cortex-M33 side is completed.

(CA55-3) Enter the Cortex-A55 Sleep Mode.
Refer to **2.2.2.4.1 Cortex-A55 Sleep Mode** procedure (1) to (3).

(CM33-2) Read SYS_LP_CTL1 register.
By confirming that the CA55SLEEP_ACK[3:0] bit is 0001b, the software on Cortex-M33 can confirm that Cortex-A55 core0 completed transiting to the sleep mode.

(CA55-4) Exit the Cortex-A55 Sleep Mode.
Refer to **2.2.2.4.1 Cortex-A55 Sleep Mode** procedure (4) to (6).

(CA55-5) Clear the CA55SLEEP_ACK[3:0] bit of the SYS_LP_CTL1 register to indicate returning from the sleep mode.
Clear the CA55SLEEP_REQ[3:0] bit of the SYS_LP_CTL1 register to release the Cortex-A55 sleep mode transition request.
Set the CA55SLEEP0_E bit of the SYS_LP_CTL6 register to 0 to disable the transition request interrupt to the Cortex-CA55 Sleep Mode.

(CM33-3) Read SYS_LP_CTL1 register.
By confirming that the CA55SLEEP_ACK[3:0] bit is cleared, the software on Cortex-M33 can confirm that Cortex-A55 completed returning from the sleep mode.
Perform the process required when Cortex-A55 returned from the sleep mode. (if need)

4.5.5 Cortex-M33 Sleep Mode

4.5.5.1 Overview

This mode puts Cortex-M33 into a low power state to reduce the power consumption.

Put into a low power state (Deep Sleep) by issuing a WFI instruction.

The return factor is interrupt and SysTick Timer.

The following table shows the registers related to the Cortex-M33.

Refer to **4.3 System Controller (SYSC)** for detail.

Table 4.5-12 Cortex-M33 Sleep Mode Related Registers

Register Name	Abbreviation	Bit Name
Lowpower Sequence Control Register1	SYS_LP_CTL1	bit[12]: CM33SLEEP_REQ bit[28]: CM33SLEEP_ACK
Lowpower Sequence Control Register5	SYS_LP_CTL5	bit[12]: CM33SLEEP_F
Lowpower Sequence Control Register6	SYS_LP_CTL6	bit[12]: CM33SLEEP_E
Lowpower Sequence Control Register7	SYS_LP_CTL7	bit[0]: IM33_MASK

4.5.5.2 Operation

4.5.5.2.1 Enter/Exit procedure for Cortex-M33 Sleep Mode

Refer to **2.2.3.4.4 Cortex-M33 Sleep Mode**.

4.5.5.2.2 Example procedure using SYSC register.

This section shows an example procedure.

The following figure is one example how to use the SYSC registers. The SYS_LP_CTL1, the SYS_LP_CTL5 and the SYS_CTL6 registers can be used to share the transition state of Cortex-M33 with Cortex-A55. Referring to these registers, Cortex-A55 can perform processing if need when Cortex-M33 enters and exits the Cortex-M33 Sleep Mode.

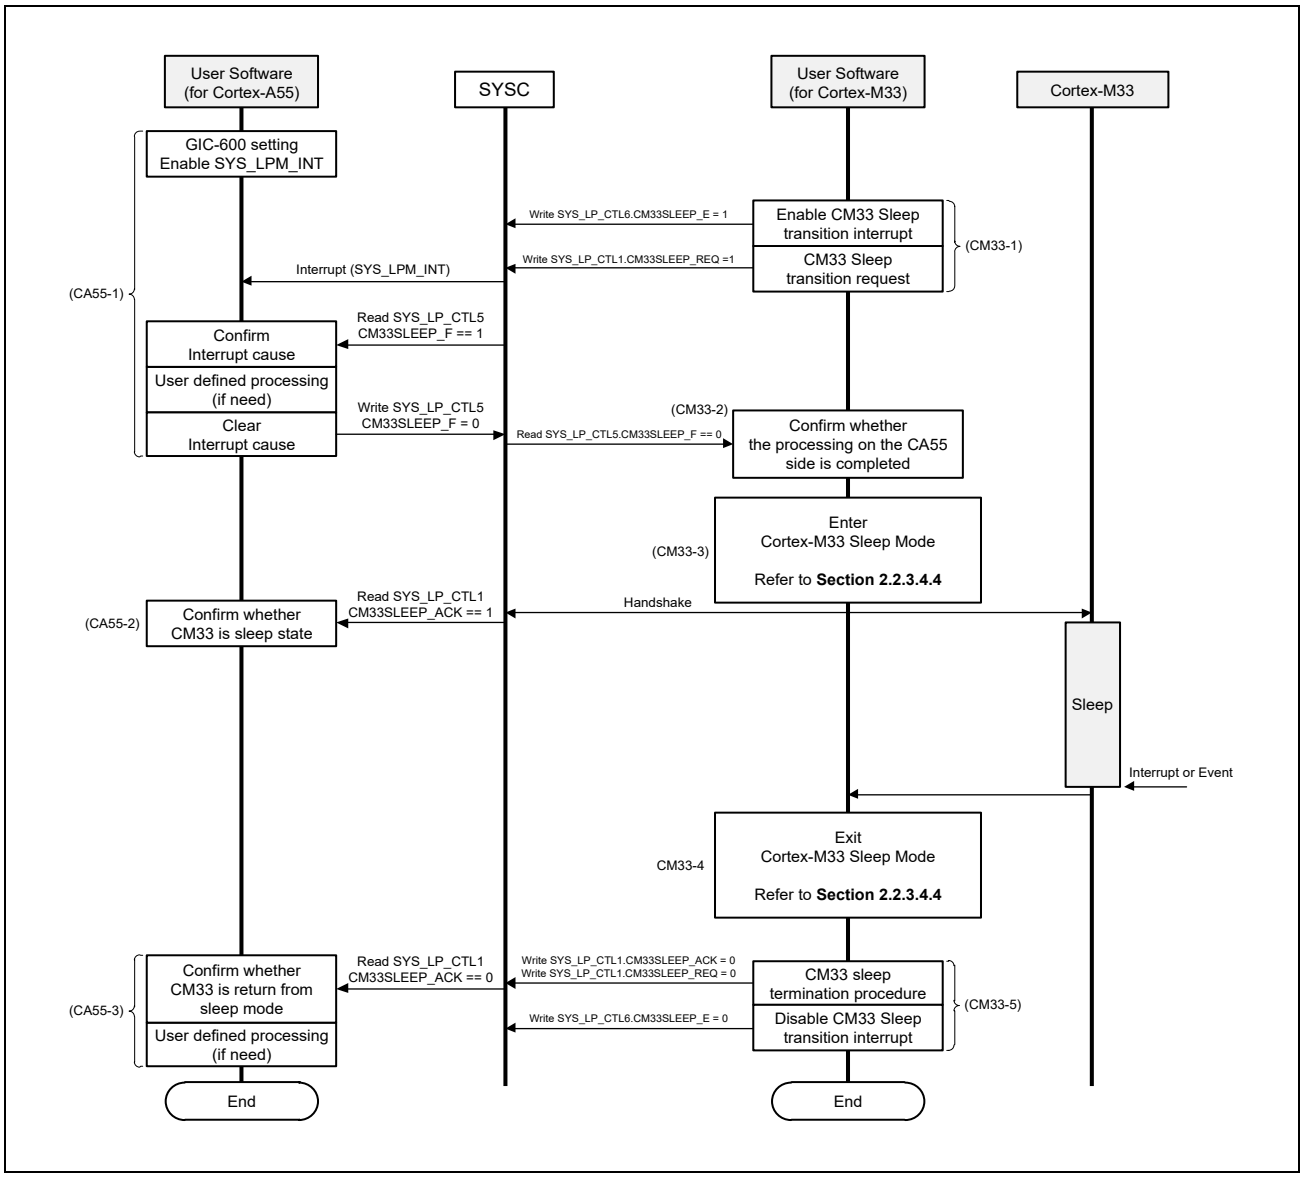

Figure 4.5-7 The Example Procedure How to Use the SYSC Registers (Cortex-M33 Sleep Mode)

(CM33-1) Set the CM33SLEEP_E bit of the SYS_LP_CTL6 register to 1 to enable the transition request interrupt to the Cortex-M33 Sleep Mode.
Setting the CM33SLEEP_REQ bit of the SYS_LP_CTL1 register to 1 causes a SYS_LPM_INT interrupt.
The CM33SLEEP_F bit of the SYS_LP_CTL5 register is set to 1 as an interrupt cause.

(CA55-1) When a SYS_LPM_INT interrupt is detected, the SYS_LP_CTL5 register is read to check the interrupt cause. (Enable the SYS_LPM_INT interrupt on the GIC in advance.)
By confirming that the CM33SLEEP_F bit is 1, the software on Cortex-A55 can know that Cortex-M33 is about to transition to Sleep Mode.
Perform the process required when Cortex-M33 is the sleep mode. (if need)
And then clear the CM33SLEEP_F bit of the SYS_LP_CTL5 register.

(CM33-2) Read the SYS_LP_CTL5 register.
By confirming that the CM33SLEEP_F is cleared, the software on Cortex-M33 can confirm that the processing on Cortex-A55 side is completed.

(CM33-3) Enter the Cortex-M33 Sleep Mode.
Refer to **2.2.3.4.4 Cortex-M33 Sleep Mode** procedure (1) to (7).

(CA55-2) Read SYS_LP_CTL1 register.
By confirming that the CM33SLEEP_ACK bit is 1, the software on Cortex-A55 can confirm that Cortex-M33 completed transiting to the sleep mode.

(CM33-4) Exit the Cortex-M33 Sleep Mode.
Refer to **2.2.3.4.4 Cortex-M33 Sleep Mode** procedure (8) to (12).

(CM33-5) Clear the CM33SLEEP_ACK bit of the SYS_LP_CTL1 register to indicate returning from the sleep mode.
Clear the CM33SLEEP_REQ bit of the SYS_LP_CTL1 register to release the Cortex-M33 sleep mode transition request.
Set the CM33SLEEP_E bit of the SYS_LP_CTL6 register to 0 to disable the transition request interrupt to the Cortex-M33 Sleep Mode.

(CA55-3) Read SYS_LP_CTL1 register.
By confirming that the CM33SLEEP_ACK bit is cleared, the software on Cortex-A55 can confirm that Cortex-M33 completed returning from the sleep mode.
Perform the process required when Cortex-M33 returned from the sleep mode. (if need)

SECTION 4 SYSTEM

4.6 Interrupt Controller

This section describes the interrupt control systems of this LSI chip.

See **1.5 Interrupt** for the overview of the interrupt.

This manual is a simplified version. For more information, refer to the Hardware Manual Additional Document.

4.6.1 Interrupt Synchronization for Cortex-A55/M33 (IA55/IM33)

IA55 and IM33 perform various interrupt controls including synchronization for the external interrupts of NMI, IRQ, and GPIOINT and the interrupts of the built-in peripheral interrupts output by each IP. And they notify the interrupts to the GIC and NVIC.

4.6.1.1 Block Diagram

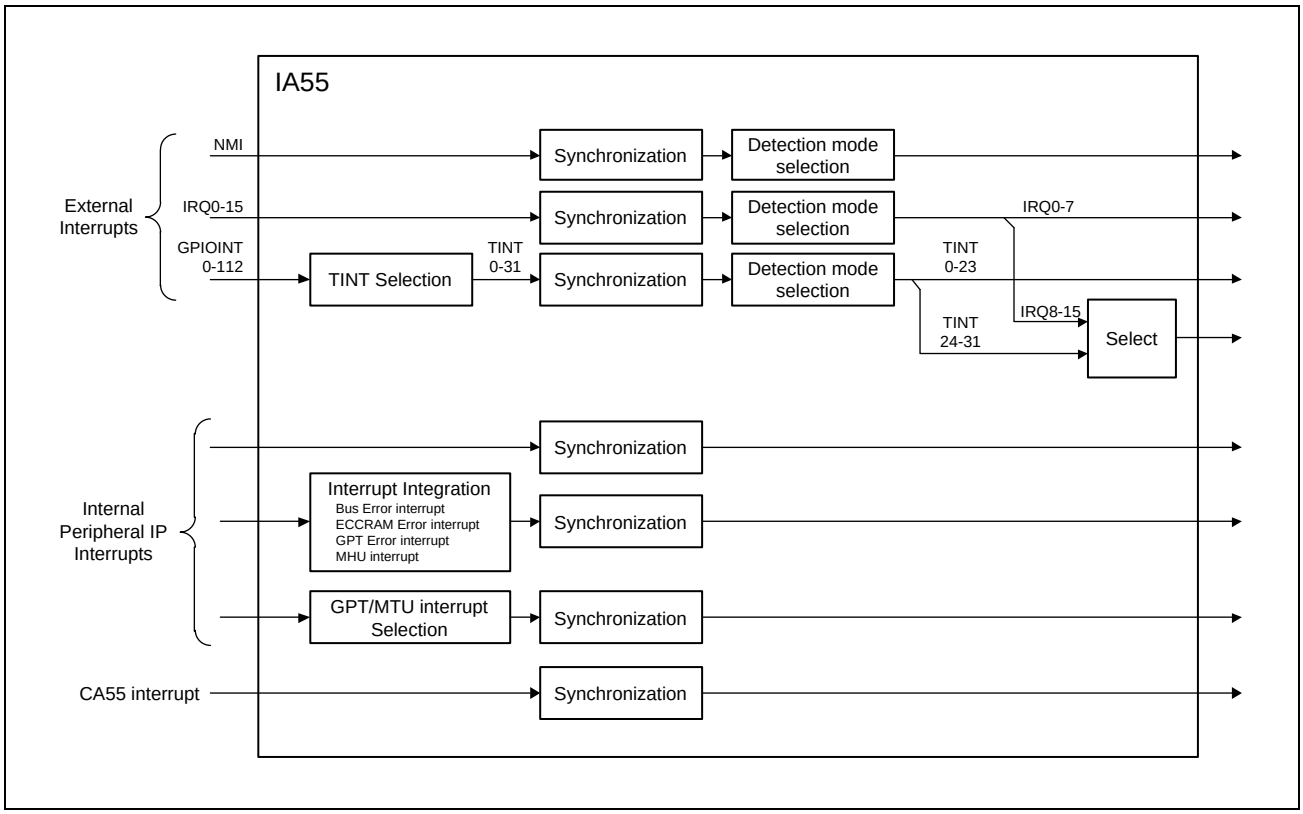

Figure 4.6-1 IA55 Block Diagram

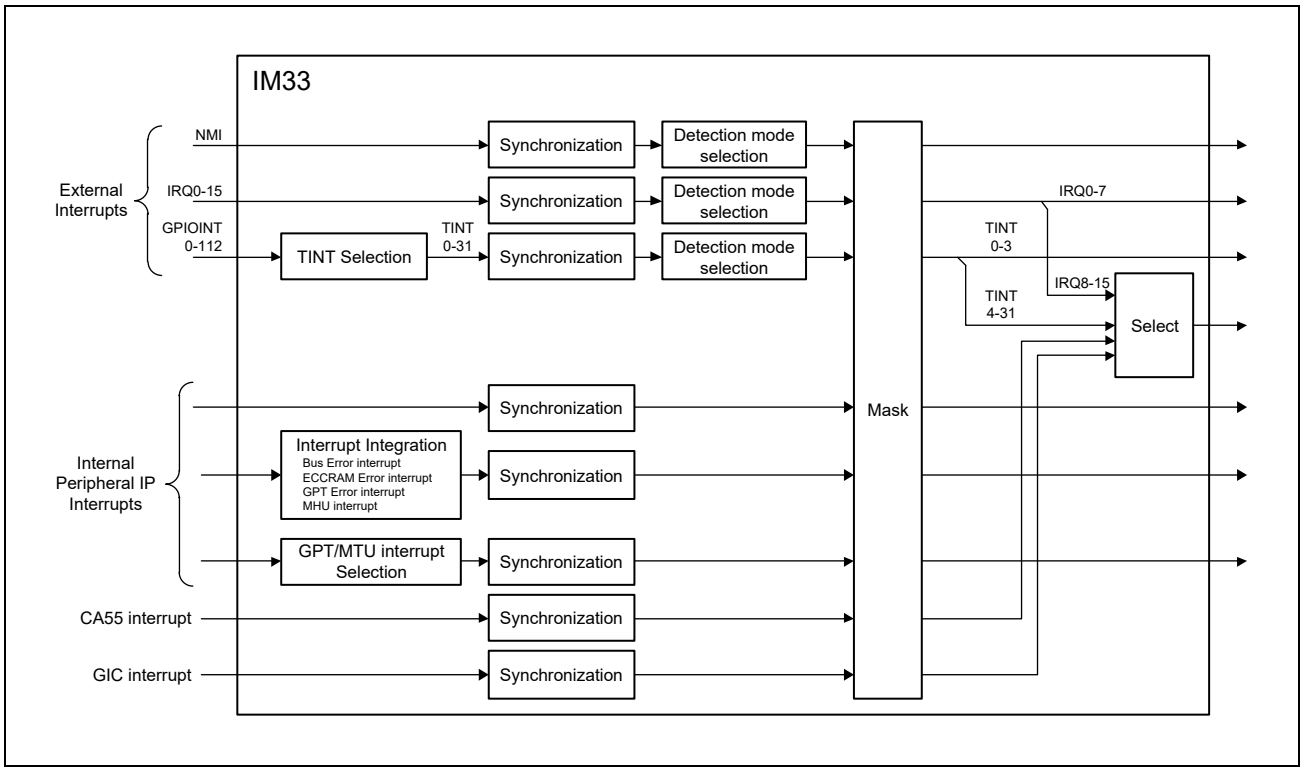

Figure 4.6-2 IM33 Block Diagram

4.6.1.2 External Signal Pins

The following table shows external signal pins for Interrupt Controller.

Table 4.6-1 External Signal Pins

Name	Width	Input/ Output	Description
NMI	1	Input	NMI (Non Maskable Interrupt) pin. Refer to **4.6.1.6.1 NMI Interrupt**.
IRQ0 to IRQ15	16	Input	IRQ (Interrupt Request) pins. GPIO pins can be used as IRQ pins. Refer to **4.6.1.6.2 IRQ Interrupt**.
PS0_AWO to P85_ISO	113	Input	GPIO pins. GPIO pins can be used as external interrupt input pins (GPIOINT0-112). Assign only 32 pins in GPIOINT0-112 to TINT0-31. Refer to **4.6.1.6.3 GPIO Interrupt (TINT)**.

4.6.1.3 Interrupt Mapping

The following table indicates interrupt mapping for Cortex-A55 and Cortex-M33.

Refer to **4.7 Direct Memory Access Controller** with the interrupts through DMA Controller, and **4.6.1.7.1 Precaution when use the peripheral modules which can initiate DMA Controller**.

Table 4.6-2 Interrupt Mapping (1/15)

Note 1. Exception handlers of Cortex-M33 has Interrupt Service Routines (ISRs), Fault handler and System handler.
IRQ0-479 is treated as Interrupt Service Routines (ISRs).
Refer to “Arm Cortex-M33 Processor Technical Reference Manual” and “Arm Cortex-M33 Processor User Guide” for details and targets of Fault handler and System handler.

Note 2. Set GICD_ICFGR<n> of the interrupt controller for Cortex-A55 (GIC-600) according to the description of Interrupt Type for each Interrupt ID.
Refer to “ARM CoreLink GIC-600 Generic Interrupt Controller Technical Reference Manual” for the specification of GIC-600 registers.
Equivalent settings are not required for the interrupt controller for Cortex-M33 (Cortex-M33 built-in NVIC).

Note 3. Refer to the source unit section for the specification of each interrupt source.

Note 4. NMI is not treated as NMI exception.
NMI interrupt setting can be controlled by the registers in IA55 and IM33. Refer to **4.6.1.6.1 NMI Interrupt** for details.

Note 5. IRQ0-15 interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **4.6.1.6.2 IRQ Interrupt** for details.

Note 6. TINT0-31 interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **4.6.1.6.3 GPIO Interrupt (TINT)** for details.

Note 7. BUS_ERR_INT is the interrupt integrated multiple interrupts into one in IA55 and IM33.
The interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **4.6.1.6.4 (1) Bus Error Interrupt** for details.

Note 8. Each EC7TIE1, TC7TIE2 and EC7TIOVF is the interrupt integrated multiple interrupts into one in IA55 and IM33.
The interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **4.6.1.6.4 (2) ECCRAM Error Interrupt** for details.

Note 9. GPT and MTU3a interrupts are selected by the registers in IA55 and IM33. Refer to **4.6.1.6.5 GPT/MTU3a Interrupt Selection** for details.

Note 10. MHU interrupts is the interrupt integrated multiple interrupts into one in IA55.
The interrupt can be confirmed with the status registers in IA55. Refer to **4.6.1.6.4 (4) MHU Interrupt for IA55** for details.

Note 11. MHU interrupts is the interrupt integrated multiple interrupts into one in IM33.
The interrupt can be confirmed with the status registers in IM33. Refer to **4.6.1.6.4 (5) MHU Interrupt for IM33** for details.

Note 12. Software interrupts is the interrupt integrated multiple interrupts into one in IM33.
The interrupt can be confirmed with the status registers in IM33. Refer to **4.6.1.6.4 (6) Software Interrupt for IM33** for details.

Note 13. GPT Error interrupts is the interrupt integrated multiple interrupts into one in IA55 and IM33.
The interrupt can be confirmed with the status registers in IA55 and IM33. Refer to **4.6.1.6.4 (3) GPT Error Interrupts** for details.

4.6.1.4 IA55 and IM33 Register Configuration

■ **IA55**

Base Address: H'0_1105_0000 (Cortex-A55Address Space)

Base Address: H'5105_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'4105_0000 (Cortex-M33 Address Space Secure)

■ **IM33**

Base Address: H'0_1106_0000 (Cortex-A55 Address Space)

Base Address: H'5106_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'4106_0000 (Cortex-M33 Address Space Secure)

The following table shows IA55 Register list.
Prohibit to write undefined area.

Table 4.6-3 IA55 Register List

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size

4.6.1.5 IA55 and IM33 Register Descriptions

4.6.1.5.1 NMI Status Control Register (NSCR) [IA55/IM33]

This register shows NMI status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NSMON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NSTAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	NSMON	0	R	This bit indicates NMI pin signal level. [Read operation] 0: NMI pin is Low-level. 1: NMI pin is High-level. [Write operation] Invalid to write.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	NSTAT	0	R/W	This bit indicates NMI interrupt status. NMI interrupt status can be cleared writing 0 in case NSTAT is 1. [Read operation] 0: NMI interrupt is not detected. 1: NMI interrupt is detected. [Write operation] • In case NSTAT is 1 0: NMI interrupt status is cleared. 1: Invalid to write. • In case NSTAT is 0 Invalid to write.

4.6.1.5.2 NMI Interrupt Type Selection Register (NITSR) [IA55/IM33]

This register selects NMI detecting method.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NTSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	NTSEL	0	R/W	This bit is used to select NMI interrupt detection method. 0: Falling-edge detection. 1: Rising-edge detection.

4.6.1.5.3 IRQ Status Control Register (ISCR) [IA55/IM33]

This register shows IRQ status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ISTAT15	ISTAT14	ISTAT13	ISTAT12	ISTAT11	ISTAT10	ISTAT9	ISTAT8	ISTAT7	ISTAT6	ISTAT5	ISTAT4	ISTAT3	ISTAT2	ISTAT1	ISTAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	ISTATn	0	R/W	This bit indicates IRQn interrupt status. When the interrupt detection method is set to an edge type detection in IITSR, IRQn interrupt status can be cleared writing 0 in case ISTATn is 1. [Read operation] 0: IRQn interrupt is not detected. 1: IRQn interrupt is detected. [Write operation] When “Falling-edge detection”, “Rising-edge detection” or “Falling/Rising-edge detection” is set in ITSR: • In case ISTAT is 1 0: IRQn interrupt detection status is cleared. 1: Invalid to write. • In case ISTAT is 0 Invalid to write. When “Low-level detection” is set in IITSR: Invalid to write.

Note: n = 15 to 0

4.6.1.5.4 IRQ Interrupt Type Selection Register (IITSR) [IA55/IM33]

This register selects IRQ detecting method.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IITSEL15		IITSEL14		IITSEL13		IITSEL12		IITSEL11		IITSEL10		IITSEL9		IITSEL8	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IITSEL7		IITSEL6		IITSEL5		IITSEL4		IITSEL3		IITSEL2		IITSEL1		IITSEL0

Bit	Bit Name	Initial Value	R/W	Description
2n+1 to 2n	IITSEL	All 0	R/W	This bit is used to select IRQn interrupt detection method. 00: Low-level detection. 01: Falling-edge detection. 10: Rising-edge detection. 11: Falling/Rising-edge detection.

Note: n = 15 to 0

4.6.1.5.5 TINT Status Control Register (TSCR) [IA55/IM33]

This register shows TINT status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSTAT 31	TSTAT 30	TSTAT 29	TSTAT 28	TSTAT 27	TSTAT 26	TSTAT 25	TSTAT 24	TSTAT 23	TSTAT 22	TSTAT 21	TSTAT 20	TSTAT 19	TSTAT 18	TSTAT 17	TSTAT 16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSTAT 15	TSTAT 14	TSTAT 13	TSTAT 12	TSTAT 11	TSTAT 10	TSTAT9	TSTAT8	TSTAT7	TSTAT6	TSTAT5	TSTAT4	TSTAT3	TSTAT2	TSTAT1	TSTAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
n	TSTATn	All 0	R/W	This bit indicates TINTn interrupt status. When the interrupt detection method is set to edge type detection in TITSR0/1, TINTn interrupt status can be cleared writing 0 in case TSTATn is 1. [Read operation] 0: TINTn interrupt is not detected. 1: TINTn interrupt is detected. [Write operation] When “Rising-edge detection” or “Falling-edge detection” is set in TITSR0/1: • In case TSTAT is 1 0: TINTn interrupt detection status is cleared. 1: Invalid to write. • In case TSTAT is 0 Invalid to write. When “Low-level detection” or ”High-Level detection” is set in TITSR0/1: Invalid to write.

Note: n = 31 to 0

4.6.1.5.6 TINT Interrupt Type Selection Register0 (TITSR0) [IA55/IM33]

This register selects detecting method of TINT15 to TINT0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TITSEL15		TITSEL14		TITSEL13		TITSEL12		TITSEL11		TITSEL10		TITSEL9		TITSEL8

	TITSEL23		TITSEL22		TITSEL21		TITSEL20		TITSEL19		TITSEL18		TITSEL17		TITSEL16	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
2n+1 to 2n	TITSEL n+16	All 0	R/W	This bit is used to select TINTn+16 interrupt detection method. 00: Rising-edge detection. 01: Falling-edge detection. 10: High-level detection. 11: Low-level detection.

Note: n = 15 to 0

4.6.1.5.8 TINT Interrupt Input Select Register (INTTSEL) [IA55/IM33]

(1) For IA55

This register selects the TINTn and IRQ.

Refer to **Table 4.6-5** for selection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TINTSEL31	TINTSEL30	TINTSEL29	TINTSEL28	TINTSEL27	TINTSEL26	TINTSEL25	TINTSEL24	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
n	TINTSELn	All 0	R/W	This bit selects TINTn and IRQ. 0: TINTn 1: IRQ
23 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Note: n = 31 to 24

Table 4.6-5 Selection of TINT and IRQ8-15 by the INTTEL Register for IA55

	TINTSEL* = 0		TINTSEL* = 1		
INTTSEL Register	Interrupt Source	Cause of Interrupt	Interrupt Source	Cause of Interrupt	IRQ No.
TINTSEL24	GPIO Interrupt	TINT24	IRQ pin	IRQ8	529
TINTSEL25		TINT25		IRQ9	530
TINTSEL26		TINT26		IRQ10	531
TINTSEL27		TINT27		IRQ11	532
TINTSEL28		TINT28		IRQ12	533
TINTSEL29		TINT29		IRQ13	534
TINTSEL30		TINT30		IRQ14	535
TINTSEL31		TINT31		IRQ15	536

(2) For IM33

This register selects the TINTn, IRQ, pmu_int (GIC), CA55 interrupts.

Refer to **Table 4.6-6** for selection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TINTSEL31	TINTSEL30	TINTSEL29	TINTSEL28	TINTSEL27	TINTSEL26	TINTSEL25	TINTSEL24	TINTSEL23	TINTSEL22	TINTSEL21	TINTSEL20	TINTSEL19	TINTSEL18	TINTSEL17	TINTSEL16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TINTSEL15	TINTSEL14	TINTSEL13	TINTSEL12	TINTSEL11	TINTSEL10	TINTSEL9	TINTSEL8	TINTSEL7	TINTSEL6	TINTSEL5	TINTSEL4	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
n	TINTSELn	All 0	R/W	This bit selects TINTn and IRQ, pmu_int (GIC), CA55 interrupts 0: TINTn 1: IRQ, pmu_int (GIC), CA55 interrupts
3 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Note: n = 31 to 4

Table 4.6-6 Selection of TINT and CA55, GIC IRQ8-15 by the INTTEL Register for IM33

	TINTSEL* = 0		TINTSEL* = 1

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8n+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8n+6 to 8n	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1110000: TINTn = GPIOINT112 1110001: Cannot be set. ~ 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 3 to 0

4.6.1.5.10 TINT Source Selection Register1 (TSSR1) [IA55/IM33]

This register selects the interrupt source of TINT7 to TINT4.

Refer to **4.6.1.6.3 GPIO Interrupt (TINT)** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN7	TSSEL7							TIEN6	TSSEL6

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-4)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-4)+6 to 8(n-4)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1110000: TINTn = GPIOINT112 1110001: Cannot be set. ~ 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 7 to 4

4.6.1.5.11 TINT Source Selection Register2 (TSSR2) [IA55/IM33]

This register selects the interrupt source of TINT11 to TINT8.

Refer to **4.6.1.6.3 GPIO Interrupt (TINT)** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN11	TSSEL11							TIEN10	TSSEL10

	TIEN9	TSSEL9							TIEN8	TSSEL8						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-8)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-8)+6 to 8(n-8)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1110000: TINTn = GPIOINT112 1110001: Cannot be set. ~ 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 11 to 8

4.6.1.5.12 TINT Source Selection Register3 (TSSR3) [IA55/IM33]

This register selects the interrupt source of TINT15 to TINT12.

Refer to **4.6.1.6.3 GPIO Interrupt (TINT)** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN15	TSSEL15							TIEN14	TSSEL14						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN13	TSSEL13							TIEN12	TSSEL12						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-12)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-12)+6 to 8(n-12)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1110000: TINTn = GPIOINT112 1110001: Cannot be set. ~ 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 15 to 12

4.6.1.5.13 TINT Source Selection Register4 (TSSR4) [IA55/IM33]

This register selects the interrupt source of TINT19 to TINT16.

Refer to **4.6.1.6.3 GPIO Interrupt (TINT)** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN19	TSSEL19							TIEN18	TSSEL18						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN17	TSSEL17							TIEN16	TSSEL16						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-16)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-16)+6 to 8(n-16)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1110000: TINTn = GPIOINT112 1110001: Cannot be set. ~ 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 19 to 16

4.6.1.5.14 TINT Source Selection Register5 (TSSR5) [IA55/IM33]

This register selects the interrupt source of TINT23 to TINT20.

Refer to **4.6.1.6.3 GPIO Interrupt (TINT)** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN23	TSSEL23							TIEN22	TSSEL22

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN21	TSSEL21							TIEN20	TSSEL20						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-20)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-20)+6 to 8(n-20)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1110000: TINTn = GPIOINT112 1110001: Cannot be set. ~ 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 23 to 20

4.6.1.5.15 TINT Source Selection Register6 (TSSR6) [IA55/IM33]

This register selects the interrupt source of TINT27 to TINT24.

Refer to **4.6.1.6.3 GPIO Interrupt (TINT)** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
8(n-24)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-24)+6 to 8(n-24)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1110000: TINTn = GPIOINT112 1110001: Cannot be set. ~ 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 27 to 24

4.6.1.5.16 TINT Source Selection Register7 (TSSR7) [IA55/IM33]

This register selects the interrupt source of TINT31 to TINT28.

Refer to **4.6.1.6.3 GPIO Interrupt (TINT)** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN31	TSSEL31							TIEN30	TSSEL30

Bit	Bit Name	Initial Value	R/W	Description
8(n-28)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-28)+6 to 8(n-28)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1110000: TINTn = GPIOINT112 1110001: Cannot be set. ~ 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 31 to 28

4.6.1.5.17 Bus Error Interrupt Status Control Register0 (BEISR0) [IA55/IM33]

This register shows Bus error status.

Refer to LSI Internal Bus section and **4.6.1.6.4 (1) Bus Error Interrupt** for bus error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BESTAT31	BESTAT30	BESTAT29	BESTAT28	BESTAT27	BESTAT26	BESTAT25	BESTAT24	BESTAT23	BESTAT22	BESTAT21	BESTAT20	BESTAT19	BESTAT18	BESTAT17	BESTAT16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BESTAT15	BESTAT14	BESTAT13	BESTAT12	BESTAT11	BESTAT10	BESTAT9	BESTAT8	BESTAT7	BESTAT6	BESTAT5	BESTAT4	BESTAT3	BESTAT2	BESTAT1	BESTAT0

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n-32	BESTATn	All 0	R/W	This bit indicates BUSERR_INTn interrupt status. BUSERR_INTn interrupt status can be cleared writing 0 in case BESTAT is 1. [Read operation] 0: BUSERR_INTn is not detected. 1: BUSERR_INTn is detected. [Write operation] • In case BESTATn is 1 0: BUSERR_INTn interrupt status is cleared. 1: Invalid to write. • In case BESTATn is 0 Invalid to write.

Note: n = 46 to 32

4.6.1.5.19 ECCRAM Error Interrupt Status Control Register0 (EREISR0) [IA55/IM33]

This register shows ECC 1bit Error status of ECCRAMA0.

Refer to **4.6.1.6.4 (2) ECCRAM Error Interrupt** for ECCRAM error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	A01ESTATn	All 0	R/W	This bit indicates ECCRAMA0_1En interrupt status. ECCRAMA0_1En interrupt status can be cleared writing 0 in case A01ESTATn is 1. [Read operation] 0: ECCRAMA0_1En is not detected. 1: ECCRAMA0_1En is detected. [Write operation] • In case A01ESTATn is 1 0: ECCRAMA0_1En interrupt status is cleared. 1: Invalid to write. • In case A01ESTATn is 0 Invalid to write.

Note: n = 7 to 0

4.6.1.5.20 ECCRAM Error Interrupt Status Control Register1 (EREISR1) [IA55/IM33]

This register shows ECC 1bit Error status of ECCRAMM0.

Refer to **4.6.1.6.4 (2) ECCRAM Error Interrupt** for ECCRAM error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	M01ESTATn	All 0	R/W	This bit indicates ECCRAMM0_1En interrupt status. ECCRAMM0_1En interrupt status can be cleared writing 0 in case M01ESTATn is 1. [Read operation] 0: ECCRAMM0_1En is not detected. 1: ECCRAMM0_1En is detected. [Write operation] • In case M01ESTATn is 1 0: ECCRAMM0_1En interrupt status is cleared. 1: Invalid to write. • In case M01ESTATn is 0 Invalid to write.

Note: n = 7 to 0

4.6.1.5.21 ECCRAM Error Interrupt Status Control Register2 (EREISR2) [IA55/IM33]

This register shows ECC 2bit Error status of ECCRAMA0.

Refer to **4.6.1.6.4 (2) ECCRAM Error Interrupt** for ECCRAM error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	A02ESTATn	All 0	R/W	This bit indicates ECCRAMA0_2En interrupt status. ECCRAMA0_2En interrupt status can be cleared writing 0 in case A02ESTATn is 1. [Read operation] 0: ECCRAMA0_2En is not detected. 1: ECCRAMA0_2En is detected. [Write operation] • In case A02ESTATn is 1 0: ECCRAMA0_2En interrupt status is cleared. 1: Invalid to write. • In case A02ESTATn is 0 Invalid to write.

Note: n = 7 to 0

4.6.1.5.22 ECCRAM Error Interrupt Status Control Register3 (EREISR3) [IA55/IM33]

This register shows ECC 2bit Error status of ECCRAMM0.

Refer to **4.6.1.6.4 (2) ECCRAM Error Interrupt** for ECCRAM error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	M02ESTATn	All 0	R/W	This bit indicates ECCRAMM0_2En interrupt status. ECCRAMM0_2En interrupt status can be cleared writing 0 in case M02ESTATn is 1. [Read operation] 0: ECCRAMM0_2En is not detected. 1: ECCRAMM0_2En is detected. [Write operation] • In case M02ESTATn is 1 0: ECCRAMM0_2En interrupt status is cleared. 1: Invalid to write. • In case M02ESTATn is 0 Invalid to write.

Note: n = 7 to 0

4.6.1.5.23 ECCRAM Error Interrupt Status Control Register4 (EREISR4) [IA55/IM33]

This register shows ECC Overflow Error status of ECCRAMA0.

Refer to **4.6.1.6.4 (2) ECCRAM Error Interrupt** for ECCRAM error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	A0OFSTATn	All 0	R/W	This bit indicates ECCRAMA0_OFn interrupt status. ECCRAMA0_OFn interrupt status can be cleared writing 0 in case A0OFSTATn is 1. [Read operation] 0: ECCRAMA0_OFn is not detected. 1: ECCRAMA0_OFn is detected. [Write operation] • In case A0OFSTATn is 1 0: ECCRAMA0_OFn interrupt status is cleared. 1: Invalid to write. • In case A0OFSTATn is 0 Invalid to write.

Note: n = 7 to 0

4.6.1.5.24 ECCRAM Error Interrupt Status Control Register5 (EREISR5) [IA55/IM33]

This register shows ECC Overflow Error status of ECCRAMM0.

Refer to **4.6.1.6.4 (2) ECCRAM Error Interrupt** for ECCRAM error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	M0OFSTATn	All 0	R/W	This bit indicates ECCRAMM0_OFn interrupt status. ECCRAMM0_OFn interrupt status can be cleared writing 0 in case M0OFSTATn is 1. [Read operation] 0: ECCRAMM0_OFn is not detected. 1: ECCRAMM0_OFn is detected. [Write operation] • In case M0OFSTATn is 1 0: ECCRAMM0_OFn interrupt status is cleared. 1: Invalid to write. • In case M0OFSTATn is 0 Invalid to write.

Note: n = 7 to 0

4.6.1.5.25 Interrupt Selection (GPT/MTU3a) Register0 (INTPMSEL0) [IA55/IM33]

This register selects the GPT interrupts and MTU3a interrupts.

Refer to **4.6.1.6.5 GPT/MTU3a Interrupt Selection** for the interrupt mapping.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMINTSEL31	PMINTSEL30	PMINTSEL29	PMINTSEL28	PMINTSEL27	PMINTSEL26	PMINTSEL25	PMINTSEL24	PMINTSEL23	PMINTSEL22	PMINTSEL21	PMINTSEL20	PMINTSEL19	PMINTSEL18	PMINTSEL17	PMINTSEL16

Bit	Bit Name	Initial Value	R/W	Description
n+24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n+16	PEUSTATn	All 0	R/W	This bit indicates gpt_gtciu_n[n] interrupt status. gpt_gtciu_n[n] interrupt status can be cleared writing 0 in case PEUSTATn is 1. [Read operation] 0: gpt_gtciu_n[n] is not detected. 1: gpt_gtciu_n[n] is detected. [Write operation] • In case PEUSTATn is 1 0: gpt_gtciu_n[n] interrupt status is cleared. 1: Invalid to write. • In case PEUSTATn is 0 Invalid to write.
n+8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	PEVSTATn	All 0	R/W	This bit indicates gpt_gtciv_n[n] interrupt status. gpt_gtciv_n[n] interrupt status can be cleared writing 0 in case PEVSTATn is 1. [Read operation] 0: gpt_gtciv_n[n] is not detected. 1: gpt_gtciv_n[n] is detected. [Write operation] • In case PEVSTATn is 1 0: gpt_gtciv_n[n] interrupt status is cleared. 1: Invalid to write. • In case PEVSTATn is 0 Invalid to write.

Note: n =7 to 0

4.6.1.5.28 MHU CORE0 Interrupt Status Control Register (MISR0) [IA55 Only]

This register shows MHU interrupts for Cortex-A55 core0.

Refer to **4.6.1.6.4 (4) MHU Interrupt for IA55** for MHU interrupts cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 25	MRSSTATm	All 0	R/W	This bit indicates rsp_chm_s interrupt status. msg_chm_s interrupt status can be cleared writing 0 in case MRSSTATm is 1. [Read operation] 0: rsp_chm_s is not detected. 1: rsp_chm_s is detected. [Write operation] • In case MRSSTATm is 1 0: rsp_chn_s interrupt status is cleared. 1: Invalid to write. • In case MRSSTATm is 0 Invalid to write.
24 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 17	MMSSTATn	All 0	R/W	This bit indicates msg_chn_s interrupt status. msg_chn_s interrupt status can be cleared writing 0 in case MMSSTATn is 1. [Read operation] 0: msg_chn_s is not detected. 1: msg_chn_s is detected. [Write operation] • In case MMSSTATn is 1 0: msg_chn_s interrupt status is cleared. 1: Invalid to write. • In case MMSSTATn is 0 Invalid to write.
16 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
12 to 9	MRNSSTATm	All 0	R/W	This bit indicates rsp_chm_ns interrupt status. msg_chm_ns interrupt status can be cleared writing 0 in case MRNSSTATm is 1. [Read operation] 0: rsp_chm_ns is not detected. 1: rsp_chm_ns is detected. [Write operation] • In case MRNSSTATm is 1 0: rsp_chn_ns interrupt status is cleared. 1: Invalid to write. • In case MRNSSTATm is 0 Invalid to write.
8 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 1	MMNSSTATn	All 0	R/W	This bit indicates msg_chn_ns interrupt status. msg_chn_ns interrupt status can be cleared writing 0 in case MMNSSTATn is 1. [Read operation] 0: msg_chn_ns is not detected. 1: msg_chn_ns is detected. [Write operation] • In case MMNSSTATn is 1 0: msg_chn_ns interrupt status is cleared. 1: Invalid to write. • In case MMNSSTATn is 0 Invalid to write.
0	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Note: n = 4, 8, 12, 16
m = 0 to 3

4.6.1.5.29 MHU CORE1 Interrupt Status Control Register (MISR1) [IA55 Only]

This register shows MHU interrupts for Cortex-A55 core1.

Refer to **4.6.1.6.4 (4) MHU Interrupt for IA55** for MHU interrupts cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R/W	R/W	R/W	R	R/W	R	R	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 26, 24	MRSSTATm	All 0	R/W	This bit indicates rsp_chm_s interrupt status. msg_chm_s interrupt status can be cleared writing 0 in case MRSSTATm is 1. [Read operation] 0: rsp_chm_s is not detected. 1: rsp_chm_s is detected. [Write operation] • In case MRSSTATm is 1 0: rsp_chn_s interrupt status is cleared. 1: Invalid to write. • In case MRSSTATm is 0 Invalid to write.
23 to 21, 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 18, 16	MMSSTATn	All 0	R/W	This bit indicates msg_chn_s interrupt status. msg_chn_s interrupt status can be cleared writing 0 in case MMSSTATn is 1. [Read operation] 0: msg_chn_s is not detected. 1: msg_chn_s is detected. [Write operation] • In case MMSSTATn is 1 0: msg_chn_s interrupt status is cleared. 1: Invalid to write. • In case MMSSTATn is 0 Invalid to write.
15 to 13, 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
12 to 10, 8	MRNSSTATm	All 0	R/W	This bit indicates rsp_chm_ns interrupt status. msg_chm_ns interrupt status can be cleared writing 0 in case MRNSSTATm is 1. [Read operation] 0: rsp_chm_ns is not detected. 1: rsp_chm_ns is detected. [Write operation] • In case MRNSSTATm is 1 0: rsp_chn_ns interrupt status is cleared. 1: Invalid to write. • In case MRNSSTATm is 0 Invalid to write.
7 to 5, 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 2, 0	MMNSSTATn	All 0	R/W	This bit indicates msg_chn_ns interrupt status. msg_chn_ns interrupt status can be cleared writing 0 in case MMNSSTATn is 1. [Read operation] 0: msg_chn_ns is not detected. 1: msg_chn_ns is detected. [Write operation] • In case MMNSSTATn is 1 0: msg_chn_ns interrupt status is cleared. 1: Invalid to write. • In case MMNSSTATn is 0 Invalid to write.

Note: n = 0, 9, 13, 17
m = 4 to 7

4.6.1.5.30 MHU CORE2 Interrupt Status Control Register (MISR2) [IA55 Only]

This register shows MHU interrupts for Cortex-A55 core2.

Refer to **4.6.1.6.4 (4) MHU Interrupt for IA55** for MHU interrupts cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R/W	R	R/W	R/W	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28, 26 to 24	MRSSTATm	All 0	R/W	This bit indicates rsp_chm_s interrupt status. msg_chm_s interrupt status can be cleared writing 0 in case MRSSTATm is 1. [Read operation] 0: rsp_chm_s is not detected. 1: rsp_chm_s is detected. [Write operation] • In case MRSSTATm is 1 0: rsp_chn_s interrupt status is cleared. 1: Invalid to write. • In case MRSSTATm is 0 Invalid to write.
23 to 21, 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20, 18 to 16	MMSSTATn	All 0	R/W	This bit indicates msg_chn_s interrupt status. msg_chn_s interrupt status can be cleared writing 0 in case MMSSTATn is 1. [Read operation] 0: msg_chn_s is not detected. 1: msg_chn_s is detected. [Write operation] • In case MMSSTATn is 1 0: msg_chn_s interrupt status is cleared. 1: Invalid to write. • In case MMSSTATn is 0 Invalid to write.
15 to 13, 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
12, 10 to 8	MRNSSTATm	All 0	R/W	This bit indicates rsp_chm_ns interrupt status. msg_chm_ns interrupt status can be cleared writing 0 in case MRNSSTATm is 1. [Read operation] 0: rsp_chm_ns is not detected. 1: rsp_chm_ns is detected. [Write operation] • In case MRNSSTATm is 1 0: rsp_chn_ns interrupt status is cleared. 1: Invalid to write. • In case MRNSSTATm is 0 Invalid to write.
7 to 5, 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4, 2 to 0	MMNSSTATn	All 0	R/W	This bit indicates msg_chn_ns interrupt status. msg_chn_ns interrupt status can be cleared writing 0 in case MMNSSTATn is 1. [Read operation] 0: msg_chn_ns is not detected. 1: msg_chn_ns is detected. [Write operation] • In case MMNSSTATn is 1 0: msg_chn_ns interrupt status is cleared. 1: Invalid to write. • In case MMNSSTATn is 0 Invalid to write.

Note: n = 2, 6, 10, 19
m = 12 to 15

4.6.1.5.32 MHU CM33 Interrupt Status Control Register (MISR4) [IM33 Only]

This register shows MHU interrupts for Cortex-M33.

Refer to **4.6.1.6.4 (5) MHU Interrupt for IM33** for MHU interrupts cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	MRSSTAT19	MRSSTAT18	MRSSTAT17	MRSSTAT16	—	—	—	—	MMSSTAT15	MMSSTAT11	MMSSTAT7	MMSSTAT3

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	MRSSTATm	All 0	R/W	This bit indicates rsp_chm_s interrupt status. msg_chm_s interrupt status can be cleared writing 0 in case MRSSTATm is 1. [Read operation] 0: rsp_chm_s is not detected. 1: rsp_chm_s is detected. [Write operation] • In case MRSSTATm is 1 0: rsp_chn_s interrupt status is cleared. 1: Invalid to write. • In case MRSSTATm is 0 Invalid to write.
23 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	MMSSTATn	All 0	R/W	This bit indicates msg_chn_s interrupt status. msg_chn_s interrupt status can be cleared writing 0 in case MMSSTATn is 1. [Read operation] 0: msg_chn_s is not detected. 1: msg_chn_s is detected. [Write operation] • In case MMSSTATn is 1 0: msg_chn_s interrupt status is cleared. 1: Invalid to write. • In case MMSSTATn is 0 Invalid to write.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	MRNSSTATm	All 0	R/W	This bit indicates rsp_chm_ns interrupt status. msg_chm_ns interrupt status can be cleared writing 0 in case MRNSSTATm is 1. [Read operation] 0: rsp_chm_ns is not detected. 1: rsp_chm_ns is detected. [Write operation] • In case MRNSSTATm is 1 0: rsp_chn_ns interrupt status is cleared. 1: Invalid to write. • In case MRNSSTATm is 0 Invalid to write.
7 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	MMNSSTATn	All 0	R/W	This bit indicates msg_chn_ns interrupt status. msg_chn_ns interrupt status can be cleared writing 0 in case MMNSSTATn is 1. [Read operation] 0: msg_chn_ns is not detected. 1: msg_chn_ns is detected. [Write operation] • In case MMNSSTATn is 1 0: msg_chn_ns interrupt status is cleared. 1: Invalid to write. • In case MMNSSTATn is 0 Invalid to write.

Note: n = 3, 7, 11, 15
m = 16 to 19

4.6.1.5.33 Software Interrupt Status Control Register (SWISR) [IM33 Only]

This register shows MHU software interrupts for Cortex-M33.

Refer to **4.6.1.6.4 (6) Software Interrupt for IM33** for MHU interrupts cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	SWSTAT3	SWSTAT2	SWSTAT1	SWSTAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	SWSTATn	All 0	R/W	This bit indicates swint_chn_s interrupt status. swint_chn_s interrupt status can be cleared writing 0 in case SWTATn is 1. [Read operation] 0: swint_chn_s is not detected. 1: swint_chn_s is detected. [Write operation] • In case SWSTATn is 1 0: swint_chn_s interrupt status is cleared. 1: Invalid to write. • In case SWSTATn is 0 Invalid to write.

Note: n = 0 to 3

4.6.1.6 Operation

4.6.1.6.1 NMI Interrupt

NMI interrupt is the highest priority interrupt by default even though it can be masked.

NMI is not treated as NMI exception.

[Setting]

- A noise filter function of NMI pin can be enabled by GPIO register setting.
  Refer to **4.2.4.1 Operation for GPIO Function** for detail.
- NMI pin input is detected by edge. A detection method is set by NTSEL bit of NMI Interrupt Type Selection Register (NITSR) in IA55/IM33. It can be selected “Rising-edge detection” or “Falling-edge detection”.

[Status Control]

- NMI interrupt request can be confirmed by reading NSTAT bit of NMI Status Control Register (NSCR) in IA55/IM33.
  The interrupt request can be cleared by writing 0 to NSTAT bit.
- A signal level (High or Low) of NMI pin can be confirmed by reading NSMON bit of NMI Status Control Register (NSCR) in IA55/IM33.

4.6.1.6.2 IRQ Interrupt

IRQ interrupt is the interrupt from IRQ0-15 input pins.

[Setting]

- Using IRQ pins as interrupt must be mapped GPIO pins onto IRQ pins by GPIO register setting.
  Refer to **4.2.4.2 Operation for Peripheral Function** for detail.
- A noise filter function of IRQ pins can be enabled by GPIO register setting.
  Refer to **4.2.4.1 Operation for GPIO Function** for detail.
- IRQ pin inputs are detected by a level or an edge. A detection method is set by ITSEL bit of IRQ Interrupt Type Selection Register (IITSR) in IA55/IM33. It can be selected “Low-level detection”, “Falling-edge detection”, “Rising-edge detection” or “Falling/Rising-edge detection”.
- INTTSEL register should be set when using IRQ8 to IRQ15.

[Status Control]

- IRQ interrupt requests can be confirmed by reading ISTATn bit of IRQ Status Control Register (ISCR) in IA55/IM33
- In case selected a level detection in IITSR, the interrupt requests are cleared when the interrupt sources de-assert the interrupts.
- In case selected an edge detection in IITSR, the interrupt requests can be cleared by writing 0 to ISTATn bit.

4.6.1.6.3 GPIO Interrupt (TINT)

GPIO interrupt is the interrupt using GPIO pins as external interrupt input pins.

[Setting]

- When using GPIO pins as interrupts, assign GPIO pins as external interrupt input pins (GPIOINT0-112) by GPIO register setting.
  - Refer to **4.2.4.1 Operation for GPIO Function** for details.
  - Refer to **Table 4.6-7** for mapping GPIO pins onto GPIOINT0-112.
- The noise filter function of GPIO pins assigned to TINT can be enabled by GPIO register setting.
  - Refer to **4.2.4.1 Operation for GPIO Function** for details.
- Assign any 32 interrupt sources to TINT from GPIOINT0-112 by TINT Source Selection Register (TSSR0-7) in IA55/IM33.

  Note: Even if the TINT is assigned by TSSR0-7, no interrupt request is generated unless it is assigned to an external pin interrupt by GPIO registers.
- TINT inputs are detected by a level or an edge. A detection method is set by TTSEL bit of TINT Interrupt Type Selection Register (TITSR0/1) in IA55/IM33. It can be selected “Rising-edge detection”, “Falling-edge detection”, “High-level detection” or “Low-level detection”.

[Status Control]

- TINT interrupt requests can be confirmed by reading TSTATn bit of TINT Status Control Register (TSCR) in IA55/IM33.
- In case selected a level detection in TITSR0/1, the interrupt requests are cleared when the interrupt sources de-assert the interrupts.
- In case selected an edge detection in TITSR0/1, the interrupt requests can be cleared by writing 0 to TSTATn bit.

Table 4.6-7 GPIOINT Mapping

4.6.1.6.4 Internal Interrupt

(1) Bus Error Interrupt

Bus error interrupts (BUSERR_INT0-57) generated by system bus are integrated into one interrupt (BUS_ERR_INT) by IA55/IM33 and the integrated interrupt is notified to CPU.

[Status Control]

- Bus error interrupt requests can be confirmed by reading BUS Error Interrupt Status Control Register (BEISR0/1) in IA55/IM33.
  - Refer to **Table 4.6-8** and **Table 4.6-9** for mapping BESTAT0-57 onto bus error interrupt causes.
- The interrupt requests can be cleared by writing 0 to BESTAT0-57 bit.

Table 4.6-8 BEISR0 Bus Error Mapping

BEISR0	Interrupt	Description
BESTAT0	BUSERR_INT0	BUS Write Error Interrupt for CA55 (ACE)
BESTAT1	BUSERR_INT1	BUS Read Error Interrupt for CA55 (ACE)
BESTAT2	BUSERR_INT2	BUS Write Error Interrupt for CA55 (PP)
BESTAT3	BUSERR_INT3	BUS Read Error Interrupt for CA55 (PP)
BESTAT4	BUSERR_INT4	TZC-400 Interrupt (TZC_SRAM_ACPU_INT)

BESTAT53	BUSERR_INT53	BUS Read Error Interrupt for DSI
BESTAT54	BUSERR_INT54	BUS Write Error Interrupt for LCDC
BESTAT55	BUSERR_INT55	BUS Read Error Interrupt for LCDC
BESTAT56	BUSERR_INT56	BUS Write Error Interrupt for GE3D
BESTAT57	BUSERR_INT57	BUS Read Error Interrupt for GE3D

(2) ECCRAM Error Interrupt

ECCRAM error interrupts generated by On-Chip RAM (ECCRAMA0, ECCRAMM0) are integrated with IA55/IM33 for each interrupt cause and notified to the CPU.

Each On-Chip RAM outputs eight 1-bit ECC error interrupts, eight 2-bit ECC error interrupts and eight overflow error interrupts. These interrupts are integrated per interrupt cause.

- Integrated 1bit error interrupt: EC7TIE1
- Integrated 2bit error interrupt: EC7TIE2
- Integrated overflow error interrupt: EC7TIOVF

[Status Control]

- ECCRAM error interrupt requests can be confirmed by reading ECCRAM Error Interrupt Status Control Register (EREISR0 to EREISR7) in IA55/IM33.
  - Refer to **Table 4.6-10** for mapping A01ESTAT0-7 and M01ESTAT0-7 onto ECCRAM error interrupt causes.
  - Refer to **Table 4.6-11** for mapping A02ESTAT0-7 and M02E2STAT0-7 onto ECCRAM error interrupt causes.
  - Refer to **Table 4.6-12** for mapping A0OFSTAT0-7 and M0OFSTAT0-7 onto ECCRAM error interrupt causes.
- The interrupt requests can be cleared by writing 0 to corresponding bit of the EREISR0 to EREISR7.

Table 4.6-10 ECC 1bit Error Mapping

Register Name	Register Status Bit	Interrupt	Description	Integrated Interrupt
EREISR0	A01ESTAT0	ECCRAMA0_1E0	ECC 1bit Error interrupt bit[31:0]	EC7TIE1
	A01ESTAT1	ECCRAMA0_1E1	ECC 1bit Error interrupt bit[63:32]	
	A01ESTAT2	ECCRAMA0_1E2	ECC 1bit Error interrupt bit[95:64]	
	A01ESTAT3	ECCRAMA0_1E3	ECC 1bit Error interrupt bit[127:96]	
	A01ESTAT4	ECCRAMA0_1E4	ECC 1bit Error interrupt bit[159:128]	
	A01ESTAT5	ECCRAMA0_1E5	ECC 1bit Error interrupt bit[191:160]	
	A01ESTAT6	ECCRAMA0_1E6	ECC 1bit Error interrupt bit[223:192]	
	A01ESTAT7	ECCRAMA0_1E7	ECC 1bit Error interrupt bit[255:224]	
EREISR1	M01ESTAT0	ECCRAMM0_1E0	ECC 1bit Error interrupt bit[31:0]	
	M01ESTAT1	ECCRAMM0_1E1	ECC 1bit Error interrupt bit[63:32]	
	M01ESTAT2	ECCRAMM0_1E2	ECC 1bit Error interrupt bit[95:64]	
	M01ESTAT3	ECCRAMM0_1E3	ECC 1bit Error interrupt bit[127:96]	
	M01ESTAT4	ECCRAMM0_1E4	ECC 1bit Error interrupt bit[159:128]	
	M01ESTAT5	ECCRAMM0_1E5	ECC 1bit Error interrupt bit[191:160]	
	M01ESTAT6	ECCRAMM0_1E6	ECC 1bit Error interrupt bit[223:192]	
	M01ESTAT7	ECCRAMM0_1E7	ECC 1bit Error interrupt bit[255:224]	

Table 4.6-11 ECC 2bit Error Mapping

Register Name	Register Status Bit	Interrupt	Description	Integrated Interrupt
EREISR2	A02ESTAT0	ECCRAMA0_2E0	ECC 2bit Error interrupt bit[31:0]	EC7TIE2
	A02ESTAT1	ECCRAMA0_2E1	ECC 2bit Error interrupt bit[63:32]	
	A02ESTAT2	ECCRAMA0_2E2	ECC 2bit Error interrupt bit[95:64]	
	A02ESTAT3	ECCRAMA0_2E3	ECC 2bit Error interrupt bit[127:96]	
	A02ESTAT4	ECCRAMA0_2E4	ECC 2bit Error interrupt bit[159:128]	
	A02ESTAT5	ECCRAMA0_2E5	ECC 2bit Error interrupt bit[191:160]	
	A02ESTAT6	ECCRAMA0_2E6	ECC 2bit Error interrupt bit[223:192]	
	A02ESTAT7	ECCRAMA0_2E7	ECC 2bit Error interrupt bit[255:224]	
EREISR3	M02ESTAT0	ECCRAMM0_2E0	ECC 2bit Error interrupt bit[31:0]	
	M02ESTAT1	ECCRAMM0_2E1	ECC 2bit Error interrupt bit[63:32]	
	M02ESTAT2	ECCRAMM0_2E2	ECC 2bit Error interrupt bit[95:64]	
	M02ESTAT3	ECCRAMM0_2E3	ECC 2bit Error interrupt bit[127:96]	
	M02ESTAT4	ECCRAMM0_2E4	ECC 2bit Error interrupt bit[159:128]	
	M02ESTAT5	ECCRAMM0_2E5	ECC 2bit Error interrupt bit[191:160]	
	M02ESTAT6	ECCRAMM0_2E6	ECC 2bit Error interrupt bit[223:192]	
	M02ESTAT7	ECCRAMM0_2E7	ECC 2bit Error interrupt bit[255:224]	

Table 4.6-12 ECC Overflow Error Mapping

Register Name	Register Status Bit	Interrupt	Description	Integrated Interrupt
EREISR4	A0OFSTAT0	ECCRAMA0_OF0	ECC Overflow Error interrupt bit[31:0]	EC7TIOVF
	A0OFSTAT1	ECCRAMA0_OF1	ECC Overflow Error interrupt bit[63:32]	
	A0OFSTAT2	ECCRAMA0_OF2	ECC Overflow Error interrupt bit[95:64]	
	A0OFSTAT3	ECCRAMA0_OF3	ECC Overflow Error interrupt bit[127:96]	
	A0OFSTAT4	ECCRAMA0_OF4	ECC Overflow Error interrupt bit[159:128]	
	A0OFSTAT5	ECCRAMA0_OF5	ECC Overflow Error interrupt bit[191:160]	
	A0OFSTAT6	ECCRAMA0_OF6	ECC Overflow Error interrupt bit[223:192]	
	A0OFSTAT7	ECCRAMA0_OF7	ECC Overflow Error interrupt bit[255:224]	
EREISR5	M0OFSTAT0	ECCRAMM0_OF0	ECC Overflow Error interrupt bit[31:0]	
	M0OFSTAT1	ECCRAMM0_OF1	ECC Overflow Error interrupt bit[63:32]	
	M0OFSTAT2	ECCRAMM0_OF2	ECC Overflow Error interrupt bit[95:64]	
	M0OFSTAT3	ECCRAMM0_OF3	ECC Overflow Error interrupt bit[127:96]	
	M0OFSTAT4	ECCRAMM0_OF4	ECC Overflow Error interrupt bit[159:128]	
	M0OFSTAT5	ECCRAMM0_OF5	ECC Overflow Error interrupt bit[191:160]	
	M0OFSTAT6	ECCRAMM0_OF6	ECC Overflow Error interrupt bit[223:192]	
	M0OFSTAT7	ECCRAMM0_OF7	ECC Overflow Error interrupt bit[255:224]	

(3) GPT Error Interrupts

GPT Error interrupts generated by GPT are integrated for each interrupt cause and notified to the CPU.

GPT outputs counter overflow and underflow interrupts per channel. These interrupts are integrated into 1 interrupt per channel as follows.

- Integrated GPT Error interrupt for channel 0: OVFUNF0
- Integrated GPT Error interrupt for channel 1: OVFUNF1
- Integrated GPT Error interrupt for channel 2: OVFUNF2
- Integrated GPT Error interrupt for channel 3: OVFUNF3
- Integrated GPT Error interrupt for channel 4: OVFUNF4
- Integrated GPT Error interrupt for channel 5: OVFUNF5
- Integrated GPT Error interrupt for channel 6: OVFUNF6
- Integrated GPT Error interrupt for channel 7: OVFUNF7

[Status Control]

- GPT Error interrupt requests can be confirmed by reading GPT Error Interrupt Status Control Register (PEISR).
  - Refer to **Table 4.6-13** for mapping PEISR register bit onto GPT Error interrupt causes.
- The interrupt requests can be cleared by writing 0 to corresponding bit of the PEISR.

Table 4.6-13 GPT Error Interrupt Mapping

Register Name	Register Status Bit	Interrupt	Description	Integrated Interrupt
PEISR	PEVSTAT0	gpt_gtciv_n[0]	GPT counter overflow (ch0)	OVFUNF0
	PEUSTAT0	gpt_gtciu_n[0]	GPT counter underflow (ch0)	
	PEVSTAT1	gpt_gtciv_n[1]	GPT counter overflow (ch1)	OVFUNF1
	PEUSTAT1	gpt_gtciu_n[1]	GPT counter underflow (ch1)	
	PEVSTAT2	gpt_gtciv_n[2]	GPT counter overflow (ch2)	OVFUNF2
	PEUSTAT2	gpt_gtciu_n[2]	GPT counter underflow (ch2)	
	PEVSTAT3	gpt_gtciv_n[3]	GPT counter overflow (ch3)	OVFUNF3
	PEUSTAT3	gpt_gtciu_n[3]	GPT counter underflow (ch3)	
	PEVSTAT4	gpt_gtciv_n[4]	GPT counter overflow (ch4)	OVFUNF4
	PEUSTAT4	gpt_gtciu_n[4]	GPT counter underflow (ch4)	
	PEVSTAT5	gpt_gtciv_n[5]	GPT counter overflow (ch5)	OVFUNF5
	PEUSTAT5	gpt_gtciu_n[5]	GPT counter underflow (ch5)	
	PEVSTAT6	gpt_gtciv_n[6]	GPT counter overflow (ch6)	OVFUNF6
	PEUSTAT6	gpt_gtciu_n[6]	GPT counter underflow (ch6)	
	PEVSTAT7	gpt_gtciv_n[7]	GPT counter overflow (ch7)	OVFUNF7
	PEUSTAT7	gpt_gtciu_n[7]	GPT counter underflow (ch7)	

(4) MHU Interrupt for IA55

MHU interrupts for IA55 generated by MHU are integrated for each interrupt cause and notified to the CPU.

MHU outputs 32 message interrupts and 32 response interrupts for IA55. These interrupts are integrated into 16 interrupts as follows.

- Integrated Message interrupt for CA55 core0 (Non-secure): MSG_CA55core0_NS_INT
- Integrated Response interrupt for CA55 core0 (Non-secure): RSP_CA55core0_NS_INT
- Integrated Message interrupt for CA55 core0 (Secure): MSG_CA55core0_S_INT
- Integrated Response interrupt for CA55 core0 (Secure): RSP_CA55core0_S_INT

- Integrated Message interrupt for CA55 core1 (Non-secure): MSG_CA55core1_NS_INT
- Integrated Response interrupt for CA55 core1 (Non-secure): RSP_CA55core1_NS_INT
- Integrated Message interrupt for CA55 core1 (Secure): MSG_CA55core1_S_INT
- Integrated Response interrupt for CA55 core1 (Secure): RSP_CA55core1_S_INT

- Integrated Message interrupt for CA55 core2 (Non-secure): MSG_CA55core2_NS_INT
- Integrated Response interrupt for CA55 core2 (Non-secure): RSP_CA55core2_NS_INT
- Integrated Message interrupt for CA55 core2 (Secure): MSG_CA55core2_S_INT
- Integrated Response interrupt for CA55 core2 (Secure): RSP_CA55core2_S_INT

- Integrated Message interrupt for CA55 core3 (Non-secure): MSG_CA55core3_NS_INT
- Integrated Response interrupt for CA55 core3 (Non-secure): RSP_CA55core3_NS_INT
- Integrated Message interrupt for CA55 core3 (Secure): MSG_CA55core3_S_INT
- Integrated Response interrupt for CA55 core3 (Secure): RSP_CA55core3_S_INT

[Status Control]

- MHU interrupt requests can be confirmed by reading MHU COREn Interrupt Status Control Register (n= 0 to 3) (MISR0 to MISR3) in IA55.
  - Refer to **Table 4.6-14** for mapping MISR0 register bit onto MHU interrupt causes for core0.
  - Refer to **Table 4.6-15** for mapping MISR1 register bit onto MHU interrupt causes for core1.
  - Refer to **Table 4.6-16** for mapping MISR2 register bit onto MHU interrupt causes for core2.
  - Refer to **Table 4.6-17** for mapping MISR3 register bit onto MHU interrupt causes for core3.
- The interrupt requests can be cleared by writing 0 to corresponding bit of the MISR0 to MISR3.

Table 4.6-14 MHU Interrupt Mapping for CA55 core0

Register Name	Register Status Bit	Interrupt	Description	Integrated Interrupt
MISR0	MMNSSTAT4	msg_ch4_ns	Non-secure MHU Message interrupt from CA55 Core1 to CA55 Core0 (channel 4)	MSG_CA55core0_NS_INT
	MMNSSTAT8	msg_ch8_ns	Non-secure MHU Message interrupt from CA55 Core2 to CA55 Core0 (channel 8)	
	MMNSSTAT12	msg_ch12_ns	Non-secure MHU Message interrupt from CA55 Core3 to CA55 Core0 (channel 12)	
	MMNSSTAT16	msg_ch16_ns	Non-secure MHU Message interrupt from CM33 to CA55 Core0 (channel 16)	
	MRNSSTAT0	rsp_ch0_ns	Non-secure MHU Response interrupt from CA55 Core1 to CA55 Core0 (channel 0)	RSP_CA55core0_NS_INT
	MRNSSTAT1	rsp_ch1_ns	Non-secure MHU Response interrupt from CA55 Core2 to CA55 Core0 (channel 1)	
	MRNSSTAT2	rsp_ch2_ns	Non-secure MHU Response interrupt from CA55 Core3 to CA55 Core0 (channel 2)	
	MRNSSTAT3	rsp_ch3_ns	Non-secure MHU Response interrupt from CM33 to CA55 Core0 (channel 3)	
	MMSSTAT4	msg_ch4_s	Secure MHU Message interrupt from CA55 Core1 to CA55 Core0 (channel 4)	MSG_CA55core0_S_INT
	MMSSTAT8	msg_ch8_s	Secure MHU Message interrupt from CA55 Core2 to CA55 Core0 (channel 8)	
	MMSSTAT12	msg_ch12_s	Secure MHU Message interrupt from CA55 Core3 to CA55 Core0 (channel 12)	
	MMSSTAT16	msg_ch16_s	Secure MHU Message interrupt from CM33 to CA55 Core0 (channel 16)	
	MRSSTAT0	rsp_ch0_s	Secure MHU Response interrupt from CA55 Core1 to CA55 Core0 (channel 0)	RSP_CA55core0_S_INT

	MRSSTAT14	rsp_ch14_s	Secure MHU Response interrupt from CA55 Core2 to CA55 Core3 (channel 14)	
	MRSSTAT15	rsp_ch15_s	Secure MHU Response interrupt from CM33 to CA55 Core3 (channel 15)	

(5) MHU Interrupt for IM33

MHU interrupts for IM33 generated by MHU are integrated for each interrupt cause and notified to the CPU.

MHU outputs 8 message interrupts and 8 response interrupts for IM33. These interrupts are integrated into 4 interrupts as follows.

- Integrated Message interrupt for CM33 (Non-secure): MSG_NS_INT
- Integrated Response interrupt for CM33 (Non-secure): RSP_NS_INT
- Integrated Message interrupt for CM33 (Secure): MSG_S_INT
- Integrated Response interrupt for CM33 (Secure): RSP_S_INT

[Status Control]

- MHU interrupt requests can be confirmed by reading MHU CM33 Interrupt Status Control Register (MISR4) in IM33.
  - Refer to **Table 4.6-18** for mapping MISR4 register bit onto MHU interrupt causes for CM33.
- The interrupt requests can be cleared by writing 0 to corresponding bit of the MISR4.

Table 4.6-18 MHU Interrupt Mapping for CM33

Register Name	Register Status Bit	Interrupt	Description	Integrated Interrupt
MISR4	MMNSSTAT3	msg_ch3_ns	Non-secure MHU Message interrupt from CA55 Core0 to CM33 (channel 3)	MSG_NS_INT
	MMNSSTAT7	msg_ch7_ns	Non-secure MHU Message interrupt from CA55 Core1 to CM33 (channel 7)	
	MMNSSTAT11	msg_ch11_ns	Non-secure MHU Message interrupt from CA55 Core2 to CM33 (channel 11)	
	MMNSSTAT15	msg_ch15_ns	Non-secure MHU Message interrupt from CA55 Core3 to CM33 (channel 15)	
	MRNSSTAT16	rsp_ch16_ns	Non-secure MHU Response interrupt from CA55 Core0 to CM33 (channel 16)	RSP_NS_INT
	MRNSSTAT17	rsp_ch17_ns	Non-secure MHU Response interrupt from CA55 Core1 to CM33 (channel 17)	
	MRNSSTAT18	rsp_ch18_ns	Non-secure MHU Response interrupt from CA55 Core2 to CM33 (channel 18)	
	MRNSSTAT19	rsp_ch19_ns	Non-secure MHU Response interrupt from CA55 Core3 to CM33 (channel 19)	
	MMSSTAT3	msg_ch3_s	Secure MHU Message interrupt from CA55 Core0 to CM33 (channel 3)	MSG_S_INT
	MMSSTAT7	msg_ch7_s	Secure MHU Message interrupt from CA55 Core1 to CM33 (channel 7)	
	MMSSTAT11	msg_ch11_s	Secure MHU Message interrupt from CA55 Core2 to CM33 (channel 11)	
	MMSSTAT15	msg_ch15_s	Secure MHU Message interrupt from CA55 Core3 to CM33 (channel 15)	
	MRSSTAT16	rsp_ch16_s	Secure MHU Response interrupt from CA55 Core0 to CM33 (channel 16)	RSP_S_INT
	MRSSTAT17	rsp_ch17_s	Secure MHU Response interrupt from CA55 Core1 to CM33 (channel 17)	
	MRSSTAT18	rsp_ch18_s	Secure MHU Response interrupt from CA55 Core2 to CM33 (channel 18)	
	MRSSTAT19	rsp_ch19_s	Secure MHU Response interrupt from CA55 Core3 to CM33 (channel 19)	

(6) Software Interrupt for IM33

MHU interrupts for IM33 generated by MHU are integrated for each interrupt cause and notified to the CPU.

MHU outputs 4 software interrupts for IM33. These interrupts are integrated into 1 interrupt as follows.

- Integrated Software interrupt for CM33 (Non-secure): SW_INT

[Status Control]

- MHU interrupt requests can be confirmed by reading Software Interrupt Status Control Register (SWISR3) in IM33.
  - Refer to **Table 4.6-19** for mapping SWISR register bit onto MHU software interrupt causes for CM33.
- The interrupt requests can be cleared by writing 0 to corresponding bit of the SWISR.

Table 4.6-19 Software Interrupt Mapping for CM33

Register Name	Register Status Bit	Interrupt	Description	Integrated Interrupt
SWISR	SWSTAT0	swint_ch0_ns	Non-secure MHU SW interrupt from CA55 Core0 to CM33 (channel 0)	SW_INT
	SWSTAT1	swint_ch1_ns	Non-secure MHU SW interrupt from CA55 Core1 to CM33 (channel 1)	
	SWSTAT2	swint_ch2_ns	Non-secure MHU SW interrupt from CA55 Core2 to CM33 (channel 2)	
	SWSTAT3	swint_ch3_ns	Non-secure MHU SW interrupt from CA55 Core3 to CM33 (channel 3)	

4.6.1.6.5 GPT/MTU3a Interrupt Selection

GPT interrupt and MTU3a Interrupt are selected by the INTPMSEL0/1 register.

Refer to the following tables.

Table 4.6-20 Selection of GPT Interrupt and MTU3a Interrupt by the INTPMSEL0 Register

INTPMSEL0 Register Bit	PMINTSEL* = 0		PMINTSEL* = 1		SPI No. (IA55)	IRQ No. (IM33)
	Interrupt Source	Cause of Interrupt	Interrupt Source	Cause of Interrupt		
PMINTSEL0	GPT (ch0)	CMPE0	MTU3a (ch0)	TGIA0	205	159
PMINTSEL1		CMPF0		TGIB0	206	160

4.6.1.7 Usage Note

4.6.1.7.1 Precaution when use the peripheral modules which can initiate DMA Controller

Some on-chip peripheral modules use the same signal both for an interrupt request and for a DMA transfer request. Refer to **4.7.4.25 DMA Extension Resource Selectors 0/0S to 7/7S (DMARS0/0S to DMARS7/7S)** for detail.

If such a module is selected by a DMARSn/nS register, the signal works as a DMA transfer request signal and interrupt requests to the interrupt controller are masked.

To enable the interrupt, clear the setting of DMARSn/nS (set all MID[7:0] and RID[1:0] to 0).
In addition, need following register settings even if DMA controller is not used.

- Set CPG_CLKON_DMAC_REG register to supply a clock for DMA Controller.
  Refer to **4.4.3.41 Clock Control Register DMAC_REG (CPG_CLKON_DMAC_REG)** for register detail.
- Set CPG_RST_DMAC register to release a reset for DMA Controller.
  Refer to **4.4.3.158 Reset Control Register DMAC (CPG_RST_DMAC)** for register detail.

4.6.1.7.2 Clear Timing of Interrupt Cause

Clear the interrupt cause flag in the interrupt exception service routine. It takes time from clearing the interrupt cause flag until the interrupt cause to the CPU is actually removed. Therefore, to prevent the interrupt cause that should have been cleared from being accidentally accepted again, the interrupt cause flag is read after clearing, and then the return instruction is executed.

4.6.1.7.3 Precaution when Changing Interrupt Settings

To change the NMI, IRQ, TINT interrupt settings, mask the interrupts and change the settings.

- When changing the noise filter settings.
- When switching the GPIO pins to IRQ or GPIOINT.
- When changing the source of TINT.
- When changing the interrupt detection method.

When changing the NMI, IRQ, TINT interrupt detection method to the edge type, perform the process of clearing the interrupt status after changing the setting.

- NMI: Write 0 to the NSTAT bit of NSCR.
- IRQ: Write 0 to the ISTATn bit of ISCR.
- TINT: Write 0 to the TSTATn bit of TSCR.

4.6.2 Generic Interrupt Controller (GIC) and Nested Vectored Interrupt Controller (NVIC)

4.6.2.1 GIC-600 and NVIC Register Configuration

■ GIC-600 Register

Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual.
ITS and LPI are not supported.

Base Address: H'0_1240_0000 (Cortex-A55 Address Space)

Base Address: H'5240_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H'4240_0000 (Cortex-M33 Address Space Secure)

■ NVIC Register

Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual.

4.6.2.2 GIC-600 and NVIC Register Descriptions

■ GIC-600 Register

Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual for detail.

■ NVIC Register

Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual for detail.

4.6.3 Message Handling Unit (MHU)

MHU is a function for message communication between Cortex-A55 (CA55) cores and Cortex-M33 (CM33). Message communication is done by shared RAM (On-chip RAM or External RAM) for passing message and response between CPUs and the function (MHU) for notifying when messages and responses are stored in the memory.

4.6.3.1 Features

Table 4.6-22 shows MHU feature summary.

Table 4.6-22 Feature Summary

Feature	Description
Interrupt by Message and response	Generate interrupt to notify each Cortex-A55, Cortex-M33 when the message/response is stored in shared RAM (On-chip RAM or External RAM).
Software interrupt control	Control registers for interrupt setting, clearing, and status confirmation

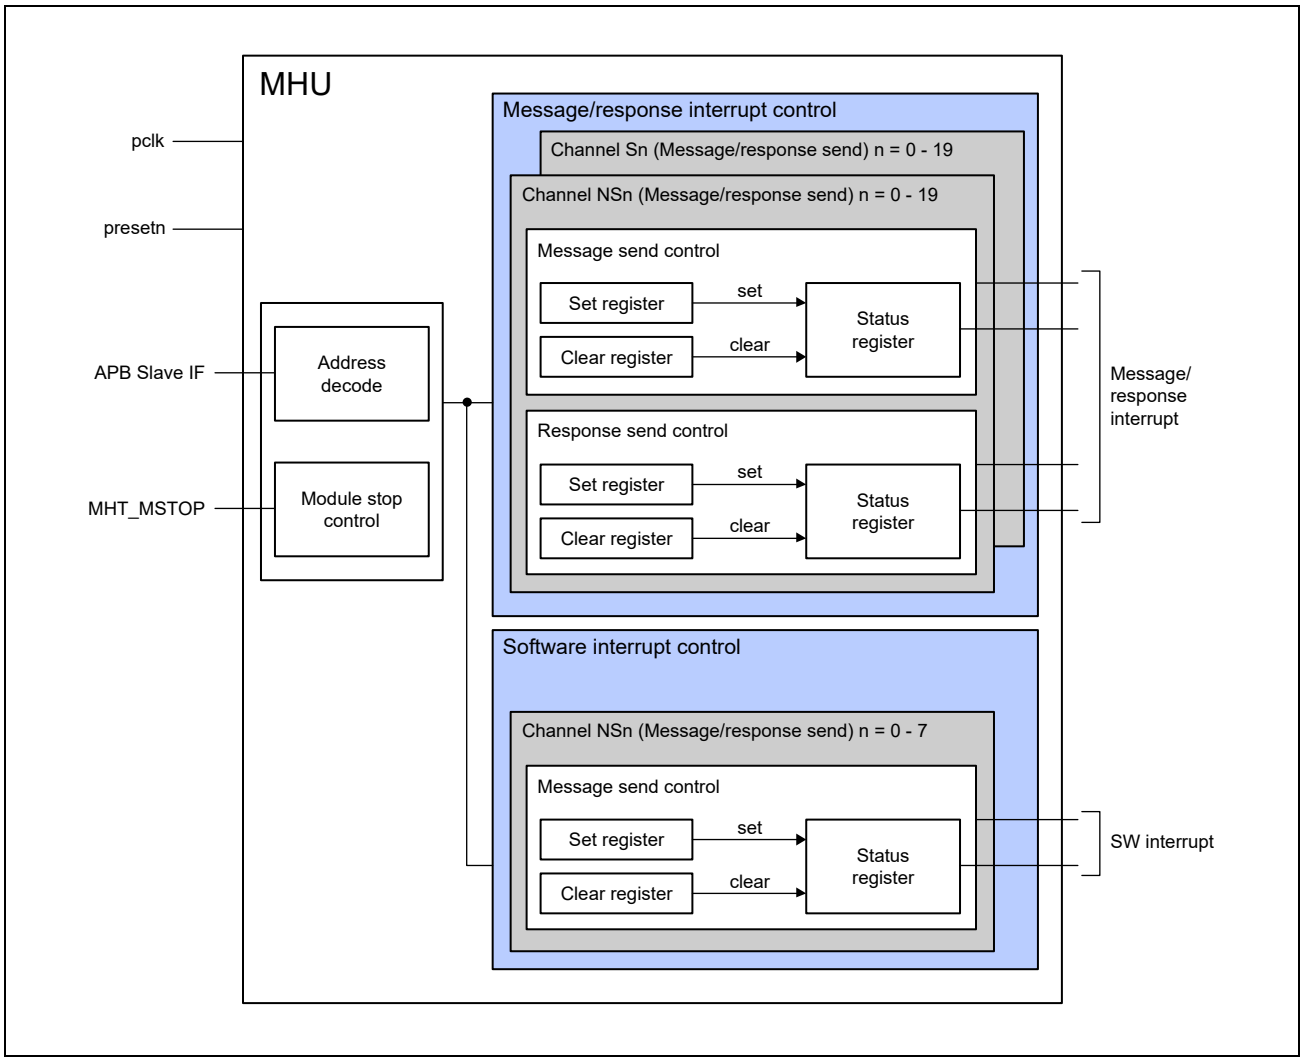

Figure 4.6-3 MHU Block Diagram

Message/response interrupt control registers

Registers that control message/response interrupts.

The message/response interrupt control register controls interrupts with the set register, clear register, and status register. An interrupt is asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register. The status can be checked by reading the status register. With these as one set, the message transmission processing register

One channel is composed of a pair of data transmission processing register and response transmission processing register, and a total of 40 channels are mounted. The breakdown of 40 channels is as follows.

Shows MHU feature summary.

Non-secure interrupt control register (Channel NS0 to 19):

Channel NS0 (CA55 Core0: Message transmission/ CA55 Core1: Response transmission)

Channel NS1 (CA55 Core0: Message transmission//CA55 Core2: Response transmission)

Channel NS2 (CA55 Core0: Message transmission/CA55 Core3: Response transmission)

Channel NS3 (CA55 Core0: Message transmission/CM33: Response transmission)

Channel NS4 (CA55 Core1: Message transmission/CA55 Core0: Response transmission)

Channel NS5 (CA55 Core1: Message transmission/ CA55 Core2: Response transmission)

Channel NS6 (CA55 Core1: Message transmission/CA55 Core3: Response transmission)

Channel NS7 (CA55 Core1: Message transmission/CM33: Response transmission)

Channel NS8 (CA55 Core2: Message transmission/CA55 Core0: Response transmission)

Channel NS9 (CA55 Core2: Message transmission/CA55 Core1: Response transmission)

Channel NS10 (CA55 Core2: Message transmission/CA55 Core3: Response transmission)

Channel NS11 (CA55 Core2: Message transmission/CM33: Response transmission)

Channel NS12 (CA55 Core3: Message transmission/CA55 Core0: Response transmission)

Channel NS13 (CA55 Core3: Message transmission/CA55 Core1: Response transmission)

Channel NS14 (CA55 Core3: Message transmission/CA55 Core2: Response transmission)

Channel NS15 (CA55 Core3: Message transmission/CM33: Response transmission)

Channel NS16 (CM33: Message transmission/CA55 Core0: Response transmission)

Channel NS17 (CM33: Message transmission/CA55 Core1: Response transmission)

Channel NS18 (CM33: Message transmission/CA55 Core2: Response transmission)

Channel NS19 (CM33: Message transmission/CA55 Core3: Response transmission)

Secure interrupt control register (Channel S0 to 19):

Channel S0 (CA55 Core0: Message transmission/ CA55 Core1: Response transmission)

Channel S1 (CA55 Core0: Message transmission/ CA55 Core2: Response transmission)

Channel S2 (CA55 Core0: Message transmission/CA55 Core3: Response transmission)

Channel S3 (CA55 Core0: Message transmission/CM33: Response transmission)

Channel S4 (CA55 Core1: Message transmission/CA55 Core0: Response transmission)

Channel S5 (CA55 Core1: Message transmission/CA55 Core2: Response transmission)

Channel S6 (CA55 Core1: Message transmission/CA55 Core3: Response transmission)

Channel S7 (CA55 Core1: Message transmission/CM33: Response transmission)

Channel S8 (CA55 Core2: Message transmission/CA55 Core0: Response transmission)

Channel S9 (CA55 Core2: Message transmission/CA55 Core1: Response transmission)

Channel S10 (CA55 Core2: Message transmission/CA55 Core3: Response transmission)

Channel S11 (CA55 Core2: Message transmission/CM33: Response transmission)

Channel S12 (CA55 Core3: Message transmission/CA55 Core0: Response transmission)

Channel S13 (CA55 Core3: Message transmission/CA55 Core1: Response transmission)

Channel S14 (CA55 Core3: Message transmission/CA55 Core2: Response transmission)

Channel S15 (CA55 Core3: Message transmission/CM33: Response transmission)

Channel S16 (CM33: Message transmission/CA55 Core0: Response transmission)

Channel S17 (CM33: Message transmission/CA55 Core1: Response transmission)

Channel S18 (CM33: Message transmission/CA55 Core2: Response transmission)

Channel S19 (CM33: Message transmission/CA55 Core3: Response transmission)

Software interrupt control register

Registers that control software interrupts.

The software interrupt control register controls interrupts using the set register, clear register, and status register. An interrupt is asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register. You can also check the interrupt status by reading the status register. With these as one set, the message transmission processing register and response.

One channel is composed of a pair of transmission processing registers, and a total of 8 channels are mounted.

Module stop control

This circuit refers to the module stop control (MHU_MSTOP) in CPG_MHU_MSTOP register on Clock Pulse Generator (CPG) and returns an error response if an access occurs while the module is stopped.

4.6.3.2 Interrupt

Table 4.6-23 shows interrupt output.

Table 4.6-23 Interrupt Type (1/3)

Output	Description	Pulse/Level	Active Level
msg_ch0_ns	Non-secure MHU Message interrupt from CA55 Core0 to CA55 Core1	Level	HIGH
rsp_ch0_ns	Non-secure MHU Response interrupt from CA55 Core1 to CA55 Core0	Level	HIGH
msg_ch1_ns	Non-secure MHU Message interrupt from CA55 Core0 to CA55 Core2	Level	HIGH
rsp_ch1_ns	Non-secure MHU Response interrupt from CA55 Core2 to CA55 Core0	Level	HIGH
msg_ch2_ns	Non-secure MHU Message interrupt from CA55 Core0 to CA55 Core3	Level	HIGH

rsp_ch10_ns	Non-secure MHU Response interrupt from CA55 Core3 to CA55 Core2	Level	HIGH
msg_ch11_ns	Non-secure MHU Message interrupt from CA55 Core2 to CM33	Level	HIGH
rsp_ch11_ns	Non-secure MHU Response interrupt from CM33 to CA55 Core2	Level	HIGH
msg_ch12_ns	Non-secure MHU Message interrupt from CA55 Core3 to CA55 Core0	Level	HIGH
rsp_ch12_ns	Non-secure MHU Response interrupt from CA55 Core0 to CA55 Core3	Level	HIGH
msg_ch13_ns	Non-secure MHU Message interrupt from CA55 Core3 to CA55 Core1	Level	HIGH
rsp_ch13_ns	Non-secure MHU Response interrupt from CA55 Core1 to CA55 Core3	Level	HIGH
msg_ch14_ns	Non-secure MHU Message interrupt from CA55 Core3 to CA55 Core2	Level	HIGH
rsp_ch14_ns	Non-secure MHU Response interrupt from CA55 Core2 to CA55 Core3	Level	HIGH
msg_ch15_ns	Non-secure MHU Message interrupt from CA55 Core3 to CM33	Level	HIGH
rsp_ch15_ns	Non-secure MHU Response interrupt from CM33 to CA55 Core3	Level	HIGH
msg_ch16_ns	Non-secure MHU Message interrupt from CM33 to CA55 Core0	Level	HIGH
rsp_ch16_ns	Non-secure MHU Response interrupt from CA55 Core0 to CM33	Level	HIGH
msg_ch17_ns	Non-secure MHU Message interrupt from CM33 to CA55 Core1	Level	HIGH
rsp_ch17_ns	Non-secure MHU Response interrupt from CA55 Core1 to CM33	Level	HIGH
msg_ch18_ns	Non-secure MHU Message interrupt from CM33 to CA55 Core2	Level	HIGH
rsp_ch18_ns	Non-secure MHU Response interrupt from CA55 Core2 to CM33	Level	HIGH
msg_ch19_ns	Non-secure MHU Message interrupt from CM33 to CA55 Core3	Level	HIGH
rsp_ch19_ns	Non-secure MHU Response interrupt from CA55 Core3 to CM33	Level	HIGH
swint_ch0_ns	Non-secure MHU SW interrupt from CA55 Core0 to CM33	Level	HIGH
swint_ch1_ns	Non-secure MHU SW interrupt from CA55 Core1 to CM33	Level	HIGH
swint_ch2_ns	Non-secure MHU SW interrupt from CA55 Core2 to CM33	Level	HIGH
swint_ch3_ns	Non-secure MHU SW interrupt from CA55 Core3 to CM33	Level	HIGH
swint_ch4_ns	Non-secure MHU SW interrupt from CM33 to CA55 Core0	Level	HIGH
swint_ch5_ns	Non-secure MHU SW interrupt from CM33 to CA55 Core1	Level	HIGH

Table 4.6-23 Interrupt Type (3/3)

Output	Description	Pulse/Level	Active Level
swint_ch6_ns	Non-secure MHU SW interrupt from CM33 to CA55 Core2	Level	HIGH
swint_ch7_ns	Non-secure MHU SW interrupt from CM33 to CA55 Core3	Level	HIGH

4.6.3.3 Register Configuration

Table 4.6-24 shows address mapping for MHU.

Table 4.6-24 MHU Address Map

Offset Address (CA55 MHU Base address: 0_1040_0000h) (CM33 Secure MHU Base address: 4040_0000h) (CM33 Non-secure MHU Base address: 5040_0000h)	Description
0000h to 07FFh	Non-secure message/response interrupt control register
0800h to 0FFFh	Non-secure software interrupt control register
1000h to 17FFh	Secure message/response interrupt control register
1800h to 1FFFh	Reserved
2000h to FFFFh	Reserved

Note: Prohibit to access Reserved area.

Table 4.6-25 shows register attributes

Table 4.6-25 Register Attributes

Attribute	Description
RW	Read&Write register
RW0	Read&Write0 register. Invalid Write 1.
RW1	Read&Write1 register. Invalid Write 0.
R0W	Read0&Write register. Always Read 0.
R1W	Read1&Write register. Always Read 1.
R	Read Only
R0W0	Read0&Write0 register. Always Read 0. Invalid Write 1.
R0W1	Read0&Write1 register. Always Read 0. Invalid Write 0.
R1W0	Read1&Write0 register. Always Read 1. Invalid Write 1.
R1W1	Read1&Write1 register. Always Read 1. Invalid Write 0.
RCW0	Read by clear. Write0 register. Invalid Write 1.
RCW1	Read by clear. Write1 register. Invalid Write 0.

Note: No guaranteed function for access to Reserved area, Debug and undefined area.

Table 4.6-26 shows registers

Table 4.6-26 List of Registers

Register Name	Abbreviation	Initial Value	Offset Address	Access Size [bits]
Non secure message transmission interrupt Status register				
Non secure message transmission interrupt register	MHU_MSG_INT_STSn_NS <n=0-19>	0000_0000h	0000h + n x 0020h	32
Non secure message transmission interrupt Set register	MHU_MSG_INT_SETn_NS <n=0-19>	0000_0000h	0004h + n x 0020h	32
Non secure message transmission interrupt Clear register	MHU_MSG_INT_CLRn_NS <n=0-19>	0000_0000h	0008h + n x 0020h	32
Non secure response transmission interrupt register				
Non secure response transmission interrupt Status register	MHU_RSP_INT_STSn_NS <n=0-19>	0000_0000h	0010h + n x 0020h	32
Non secure response transmission interrupt Set register	MHU_RSP_INT_SETn_NS <n=0-19>	0000_0000h	0014h + n x 0020h	32
Non secure response transmission interrupt Clear register	MHU_RSP_INT_CLRn_NS <n=0-19>	0000_0000h	0018h + n x 0020h	32
Non secure software interrupt register				
Non secure software interrupt Status register	MHU_SW_INT_STSn_NS <n=0-7>	0000_0000h	0800h + n x 0010h	32
Non secure software interrupt Set register	MHU_SW_INT_SETn_NS <n=0-7>	0000_0000h	0804h + n x 0010h	32
Non secure software interrupt Clear register	MHU_SW_INT_CLRn_NS <n=0-7>	0000_0000h	0808h + n x 0010h	32
Secure message transmission interrupt register				
Secure message transmission interrupt Status register	MHU_MSG_INT_STSn_S <n=0-19>	0000_0000h	1000h + n x 0020h	32
Secure message transmission interrupt Set register	MHU_MSG_INT_SETn_S <n=0-19>	0000_0000h	1004h + n x 0020h	32
Secure message transmission interrupt Clear register	MHU_MSG_INT_CLRn_S <n=0-19>	0000_0000h	1008h + n x 0020h	32
Secure response transmission interrupt register				
Secure response transmission interrupt Status register	MHU_RSP_INT_STSn_S <n=0-19>	0000_0000h	1010h + n x 0020h	32
Secure response transmission interrupt Set register	MHU_RSP_INT_SETn_S <n=0-19>	0000_0000h	1014h + n x 0020h	32
Secure response transmission interrupt Clear register	MHU_RSP_INT_CLRn_S <n=0-19>	0000_0000h	1018h + n x 0020h	32

Note: Access size must be 32bit. Prohibit to access to Reserved register.

4.6.3.4 Register Descriptions

4.6.3.4.1 Non Secure Message Transmission Interrupt Status Register (MHU_MSG_INT_STSn_NS <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 0000h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	STAT	0h	R	Show status of message transmission interrupt. Read only. Write is invalid. 0: No message transmission interrupt (No interrupt being notified to the interrupt controller at the message destination) 1: Assert message transmission interrupt (There is an interrupt being notified to the interrupt controller at the message destination.)

4.6.3.4.2 Non Secure Message Transmission Interrupt Set Register (MHU_MSG_INT_SETn_NS <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 0004h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	SET	0h	R0W1	Set message transmission interrupt. Write "1" only. Always read "0". 0: invalid 1: Issue interrupt to interrupt controller of the message destination.

4.6.3.4.3 Non Secure Message Transmission Interrupt Clear Register (MHU_MSG_INT_CLRn_NS <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 0008h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLEAR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	CLEAR	0h	R0W1	Clear message transmission interrupt Write "1" only. Always read "0". 0: invalid 1: Clear interrupt to interrupt controller of the message destination.

4.6.3.4.4 Non Secure Response Transmission Interrupt Status Register (MHU_RSP_INT_STSn_NS <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 0010h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	STAT	0h	R	Show status of message transmission interrupt. Read only. Write is invalid. 0: No message transmission interrupt (No interrupt being notified to the interrupt controller at the message destination) 1: Assert message transmission interrupt (There is an interrupt being notified to the interrupt controller at the message destination.)

4.6.3.4.5 Non Secure Response Transmission Interrupt Set Register (MHU_RSP_INT_SETn_NS <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 0014h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	SET	0h	R0W1	Set message transmission interrupt. Write “1” only. Always read “0”. 0: invalid 1: Issue interrupt to interrupt controller of the message destination.

4.6.3.4.6 Non Secure Response Transmission Interrupt Clear Register (MHU_RSP_INT_CLRn_NS <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 0018h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLEAR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	CLEAR	0h	R0W1	Clear message transmission interrupt Write “1” only. Always read “0”. 0: invalid 1: Clear interrupt to interrupt controller of the message destination.

4.6.3.4.7 Non Secure Software Interrupt Status Register (MHU_SW_INT_STSn_NS <n=0-7>)

Access Size : 32 bits

Address : <MHU_base> + 0800h + n x 0010h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	STAT	0h	R	Show status of Non secure software interrupt. Read only. Write is invalid. 0: No interrupt (No interrupt being notified to the interrupt controller) 1: Software interrupt is asserted. (There is an interrupt being notified to the interrupt controller)

4.6.3.4.8 Non Secure Software Interrupt Set Register (MHU_SW_INT_SETn_NS <n=0-7>)

Access Size : 32 bits
Address : <MHU_base> + 0804h + n x 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	SET	0h	R0W1	R0W1 Set Non secure software interrupt. Write “1” only. Always read “0”. 0: invalid 1:Issue interrupt to interrupt controller

4.6.3.4.9 Non Secure Software Interrupt Clear Register (MHU_SW_INT_CLRn_NS <n=0-7>)

Access Size : 32 bits
Address : <MHU_base> + 0808h + n x 0010h
Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLEAR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	CLEAR	0h	R0W1	Clear Non secure software interrupt. Write “1” only. Always read “0”. 0: invalid 1:Clear interrupt to interrupt controller.

4.6.3.4.10 Secure Message Transmission Interrupt Status Register (MHU_MSG_INT_STSn_S <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 1000h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	STAT	0h	R	Show status of message transmission interrupt. Read only. Write is invalid. 0: No message transmission interrupt (No interrupt being notified to the interrupt controller at the message destination) 1: Assert message transmission interrupt (There is an interrupt being notified to the interrupt controller at the message destination.)

4.6.3.4.11 Secure Message Transmission Interrupt Set Register (MHU_MSG_INT_SETn_S <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 1004h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	SET	0h	R0W1	Set message transmission interrupt. Write “1” only. Always read “0”. 0: invalid 1: Issue interrupt to interrupt controller of the message destination.

4.6.3.4.12 Secure Message Transmission Interrupt Clear Register (MHU_MSG_INT_CLRn_S <n=0-19>

Access Size : 32 bits

Address : <MHU_base> + 1008h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLEAR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	CLEAR	0h	R0W1	Clear message transmission interrupt Write “1” only. Always read “0”. 0: invalid 1: Clear interrupt to interrupt controller of the message destination.

4.6.3.4.13 Secure Response Transmission Interrupt Status Register (MHU_RSP_INT_STSn_S <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 1010h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	STAT	0h	R	Show status of message transmission interrupt. Read only. Write is invalid. 0: No message transmission interrupt (No interrupt being notified to the interrupt controller at the message destination) 1: Assert message transmission interrupt (There is an interrupt being notified to the interrupt controller at the message destination.)

4.6.3.4.14 Secure Response Transmission Interrupt Set Register (MHU_RSP_INT_SETn_S <n=0-19>

Access Size : 32 bits

Address : <MHU_base> + 1014h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	SET	0h	R0W1	Set message transmission interrupt. Write "1" only. Always read "0". 0: invalid 1: Issue interrupt to interrupt controller of the message destination.

4.6.3.4.15 Secure Response Transmission Interrupt Clear Register (MHU_RSP_INT_CLRn_S <n=0-19>)

Access Size : 32 bits

Address : <MHU_base> + 1018h + n x 0020h

Initial Value : 0000_0000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CLEAR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	-	All 0	R	Reserved These bits are read as 0b. The written value will be ignored.
0	CLEAR	0h	R0W1	Clear message transmission interrupt Write "1" only. Always read "0". 0: invalid 1: Clear interrupt to interrupt controller of the message destination.

4.6.3.5 Function Description

4.6.3.5.1 Inter CPU Communication

The hardware configuration is shown in **Figure 4.6-4**. Inter-CPU communication is established by sending a message from the message source to the message destination and sending a response from the message destination to the message source. The MHU uses an interrupt to notify that the message / response to the CPU has been written to Shared RAM(On-chip RAM). Interrupts are controlled by the Set register, Clear register, and Status register. Interrupt can be asserted by writing “1” to the Set register. Interrupt is negated by writing “1” to the Clear register, and check the interrupt status by reading the Status register. With these registers as one set, one channel is composed of a message transmission processing / response transmission processing pair. A total of 40 channels (non-secure: 20 channels; secure: 20 channels) are installed so that bidirectional communication can be performed between CA55 Core0/Core1/Core2/Core3 and CM33. **Table 4.6-27** shows the channel and message source / destination correspondence.

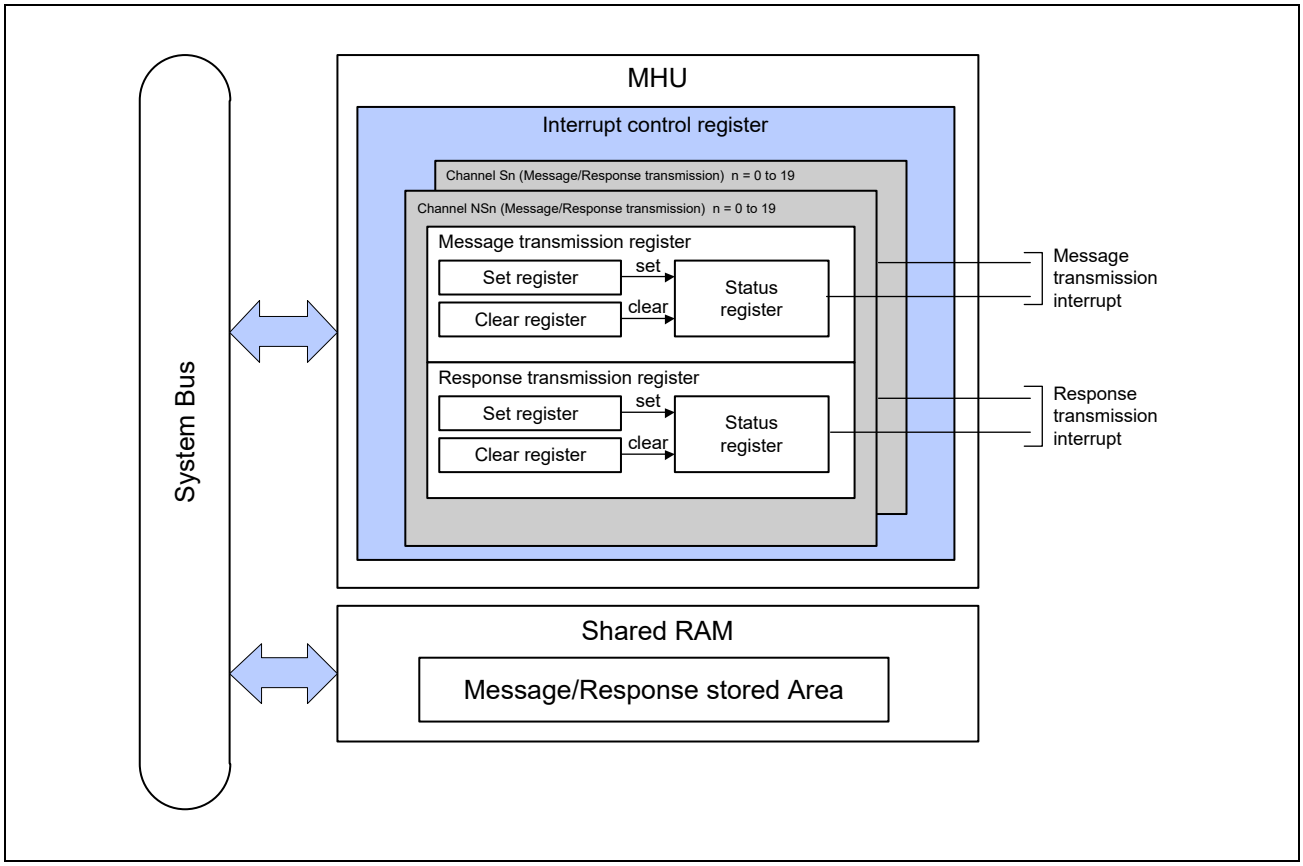

Figure 4.6-4 Hardware Configuration

Table 4.6-27 Channel and Message Destination/Source Reference

Channel	Source	Destination	Message Transmit Register	Response Transmit Register
Channel NS0	CA55 Core0	CA55 Core1	MSG_INT_(SET/CLR/STS)0_NS	RSP_INT_(SET/CLR/STS)0_NS
Channel NS1	CA55 Core0	CA55 Core2	MSG_INT_(SET/CLR/STS)1_NS	RSP_INT_(SET/CLR/STS)1_NS
Channel NS2	CA55 Core0	CA55 Core3	MSG_INT_(SET/CLR/STS)2_NS	RSP_INT_(SET/CLR/STS)2_NS
Channel NS3	CA55 Core0	CM33	MSG_INT_(SET/CLR/STS)3_NS	RSP_INT_(SET/CLR/STS)3_NS
Channel NS4	CA55 Core1	CA55 Core0	MSG_INT_(SET/CLR/STS)4_NS	RSP_INT_(SET/CLR/STS)4_NS
Channel NS5	CA55 Core1	CA55 Core2	MSG_INT_(SET/CLR/STS)5_NS	RSP_INT_(SET/CLR/STS)5_NS
Channel NS6	CA55 Core1	CA55 Core3	MSG_INT_(SET/CLR/STS)6_NS	RSP_INT_(SET/CLR/STS)6_NS
Channel NS7	CA55 Core1	CM33	MSG_INT_(SET/CLR/STS)7_NS	RSP_INT_(SET/CLR/STS)7_NS
Channel NS8	CA55 Core2	CA55 Core0	MSG_INT_(SET/CLR/STS)8_NS	RSP_INT_(SET/CLR/STS)8_NS
Channel NS9	CA55 Core2	CA55 Core1	MSG_INT_(SET/CLR/STS)9_NS	RSP_INT_(SET/CLR/STS)9_NS

Channel S1	CA55 Core0	CA55 Core2	MSG_INT_(SET/CLR/STS)1_S	RSP_INT_(SET/CLR/STS)1_S
Channel S2	CA55 Core0	CA55 Core3	MSG_INT_(SET/CLR/STS)2_S	RSP_INT_(SET/CLR/STS)2_S
Channel S3	CA55 Core0	CM33	MSG_INT_(SET/CLR/STS)3_S	RSP_INT_(SET/CLR/STS)3_S
Channel S4	CA55 Core1	CA55 Core0	MSG_INT_(SET/CLR/STS)4_S	RSP_INT_(SET/CLR/STS)4_S
Channel S5	CA55 Core1	CA55 Core2	MSG_INT_(SET/CLR/STS)5_S	RSP_INT_(SET/CLR/STS)5_S
Channel S6	CA55 Core1	CA55 Core3	MSG_INT_(SET/CLR/STS)6_S	RSP_INT_(SET/CLR/STS)6_S
Channel S7	CA55 Core1	CM33	MSG_INT_(SET/CLR/STS)7_S	RSP_INT_(SET/CLR/STS)7_S
Channel S8	CA55 Core2	CA55 Core0	MSG_INT_(SET/CLR/STS)8_S	RSP_INT_(SET/CLR/STS)8_S
Channel S9	CA55 Core2	CA55 Core1	MSG_INT_(SET/CLR/STS)9_S	RSP_INT_(SET/CLR/STS)9_S
Channel S10	CA55 Core2	CA55 Core3	MSG_INT_(SET/CLR/STS)10_S	RSP_INT_(SET/CLR/STS)10_S
Channel S11	CA55 Core2	CM33	MSG_INT_(SET/CLR/STS)11_S	RSP_INT_(SET/CLR/STS)11_S
Channel S12	CA55 Core3	CA55 Core0	MSG_INT_(SET/CLR/STS)12_S	RSP_INT_(SET/CLR/STS)12_S
Channel S13	CA55 Core3	CA55 Core1	MSG_INT_(SET/CLR/STS)13_S	RSP_INT_(SET/CLR/STS)13_S
Channel S14	CA55 Core3	CA55 Core2	MSG_INT_(SET/CLR/STS)14_S	RSP_INT_(SET/CLR/STS)14_S
Channel S15	CA55 Core3	CM33	MSG_INT_(SET/CLR/STS)15_S	RSP_INT_(SET/CLR/STS)15_S
Channel S16	CM33	CA55 Core0	MSG_INT_(SET/CLR/STS)16_S	RSP_INT_(SET/CLR/STS)16_S
Channel S17	CM33	CA55 Core1	MSG_INT_(SET/CLR/STS)17_S	RSP_INT_(SET/CLR/STS)17_S
Channel S18	CM33	CA55 Core2	MSG_INT_(SET/CLR/STS)18_S	RSP_INT_(SET/CLR/STS)18_S
Channel S19	CM33	CA55 Core3	MSG_INT_(SET/CLR/STS)19_S	RSP_INT_(SET/CLR/STS)19_S

4.6.3.5.2 Software Interrupt

Software interrupts are controlled by the Set register, Clear register, and Status register. Interrupt can be asserted by writing “1” to the Set register. Interrupt is negated by writing “1” to the Clear register and check the interrupt status by reading the Status register. With these registers as one set, one channel is composed of a message transmission processing / response transmission processing pair. A total of 8 channels. **Table 4.6-28** shows the interrupt source/destination correspondence.

Table 4.6-28 Channel and Message Destination/Source Reference for software interrupt

Channel	Source	Destination	Message Transmit Register
Channel NS0	CA55 Core0	CM33	SW_INT_(SET/CLR/STS)0_NS
Channel NS1	CA55 Core1	CM33	SW_INT_(SET/CLR/STS)1_NS
Channel NS2	CA55 Core2	CM33	SW_INT_(SET/CLR/STS)2_NS
Channel NS3	CA55 Core3	CM33	SW_INT_(SET/CLR/STS)3_NS
Channel NS4	CM33	CA55 Core0	SW_INT_(SET/CLR/STS)4_NS
Channel NS5	CM33	CA55 Core1	SW_INT_(SET/CLR/STS)5_NS
Channel NS6	CM33	CA55 Core2	SW_INT_(SET/CLR/STS)6_NS
Channel NS7	CM33	CA55 Core3	SW_INT_(SET/CLR/STS)7_NS

4.6.3.6 Operation Sequence

4.6.3.6.1 Message Transmit Sequence

Show Message transmit sequence from CM33 to CA55 Core0 in below and **Figure 4.6-5**.

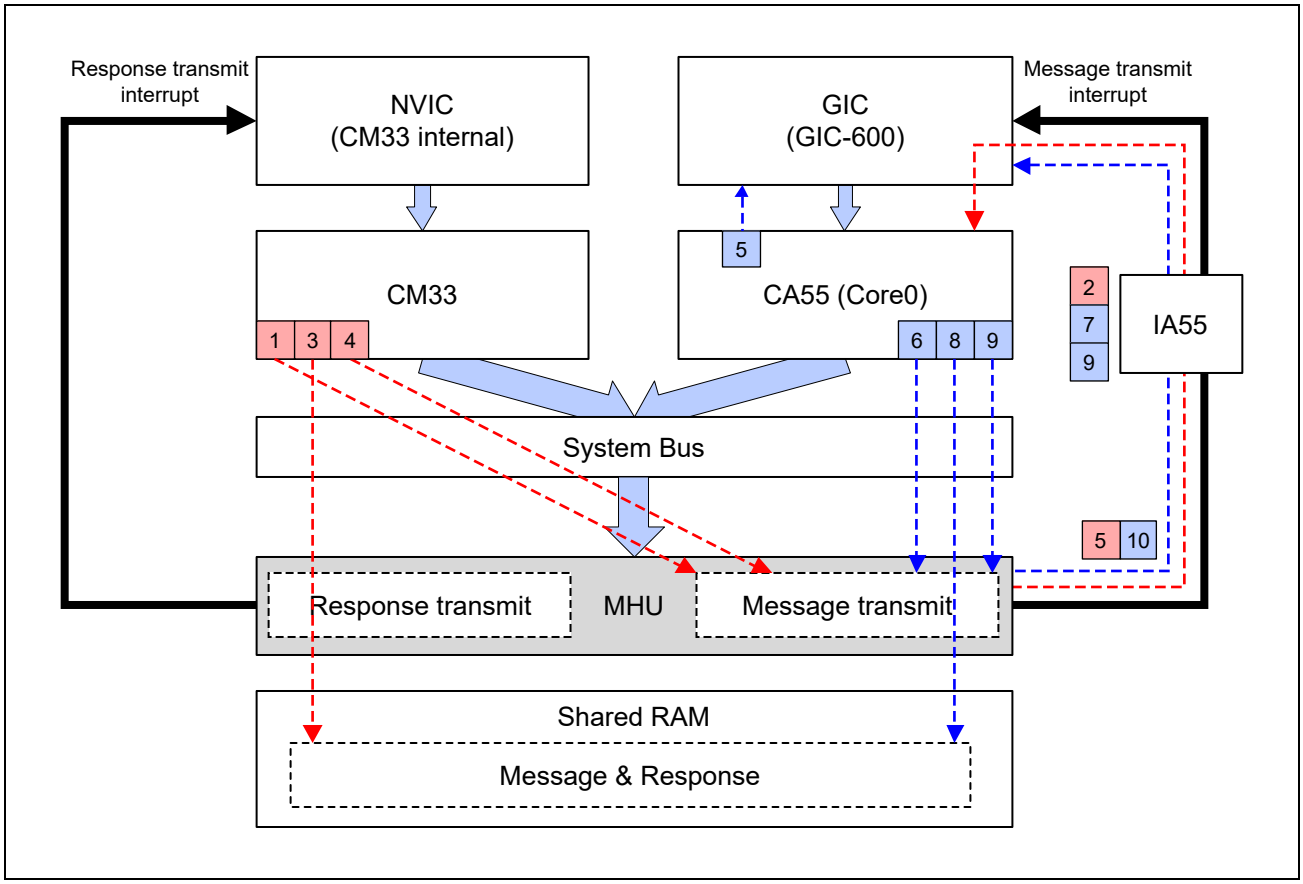

Figure 4.6-5 Message Transmit Sequence (CM33 -> CA55 Core0)

(1) CM33:	Check “0” for bit0 in register: MSG_INT_STS16 (Confirm cleared status and move to (2))
(2) CM33:	Check “0” for bit4 in register: MISR0 of IA55 (non-secure case) Check “0” for bit20 in register: MISR0 of IA55 (secure case) (Confirm cleared status and move to (3))
(3) CM33:	Write message to Shared RAM
(4) CM33:	Write “1” to bit 0 in register: MSG_INT_SET16
(5) MHU channel 16:	Assert interrupt: int_msg_ch16 for CA55
(6) CA55Core0:	Check interrupt reason (Detect message transmit)
(7) CA55 Core0:	Check “1” for bit 0 in register: MSG_INT_STS16 Check “1” for bit4 in register: MISR0 of IA55 (non-secure case) Check “1” for bit20 in register: MISR0 of IA55 (secure case)
(8) CA55 Core0:	Read message from shared RAM
(9) CA55 Core0:	Write “1” to bit0 in register: MSG_INT_CLR16 Write “0” to bit4 in register: MISR0 of IA55 (non-secure case) Write “0” to bit20 in register: MISR0 of IA55 (secure case)
(10) MHU channel 16:	Negate interrupt: int_msg_ch16 to CA55

4.6.3.6.2 Response Transmit Sequence

Show Response transmit sequence from CA55 Core0 to CM33 in below and **Figure 4.6-6**.

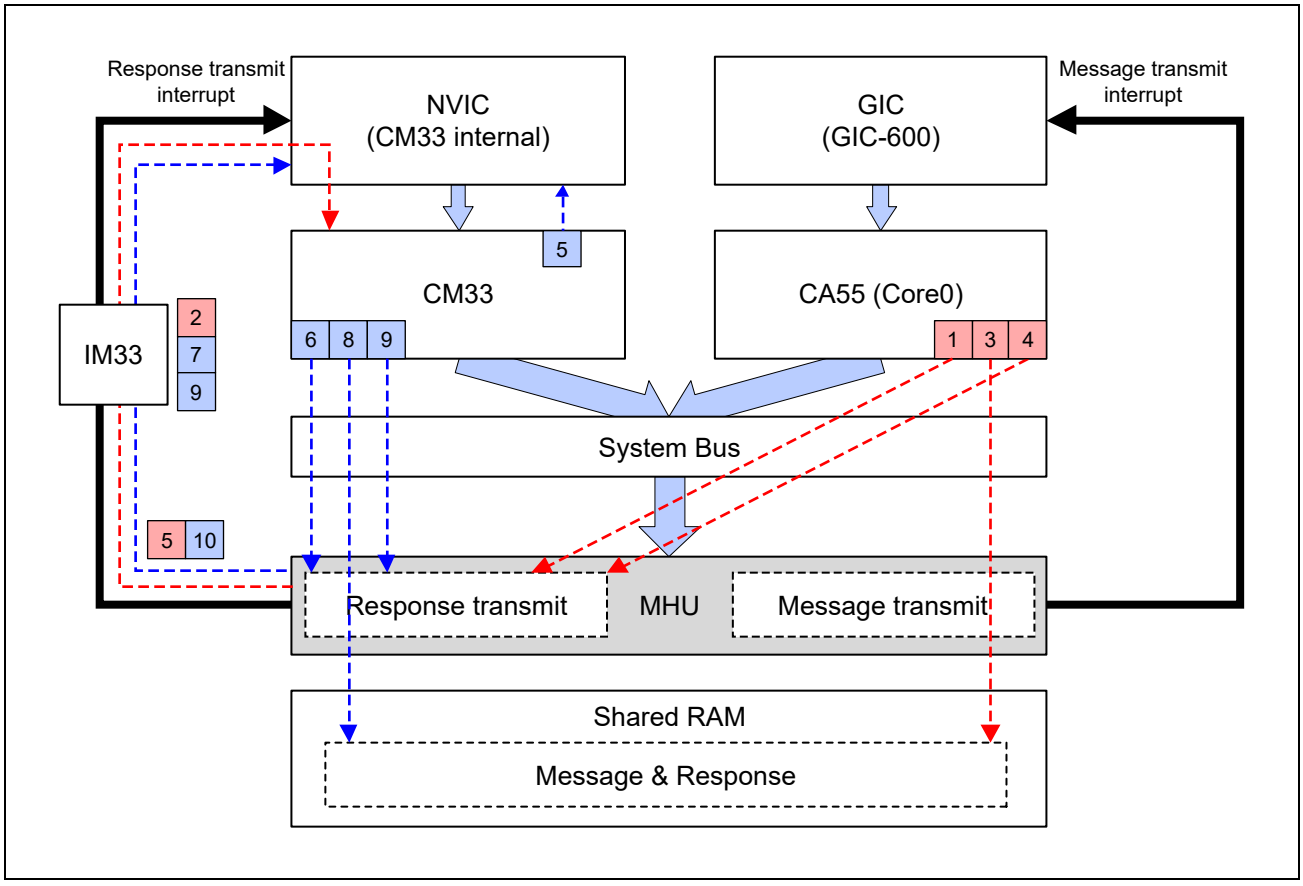

Figure 4.6-6 Response Transmit Sequence (CA55 Core0 -> CM33)

(1) CA55 Core0:	Check “0” for bit0 in register: RSP_INT_STS16 (Confirm cleared status and move to (2))
(2) CA55 Core0:	Check “0” for bit 8 in register: MISR4 of IM33 (non-secure case) Check “0” for bit 24 in register: MISR4 of IM33 (secure case) (Confirm cleared status and move to (3))
(3) CA55 Core0:	Write Response to Shared RAM
(4) CA55 Core0:	Write “1” to bit 0 in register: RSP_INT_SET16
(5) MHU channel 16:	Assert interrupt: int_rsp_ch16 forCM33
(6) CM33:	Check interrupt reason (Detect response transmit)
(7) CM33:	Check “1” for bit 0 in register: RSP_INT_STS16 Check “1” for bit 8 in register: MISR4 of IM33 (non-secure case) Check “1” for bit 24 in register: MISR4 of IM33 (secure case)
(8) CM33:	Read response from shared RAM
(9) CM33:	Write “1” to bit0 in register: RSP_INT_CLR16 Write “0” to bit 8 in register: MISR4 of IM33 (non-secure case) Write “0” to bit 24 in register: MISR4 of IM33 (secure case)
(10) MHU channel 16:	Negate interrupt:int_rsp_ch16 to CM33

4.6.3.6.3 Software interrupt sequence

Show Software interrupt sequence from CA55 Core0 to CM33 in below.

(1) CA55 Core0:	Check “0” for bit 0 in register: SW_INT_STS0_NS (Confirm cleared status and move to (2))
(2) CA55 Core0:	Check “0” for bit 0 in register: SWISR of IM33 (Confirm cleared status and move to (3))
(3) CA55 Core0:	Write “1” to bit 0 in register: SW_INT_SET0_NS
(4) MHU software interrupt channel0:	Assert interrupt: swint_ch0_ns for CM33
(5) CM33:	Check interrupt reason (Detect response transmit)
(6) CM33:	Check “1” for bit 0 in register: SW_INT_STS0_NS Check “1” for bit 0 in register: SWISR of IM33
(7) CM33:	Write “1” for bit 0 in register: SW_INT_CLR0_NS Write “0” for bit 0 in register: SWISR of IM33
(8) MHU software interrupt channel0:	Negate interrupt: swint_ch0_ns to CM33

Show Software interrupt sequence from CM33 to CA55 Core0 in below.

(1) CM33:	Check “0” for bit 0 in register: SW_INT_STS4_NS (Confirm cleared status and move to (2))
(2) CM33:	Write “1” to bit 0 in register: SW_INT_SET4_NS
(3) MHU software interrupt channel4:	Assert interrupt: swint_ch4_ns for CA55 Core0
(4) CA55 Core0:	Check interrupt reason (Detect response transmit)
(5) CA55 Core0:	Check “1” for bit 0 in register: SW_INT_STS4_NS
(6) CA55 Core0:	Write “1” to bit 0 in register: SW_INT_CLR4_NS
(7) MHU software interrupt channel4:	Negate interrupt: swint_ch4_ns to CA55 Core0

SECTION 4 SYSTEM

4.7 Direct Memory Access Controller (DMAC)

The direct memory access controller can be used in place of the CPU to perform high-speed transfers between external memory, on-chip memory, memory-mapped external devices, and on-chip peripheral modules.

This module has controllers that handles secure and non-secure access. Do not assign the same DMA transfer request to secure access and non- secure access, respectively.

4.7.1 Features

- Number of channels selectable: 16 channels (CH0 to CH15).
- 4-Gbyte address space (according to the architecture)
- Transfer data size: Byte, 2 bytes, 4 bytes, 8 bytes, 16 bytes, 32 bytes, 64 bytes, and 128 bytes
- Maximum transfer count: $2^{32} - 1$ bytes
- Address mode: Dual address mode
- Transfer requests: Can be selected from the two types of on-chip peripheral module request, and auto request (software trigger)
- Transfer mode: Single transfer mode and block transfer mode are selectable.
- Priority: The channel priority levels within channels 0 to 7 and within channels 8 to 15 are selectable between fixed mode and round-robin mode (the channel priority level between the group of channels 0 to 7 and the group of channels 8 to 15 is round-robin mode).
- Interrupt request: An interrupt request can be sent to the CPU on completion of data transfer (DMA transfer end interrupt per channel) or on occurrence of a transfer error (DMA error interrupt).
- The DMA registers have a continuous execution function that allows the next DMA transfer to be executed continuously by making settings for the next DMA transfer during execution of the current DMA transfer. This continuous execution function can be enabled or disabled independently in each channel.
- Link mode: In this mode, the setting data (descriptor data) located in the memory by the CPU is automatically retrieved by the DMAC, and DMA transfer is performed according to those values.
- Buffer sweep: If an ongoing DMA transfer is forced to end, the data already retrieved into the buffer can be output before DMA transfer ends.
- Interval: A specific DMA transfer interval can be specified to adjust the bus occupancy.
- External request detection: Low level detection, high level detection, rising edge detection, and falling edge detection are selectable for DMQ_REQ input detection.

4.7.2 Input/Output Pins

Table 4.7-1 list the pin configuration. This module has external pins for 5 channel (CH0 to CH4).]

Table 4.7-1 Pin Configuration

Channel	Name	Pin Name	Signal Name in This Section	Input/ Output	Functional description
0	DMA transfer request	DMAC_REQ0	DREQ0	Input	DMA transfer request input from an external device to channel 0
	DMA transfer request acknowledge	DMAC_ACK0	DACK0	Output	DMA transfer request acknowledge output from channel 0 of this module
	DMA transfer end	DMAC_TEND0	TEND0	Output	DMA transfer end output for channel 0 of this module
1	DMA transfer request	DMAC_REQ1	DREQ1	Input	DMA transfer request input from an external device to channel 1
	DMA transfer request acknowledge	DMAC_ACK1	DACK1	Output	DMA transfer request acknowledge output from channel 1 of this module
	DMA transfer end	DMAC_TEND1	TEND1	Output	DMA transfer end output for channel 1 of this module
2	DMA transfer request	DMAC_REQ2	DREQ2	Input	DMA transfer request input from an external device to channel 2
	DMA transfer request acknowledge	DMAC_ACK2	DACK2	Output	DMA transfer request acknowledge output from channel 2 of this module
	DMA transfer end	DMAC_TEND2	TEND2	Output	DMA transfer end output for channel 2 of this module
3	DMA transfer request	DMAC_REQ3	DREQ3	Input	DMA transfer request input from an external device to channel 3
	DMA transfer request acknowledge	DMAC_ACK3	DACK3	Output	DMA transfer request acknowledge output from channel 3 of this module
	DMA transfer end	DMAC_TEND3	TEND3	Output	DMA transfer end output for channel 3 of this module
4	DMA transfer request	DMAC_REQ4	DREQ4	Input	DMA transfer request input from an external device to channel 4
	DMA transfer request acknowledge	DMAC_ACK4	DACK4	Output	DMA transfer request acknowledge output from channel 4 of this module
	DMA transfer end	DMAC_TEND4	TEND4	Output	DMA transfer end output for channel 4 of this module

4.7.3 Register Configuration

The register configuration is shown in the figure below.

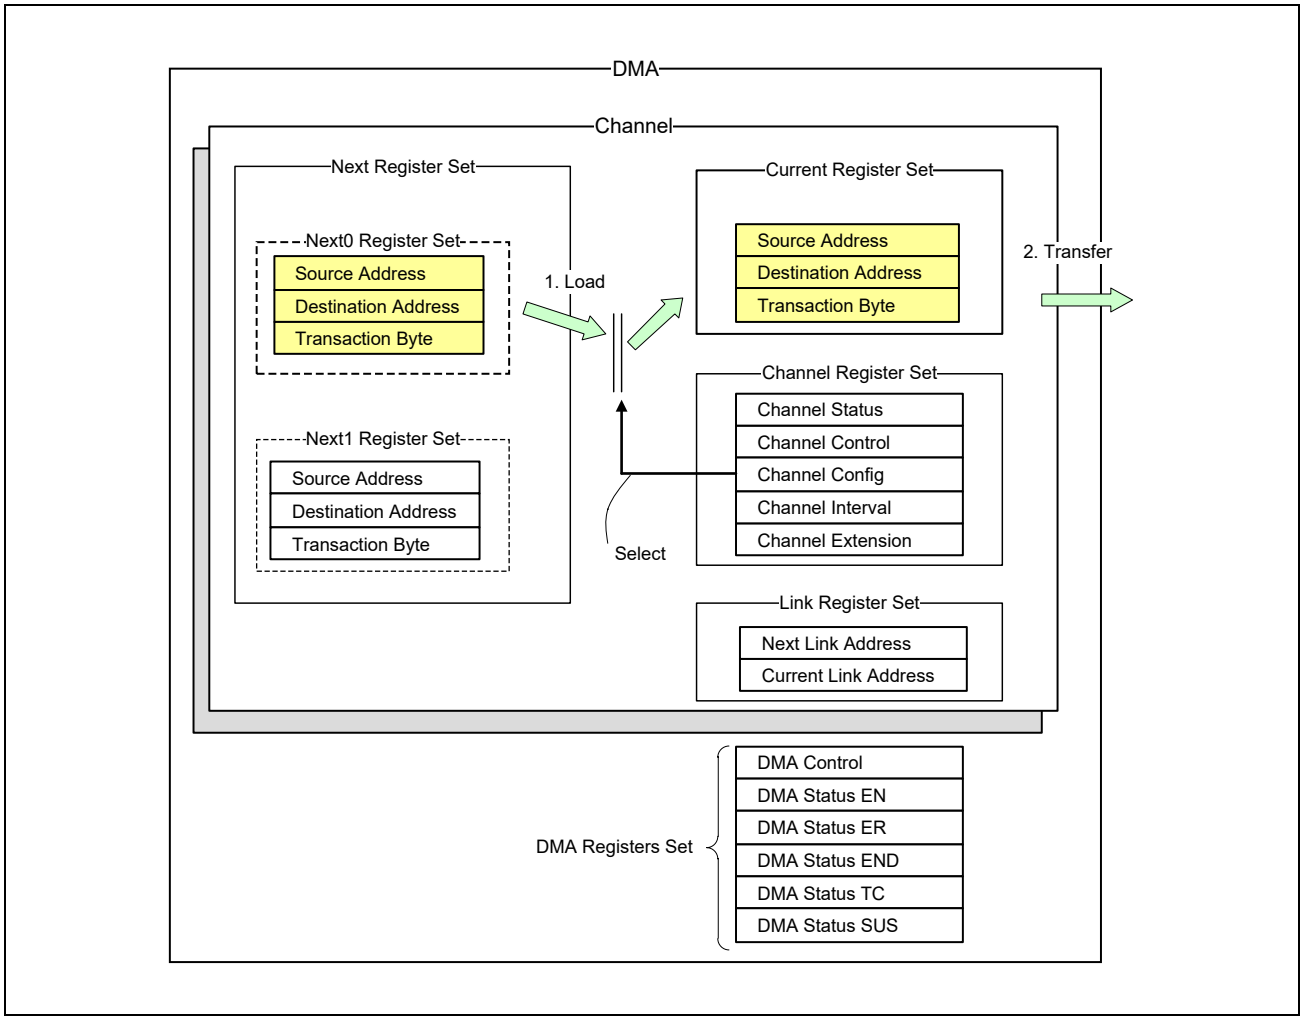

Figure 4.7-1 Register Configuration

(a) Next Register Set

This register set is used to set the source address, destination address, and transfer byte count of the DMA transaction to be executed next.

It consists of the Next0 register set and the Next1 register set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These registers set values are loaded to the Current Register Set and used for DMA transfer.

(b) Current Register Set

This register set indicates the source address, destination address, and transfer byte count of the currently executed DMA transaction.

The values are loaded from the Next0/1 register set (register mode) or from the descriptor read data (link mode). The user cannot write directly to this register set.

The register set is automatically updated each time a DMA transaction is executed.

(c) Channel Register Set

This register set is used to make the DMA transfer settings.
The settings to be made with this register set include channel status indication, channel control, DMA transaction setting, and DMA transaction interval.

(d) Link Register Set

This register set consists of a register that sets the address of the descriptor to be loaded next in link mode (Next Link Address Register) and a register that indicates the address of the currently executed descriptor (Current Link Address Register).

The Current Link Address Register is automatically updated when a descriptor is read. The user cannot write directly to this register set.

(e) DMA Register Set

This register set consists of a register that controls DMA as a whole and registers that indicate the status of the corresponding channels. It enables channel priority control as well as the monitoring of the channel status (EN, ER, END, TC, and SUS).

(f) Extended Resource Selector Register Set

It also controls output polarity of external response (DMA_ACK0-4, DMA_TEND0-4).

4.7.4 Register Descriptions

Table 4.7-2 lists the register configuration. There are eleven control registers and five status registers for each channel, and twelve common control registers are used by all channels. In addition, there is one extension resource selector every two channels.

The notation for the registers of each channel is as follows.

- Next 0 Source Address Register of channel 0 for secure access: Next 0 Source Address Register 0S (abbreviation: N0SA_0S)
- Next 0 Source Address Register of channel 0 for non-secure access: Next 0 Source Address Register 0 (abbreviation: N0SA_0)

(1) AXI I/F

Base Address Name	Base Address	
<Base_S0>	H'0_1180_0000	(Cortex-A55 Address Space)
	H'4180_0000	(Cortex-M33 Address Space Secure)
	H'5180_0000	(Cortex-M33 Address Space Non-Secure)
<Base_NS0>	H'0_1182_0000	(Cortex-A55 Address Space)
	H'4182_0000	(Cortex-M33 Address Space Secure)
	H'5182_0000	(Cortex-M33 Address Space Non-Secure)

Table 4.7-2 Register Configuration (1/12)

Channel	Register Name	Abbreviation		R/W	Initial Value	Address		Access Size

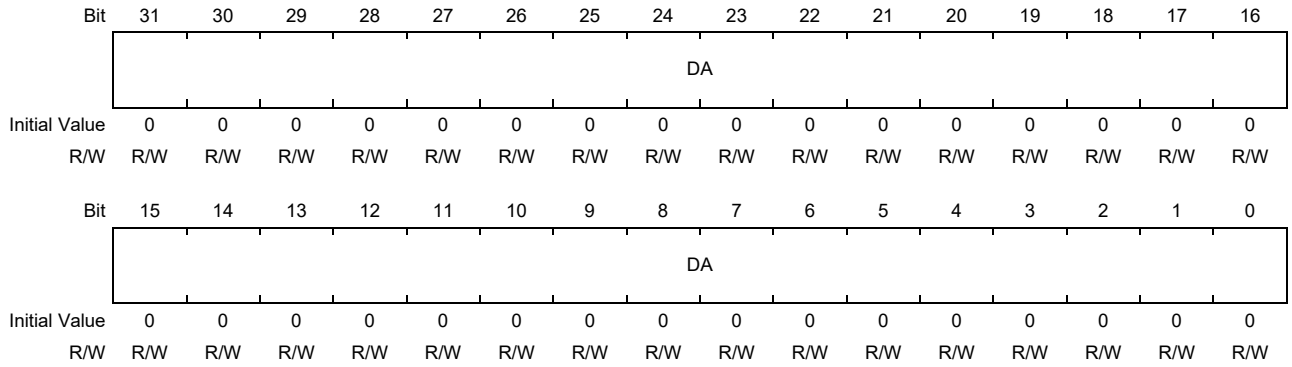
4.7.4.1 Next Source Address Register n/nS (N0SA_n/nS, N1SA_n/nS)

This register sets the DMA transfer source address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next. N0SA_n/nS is for the Next0 Register Set, and N1SA_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA	All 0	R/W	Source Address Sets the start address of the DMA transfer source.



4.7.4.2 Next Destination Address Register n/nS (N0DA_n/nS, N1DA_n/nS)

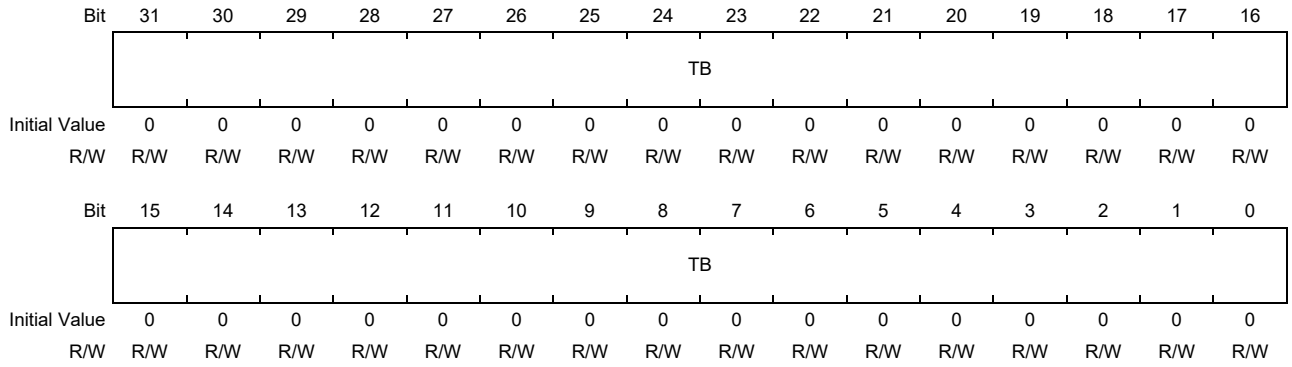
This register sets the DMA transfer destination address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next.

N0DA_n/nS is for the Next0 Register Set, and N1DA_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA	All 0	R/W	Destination Address Sets the start address of the DMA transfer destination.



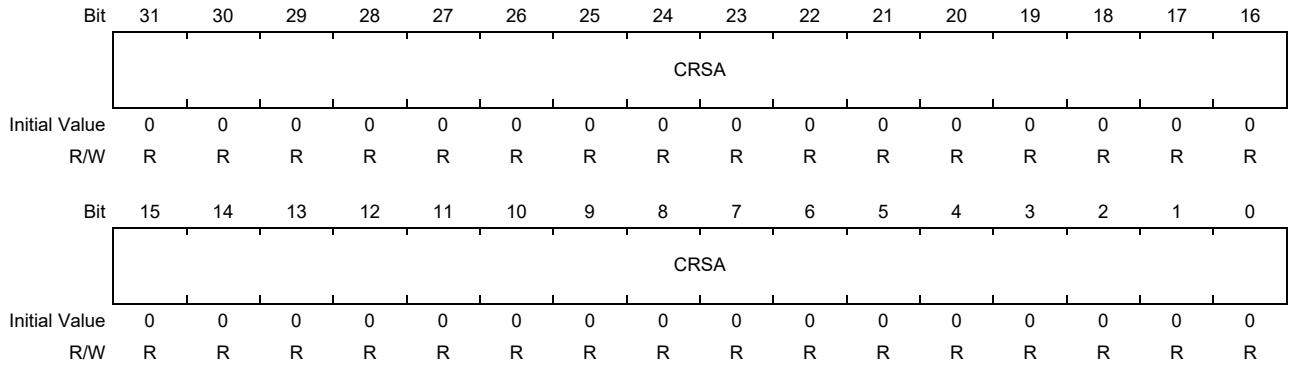
4.7.4.3 Next Transaction Byte Register n/nS (N0TB_n/nS, N1TB_n/nS)

This register sets the total transfer byte count (DMA transaction) of DMA channel (n = 0 to 15) which is to be executed next.

N0TB_n/nS is for the Next0 Register Set, and N1TB_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB	All 0	R/W	Transaction Byte Sets the total transfer byte count. *Note*: Do not start a DMA transaction with 0 set in this register.

4.7.4.4 Current Source Address Register n/nS (CRSA_n/nS)

This register indicates the DMA transfer source address of DMA channel n (n = 0 to 15).

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRSA	All 0	R	Current Source Address Register Indicates the read address of the next DMA transaction. The value automatically increments during the DMA transaction. (The value is fixed when 1 is set in SAD of the CHCFG_n/nS register.) The value increments when a read transfer starts. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

4.7.4.5 Current Destination Address Register n/nS (CRDA_n/nS)

This register indicates the DMA transfer destination address of DMA channel n (n = 0 to 15).

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRDA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRDA	All 0	R	Current Destination Address Register Indicates the write address of the next DMA transaction. The value automatically increments during the DMA transaction. (The value is fixed when 1 is set in DAD of the CHCFG_n/nS register.) The value increments when a write transfer starts. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

4.7.4.6 Current Transaction Byte Register n/nS (CRTB_n/nS)

This register indicates the total transfer byte count of DMA channel n (n = 0 to 15). The value of this register becomes 0 when the transaction ends.

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTB	All 0	R	Current Transaction Byte Register Indicates the remaining transfer byte count of the currently executed DMA transaction. The value automatically decrements during the DMA transaction. The value decrements when a write transfer is completed. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

4.7.4.7 Channel Status Register n/nS (CHSTAT_n/nS)

This register indicates the status of DMA channel n (n = 0 to 15).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INTMSK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
16	INTMSK	0	R	Indicates the temporary mask status of the DMA transfer end interrupt. 1: Masked temporarily 0: Unmasked temporarily Set condition(s): • When SETINTMSK (CHCTRL_n/nS) is set to 1 Reset condition(s): • When CLRINTMSK (CHCTRL_n/nS) is set to 1 • When SWRST (CHCTRL_n/nS) is set to 1
15 to 12	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
11	MODE	0	R	DMA Mode Indicates the DMA mode. It corresponds to the value set in the DMS bit of the CHCFG_n/nS register. 0: Register mode 1: Link mode
10	DER	0	R	Descriptor Error Indicates whether the link valid value of the read descriptor is invalid (LV = 0) (this is not dependent on the DIM level of the descriptor). If a descriptor error has occurred, the transfer is stopped but no DMA error interrupt occurs. 0: Descriptor Error not detected 1: Descriptor Error detected Set condition(s): • When the LV value loaded with the descriptor in link mode is 0 Reset condition(s): • When SWRST (CHCTRL_n/nS) is set to 1
9	DW	0	R	Descriptor WriteBack Indicates the descriptor writeback status. The bit maintains 1 if a bus error is received during descriptor writeback. 0: Operation other than writeback is being performed for the header in link mode. 1: (ER = 0) Writeback is being performed for the header in link mode. (ER = 1) A bus error occurs during writeback for the header in link mode. Set condition(s): • When header writeback in link mode starts Reset condition(s): • When header writeback in link mode ends with an OK response • When SWRST (CHCTRL_n/nS) is set to 1

Bit	Bit Name	Initial Value	R/W	Description
8	DL	0	R	Descriptor Load Indicates whether the descriptor is being loaded. The bit maintains 1 if a bus error is received during descriptor load. 0: Operation other than descriptor load 1: (ER = 0) Descriptor load is in progress in link mode. (ER = 1) A bus error occurs during descriptor load in link mode. Set condition(s): • When descriptor load in link mode starts Reset condition(s): • When descriptor load in link mode ends with an OK response • When SWRST (CHCTRL_n/nS) is set to 1
7	SR	0	R	Selected Register Set Indicates the register set currently selected in register mode. 0: Next0 Register Set 1: Next1 Register Set Set condition(s): • When RSEL (CHCFG_n/nS) is set to 1 Reset condition(s): • When RSEL (CHCFG_n/nS) is set to 0
6	TC	0	R	Terminal Count Indicates whether the DMA transaction is completed. 0: DMA transfer not completed 1: DMA transfer completed Set condition(s): • When data equivalent to the total transfer byte count set in the CRTB register has been transferred in register mode • When data equivalent to the total transfer byte count set in the CRTB register has been transferred in link mode, with 1 set in WBD of the descriptor header • When descriptor writeback is completed in link mode, with 0 set in WBD of the descriptor header Clear condition(s): • When the CLRTC (CHCTRL_n/nS) bit is set to 1 • When the SWRST (CHCTRL_n/nS) bit is set to 1
5	END	0	R	DMAEND Interrupted Indicates whether the DMA transaction is completed and whether the DMA transfer end interrupt has occurred. 0: DMA transfer not completed 1: DMA transfer completed Set condition(s): • When one of the set conditions for the TC bit is met and 0 is set in DEM of the CHCFG_n/nS register • When the descriptor is read in link mode and both LV of the header and DIM are set to 0 Clear condition(s): • When CLREND (CHCTRL_n/nS) is set to 1 • When SWRST (CHCTRL_n/nS) is set to 1

Bit	Bit Name	Initial Value	R/W	Description
4	ER	0	R	Error bit Indicates that a DMA error interrupt has occurred because an error response has been received from the transfer source or destination and a bus error has occurred during the DMA transfer. 0: No bus error has occurred 1: A DMA error interrupt has occurred due to a bus error Set condition(s): • When a bus error has occurred during a bus cycle Clear condition(s): • When SWRST (CHCTRL_n/nS) is set to 1
3	SUS	0	R	Suspend Indicates whether the channel is suspended. 0: Channel_n not suspended 1: Channel_n suspended Set condition(s): • When SETSUS (CHCTRL_n/nS) is set to 1 during a DMA transfer on Channel_n, creating a SUSPEND status internally Clear condition(s): • When CLRSUS (CHCTRL_n/nS) is set to 1 • When CLREN (CHCTRL_n/nS) is set to 1
2	TACT	0	R	Transaction Active Indicates whether the DMAC is active. This bit is intended to check that the channel is completely inactive. 0: DMA on Channel_n inactive 1: DMA on Channel_n active Set condition(s): • When a DMA transaction starts on Channel_n Clear condition(s): • When a DMA transaction is completed
1	RQST	0	R	Request Indicates whether a transfer request is being received. 0: DMA transfer request not being received 1: DMA transfer request being received Set condition(s): • When the STG bit (CHCTRL_n/nS) is set to 1 (auto request) • When a transfer request is received from the DMA request source set in the CHCFG_n/nS register Clear condition(s): • When SWRST (CHCTRL_n/nS) is set to 1 • When CLRRQ (CHCTRL_n/nS) is set to 1 • When a transfer is executed on the side specified by REQD (CHCFG_n/nS) in single transfer mode (TM = 0). • When all DMA transactions are completed in register mode (the transaction ends with REN set to 0) • When the DMA transfer of the last descriptor (LE = 1) is completed in link mode • When descriptor read stops (LV = 0) in link mode • When a bus error is received due to an error response

Bit	Bit Name	Initial Value	R/W	Description
0	EN	0	R	Enable Indicates whether the operation of DMA channel n is enabled or disabled. 0: Operation disabled 1: Operation enabled Set condition(s): • When SETEN (CHCTRL_n/nS) is set to 1 Clear condition(s): • When SWRST (CHCTRL_n/nS) is set to 1 • When CLREN (CHCTRL_n/nS) is set to 1 • When a bus error is received due to an error response during the transfer • When all DMA transactions are completed in register mode (the transaction ends with REN set to 0) • When the DMA transfer of the last descriptor (LE = 1) is completed in link mode (writeback when WBD is set to 0) • When descriptor read stops (LV = 0) in link mode

CAUTION

If the ER bit is set to 1 for any transfer, the whole transfer should be handled as invalid.

To suspend a DMA transaction, mask or clear the transfer request or clear the Enable bit (for the procedure, see **4.7.7.10 (2) Transfer Stop**).

If a transfer request from an on-chip peripheral module input is made concurrently with an auto request (by setting 1 in the STG bit) for the same one channel, the trigger source that takes effect cannot be identified. Make sure that only one of these transfer requests is used in the system.

When transfer is requested by an auto request, wait for the last requested DMA transfer to complete (use the Current Register or other data to check the status) before setting the STG bit for the next transfer request.

4.7.4.8 Channel Control Register n/nS (CHCTRL_n/nS)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRINTMSK	SETINTMSK

	—	—	—	—	—	—	CLRSUS	SETSUS	—	CLRTC	CLRENDD	CLRRQ	SWRST	STG	CLREN	SETEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
17	CLRINTMSK	0	R/W	When this bit is set to 1, the mask of the DMA transfer end interrupt is cleared. Also, the INTMSK bit of the CHSTAT_n/nS register is set to 0. If the mask is cleared when 1 is set in both LVINT of the DCTRL register and END of the CHSTAT_n/nS register, the DMA transfer end interrupt becomes active. (It does not become active when 0 is set in LVINT.) A read operation results in 0 being read. 1: Clears the mask set by SETINTMSK. 0: Does not affect the operation.
16	SETINTMSK	0	R/W	When this bit is set to 1, the DMA transfer end interrupt is temporarily masked. Also, the INTMSK bit of the CHSTAT_n/nS register is set to 1. A read operation results in 0 being read. 1: Masks the DMA transfer end interrupt. 0: Does not affect the operation.
15 to 10	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
9	CLRSUS	0	R/W	Clear Suspend Clears the suspend status. Setting this bit to 1 when 1 is set in SUS of the CHSTAT_n/nS register can clear the suspend status. An attempt to read this bit results in 0 being read. 1: Clears the suspend status of the current DMA transfer. 0: Does not affect the operation.
8	SETSUS	0	R/W	Set Suspend Suspends the current DMA transfer. Setting this bit to 1 when 1 is set in EN of the CHSTAT_n/nS register can suspend the current DMA transfer. An attempt to read this bit results in 0 being read. 1: Suspends the current DMA transfer. 0: Does not affect the operation.
7	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
6	CLRTC	0	R/W	Clear TC bit Setting this bit to 1 can clear the TC bit of the CHSTAT_n/nS register. An attempt to read this bit results in 0 being read. 1: Clears the TC bit. 0: Does not affect the operation.

Bit	Bit Name	Initial Value	R/W	Description
5	CLREND	0	R/W	Clear End bit Setting this bit to 1 can clear the END bit of the CHSTAT_n/nS register. Also, the DMA transfer end interrupt is cleared. An attempt to read this bit results in 0 being read. 1: Clears the END bit. 0: Does not affect the operation.
4	CLRRQ	0	R/W	Clear Request bit Setting this bit to 1 can clear the RQST bit of the CHSTAT_n/nS register. An attempt to read this bit results in 0 being read. 1: Clears the RQST bit. 0: Does not affect the operation.
3	SWRST	0	R/W	Software Reset Setting this bit to 1 can clear the channel status register (CHSTAT_n/nS). When setting this bit to 1, make sure that both the EN bit and TACT bit are set to 0. An attempt to read this bit results in 0 being read. 1: Resets the channel status register. 0: Does not affect the operation.
2	STG	0	R/W	Software Trigger Setting this bit to 1 sets an auto request. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence. An attempt to read this bit results in 0 being read. 1: Sets a transfer request triggered by an auto request (sets 1 in the RQST bit). 0: Does not affect the operation.
1	CLREN	0	R/W	Clear Enable Setting this bit to 1 can clear the EN bit (for details, see **4.7.7.10 (2) Transfer Stop**). An attempt to read this bit results in 0 being read. 1: Stops the DMA transfer (clears the EN bit). 0: Does not affect the operation.
0	SETEN	0	R/W	Set Enable Enables a DMA transfer on DMA channel n. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence and the transfer does not start. An attempt to read this bit results in 0 being read. 1: Enables a DMA transfer (sets 1 in the EN bit). 0: Does not affect the operation.

4.7.4.9 Channel Configuration Register n/nS (CHCFG_n/nS)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

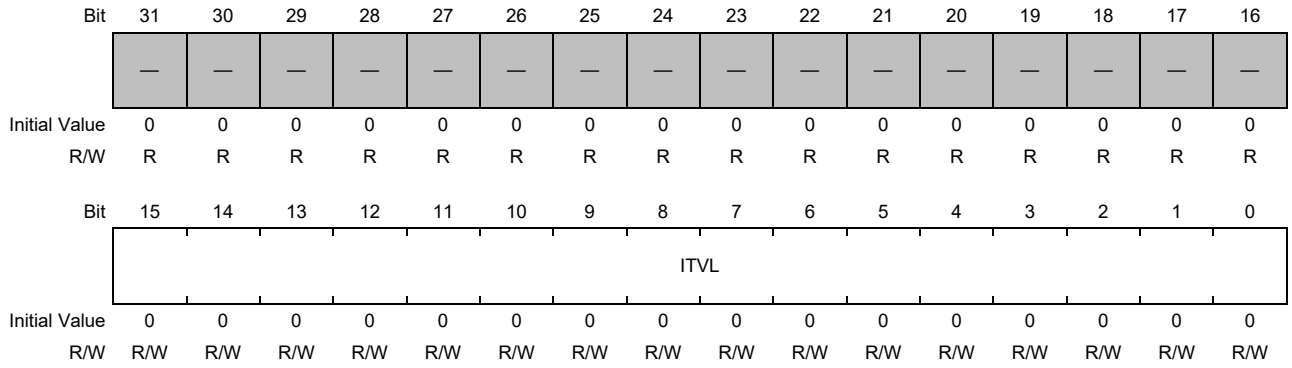
Bit	Bit Name	Initial Value	R/W	Description
31	DMS	0	R/W	DMA Mode Select Sets the DMA mode. 0: Register mode (initial value) 1: Link mode
30	REN	0	R/W	Register Set Enable After a DMA transaction is completed, DMA transfers are continued using the Next register set selected by RSEL. This bit is valid only in register mode. 0: Does not continue DMA transfers. 1: Continues DMA transfers. Set condition(s): • When 1 is written to this bit Clear condition(s): • When 0 is written to this bit • When a DMA transaction is completed, with REN set to 1
29	RSW	0	R/W	Register Select Switch Inverts RSEL automatically after a DMA transaction is completed. This bit is valid only in register mode. 0: Does not invert RSEL automatically after a DMA transaction (initial value). 1: Inverts RSEL automatically after a DMA transaction.
28	RSEL	0	R/W	Register Set Select Selects the Next register set to be executed next. This bit is valid only in register mode. When RSW is set to 1, this bit is inverted automatically when a DMA transaction is completed. 0: Executes the Next0 Register Set (initial value). 1: Executes the Next1 Register Set. Transition condition(s): • When a DMA transaction is completed, with RSW set to 1
27	SBE	0	R/W	Sweep Buffer Enable Selects whether to sweep (write) the data already read into the buffer and stop the DMA transfer if the Enable bit is cleared to 0 during a DMA transaction. The sweep mode is available only when REQD is set to 0. 0: Stops the DMA transfer without sweeping the buffer (initial value). 1: Stops the DMA transfer after sweeping the buffer.
26, 25	—	00	R	Reserved. Set 0. A read operation results in 0 being read.

Bit	Bit Name	Initial Value	R/W	Description
24	DEM	0	R/W	DMA Transfer End Interrupt Mask Masks the DMA transfer end interrupt for register mode transfer. If 1 is set in this bit when a DMA transfer end interrupt is output, the DMA transfer end interrupt signal is not asserted. In this case, DEM is cleared to 0 automatically. 0: Does not mask the DMA transfer end interrupt (initial value). 1: Masks the DMA transfer end interrupt. Clear condition(s): • When a DMA transaction is completed with DEM set to 1
23	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
22	TM	0	R/W	Transfer Mode Sets the DMA transfer mode. 0: Single transfer mode (initial value) 1: Block transfer mode
21	DAD	0	R/W	Sets the destination address counting direction of DMA channel n. 0: Increment (initial value) 1: Fixed
20	SAD	0	R/W	Sets the source address counting direction of DMA channel n. 0: Increment (initial value) 1: Fixed
19 to 16	DDS[3:0]	0000	R/W	Destination Data Size Sets the DMA transfer size of the transfer destination.

Value	Size	Remark
0000	8 bits	Initial value
0001	16 bits	
0010	32 bits	
0011	64 bits	
0100	128 bits	
0101	256 bits	
0110	512 bits	
0111	1024 bits	
Other than the above	—	Setting prohibited

15 to 12	SDS[3:0]	0000	R/W	Source Data Size Sets the DMA transfer size of the transfer source.

Value	Size	Remark
0000	8 bits	Initial value
0001	16 bits	
0010	32 bits	
0011	64 bits	
0100	128 bits	
0101	256 bits	
0110	512 bits	
0111	1024 bits	
Other than the above	—	Setting prohibited



11	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
10 to 8	AM[2:0]	000	R/W	ACK Mode Sets the DMAACK output mode. 000: Pulse mode 001: Level mode (active until the transfer request from an on-chip peripheral module input becomes inactive) 01x: Bus cycle mode (active while the DMA transfer is in a bus cycle) 1xx: DMAACK not to be output (this setting should be made when an auto request is made by STG (CHCTRL_n/nS) or when the SCIFA transfer is performed)

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
6	LVL	0	R/W	Level Selects whether to detect a DMA request based on the level or edge of the signal. 0: Detects based on the edge (initial value). 1: Detects based on the level.
5	HIEN	0	R/W	High Enable Selects whether to detect a DMA request using the High level or rising edge of the signal. When LVL = 0: HIEN = 1: Detects a request in response to the rising edge of the signal. HIEN = 0: Does not detect a request in response to the rising edge of the signal (initial value). When LVL = 1: HIEN = 1: Detects a request when the signal is at the High level. HIEN = 0: Does not detect a request even when the signal is at the High level (initial value).
4	LOEN	0	R/W	Low Enable Selects whether to detect a DMA request using the Low level or falling edge of the signal. When LVL = 0: LOEN = 1: Detects a request in response to the falling edge of the signal. LOEN = 0: Does not detect a request in response to the falling edge of the signal (initial value). When LVL = 1: LOEN = 1: Detects a request when the signal is at the Low level. LOEN = 0: Does not detect a request even when the signal is at the Low level (initial value).
3	REQD	0	R/W	Request Direction Selects whether DMAREQ selected by the SEL bit is the source or destination. This bit is also used to define when DMAACK is to become active. 0: Source; DMAACK is to become active when read (initial value). 1: Destination; DMAACK is to become active when written.
2 to 0	SEL[2:0]	000	R/W	These bits are used to set a DMAC channel. Set one of the following values so that the channel set by the SEL bits matches the CHCFG_n/nS channel. 000: CH0/CH8 001: CH1/CH9 010: CH2/CH10 011: CH3/CH11 100: CH4/CH12 101: CH5/CH13 110: CH6/CH14 111: CH7/CH15

4.7.4.10 Channel Interval Register n/nS (CHITVL_n/nS)

This register sets the transfer interval for DMA channel n (n = 0 to 15).

For details, see **4.7.7.8 Interval Count Function**.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
15 to 0	ITVL	All 0	R/W	Sets the channel transfer interval.

4.7.4.11 Channel Extension Register n/nS (CHEXT_n/nS)

This is an extension register for DMA channel n (n = 0 to 15).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
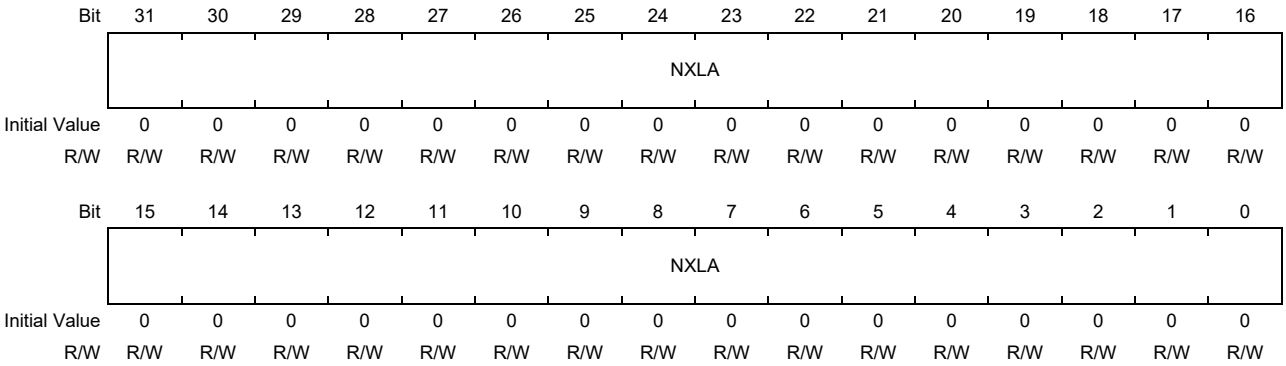
R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Set 0. A read operation results in 0 being read.
15 to 12	DCA[3:0]	0000	R/W	Destination CACHE Sets the value to be output to AWCACHE[3:0] for DMA write transfer. See Note 1 below.
11	—	0	R	Set 0. A read operation results in 0 being read.
10 to 8	DPR[2:0]	000	R/W	Destination PROT Sets the value to be output to AWPROT[2:0] for DMA write transfer. In the case of non-secure access, the value output as AWPROT[1] is fixed to 1 regardless of the setting of the DPR[1] bit. See Note 2 below.
7 to 4	SCA[3:0]	0000	R/W	Source CACHE Sets the value to be output to ARCACHE[3:0] for DMA read transfer. See Note 1 below.
3	—	0	R	Set 0. A read operation results in 0 being read.
2 to 0	SPR[2:0]	000	R/W	Source PROT Sets the value to be output to ARPROT[2:0] for DMA read transfer. In the case of non-secure access, the value output as ARPROT[1] is fixed to 1 regardless of the setting of the SPR[1] bit. See Note 2 below.



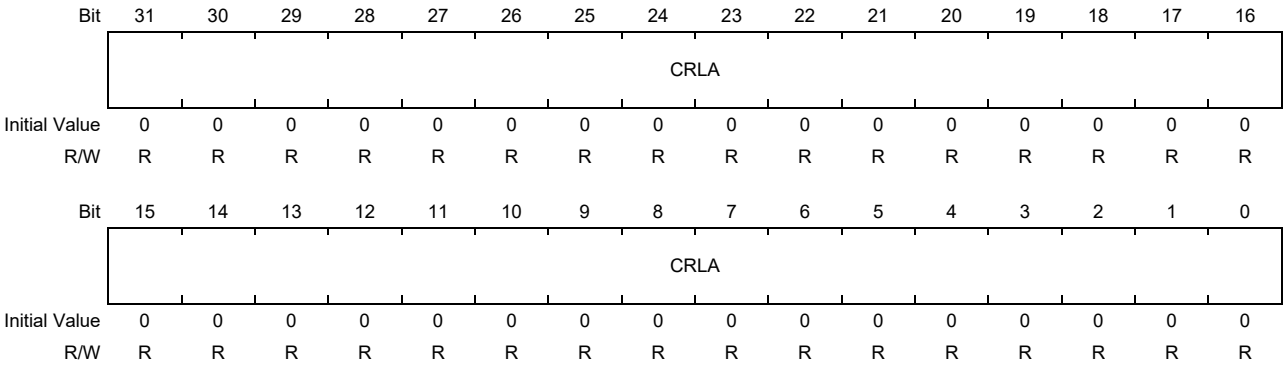
Note 1. Cache support: Bits SCA and DCA are used to change the settings.

Note 2. Protection unit support: Bits SPR and DPR are used to change the settings.
For the setting value, see AMBA AXI Protocol Specification from Arm Limited.

4.7.4.12 Next Link Address Register n/nS (NXLA_n/nS)

This is a 32-bit register that sets the link address of DMA channel n (n = 0 to 15).

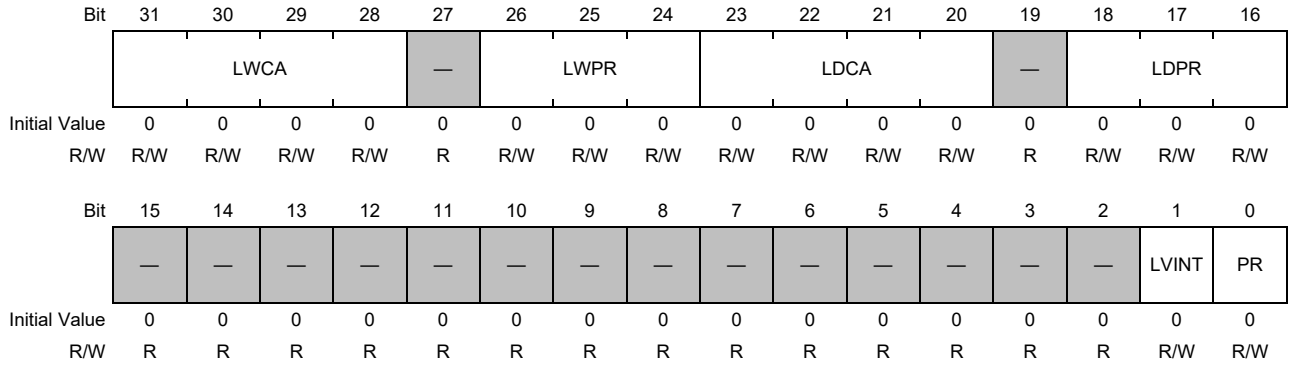
For information about the link mode, see **4.7.6.3 Link Mode**.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NXLA	All 0	R/W	Sets a link address. The low-order 2 bits are masked with 0s. Only an address aligned with a 4-byte boundary can be set.

4.7.4.13 Current Link Address Register n/nS (CRLA_n/nS)

This is a 32-bit register that indicates the link address of DMA channel n (n = 0 to 15).



For information about the link mode, see **4.7.6.3 Link Mode**.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRLA	All 0	R	Indicates the address of the currently executed descriptor.

4.7.4.14 DMA Control Register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S)

This register sets the transfer type for descriptor access and the arbitration between channels.
(DCTRL_0_7/0_7S is common for channels 0 to 7 and DCTRL_8_15/8_15S is common for channels 8 to 15.)

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	LWCA	0000	R/W	Link WriteBack CACHE Sets the value to be output to AWCACHE[3:0] during descriptor writeback in link mode. For the setting value, see Note in **4.7.4.11 Channel Extension Register n/nS (CHEXT_n/nS)**.
27	—	0	R	Reserved. Set 0. The initial value is 0.
26 to 24	LWPR	000	R/W	Link WriteBack PROT Sets the value to be output to AWPROT[2:0] during descriptor writeback in link mode. In the case of non-secure access, the value output as AWPROT[1] is fixed to 1 regardless of the setting of the LWPR[1] bit. For the setting value, see AMBA AXI Protocol Specification from Arm Limited.
23 to 20	LDCA	0000	R/W	Link Descriptor CACHE Sets the value to be output to ARCACHE[3:0] during descriptor load in link mode. For the setting value, see Note in **4.7.4.11 Channel Extension Register n/nS (CHEXT_n/nS)**.
19	—	0	R	Reserved. Set 0. The initial value is 0.
18 to 16	LDPR	000	R/W	Link Descriptor PROT Sets the value to be output to ARPROT[2:0] during descriptor load in link mode. In the case of non-secure access, the value output as ARPROT[1] is fixed to 1 regardless of the setting of the LDPR[1] bit. For the setting value, see AMBA AXI Protocol Specification from Arm Limited.
15 to 2	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
1	LVINT	0	R/W	Sets whether to use pulse output or level output for the DMA transfer end interrupt and DMA error interrupt. Set pulse output for this product. 0: Pulse output (initial value) 1: Level output
0	PR	0	R/W	Sets the transfer priority control mode between channels (see **4.7.7.2 Priority Control for DMA Channels**). 0: Fixed priority mode (initial value) 1: Round robin mode

4.7.4.15 DMA Status EN Register (DSTAT_EN_0_7/0_7S)

This register indicates the EN bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	EN7	0	R	Indicates the EN bit status of DMA channel 7.
6	EN6	0	R	Indicates the EN bit status of DMA channel 6.
5	EN5	0	R	Indicates the EN bit status of DMA channel 5.
4	EN4	0	R	Indicates the EN bit status of DMA channel 4.
3	EN3	0	R	Indicates the EN bit status of DMA channel 3.
2	EN2	0	R	Indicates the EN bit status of DMA channel 2.
1	EN1	0	R	Indicates the EN bit status of DMA channel 1.
0	EN0	0	R	Indicates the EN bit status of DMA channel 0.

4.7.4.16 DMA Status EN Register (DSTAT_EN_8_15/8_15S)

This register indicates the EN bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	EN15	0	R	Indicates the EN bit status of DMA channel 15.
6	EN14	0	R	Indicates the EN bit status of DMA channel 14.
5	EN13	0	R	Indicates the EN bit status of DMA channel 13.
4	EN12	0	R	Indicates the EN bit status of DMA channel 12.
3	EN11	0	R	Indicates the EN bit status of DMA channel 11.
2	EN10	0	R	Indicates the EN bit status of DMA channel 10.
1	EN9	0	R	Indicates the EN bit status of DMA channel 9.
0	EN8	0	R	Indicates the EN bit status of DMA channel 8.

4.7.4.17 DMA Status ER Register (DSTAT_ER_0_7/0_7S)

This register indicates the ER bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	ER7	0	R	Indicates the ER bit status of DMA channel 7.
6	ER6	0	R	Indicates the ER bit status of DMA channel 6.
5	ER5	0	R	Indicates the ER bit status of DMA channel 5.
4	ER4	0	R	Indicates the ER bit status of DMA channel 4.
3	ER3	0	R	Indicates the ER bit status of DMA channel 3.
2	ER2	0	R	Indicates the ER bit status of DMA channel 2.
1	ER1	0	R	Indicates the ER bit status of DMA channel 1.
0	ER0	0	R	Indicates the ER bit status of DMA channel 0.

4.7.4.18 DMA Status ER Register (DSTAT_ER_8_15/8_15S)

This register indicates the ER bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	ER15	0	R	Indicates the ER bit status of DMA channel 15.
6	ER14	0	R	Indicates the ER bit status of DMA channel 14.
5	ER13	0	R	Indicates the ER bit status of DMA channel 13.
4	ER12	0	R	Indicates the ER bit status of DMA channel 12.
3	ER11	0	R	Indicates the ER bit status of DMA channel 11.
2	ER10	0	R	Indicates the ER bit status of DMA channel 10.
1	ER9	0	R	Indicates the ER bit status of DMA channel 9.
0	ER8	0	R	Indicates the ER bit status of DMA channel 8.

4.7.4.19 DMA Status END Register (DSTAT_END_0_7/0_7S)

This register indicates the END bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	END7	0	R	Indicates the END bit status of DMA channel 7.
6	END6	0	R	Indicates the END bit status of DMA channel 6.
5	END5	0	R	Indicates the END bit status of DMA channel 5.
4	END4	0	R	Indicates the END bit status of DMA channel 4.
3	END3	0	R	Indicates the END bit status of DMA channel 3.
2	END2	0	R	Indicates the END bit status of DMA channel 2.
1	END1	0	R	Indicates the END bit status of DMA channel 1.
0	END0	0	R	Indicates the END bit status of DMA channel 0.

4.7.4.20 DMA Status END Register (DSTAT_END_8_15/8_15S)

This register indicates the END bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	END15	0	R	Indicates the END bit status of DMA channel 15.
6	END14	0	R	Indicates the END bit status of DMA channel 14.
5	END13	0	R	Indicates the END bit status of DMA channel 13.
4	END12	0	R	Indicates the END bit status of DMA channel 12.
3	END11	0	R	Indicates the END bit status of DMA channel 11.
2	END10	0	R	Indicates the END bit status of DMA channel 10.
1	END9	0	R	Indicates the END bit status of DMA channel 9.
0	END8	0	R	Indicates the END bit status of DMA channel 8.

4.7.4.21 DMA Status TC Register (DSTAT_TC_0_7/0_7S)

This register indicates the TC bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	TC7	0	R	Indicates the TC bit status of DMA channel 7.
6	TC6	0	R	Indicates the TC bit status of DMA channel 6.
5	TC5	0	R	Indicates the TC bit status of DMA channel 5.
4	TC4	0	R	Indicates the TC bit status of DMA channel 4.
3	TC3	0	R	Indicates the TC bit status of DMA channel 3.
2	TC2	0	R	Indicates the TC bit status of DMA channel 2.
1	TC1	0	R	Indicates the TC bit status of DMA channel 1.
0	TC0	0	R	Indicates the TC bit status of DMA channel 0.

4.7.4.22 DMA Status TC Register (DSTAT_TC_8_15/8_15S)

This register indicates the TC bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	TC15	0	R	Indicates the TC bit status of DMA channel 15.
6	TC14	0	R	Indicates the TC bit status of DMA channel 14.
5	TC13	0	R	Indicates the TC bit status of DMA channel 13.
4	TC12	0	R	Indicates the TC bit status of DMA channel 12.
3	TC11	0	R	Indicates the TC bit status of DMA channel 11.
2	TC10	0	R	Indicates the TC bit status of DMA channel 10.
1	TC9	0	R	Indicates the TC bit status of DMA channel 9.
0	TC8	0	R	Indicates the TC bit status of DMA channel 8.

4.7.4.23 DMA Status SUS Register (DSTAT_SUS_0_7/0_7S)

This register indicates the SUS bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	SUS7	0	R	Indicates the SUS bit status of DMA channel 7.
6	SUS6	0	R	Indicates the SUS bit status of DMA channel 6.
5	SUS5	0	R	Indicates the SUS bit status of DMA channel 5.
4	SUS4	0	R	Indicates the SUS bit status of DMA channel 4.
3	SUS3	0	R	Indicates the SUS bit status of DMA channel 3.
2	SUS2	0	R	Indicates the SUS bit status of DMA channel 2.
1	SUS1	0	R	Indicates the SUS bit status of DMA channel 1.
0	SUS0	0	R	Indicates the SUS bit status of DMA channel 0.

4.7.4.24 DMA Status SUS Register (DSTAT_SUS_8_15/8_15S)

This register indicates the SUS bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	SUS15	0	R	Indicates the SUS bit status of DMA channel 15.
6	SUS14	0	R	Indicates the SUS bit status of DMA channel 14.
5	SUS13	0	R	Indicates the SUS bit status of DMA channel 13.
4	SUS12	0	R	Indicates the SUS bit status of DMA channel 12.
3	SUS11	0	R	Indicates the SUS bit status of DMA channel 11.
2	SUS10	0	R	Indicates the SUS bit status of DMA channel 10.
1	SUS9	0	R	Indicates the SUS bit status of DMA channel 9.
0	SUS8	0	R	Indicates the SUS bit status of DMA channel 8.

4.7.4.25 DMA Extension Resource Selectors 0/0S to 7/7S (DMARS0/0S to DMARS7/7S)

DMARSn/nS (n = 0 to 7) are 32-bit readable/writable registers that specify the DMA transfer sources from peripheral modules in each channel. DMARS0/0S is for channels 0/0S and 1/1S, DMARS1/1S is for channels 2/2S and 3/3S, and so on.

Table 4.7-5 shows the specifiable combinations.

Some on-chip peripheral modules in this product use the same signal both for an interrupt request and for a DMA transfer request. If such a module is selected by a DMARSn/nS register, the signal works as a DMA transfer request signal and interrupt requests to the interrupt controller are masked. To enable the interrupt, clear the setting of DMARSn/nS (set all MID[7:0] and RID[1:0] to 0). See **Table 4.7-5** for possible combinations of MID[7:0] and RID[1:0].

4.7.5 Operation

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority order; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request, and on-chip peripheral module request.

4.7.5.1 Transfer Flow

After the next source address register (N0SA_n/nS, N1SA_n/nS), next destination address register (N0DA_n/nS, N1DA_n/nS), next transaction byte register (N0TB_n/nS, N1TB_n/nS), channel control register (CHCTRL_n/nS), channel configuration register (CHCFG_n/nS), channel extension register (CHEXT_n/nS), DMA control register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S), and DMA extension resource selector (DMARSn/nS) are set for the target transfer conditions, the DMAC transfers data according to the following procedure:

1. Checks to see if transfer is enabled (EN = 0 and TACT = 0 in channel status register).
2. Clears the channel status register (set 1 in the SWRST bit of the channel control register).
3. Enables DMA transfer (set 1 in the SETEN bit of the channel control register).
4. When a transfer request comes and transfer is enabled, the DMAC transfers one transfer unit of data (depending on the DDS[3:0] and SDS[3:0] bit settings). For an auto request, the transfer begins automatically when 1 is set in the STG bit of the channel control register. The CRTB_n/nS value will be decremented by 1 for each transfer.
5. If 0 is set in the REN bit of the channel configuration register when transfer has been completed for the specified count (when CRTB_n/nS reaches 0), transfer ends normally. If the DEM bit of the channel configuration register is set to 0 at this time, a DMA transfer end interrupt is sent to the CPU. If the REN bit is 1 when CRTB_n/nS reaches 0, transfer operations are continued with the values of N0SA_n/nS, N1SA_n/nS, N0DA_n/nS, N1DA_n/nS, N0TB_n/nS, and N1TB_n/nS set by the RSEL bit of the channel configuration register until there are no more transfer requests.
6. When an address error in the DMAC is generated, the transfer is stopped. Transfers are also stopped when 1 is set in the CLREN bit of CHCTRL_n/nS.

4.7.5.2 DMA Transfer Requests

DMA transfer requests are basically generated in either the data transfer source or destination, but they can also be generated in on-chip peripheral modules that are neither the transfer source nor destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. On-chip peripheral module request is selected by the DMARS0/0S to DMARS7/7S registers.

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the DMAC to automatically generate a transfer request signal internally. When the STG bit in channel control register n is set to 1, the transfer begins so long as the TACT bit in channel status register is 0.

(2) External Request Mode

In this mode a transfer is performed at the transfer request signal (DREQ0-4) of an external device of the LSI. When the DMA transfer is enabled, DMA transfer is performed upon a DREQ0-4 input.

Choose to detect DREQ0-4 by either the edge or level of the signal input with the LVL, HIEN, and LOEN bits in channel configuration register 0 to 4 as shown below. The source of the transfer request does not have to be the data transfer source or destination.

For the output level settings of the DACK0 and TEND0-4 pins, refer to **4.7.4.26 DMA External Output Control Register (DMAEOC/DMAEOCS)**.

Table 4.7-4 Settings for External Request Detection

CHCFG_n/CHCFG_nS			
LVL	HIEN	LOEN	Detection of External Request
0	0	1	Falling edge detection
	1	0	Rising edge detection
1	0	1	Low level detection
	1	0	High level detection

When DREQ0-4 is accepted, the DREQ0-4 pin enters the request accept disabled state (non-sensitive period). After issuing an acknowledge DACK0-4 signal for the accepted DREQ0-4, the DREQ0-4 pin again enters the request accept enabled state.

(3) On-Chip Peripheral Module Request Mode

In this mode, the transfer is performed in response to the DMA transfer request signal from an on-chip peripheral module.

When a transfer request signal is sent in on-chip peripheral module request mode while DMA transfer is enabled, the DMA transfer is performed.

The DMA transfer request signals to be sent from on-chip peripheral modules or external pin input are listed in

Table 4.7-5.

The transfer source or destination is fixed for some on-chip peripheral module requests. For details, see **Table 4.7-5**.

Note 1. Refer to **4.7.4.9 Channel Configuration Register n/nS (CHCFG_n/nS)** for detail.

Note 2. Only in products with a Trusted Secure IP

4.7.6 DMA Mode

4.7.6.1 Mode Setting

The DMS field of the CHCFG_n/nS register can be used to toggle between register mode and link mode.

Table 4.7-6 DMA Mode Setting

DMS (CHCFG_n/nS)	Mode	Description
0	Register mode	A DMA transfer is executed using the values set in the Next Register Set.
1	Link mode	A DMA transfer is executed using the descriptor set in the Current register. The DMAC repeatedly loads the descriptor and executes the DMA transfer unless otherwise set by the descriptor or stopped by the control register.

4.7.6.2 Register Mode

In register mode, a DMA transfer is executed using the values set in the internal registers.

Two sets of the source address, destination address, and transfer byte count (Next0 Register Set and Next1 Register Set) can be set. It is possible to select the Next register set to be used for the DMA transfer, as well as to execute two Next register sets continuously for the DMA transfer.

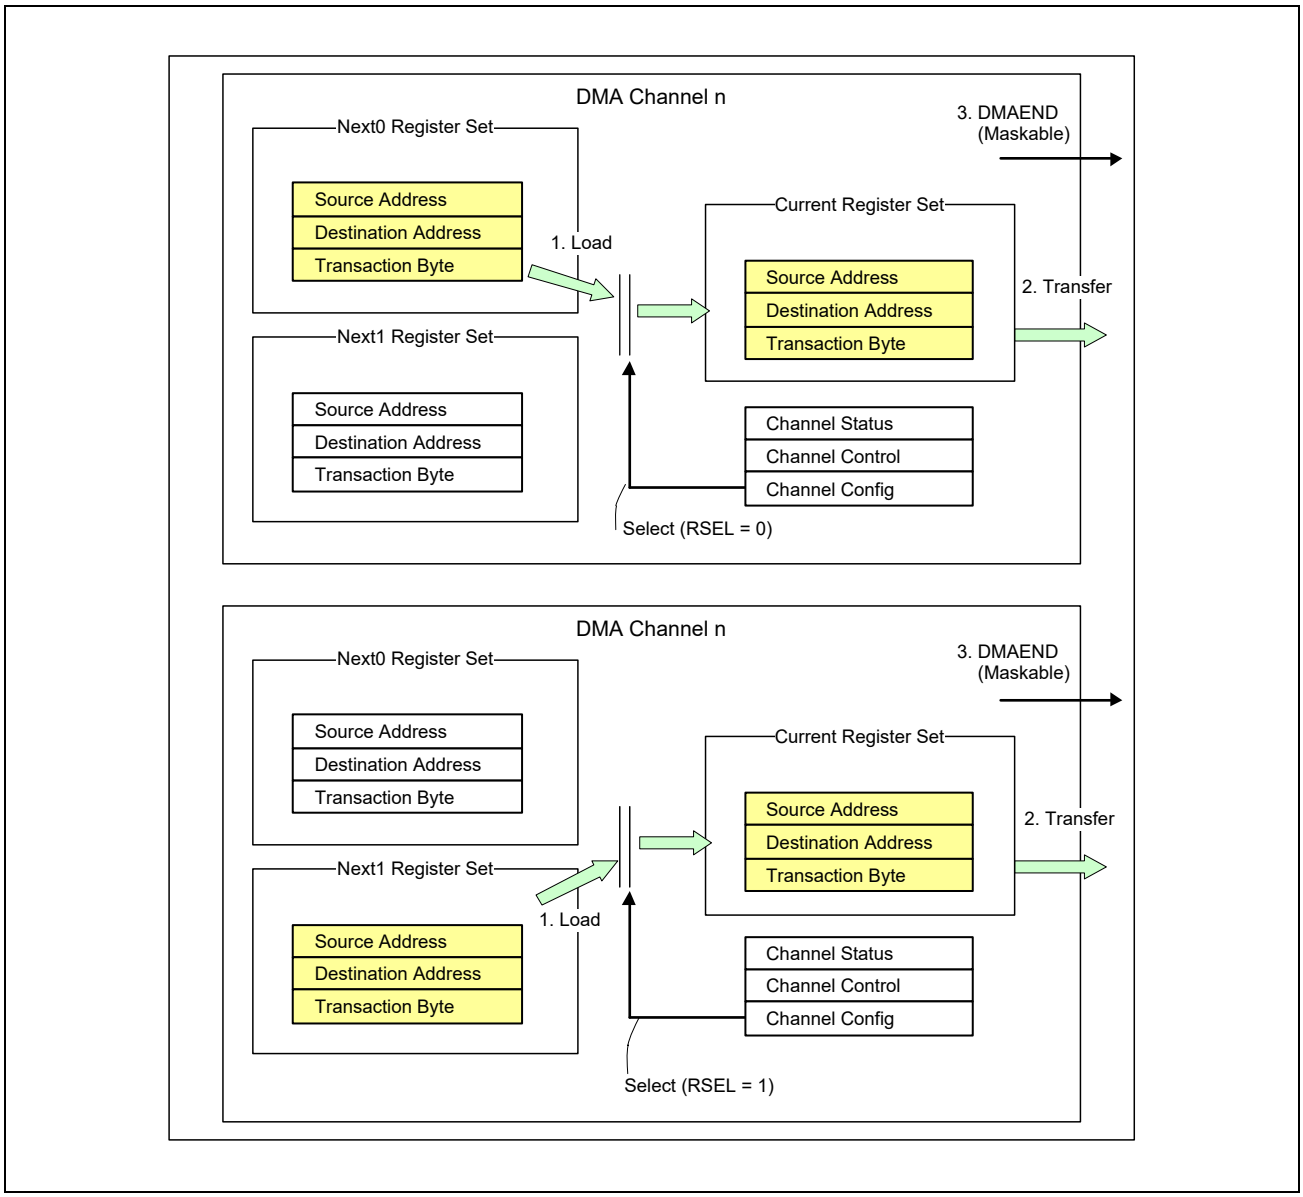

Figure 4.7-2 Outline of Normal Register Mode

The above figure shows how the transfer is executed when the Next0 Register Set is used (upper part of the figure) and when the Next1 Register Set is used (lower part of the figure).

(1) Operation Flow

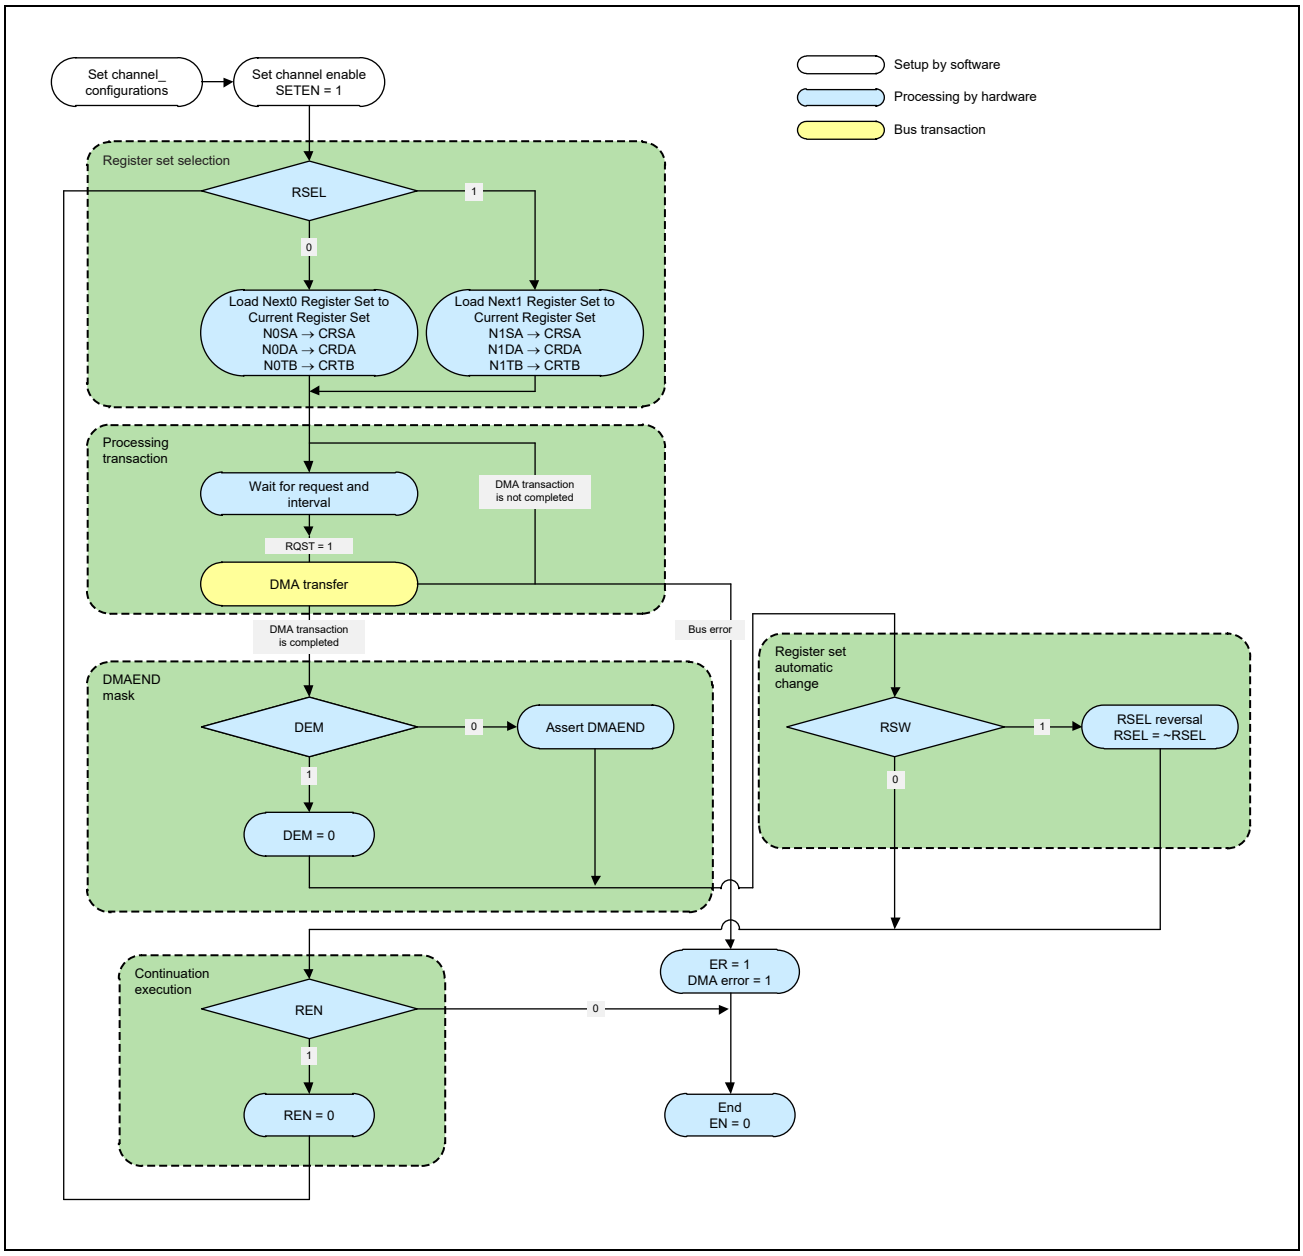

Figure 4.7-3 Register Mode Flow

<Explanation of the register mode flow>

1. Channel setting (set channel configuration)

   The Next0 or Next1 register set (destination address, source address, and total transfer byte count) is set.

   In the Channel register set, the DMA register set (REQ, DMAACK, transfer size, etc.) is set. (See **4.7.7 DMA Transfer**.)

2. Register set selection (register set selection)

   When 1 is set in EN, the values set in the Next register set selected by RSEL are loaded to the Current register set.

3. DMA transaction (processing transaction)

   A DMA transfer is executed according to the set values. For details of the transfer, see **Section 4.7.7, DMA Transfer**.

4. DMA transfer end interrupt mask (DMAINT mask)

   The DMA transfer end interrupt is masked according to the value set in the DEM bit of CHCFG_n/nS. When 1 is set in DEM, the DMA transfer end interrupt is not output. Also, immediately after that, DEM is automatically cleared to 0.

5. Automatic register set change (register set automatic change)

   Whether to use the other Next register set is determined by the value set in the RSW bit of CHCFG_n/nS.

6. Continuation of execution (continuation execution)

   Whether to continue the execution of the DMA transfer is determined by the value set in the REN bit of CHCFG_n/ nS. When 1 is set in REN, the execution of the DMA transfer is continued. Also, immediately after that, REN is automatically cleared to 0.

(2) Register Setting

(a) Register mode setting

Select the register set to be executed.

Table 4.7-7 Register Mode Setting

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	Description
0	0	Executes the Next0 Register Set.
	1	Executes the Next1 Register Set.

(b) DMA transfer end interrupt mask setting

The DMA transfer end interrupt can be masked individually for each register set.

Table 4.7-8 DMAINT Mask Setting

DEM (CHCFG_n/nS)	Operation
0	When the DMA transaction is completed, a DMA transfer end interrupt is issued.
1	Even when the DMA transaction is completed, a DMA transfer end interrupt is not issued. After the DMA transaction is completed, DEM is cleared to 0 by hardware.

(c) Automatic register set execution setting

After DMA transfers, the DMA transaction of the selected register set is automatically executed.

Table 4.7-9 Automatic Register Set Execution Setting

REN (CHCFG_n/nS)	Operation	Remark
0	When the DMA transaction of the register set selected by RSEL is completed, the EN bit is cleared and the DMA operation ends.	Set this value to execute a DMA transaction once.
1	When a DMA transaction is completed, the DMAC continues to execute a DMA transfer by using the data set in the selected register set. When continuous transfers are successful, REN is cleared to 0.	Set this value to continuously execute DMA transfers by using the data set in separate register sets.

(d) Automatic register set change setting

When 1 is set in REN, the DMAC can automatically change to the register set to be executed next, after a DMA transaction is completed.

Table 4.7-10 Automatic Register Set Change Setting

RSW (CHCFG_n/nS)	Operation	Remark
0	If 1 is set in REN when a DMA transaction is completed, the register set is not changed.	Set this value to use only one register set.
1	If 1 is set in REN when a DMA transaction is completed, the value of RSEL is automatically inverted and the other register set is selected.	Set this value to change the register set.

(3) Setting Examples

(a) When only the Next0 register set is used

Table 4.7-11 Register Mode Setting Example 1

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	DEM (CHCFG_n/nS)	RSW (CHCFG_n/nS)	REN (CHCFG_n/nS)
0 (Register mode)	0 (Next0)	0 (not masked)	0 (not switched)	0 (not continuously executed)

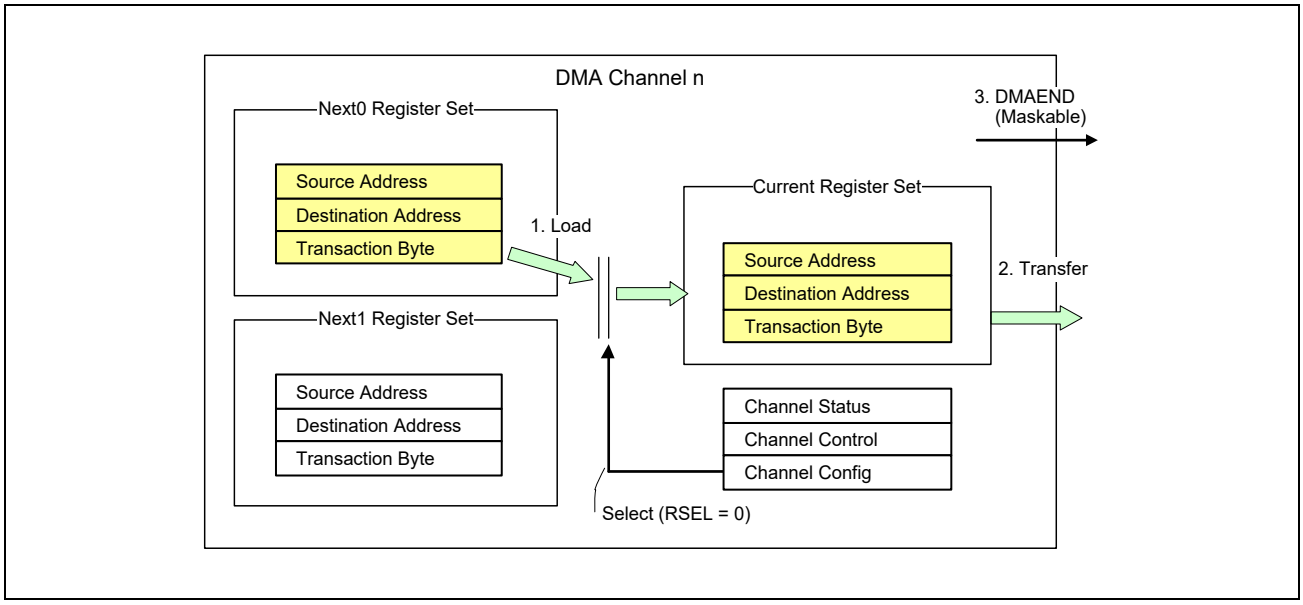

Figure 4.7-4 Register Mode Setting Example 1

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
4. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

(b) When two register sets are used continuously

Table 4.7-12 Automatic Register Set Execution Setting

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	DEM (CHCFG_n/nS)	RSW (CHCFG_n/nS)	REN (CHCFG_n/nS)
0 (Register mode)	0 (Next0)	1 (masked)	1 (switched)	1 (continuously executed)

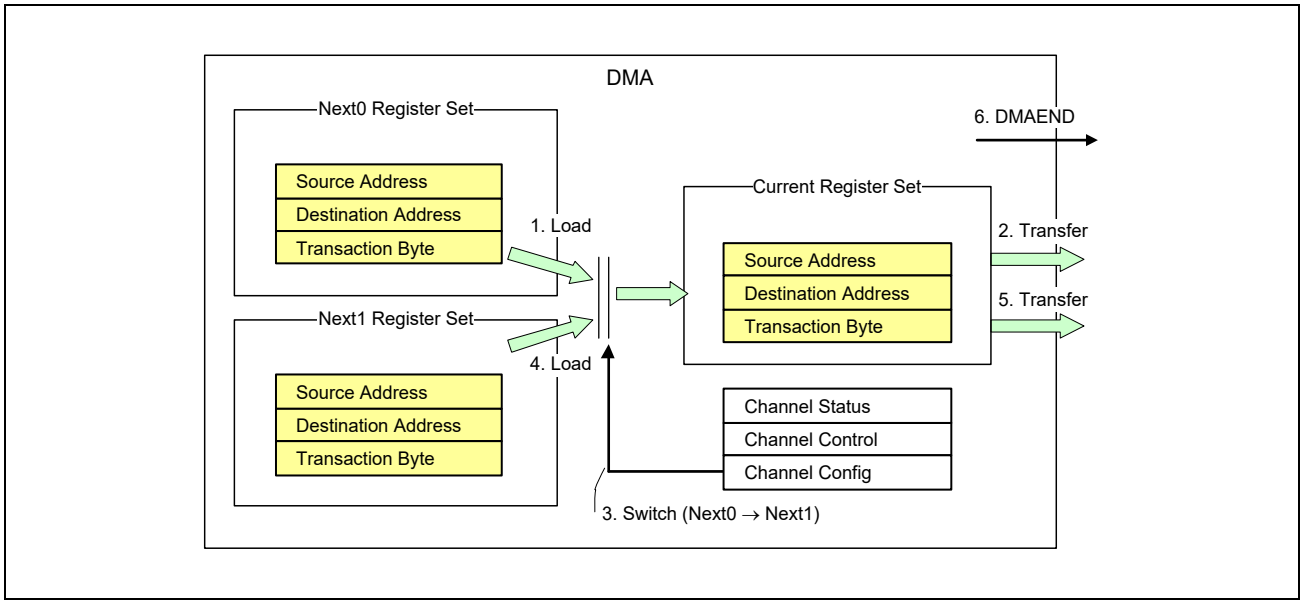

Figure 4.7-5 Register Mode Setting Example 2

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 1 is set in DEM, DMA transfer end interrupt is not output after the DMA transaction is completed. Also, DEM is automatically cleared to 0.
4. Because 1 is set in REN, the execution is continued. Also, REN is automatically cleared to 0.
5. Because 1 is set in RSW, the register set to be executed next is switched (RSEL = 0 → 1).
6. The Next1 register set is loaded to the Current register set.
7. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
8. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
9. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

4.7.6.3 Link Mode

In link mode, a descriptor stored in external memory is loaded as set values and a DMA transaction is executed using the loaded values. The DMAC contains a Next Link address and a Current Link address for each channel, and these addresses are used to set the descriptor address to be executed next and to indicate the descriptor address of the currently executed DMA transaction, respectively.

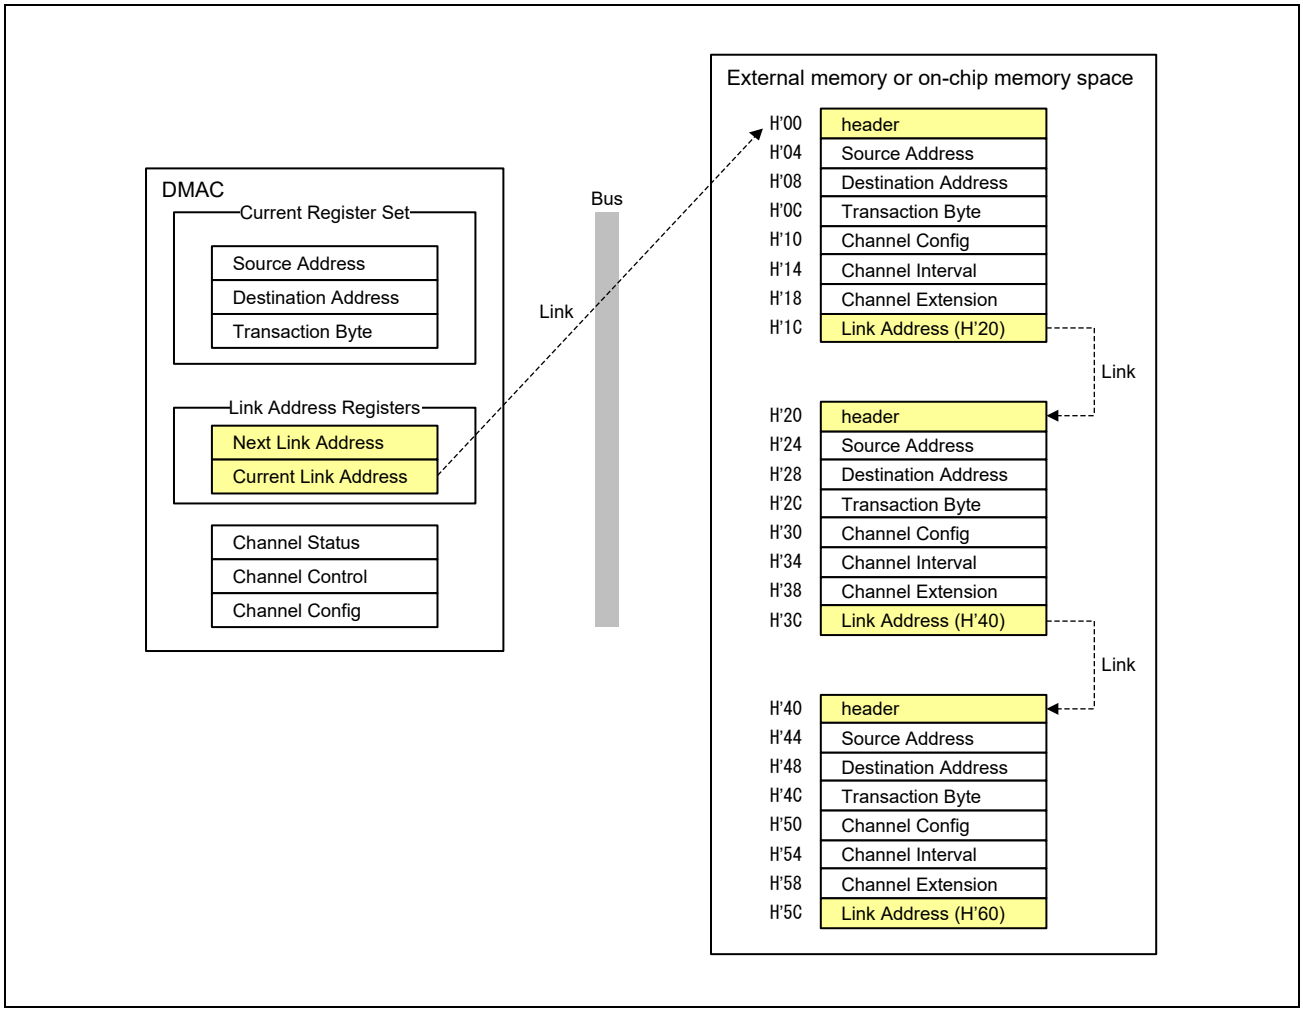

Figure 4.7-6 Link Mode Outline

(1) Operation Flow

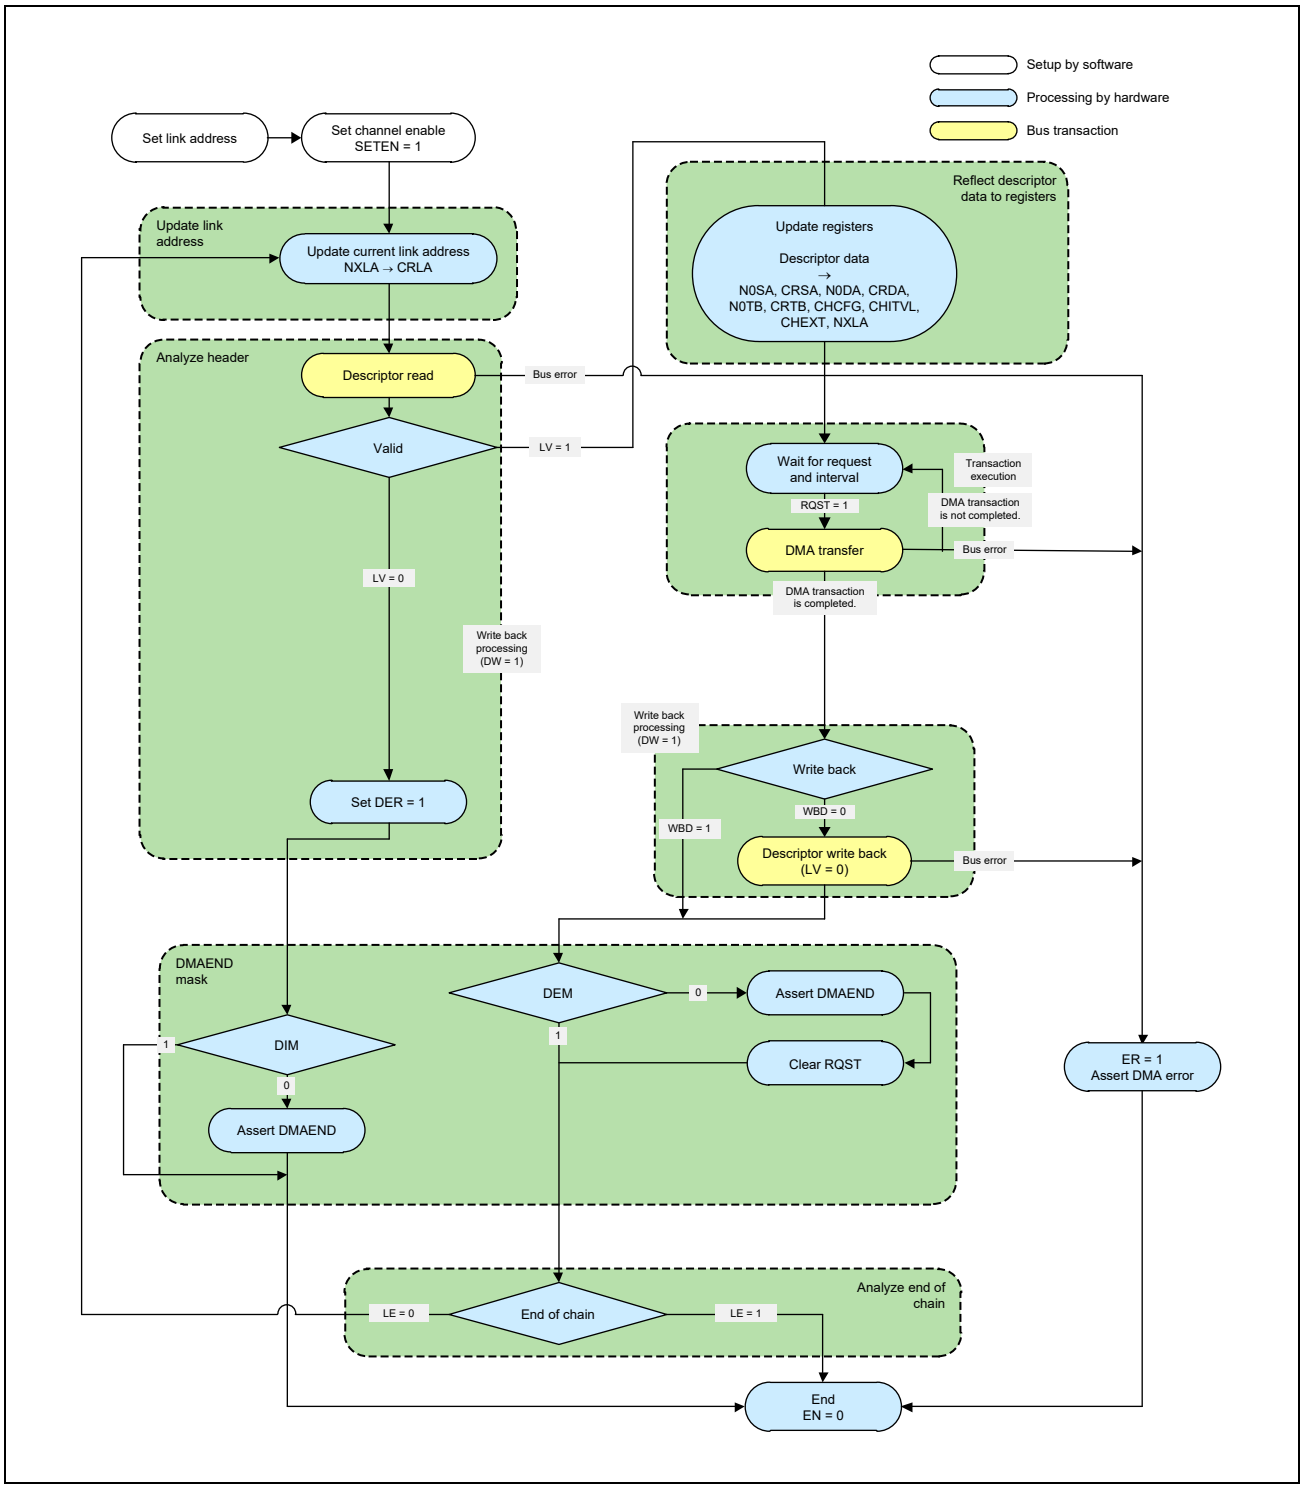

Figure 4.7-7 Link Mode Flow

<Explanation of the link mode flow>

1. Channel setting

The start address of the link destination is set in NXLA_n/nS.

2. Link address update

   When 1 is set in EN (1 is set in SETEN), the Link address set in NXLA_n/nS is loaded to CRLA_n/nS.

3. Descriptor load and header analysis

   The DMAC begins to load the descriptor and then analyzes the content of the header. When LV is 0, the DMAC discards the loaded descriptor and sets 1 in DER to end the operation (EN = 0). In this case, if 0 is set in DIM of the header, DMAEND is issued.

4. Descriptor setting

   The loaded descriptor is set in the Current register set and Channel register set. Also, the next link address is set in NXLA_n/nS.

5. DMA transaction

   A DMA transaction is executed according to the set values.

6. Header writeback

   When 0 is set in WBD of the header, the DMAC writes back the header with 0 set in its LV bit.

7. DMAINT mask

   When 0 is set in the DEM bit of CHCFG_n/nS, the DMA transfer end interrupt is issued.

8. Link end analysis

   When 1 is set in LE of the header, the operation is ended by clearing EN to 0, after transfer using the settings of the descriptor is completed. If the setting of LE is 0, the Current registers are then updated and loading of the next descriptor begins. The TEND signal is issued after the transfer of each descriptor.

(2) Register Setting

(a) Link mode setting

To use the link mode, set 1 in the DMS bit of the CHCFG_n/nS register.

Table 4.7-13 Link Mode Setting

DMS (CHCFG_n/nS)	Description
1	Operates in link mode. This bit cannot be changed using a descriptor.

(b) Link address setting

There are two registers that indicate a link address:
Next Link address register and Current Link address register.
To start the link mode, set a link address in the Next Link address register.

The Next Link address indicates the next link address after a descriptor is loaded. The Current Link address indicates the currently executed link address.

Table 4.7-14 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n/nS)	Sets and indicates the next link address. Before starting the link mode, set a link address in this register.
Current Link Address Register (CRLA_n/nS)	Indicates the currently executed link address. This register is read-only.

CAUTION

In link mode, the settings can be changed by reading a descriptor. It is not possible, however, to synchronize the change of the settings with a peripheral module request or external request. Therefore, when using a peripheral module request or external request, set AM, LVL, HIEN, LOEN, and SEL of the CHCFG_n/nS register before setting Enable and do not change any of these bits in the descriptor.

(3) Descriptor Setting

In a link address, prepare a descriptor with data arranged in the order shown below.

The DMAC reads the descriptor in burst mode.

(a) Descriptor data arrangement

Table 4.7-15 Descriptor Data Arrangement

Address	Data	Remarks
Link address + H'00	header	
Link address + H'04	Source Address	
Link address + H'08	Destination Address	
Link address + H'0C	Transaction Byte	
Link address + H'10	Config	The register mode cannot be set.
Link address + H'14	Interval	
Link address + H'18	Extension	
Link address + H'1C	Next Link Address	

Note: As a link address, set an address aligned along the 32-bit boundary.

(b) header

The header indicates the status of the descriptor, as shown below.

The DMAC reads this area when a DMA transfer is started in link mode. Also, after a DMA transaction is completed, the DMAC writes back the transfer status to the area.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	—	—	—	—	—	DIM	WBD	LE	LV

If 0 is set in WBD when the header is read, the DMAC writes back to this 4-byte area after a DMA transaction using a descriptor is completed.

0 is written back to LV, and the values obtained when reading the header are written back to the other fields.

Figure 4.7-8 Header Area

Table 4.7-16 Header Area

Bit Position	Bit Name	Meaning
31 to 4	—	—
3	DIM	Descriptor Interrupt Mask Sets whether to mask the DMA transfer end interrupt if 0 is set in LV when the header is loaded. 0: Issues a DMA transfer end interrupt. 1: Does not issue a DMA transfer end interrupt.
2	WBD	Write Back Disable Sets whether to mask LV bit writeback. When 1 is set in this bit, the DMAC does not perform writeback. 0: Writes the LV bit back to 0. 1: Does not write back the LV bit.
1	LE	Link End Indicates whether the link ends with the DMA transaction of this descriptor. Set 1 in this bit to indicate the end of the link. 0: The link continues. 1: The link ends.
0	LV	Link Valid Indicates whether this descriptor is valid. If 0 is set in WBD, the DMAC writes 0 in this bit after the DMA transaction written in the descriptor is executed. When setting the header, set 1 in this bit. 0: Descriptor invalid 1: Descriptor valid

(c) Descriptor data other than the header

The data items of the descriptor other than the header are the same as defined in the internal register specifications (note that the DMS bit of the CHCFG_n/nS register cannot be changed using the descriptor). For information about the internal register specifications, see **4.7.4 Register Descriptions**.

For descriptor setting examples, see **4.7.8 DMA Setting Examples**.

(d) CACHE settings for descriptor access

The CACHE settings for descriptor access can be set in LWCA and LDCA of the DMA control register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S). Make these settings as appropriate for the access destination in which the descriptor is prepared.

(e) Descriptor area and DMA transfer area

The following figure outlines the descriptor area and DMA transfer area that are accessed by the DMAC.

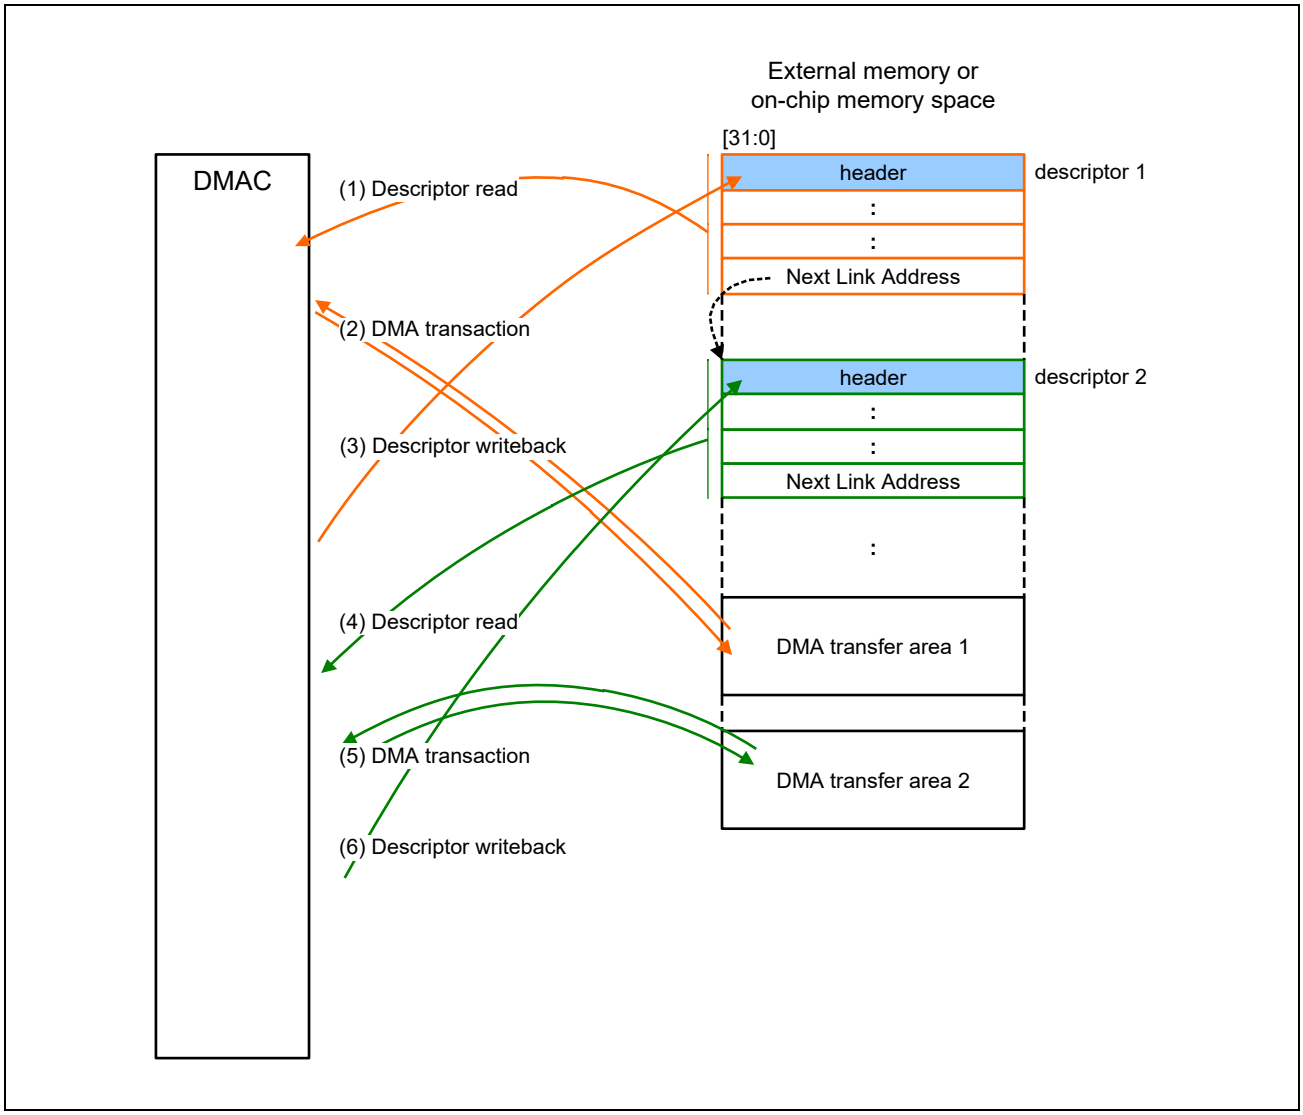

Figure 4.7-9 Outline of the Descriptor Area and DMA Transfer Area

1. Descriptor read

   The values set in the internal Next Link Address register are loaded to the Current Link Address register, and a descriptor is read from the external memory space (descriptor1) pointed to by the Current Link Address register.

2. DMA transfer

   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.

3. Descriptor writeback

   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor1, with 0 set in LV and the other bits containing the values read in <1>.

4. Descriptor read

   When 0 is set in the LE bit of the header in the last read descriptor (<1>), the next descriptor is read from the address (descriptor2) indicated by Next Link Address in the descriptor.

5. DMA transfer

   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.

6. Descriptor writeback

   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor2, with 0 set in LV and the other bits containing the values read in <4>.

4 through 6 are repeated.

When the header contains 1 in LE and 0 in WBD, the DMAC executes a DMA transfer using the settings of that descriptor, writes back data with 0 set in the LV bit of the header and ends the operation.

When the header contains 1 in both LE and WBD, the DMAC executes a DMA transfer using the settings of that descriptor and ends the operation (without writing back).

When the header contains 0 in LV, the DMAC ends the operation (without executing a DMA transfer).

(4) Descriptor Configuration Examples

In link mode, a descriptor can be configured as shown below.

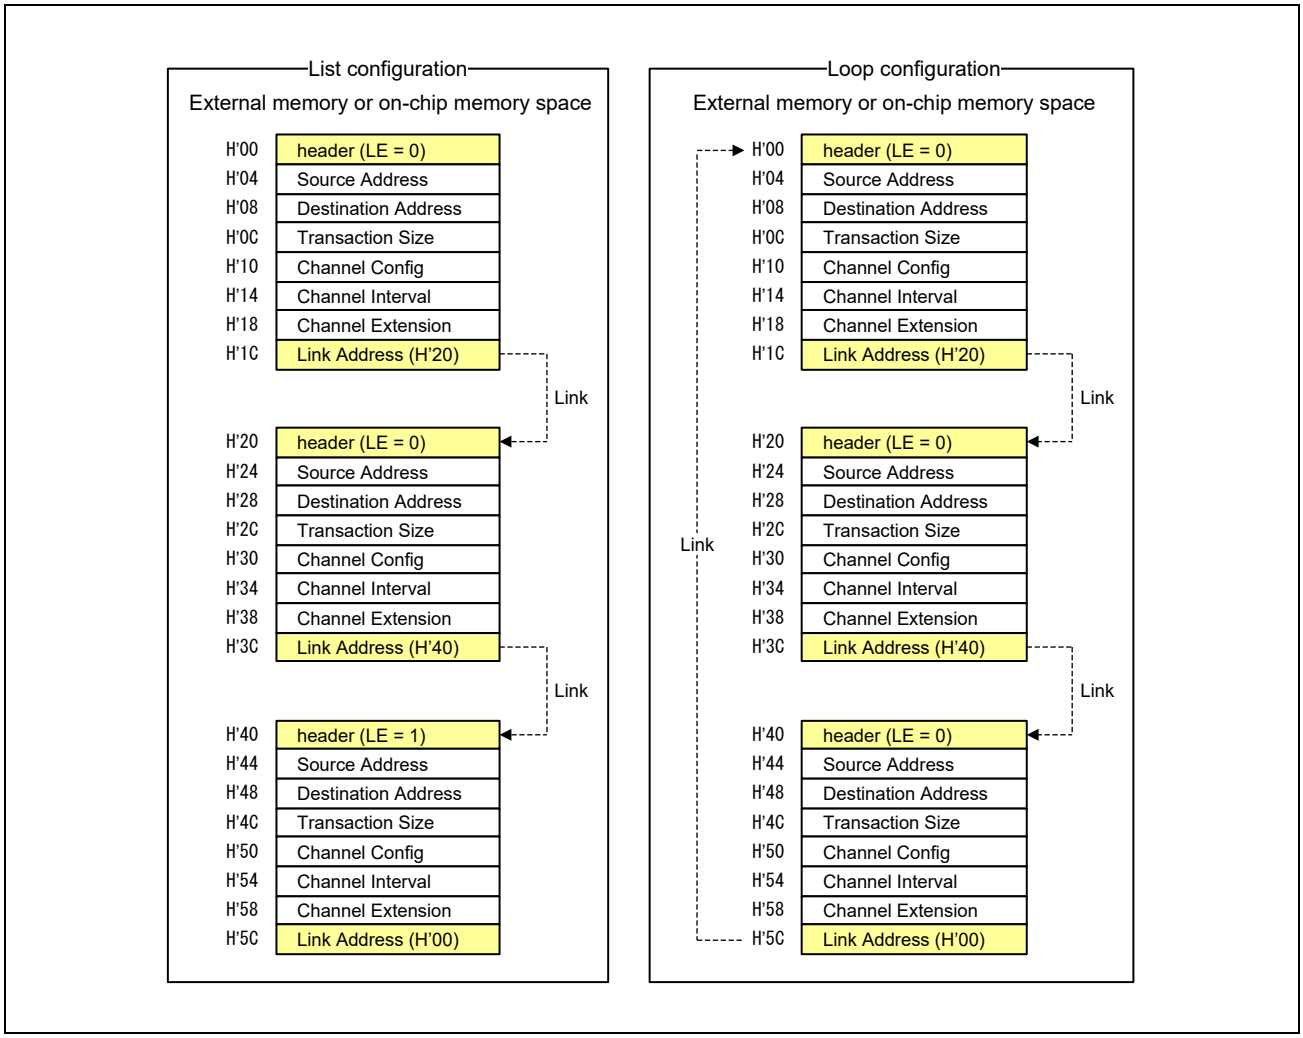

Figure 4.7-10 Descriptor Configuration Examples

- List configuration
  The link is ended by setting 1 in the LE bit of the header in the last descriptor.
- Loop configuration
  A descriptor can be created with a loop configuration, by setting the address of the top descriptor in the link address of the last descriptor. To end the loop, change the value of the LE bit of the header to 1 before the DMAC reads the descriptor, or follow the transfer suspension procedure.

4.7.7 DMA Transfer

The basic operation of DMA transfer is described here.

4.7.7.1 Transfer Mode

Two transfer modes are supported: single transfer mode and block transfer mode.

To select a transfer mode, set the TM bit of CHCFG_n/nS for each channel.

Table 4.7-17 Basic Transfer Setting

Transfer Mode	TM (CHCFG_n/nS)	Function
Single transfer	0	A single DMA transfer is executed in response to a DMAREQ.
Block transfer	1	In response to a DMAREQ, the DMAC continues to execute the transfer until the DMA transaction is completed.

(1) Single Transfer Mode

When a DMA transfer request is received, a DMA transfer is executed once in the direction indicated by REQD (source or destination). A DMA transfer is executed once each time a transfer request is received, and this operation continues until the number of bytes loaded to CRTB_n/nS is reached (arbitration between channels is accomplished for each DMA transfer).

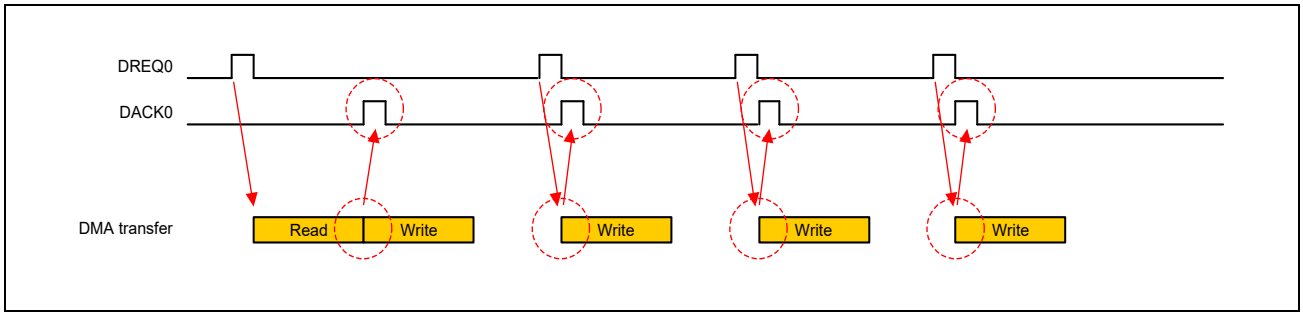

Figure 4.7-11 Single Transfer Mode (REQD = 1, SDS > DDS)

(2) Block Transfer Mode

Once a DMA transfer request is received, the DMAC continues to execute the transfer until data equivalent to the number of bytes loaded to the DMA transfer byte register (CRTB_n/nS register) is transferred (the DMA transaction is completed) (arbitration between channels is accomplished for each DMA transfer).

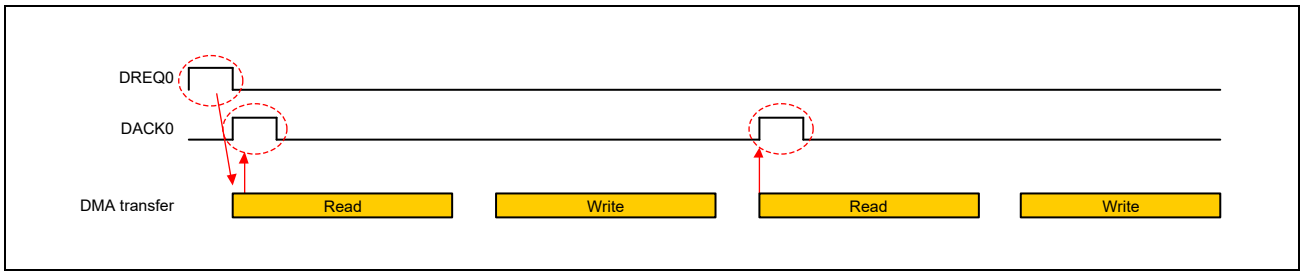

Figure 4.7-12 Block Transfer Mode (REQD = 0, SDS < DDS)

4.7.7.2 Priority Control for DMA Channels

Within channels 0 to 7 and 8 to 15, two priority control modes are supported: fixed priority mode and round robin mode. Only round robin mode is supported for priority control between the group of channels 0 to 7 and the group of channels 8 to 15. To select a priority control mode, use the PR bit of the DMA control register (DCTRL register). The fixed priority mode is selected when 0 is set in the PR bit, and the round robin mode is selected when 1 is set.

Read priority and write priority are controlled independently.

The DMAC issues transfer requests to different channels concurrently without waiting for the completion of any particular transfer and processes responses in the order it receives them. Therefore, the order in which the channels start transactions is not necessarily consistent with the order in which the transactions end.

Table 4.7-18 Priority Control Setting

Mode	PR (DCTRL)	Function	Purpose
Fixed priority	0	Requests are controlled based on the fixed order of priority for channels 0 to 7 and 8 to 15 (High: CH0 (CH8) > CH1 (CH9) > CH2 (CH10) > CH3 (CH11) > CH4 (CH12) > CH5 (CH13) > CH6 (CH14) > CH7 (CH15): Low).	Use this mode when the channels have a specific order of priority.
Round robin	1	Requests are controlled in a round robin fashion.	Use this mode to execute all requests evenly.

(1) Fixed Priority Mode

In fixed priority mode, the channels have a fixed order of priority in channels 0 to 7 and 8 to 15. Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is as follows.

High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If there is a transfer request from DMA channel 0 in this state, a transfer is executed on DMA channel 0. After the transfer is completed, the order of priority is as follows.

High CH8 > CH0 > CH9 > CH1 > CH10 > CH2 > CH11 > CH3 > CH12 > CH4 > CH13 > CH5 > CH14 > CH6 > CH15 > CH7 Low

If a DMA transfer request occurs on multiple channels simultaneously, the DMA transfer request of the channel having the smallest channel number is given priority. The following figure shows an example where a DMA transfer request occurs on a channel having a higher priority while a DMA transfer is being executed in fixed priority mode.

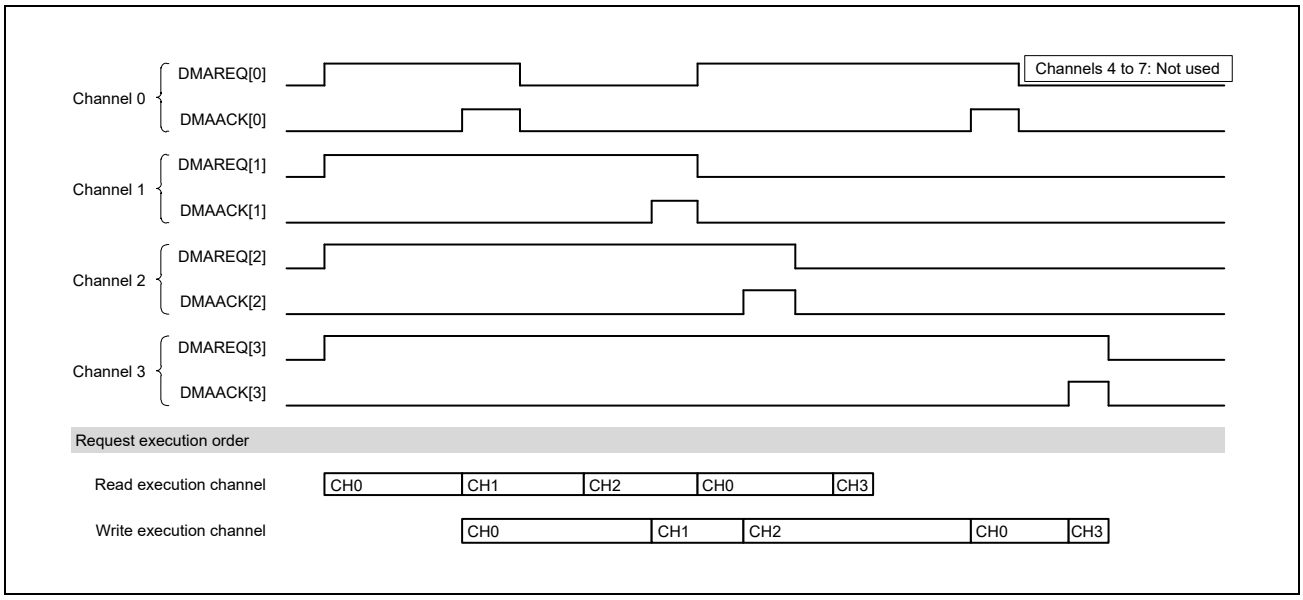

Figure 4.7-13 Fixed Priority Mode (Number of Channels = 4, REQD = 1)

(2) Round Robin Mode

In round robin mode, each time a transfer request is received from a channel in the group of channels 0 to 7 and the group of channels 8 to 15, the order of priority is changed in such a way that the channel that executed a transfer last has the lowest priority.
Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is the same as that of the fixed priority mode, which is as follows.
High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If a transfer request is received from DMA channel 2 in this state, a transfer is executed on DMA channel 2. After the transfer is completed, the order of priority is as follows.
High CH8 > CH3 > CH9 > CH4 > CH10 > CH5 > CH11 > CH6 > CH12 > CH7 > CH13 > CH0 > CH14 > CH1 > CH15 > CH2 Low

The following figure shows an example where DMA transfers are executed in round robin mode.

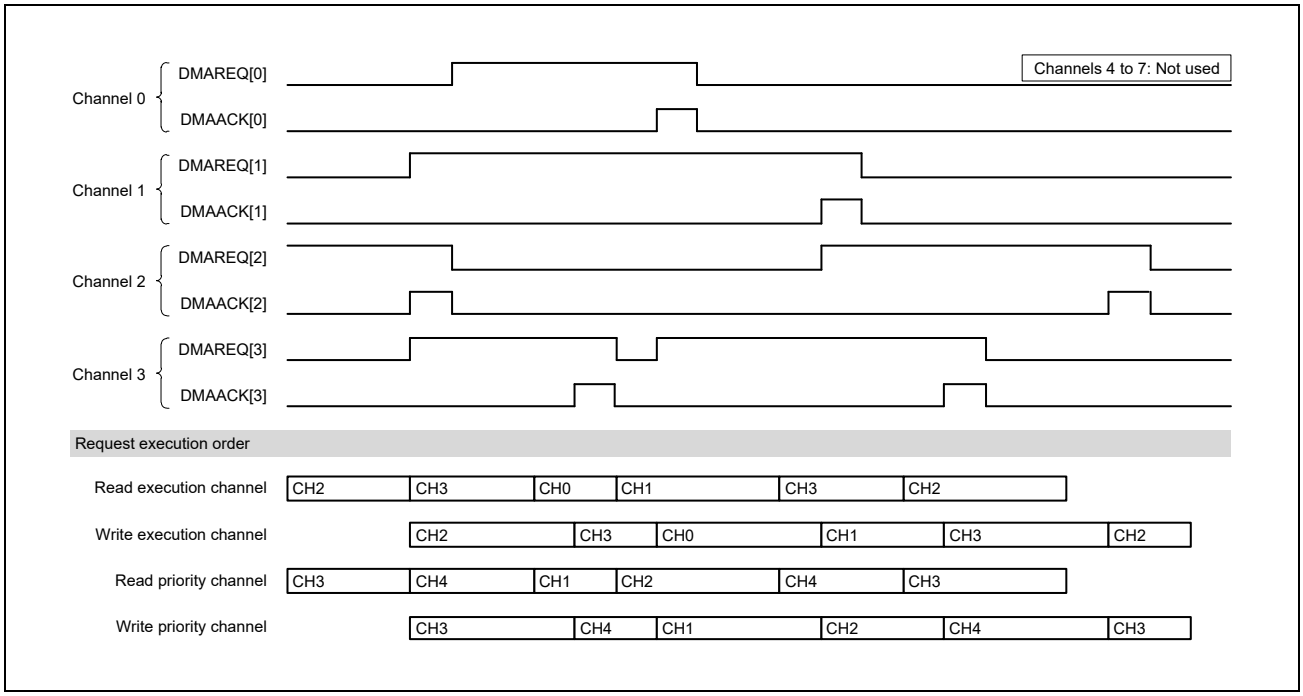

Figure 4.7-14 Round Robin Mode (Number of Channels = 4, REQD = 0)

The channel whose channel number is the number of the currently transferring channel + 1 gets to execute a DMA transfer next. If there is no transfer request from this channel, the channel whose channel number is the number of this channel + 1 gets to execute a DMA transfer.

4.7.7.3 DMA Transfer Request

Edge detection or level detection can be selected using the LVL bit of the CHCFG_n/nS register.

The HIEN and LOEN bits of the CHCFG_n/nS register are used to select either the rising edge or falling edge in the case of edge detection or either the high level or low level in the case of level detection.

When the transfer request is by an on-chip peripheral module, set the CHCFG_n/nS register according to **Table 4.7-5**.

When the transfer request is by the external pin (DREQ0-4), set the detection conditions (rising/falling edge and high/low level) according to **Table 4.7-19**.

Table 4.7-19 Settings for External Request Detection

Mode	LVL (CHCFG_n/nS)	HIEN (CHCFG_n/nS)	LOEN (CHCFG_n/nS)	Function
Edge detection	0	0	0	Specify this value when auto request triggers are in use.
			1	Detects external pin request (DREQ0-4) at its falling edge.
		1	0	Detects external pin request (DREQ0-4) at its rising edge.
			1	Setting prohibited
Level detection	1	0	0	Setting prohibited
			1	Detects external pin request (DREQ0-4) in Low level mode.
		1	0	Detects external pin request (DREQ0-4) in High level mode.
			1	Setting prohibited

(1) Edge Detection

Setting 0 in the LVL bit of the CHCFG_n/nS register enables edge detection.

When 1 is set in the HIEN bit of the CHCFG_n/nS register, rising edge detection is enabled. When 1 is set in the LOEN bit, falling edge detection is enabled.

Wait for DACK0-4 to be detected, before issuing the next DREQ0-4 request.

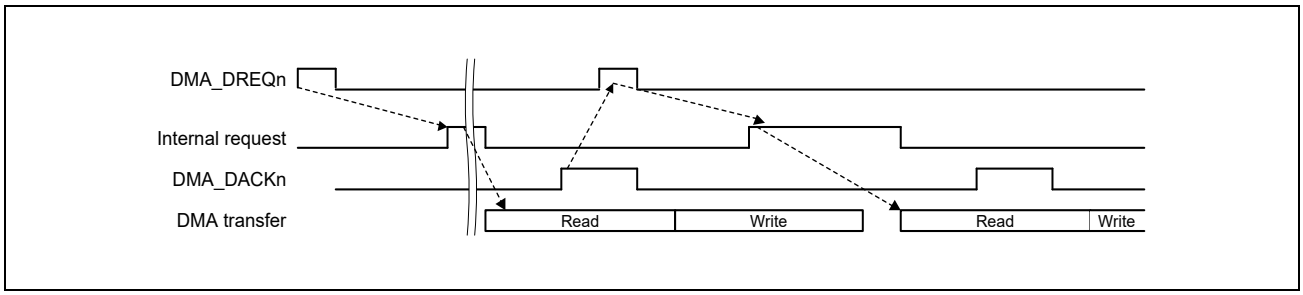

Figure 4.7-15 Edge Detection Timing (HIEN = 1, REQD = 0, ACKPC = 0)

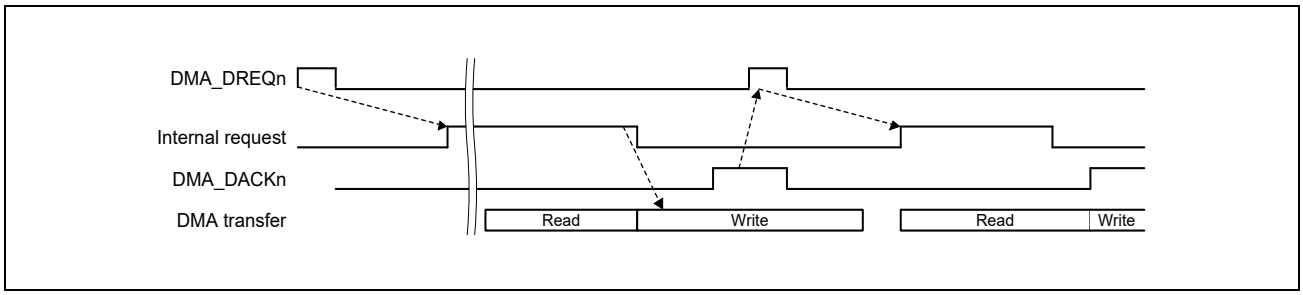

Figure 4.7-16 Edge Detection Timing (HIEN = 1, REQD = 1, ACKPC = 0)

(2) Level Detection

Setting 1 in the LVL bit of the CHCFG_n/nS register enables level detection.

DREQ0-4 is regarded as valid when it remains active for two consecutive clock cycles or more (depending on the HIEN and LOEN settings).

When the level mode is selected for DACK0-4, it remains at the High level until DREQ0-4 is de-asserted.

When the next DMA transfer request is to be issued, DACK0-4 needs to be de-asserted before DREQ0-4 can be asserted.

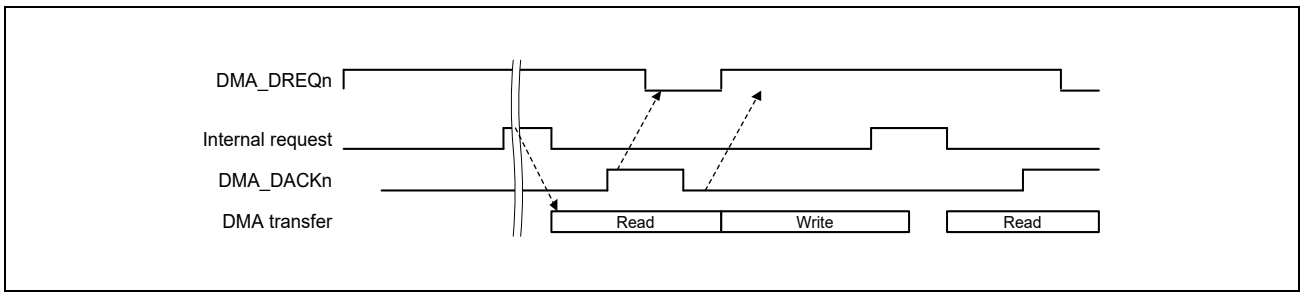

Figure 4.7-17 Level Detection Timing (HIEN = 1, REQD = 0, AM[2:0] = 001, ACKPC = 0)

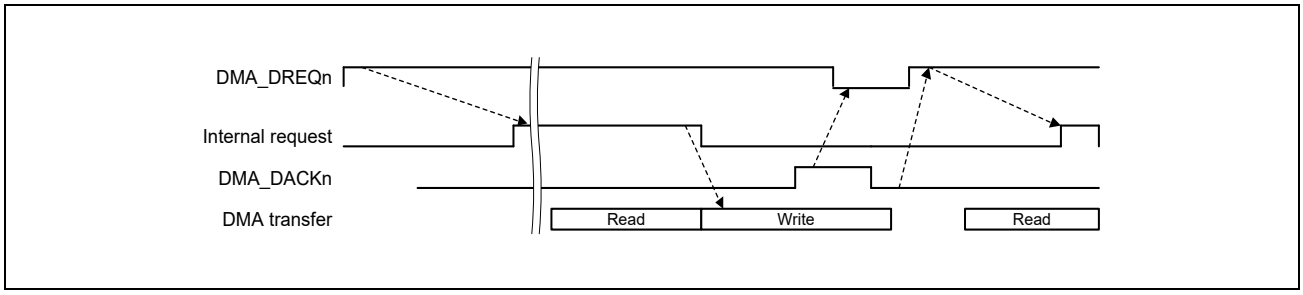

Figure 4.7-18 Level Detection Timing (HIEN = 1, REQD = 1, AM[2:0] = 001, ACKPC = 0)

4.7.7.4 DMA Acknowledge Output Function

DACK0-4 is an acknowledge signal that is sent to DREQ0-4. Level output and Pulse output are supported.

(1) DMA Acknowledge Signal Active level Setting

Active level of DACK0-4 is selectable by ACKPC0-4.

Table 4.7-20 Settings for Active Level of DACKn

ACKPC0-4 (DMAOPC/DMAOPCS)	Function (DACK0-4 Active level)
0	High Active
1	Low Active

(2) DMA Acknowledge Signal Output Timing Setting

Upon receiving a DMA transfer request, the DACK0-4 pin becomes active. The Active Level of DACK0-4 can be selected by ACKPC0-4 in the DMAEOC/DMAEOCS registers. By using the REQD and AM[2:0] bits of the CHCFG_n/nS register, the DACK0-4 output timing can be set as shown below.

Table 4.7-21 Settings for External Request Detection

Mode	AM[2] (CHCFG_n/nS)	AM[1:0] (CHCFG_n/nS)	REQD (CHCFG_n/nS)	Function
Pulse	0	00	0	DACK0-4 is output as a Pulse.
			1	
Level	0	01	0 (Active during read)	DACK0-4 is output as a level. DACK0-4 remains asserted until DREQ0-4 is de-asserted.
			1 (Active during write)	
Bus cycle	0	10	0 (Active during read)	Not Supported for DMA Acknowledge output.
		11	1 (Active during write)	
Mask	1	—	—	Make this setting when using auto request trigger or when performing the SCIFA transfer.

(3) Pulse Output

Setting 000 in the AM bits of the CHCFG_n/nS register enables Pulse output. DMA_ACK0-4 is valid for 32 cycle of PL2_CLK200_C.

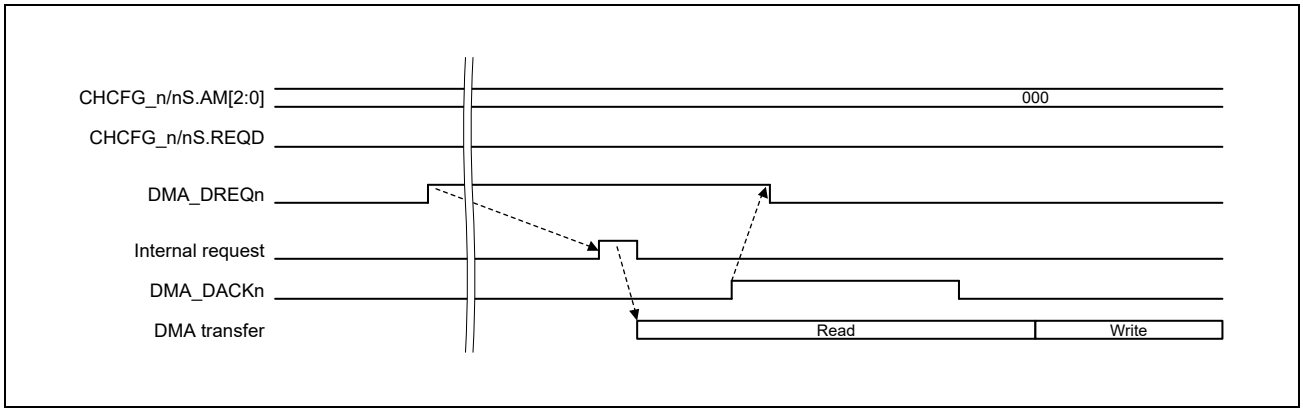

Figure 4.7-19 DACK0 Output Timing (AM[2:0] = 000, REQD = 0, ACKPC = 0)

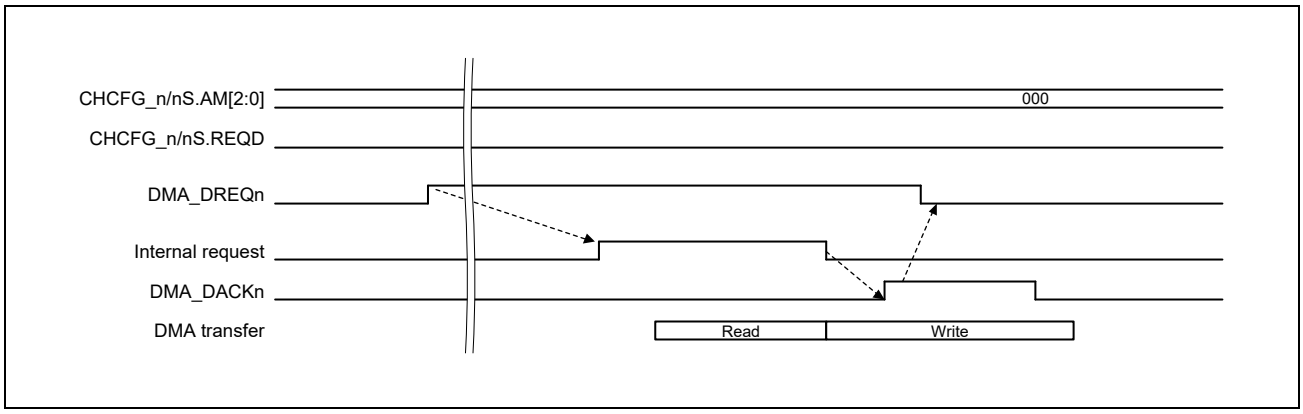

Figure 4.7-20 DACK0 Output Timing (AM[2:0] = 000, REQD = 1, ACKPC = 0)

(4) Level Output

Setting 001 in the AM bits of the CHCFG_n/nS register enables level output. DACK0-4 remains asserted until DREQ0-4 is de-asserted.

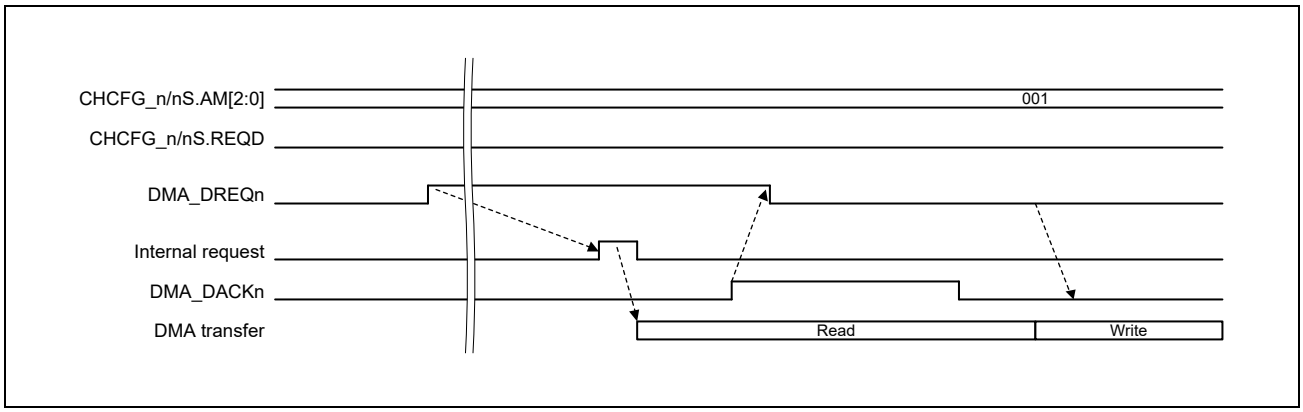

Figure 4.7-21 DACK0 Output Timing (AM[2:0] = 001, REQD = 0, ACKPC = 0)

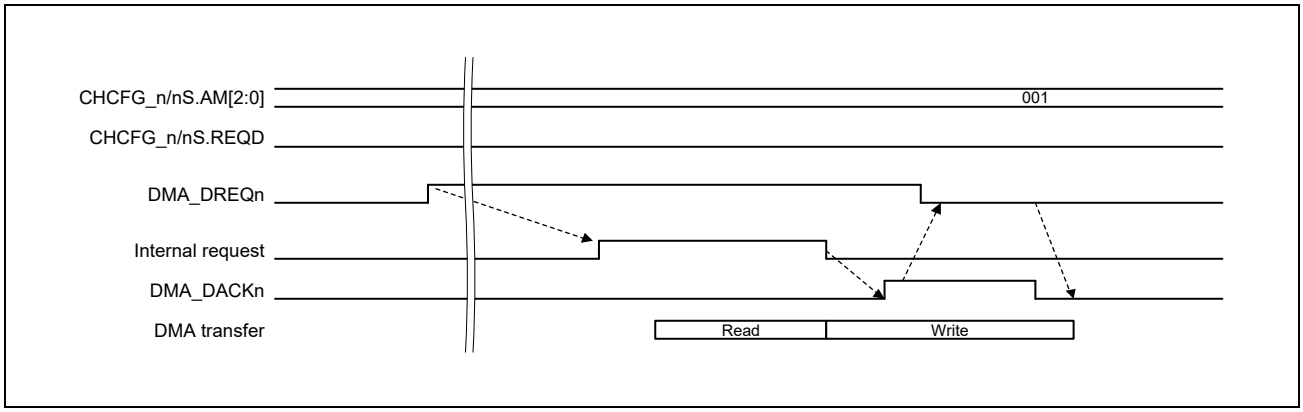

Figure 4.7-22 DACK0 Output Timing (AM[2:0] = 001, REQD = 1, ACKPC = 0)

(5) Bus Cycle Output

Bus Cycle Output is not supported.

4.7.7.5 DMA Transfer End Output Function

DMA_TEND0-4 is a transaction completion signal that is sent to the source of a DMA transfer request when REQD bit in CHCFG_n/nS register is set to 1. DMA_TEND0-4 is asserted for 32 cycles of DMAC_ACLK as the same time as DMA_ACK0-4 for the last transfer transaction.

Table 4.7-22 CHCFG_n/nS Register

REQD	TEND Output
1	Output
0	Not output

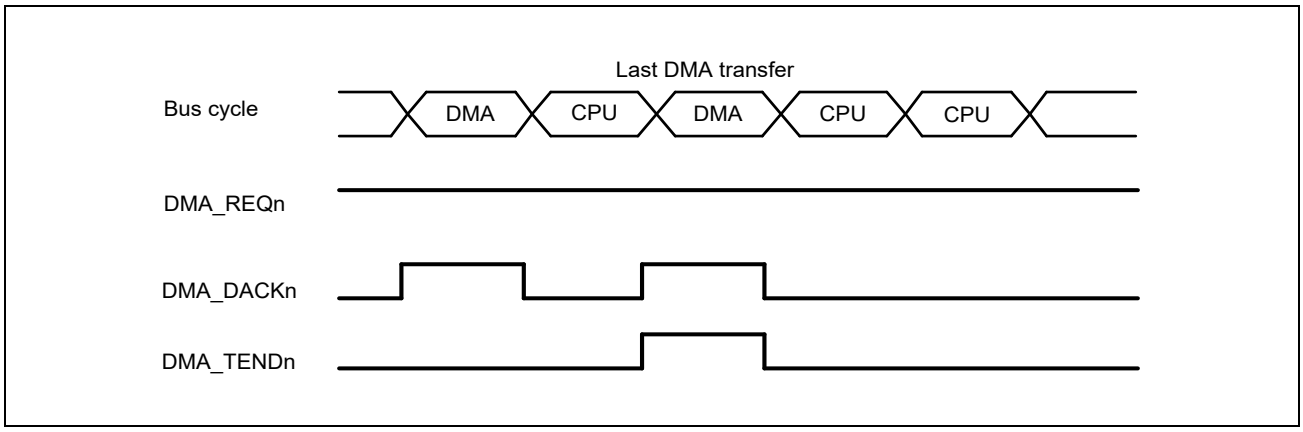

Figure 4.7-23 TEND Output Timing

4.7.7.6 DMA Transfer End Interrupt

The DMA transfer end interrupt is an interrupt request signal that indicates that a DMA transaction is completed. There is an independent DMA transfer end interrupt for each channel.

When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed, 1 is set in END of the CHSTAT_n/nS register. In this case, when 0 is set in DEM of the CHCFG_n/nS register, the DMA transfer end interrupt (DMAINTn_NS/S) is output (n = 0 to 15). (When writeback is performed in link mode, the signal is output after the writeback operation.)

When 0 is set in LV of the header in the read descriptor in link mode, 1 is set in DER of the CHSTAT_n/nS register. In this case, when 0 is set in DIM of the header, the DMA transfer end interrupt is output.

Table 4.7-23 Assertion Conditions of DMA Transfer End Interrupt

Source	Condition	DMA Transfer End Interrupt Mask Signal
DMA transaction end	When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed with an OKAY response (or after the writeback operation when writeback is performed in link mode)	DEM bit of the CHCFG_n/nS register
Descriptor invalid	When 0 is set in LV of the header in the read descriptor in link mode while 0 is set in DIM of the header	DIM bit of the header

4.7.7.7 DMA Error Interrupt

If an error response is received for a DMA transfer or descriptor access, the DMAC regards it as an error and stops the transfer. Upon receiving an error response, the EN bit of the CHSTAT_n/nS register of transferring channel n is cleared to 0 and 1 is set in the ER bit (n = 0 to 15). Also, the DMA error interrupt (DMAERR_NS/S) is output.

The DMA error interrupt cannot be masked.

Once an error occurs, the data of the whole transfer cannot be guaranteed. Be sure to start the transaction again from the beginning by following the procedure below.

1. Set 1 in the SWRST bit of the CHCTRL_n/nS register.
2. Set each register again.

4.7.7.8 Interval Count Function

The interval at which a DMA transfer is executed can be adjusted by setting the ITVL bit of the channel interval register (CHITVL_n/nS). This function is intended to prevent the DMA controller from occupying the bus all the time.

When a read or write operation is completed, a countdown starts from the value set in CHITVL_n/nS. The next internal request is not executed until the count value reaches 0.

The following figure shows an example of how this works.

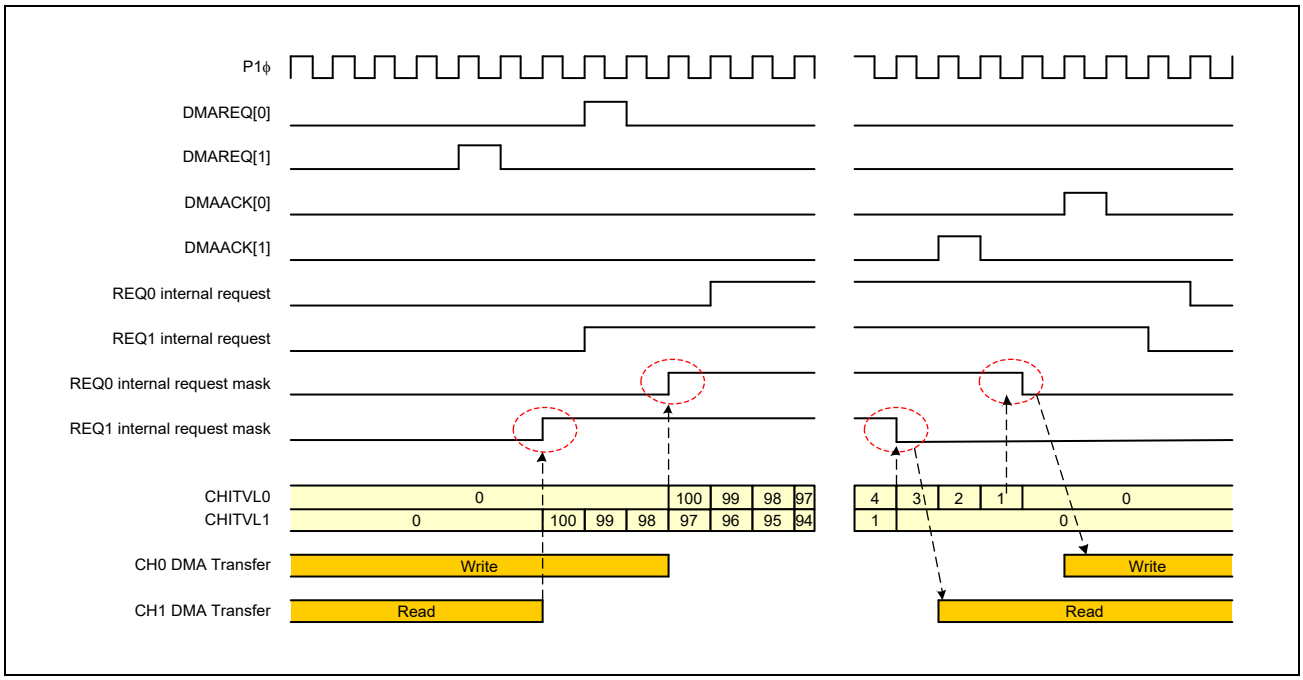

Figure 4.7-24 Interval Count

4.7.7.9 Difference in Operation Due to the Transfer Size

(1) When the Source Transfer Size Is Smaller

When the read of data equivalent to the destination data size is completed, the data is written to the destination.

The following figure shows a timing chart where the source transfer size is 8 bits and the destination transfer size is 32 bits (in the case of rising edge detection).

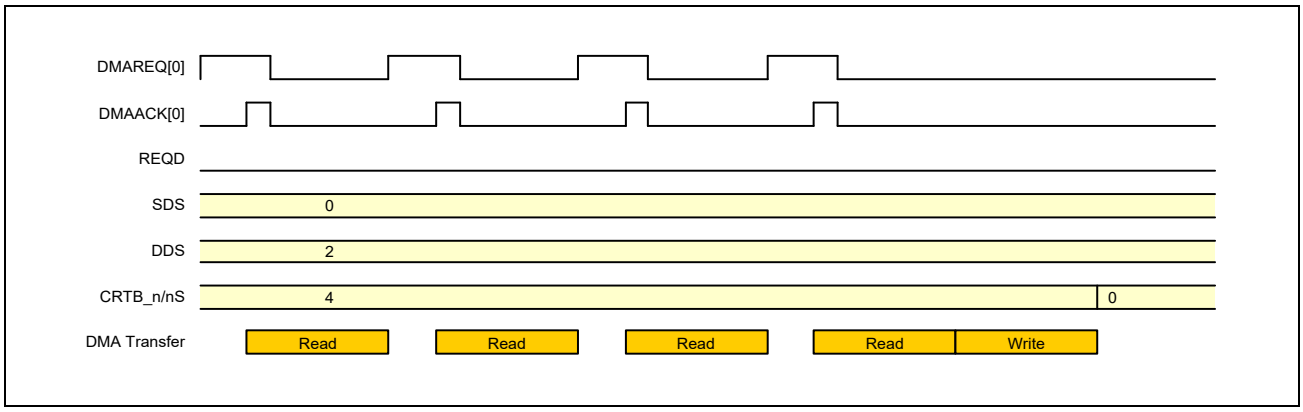

Figure 4.7-25 When the Source Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 0, SDS < DDS in CHCFG_n/nS)

(2) When the Destination Transfer Size Is Smaller

Since the source transfer size is larger, multiple destination writes occur after a single source read. The following figure shows a timing chart where the source transfer size is 64 bits and the destination transfer size is 16 bits (in the case of rising edge detection) (1 is set in REQD of the CHCFG_n/nS register).

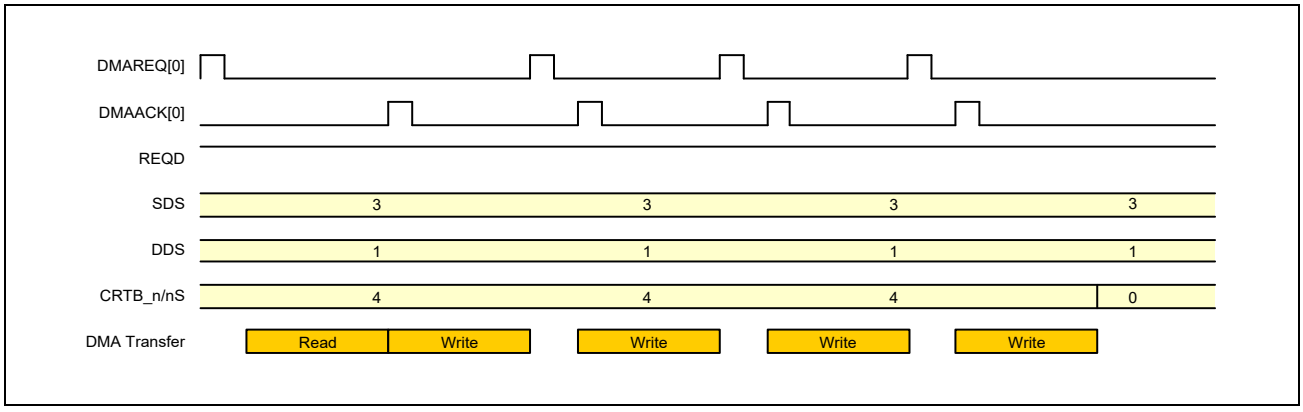

Figure 4.7-26 When the Destination Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 1, SDS > DDS in CHCFG_n/nS)

(3) When the Source Transfer Size Is the Same as the Destination Transfer Size

Every time a DMA transfer request is detected, a source read and a destination write occur.

The following figure shows a timing chart where the source transfer size and the destination transfer size are both 8 bits (in the case of rising edge detection, with 1 set in REQD of the CHCFG_n/nS register).

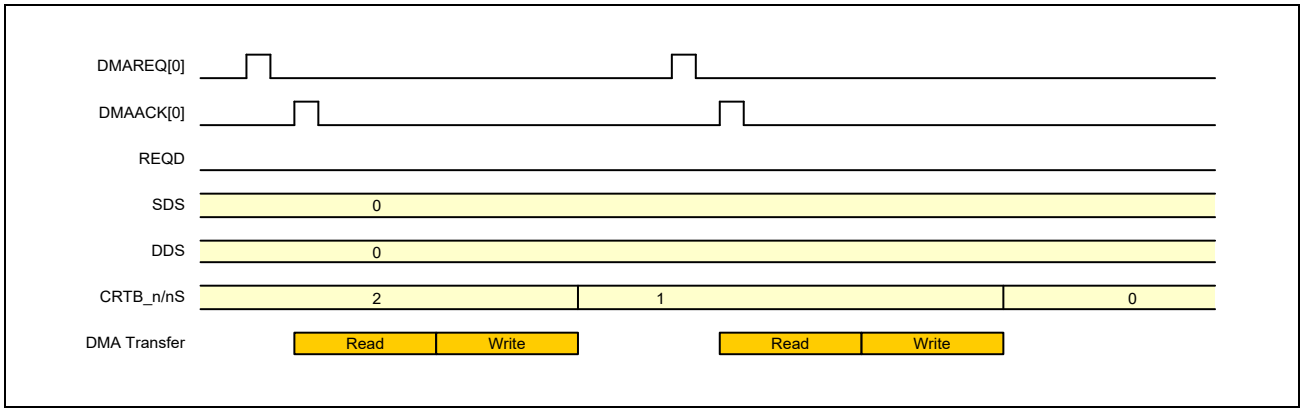

Figure 4.7-27 When the Source Transfer Size Is the Same as the Destination Transfer Size (LVL = 0, HIEN = 1, REQD = 0, SDS = DDS in CHCFG_n/nS)

4.7.7.10 Transfer Status

The channel status register indicates the status of DMA transfer execution on a channel.

(1) Suspend

A DMA transfer can be suspended by using the SETSUS bit of CHCTRL_n/nS. In this case, if an ongoing bus cycle exists, the DMAC waits for that cycle to end before suspending the transfer. Writing 1 in the CLRSUS bit restores the DMA transfer from the suspend status.

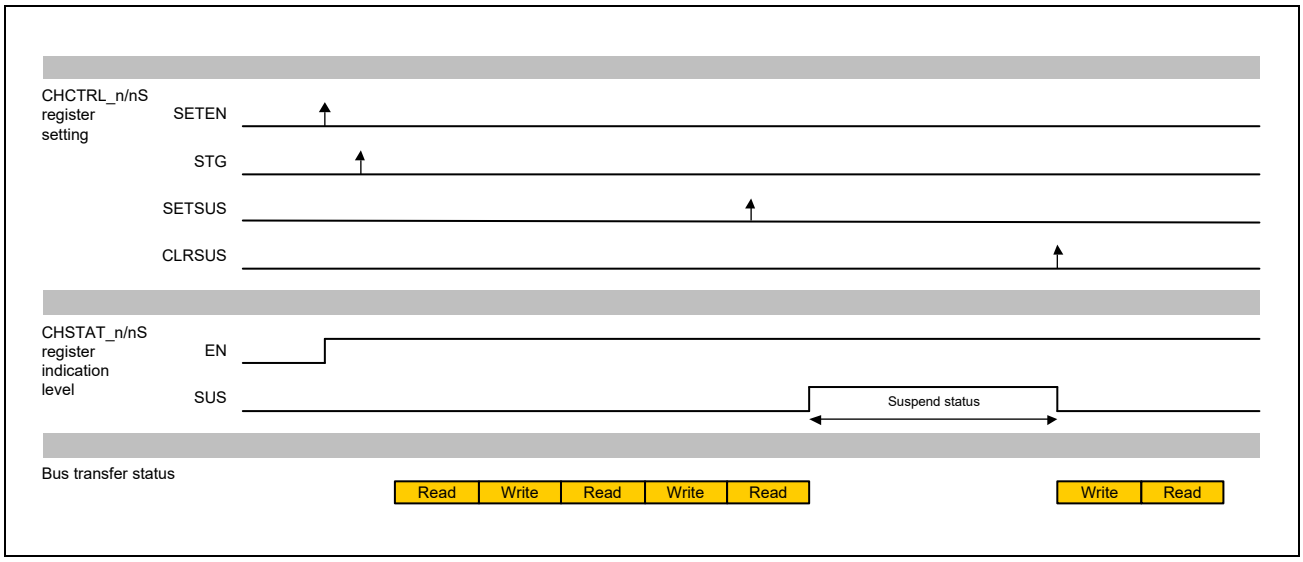

Figure 4.7-28 DMAC Suspend Status (Auto Request/Block Transfer)

In the above case, the DMA transfer is suspended after the read transfer is completed.

If there is any ongoing DMA transfer, the suspend status starts when that transfer is completed. To make sure that the transfer is suspended, read the CHSTAT or DSTAT_SUS register, after setting SETSUS, and check that 1 is set in the SUS bit for the relevant channel.

(2) Transfer Stop

If 1 is written to CLREN while a DMA transaction is in progress, the DMA transaction for the corresponding channel can be stopped. For the post-stop processing, two modes are supported: one sweeps out the data remaining in the buffer when the transaction is stopped (SBE = 1) and the other does not (SBE = 0). One of these modes can be selected using the SBE bit of the CHCFG_n/nS register. By default, SBE is set to 0.

When this sweep mode is enabled and CLREN is set to 1, and if a DMA transaction is stopped with data remaining in the DMAC buffer, the transaction is completed after the DMAC sweeps the data.

(a) Transfer Stop (Buffer Sweep Disabled - SBE = 0)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. The stop timing depends on the value set in REQD. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMA internal status before setting the next transfer.

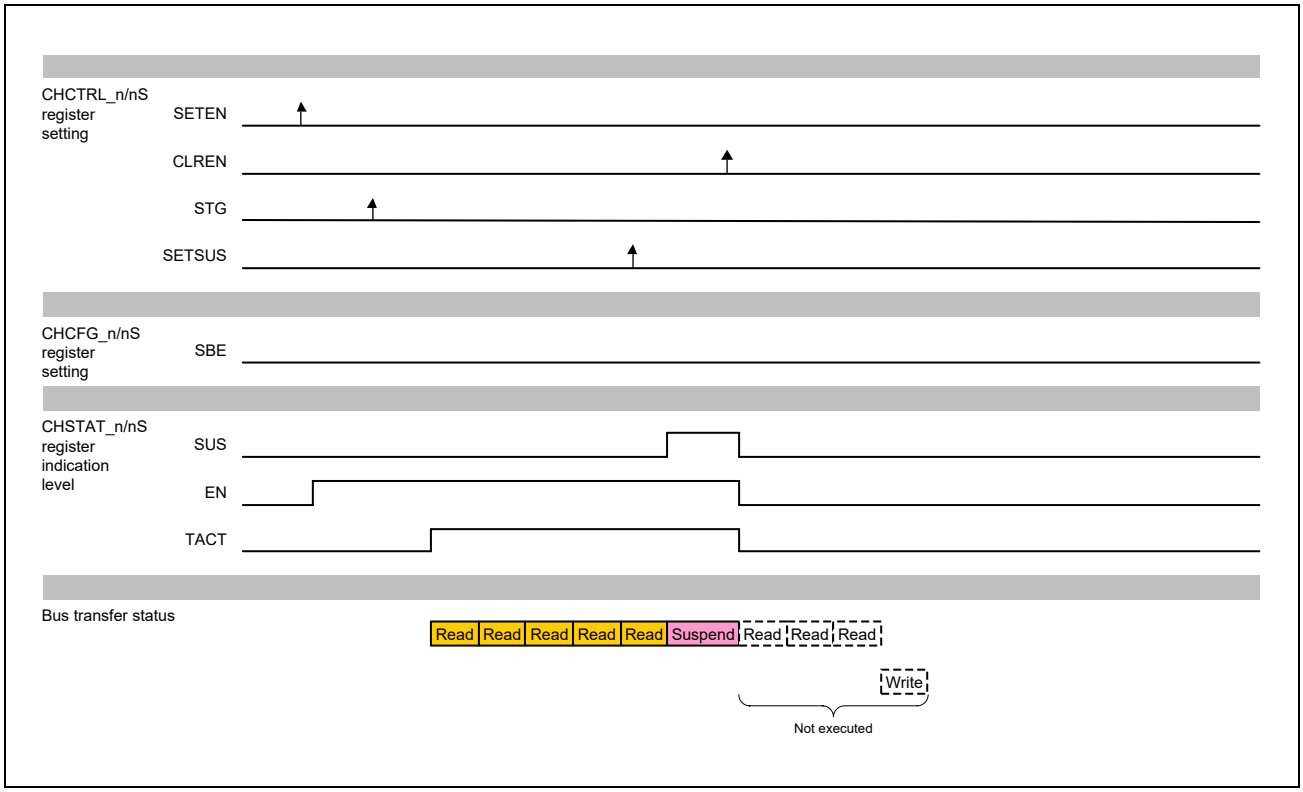

Figure 4.7-29 DMAC Transfer Stop

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If an ongoing DMA transfer is stopped before it is completed, the DMA transfer end interrupt is not asserted.
- If 0 is set in REQD, the DMA transfer is stopped when the next read is completed. (If the buffer contains any data that can be written, the DMA transfer is stopped after the data is written.)
- If 1 is set in REQD, the DMA transfer is stopped when the next write is completed.

(b) Transfer Stop (Buffer Sweep Enabled - SBE = 1)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. When 0 is set in REQD, the DMA transfer is stopped after the DMAC sweeps (writes) the already read data. If 1 is set in REQD to use hardware requests, do not use the sweep mode. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMAC internal status before setting the next transfer.

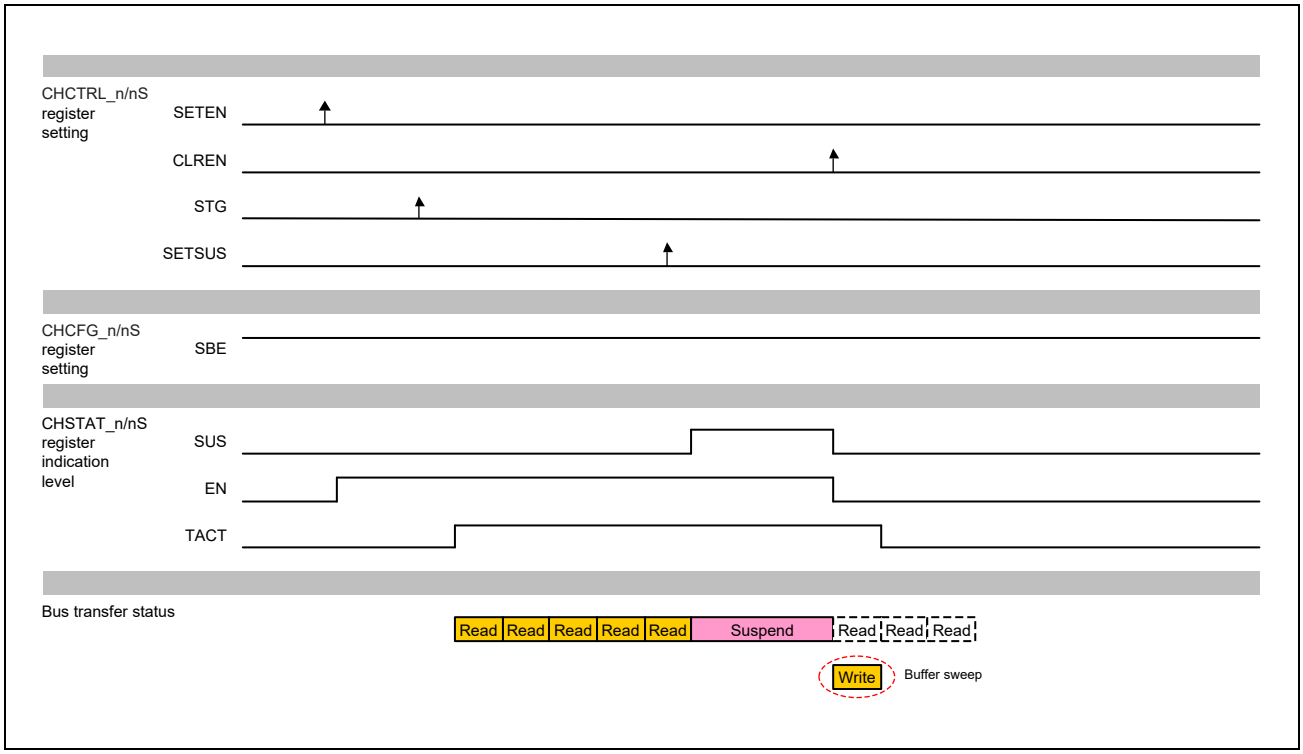

Figure 4.7-30 DMA Transfer Stop (Buffer Sweep Mode)

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If a transfer is stopped in sweep mode (SBE = 1) during the fifth read transfer by setting SETSUS and then CLREN, the read data is written before the DMA transfer is stopped.

(c) Channel Stop Check Method

Even when the EN bit is cleared to 0, the DMA transfer cannot be stopped immediately, if the bus is already executing the transfer. Therefore, in order to make sure that the DMAC has been brought to a complete stop, check that the EN bit and TACT bit are both set to 0.

(d) Transfer Stop Procedure

The transfer stop procedure is described below.

1. Set 1 in SETSUS of CHCTRL_n/nS.
2. Repeat polling until the SUS bit of CHSTAT_n/nS is set to 1. (If EN is already set to 0, the DMAC has already been stopped. Go to step 6.)
3. Set 1 in CLREN of CHCTRL_n/nS.

4. When 0 is set in SBE, the transfer is stopped according to the value of REQD. When 1 is set in SBE, the sweep mode is enabled. When 1 is set in SBE, set 0 in REQD.
5. Read CHSTAT_n/nS to check that 0 is set in the TACT bit. When TACT is set to 0, it means that the DMAC has been brought to a complete stop. When TACT is set to 1, repeat polling until this bit is set to 0.
6. To execute the next DMA transfer after stopping a transfer, be sure to set 1 in the SWRST (software reset) bit of CHCTRL_n/nS before the next DMA transfer starts.

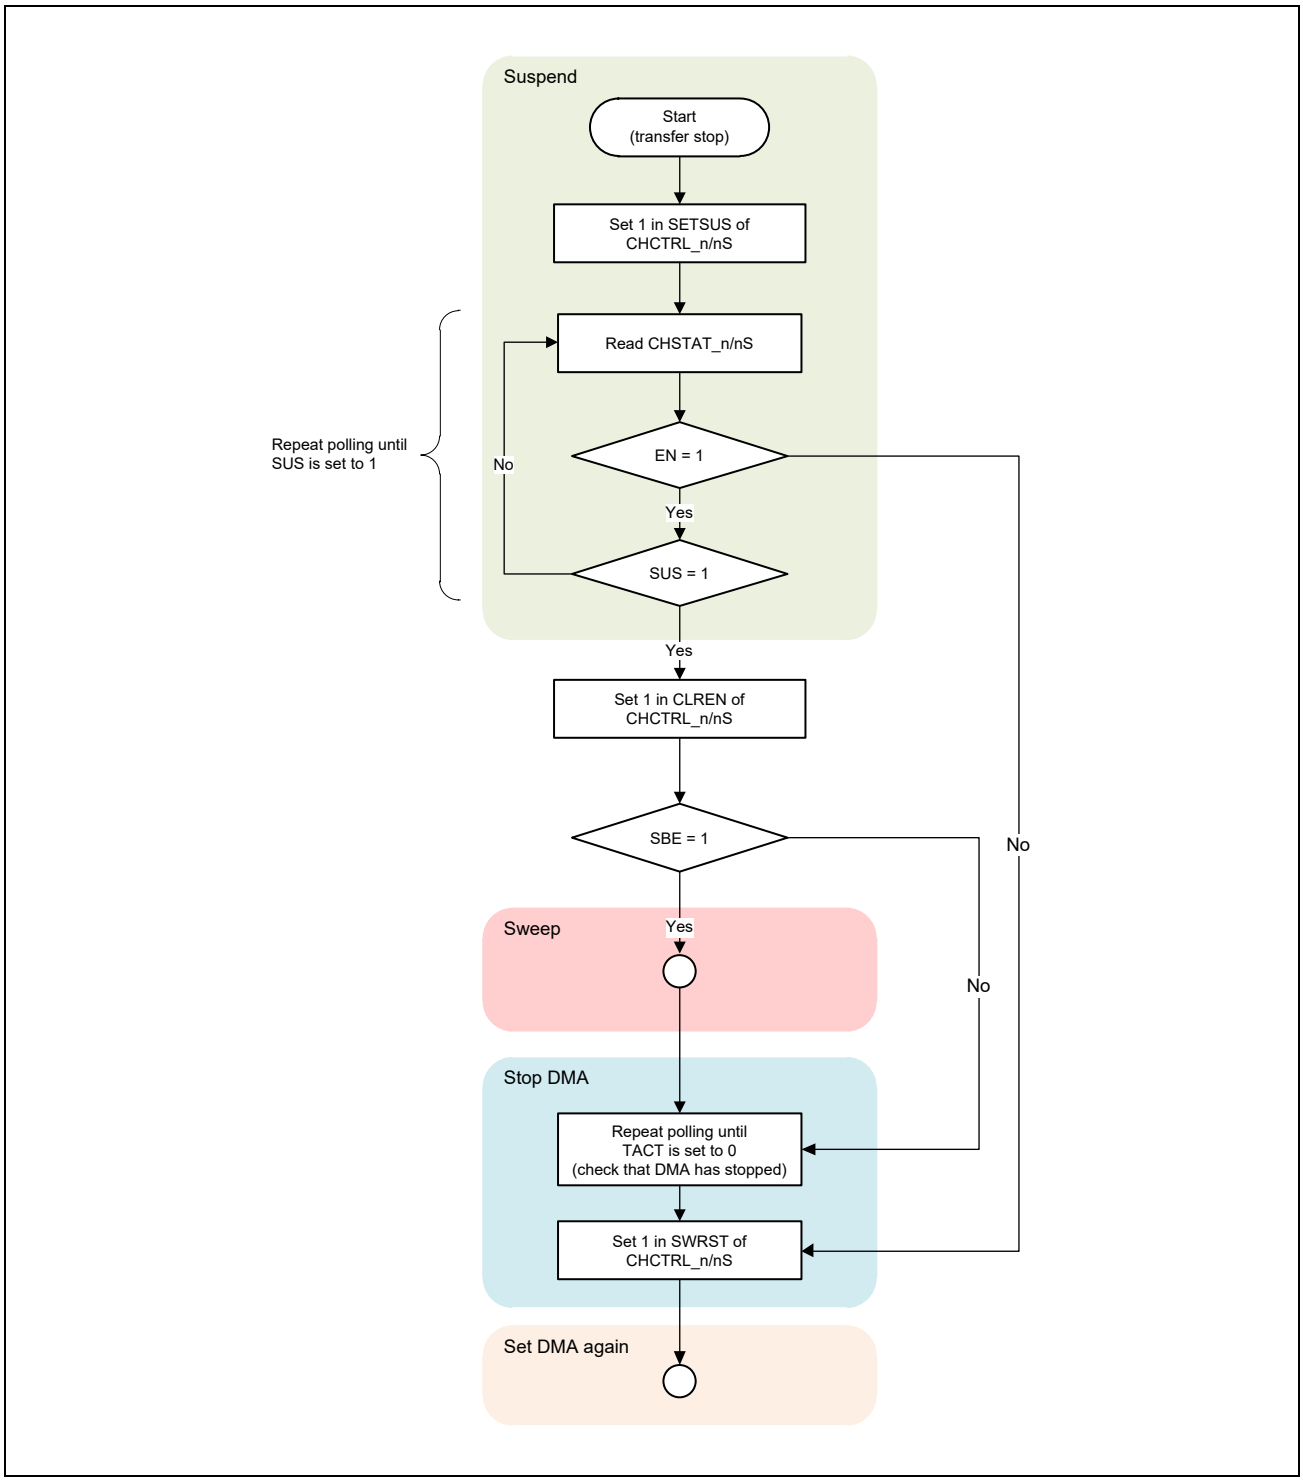

Figure 4.7-31 Transfer Stop Flow

4.7.8 DMA Setting Examples

Setting examples applicable when DMA transfer is executed using the direct memory access controller are shown in the following.

The transfer conditions for these setting examples are as follows.

Table 4.7-24 Transfer Condition List for DMA Transfer Setting Examples

	DMA Mode	Transfer Mode	Transfer Request
Setting example 1	Register	Single	Hardware
Setting example 2	Register	Block	Software
Setting example 3	Register (continuous execution)	Block	Software
Setting example 4	Link	Block	Software

For details of the settings, see the individual setting examples.

4.7.8.1 Setting Example 1 (Register Mode/Hardware Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 4.7-25 DMA Transfer Setting Example 1

Item		Description	
Channel used		3	
DMA mode		Register	
Transfer mode		Single transfer	
Register set used		Next0	
Source/destination		Source	Destination
	Start address	H'1111_0000	H'2222_0000
	Address direction	Increment	Increment
	Data size	32 bits	32 bits
DMA transfer byte count		64 bytes	
DMA transfer request		Rising edge detection by hardware	
DMAACK signal		Level output during read	
DMA transfer end interrupt mask		Not masked	
CACHE setting		Default value	

Setting example 1

N0SA = H'1111_0000 (source address)
N0DA = H'2222_0000 (destination address)
N0TB = H'0000_0040 (transfer byte count)

CHCFG = H'0002_2123 (configuration)
CHITVL = H'0000_0000 (interval)
CHEXT = H'0000_0000 (CACHE setting)

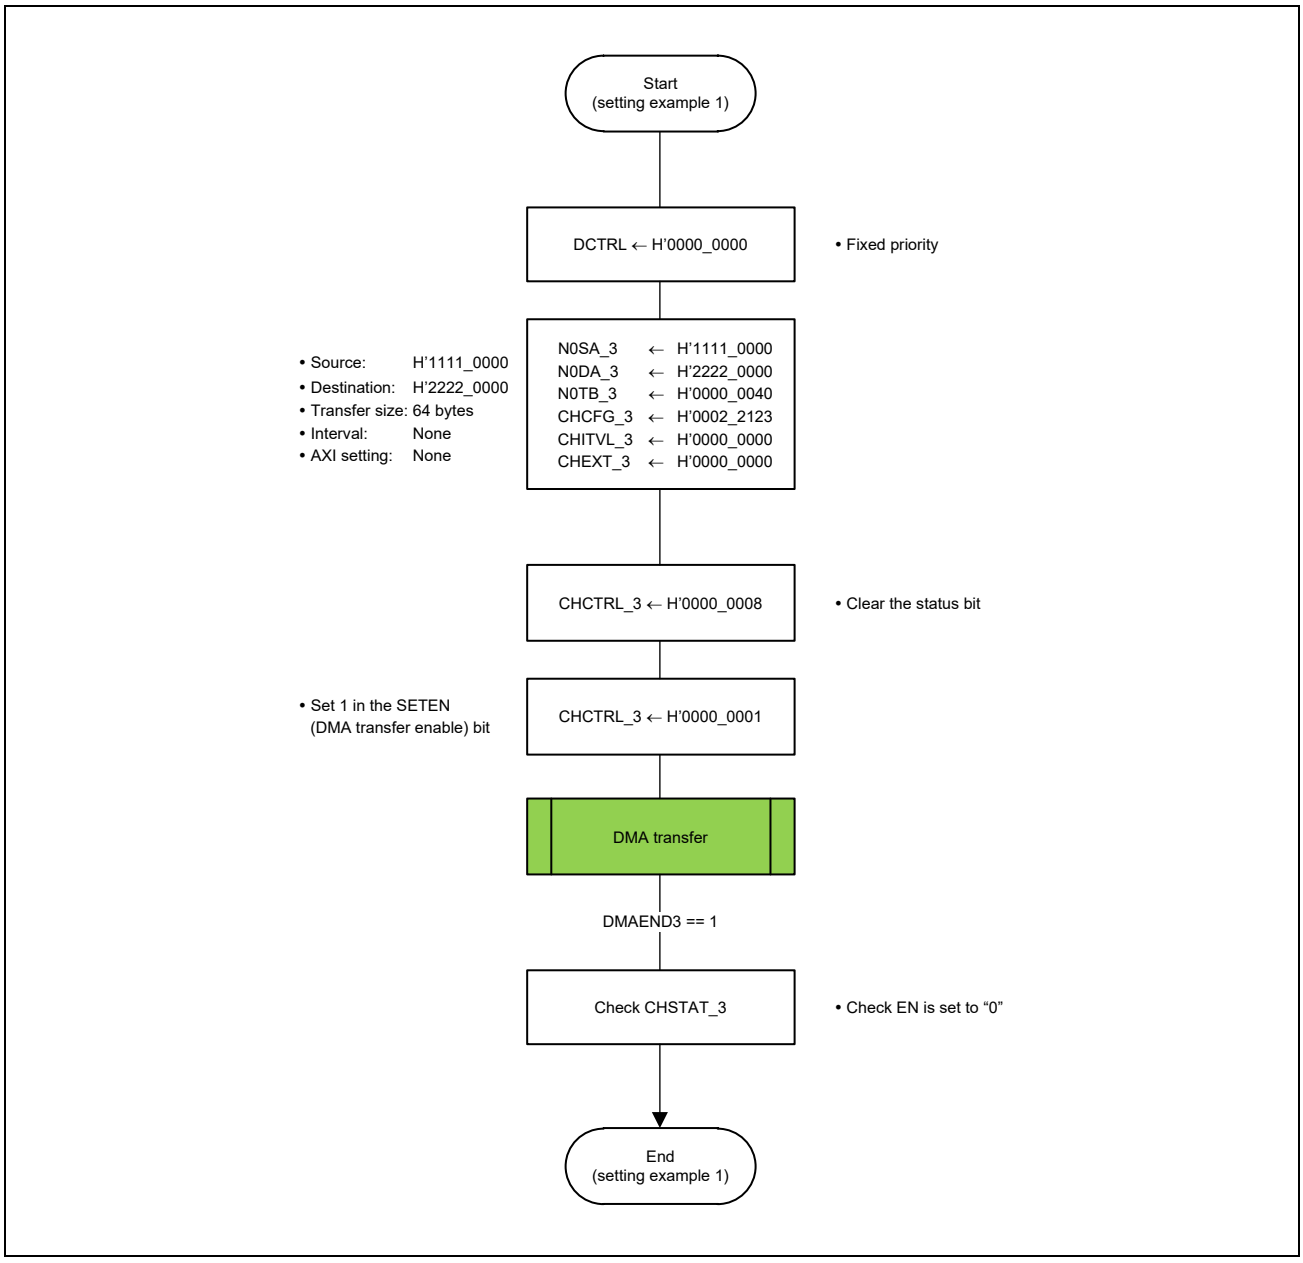

Figure 4.7-32 Setting Example 1

4.7.8.2 Setting Example 2 (Register Mode/Software Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 4.7-26 DMA Transfer Setting Example 2

Item		Description	
Channel used		2	
Priority control		Round robin	
DMA mode		Register	
Transfer mode		Block transfer	
Register set used		Next1	
Source/destination		Source	Destination
	Start address	H'0FFF_E000	H'3333_0000
	Address direction	Increment	Increment
	Data size	8 bits	256 bits
DMA transfer byte count		128 bytes	
DMA transfer request		Auto request	
DMAACK signal		Masked	
DMA transfer end interrupt mask		Not masked	
CACHE setting		Default value	

Setting example 2

DCTRL = H'0000_0001 (DMA setting)

N1SA = H'0FFF_E000 (source address)
N1DA = H'3333_0000 (destination address)
N1TB = H'0000_0080 (transfer byte count)

CHCFG = H'1045_0402 (configuration)
CHITVL = H'0000_0000 (interval)
CHEXT = H'0000_0000 (CACHE setting)

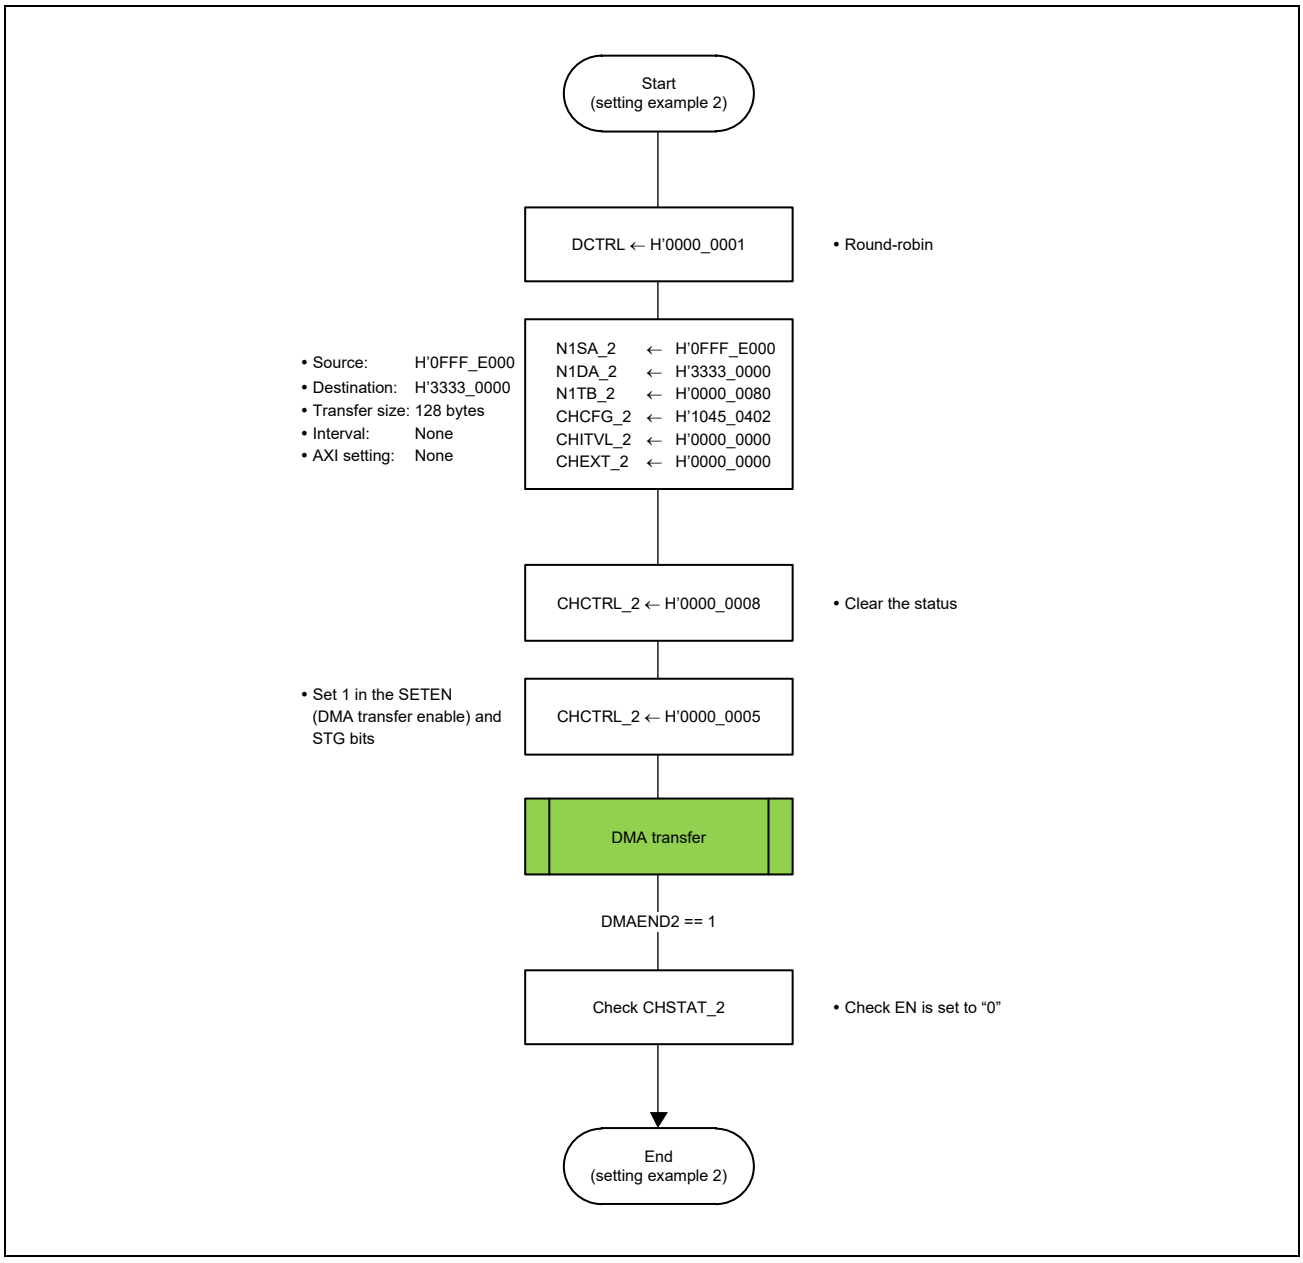

Figure 4.7-33 Setting Example 2

4.7.8.3 Setting Example 3 (Register Mode/Continuous Execution)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 4.7-27 DMA Transfer Setting Example 3

Item		Description	
Channel used		1	
Priority control		Round robin	
DMA mode		Register	
Transfer mode		Block transfer	
Register set used		Use Next0 and then Next1 continuously	
Next0		Source	Destination
	Start address	H'1111_0000	H'3333_0000
	Address direction	Fixed	Fixed
	Data size	32 bits	512 bits
	DMA transfer byte count	512 bytes	
Next1		Source	Destination
	Start address	H'2222_0000	H'4444_0000
	Address direction	Fixed	Fixed
	Data size	32 bits	512 bits
	DMA transfer byte count	2048 bytes	
DMA transfer request		Auto request	
DMAACK signal		Not output	
DMA transfer end interrupt mask		Mask the DMA transfer end interrupt upon completion of Next0	
CACHE setting		Default value	

Setting example 3

DCTRL = H'0000_0001 (DMA setting)

N0SA = H'1111_0000 (source address)
N0DA = H'3333_0000 (destination address)
N0TB = H'0000_0200 (transfer byte count)

N1SA = H'2222_0000 (source address)
N1DA = H'4444_0000 (destination address)
N1TB = H'0000_0800 (transfer byte count)

CHCFG = H'6176_2001 (configuration)
CHITVL = H'0000_0000 (interval)
CHEXT = H'0000_0000 (CACHE setting)

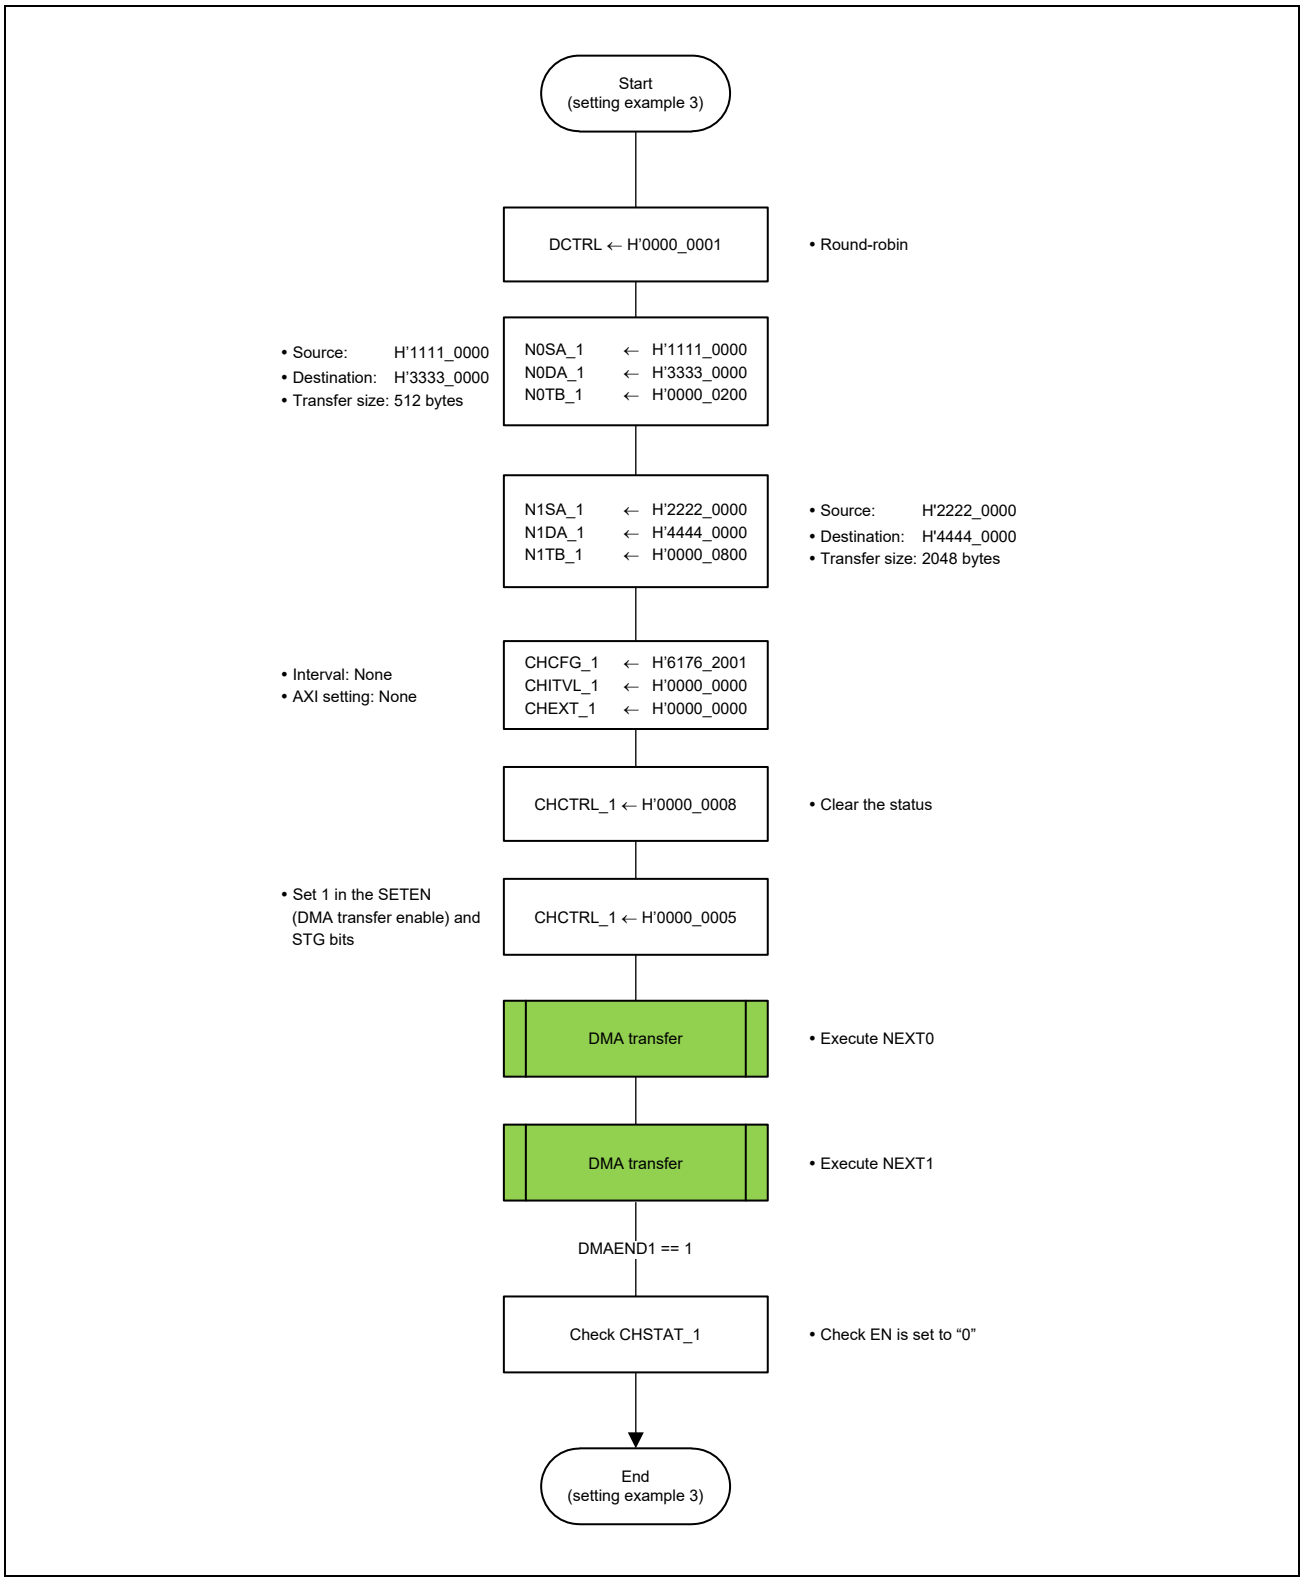

Figure 4.7-34 Setting Example 3

4.7.8.4 Setting Example 4 (Link Mode)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 4.7-28 DMA Transfer Setting Example 4

Item	Description
Channel used	0
Priority control	Round robin
DMA mode	Link
Transfer mode	Block transfer
Register set used	—
Descriptor start address	H'0000_1000

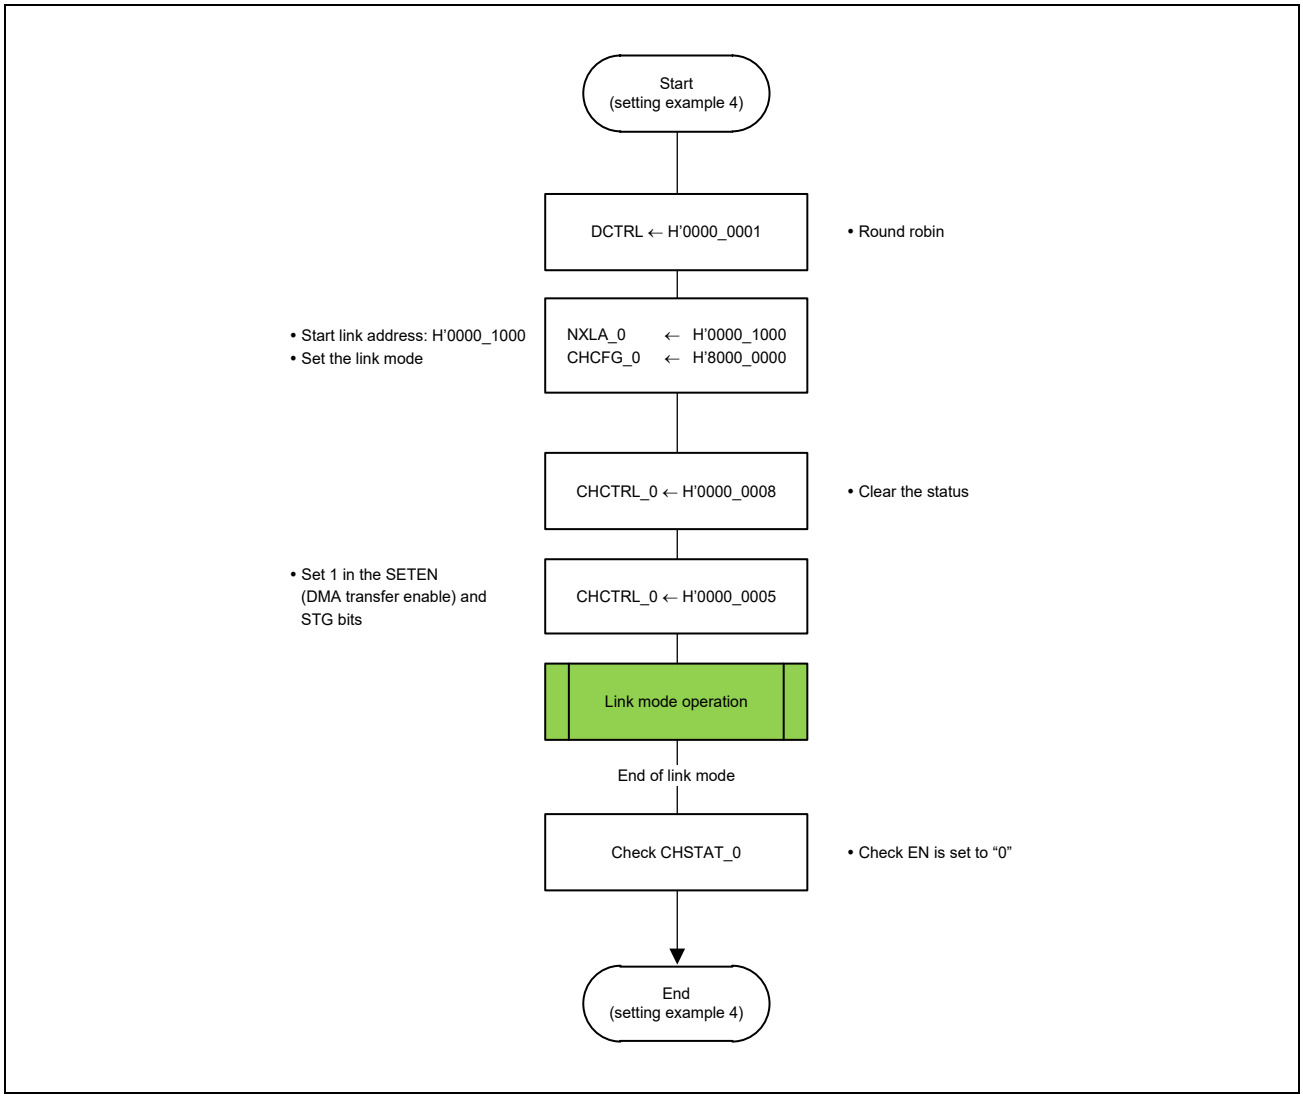

Figure 4.7-35 Setting Example 4

4.7.8.5 Next Register Set Continuous Execution Setting

The following figure shows the flowchart for executing DMA transfers continuously by using two Next register sets in register mode. While a DMA transaction is being executed using one Next register set, the other Next register set is set in order to continue to execute DMA transfers.

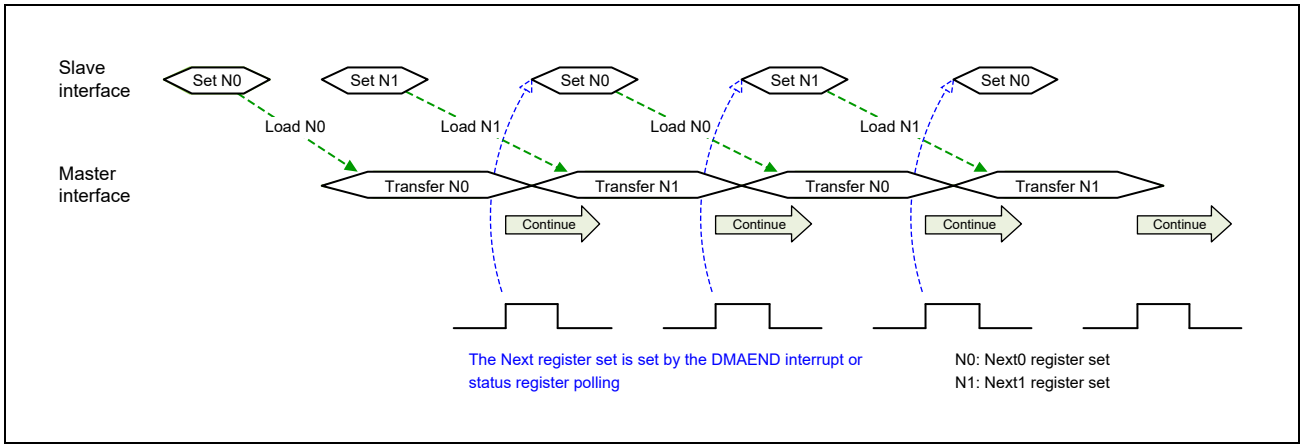

Figure 4.7-36 Image of Next Register Set Continuous Execution

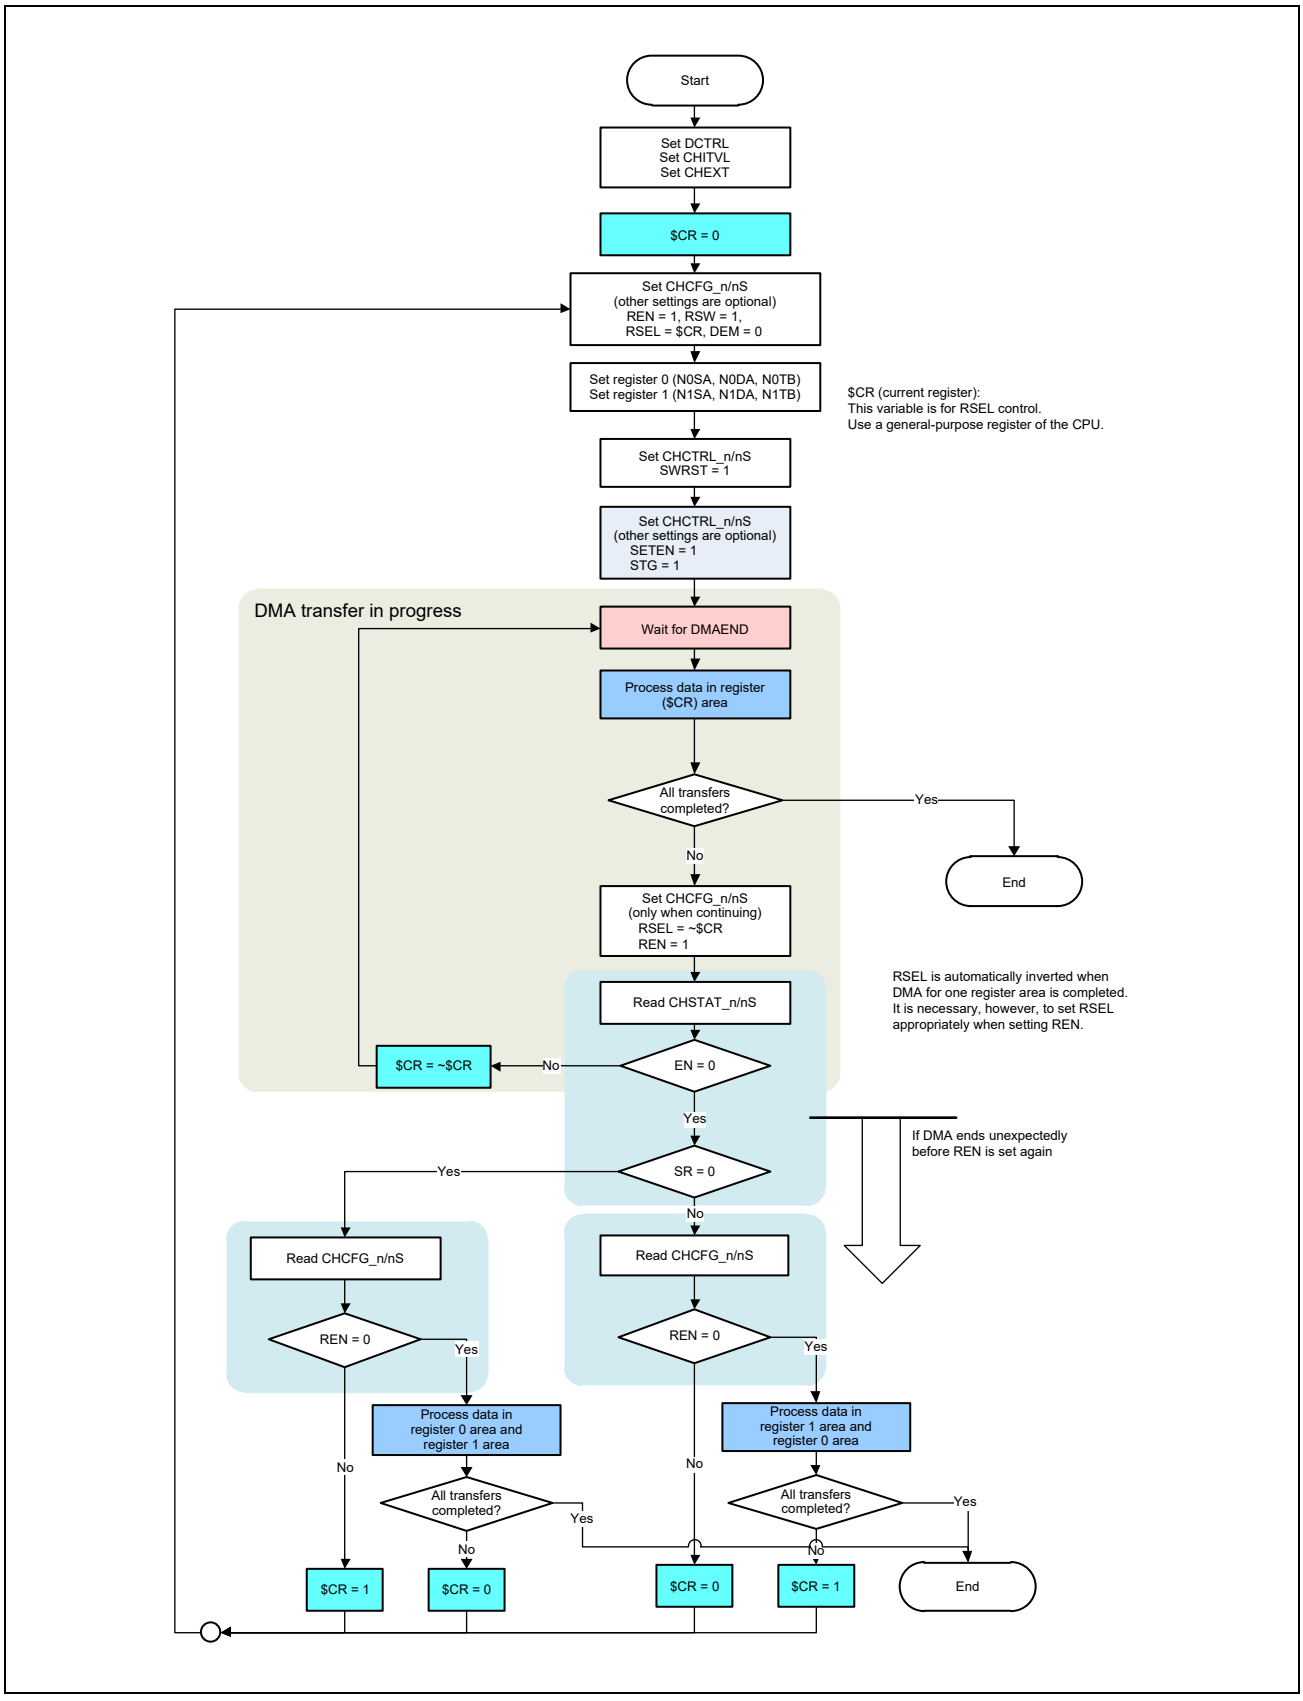

Figure 4.7-37 Example of Continuous DMA Execution by Using a Next Register Set

- Supplementary information

  First, save the data of the register sets to be used for DMA transfers (0 (N0SA, N0DA, and N0TB) and 1 (N1SA, N1DA, and N1TB)) to a general-purpose register of the CPU (the values of this register is referred to as $CR for the sake of convenience).

  Each time the DMA transfers for one register set are completed (the DMA transfer end interrupt is output), REN is automatically cleared to 0. In order to continue to execute DMA transfers, it is necessary to set REN of the CHCFG_n/nS register every time the DMA transfer end interrupt is asserted. This register also contains the RSEL bit, and the value of this bit needs to be set appropriately as well. Therefore, use $CR.

  In this mode, two Next register sets are executed continuously. However, if CLREN is not set before the DMA transaction is completed (the next DMA transfer end interrupt is output), continuous execution stops. In this case, how much of data has been transferred can be checked by reading the SR and EN bits of the CHSTAT_n/nS register and the REN bit of the CHCFG_n/nS register. To restart the DMA transaction, follow the flowchart shown above.

4.7.9 Points for Caution

4.7.9.1 Problem of the Interrupt Signal Overtaking DMA Transfer

(1) Overview

This unit asserts the DMAINT interrupt signal on completion of transfer and this serves as a trigger for the CPU to start processing the data.

However, in cases such as where the device for writing is on another bus, the final data to be written may not yet have reached the device for writing at the time the DMAINT interrupt signal is asserted.

If the CPU accesses a device that has detected the DMAINT interrupt signal before the final data of the DMA transaction have been written to the device, it may be using some old data from before the writing.

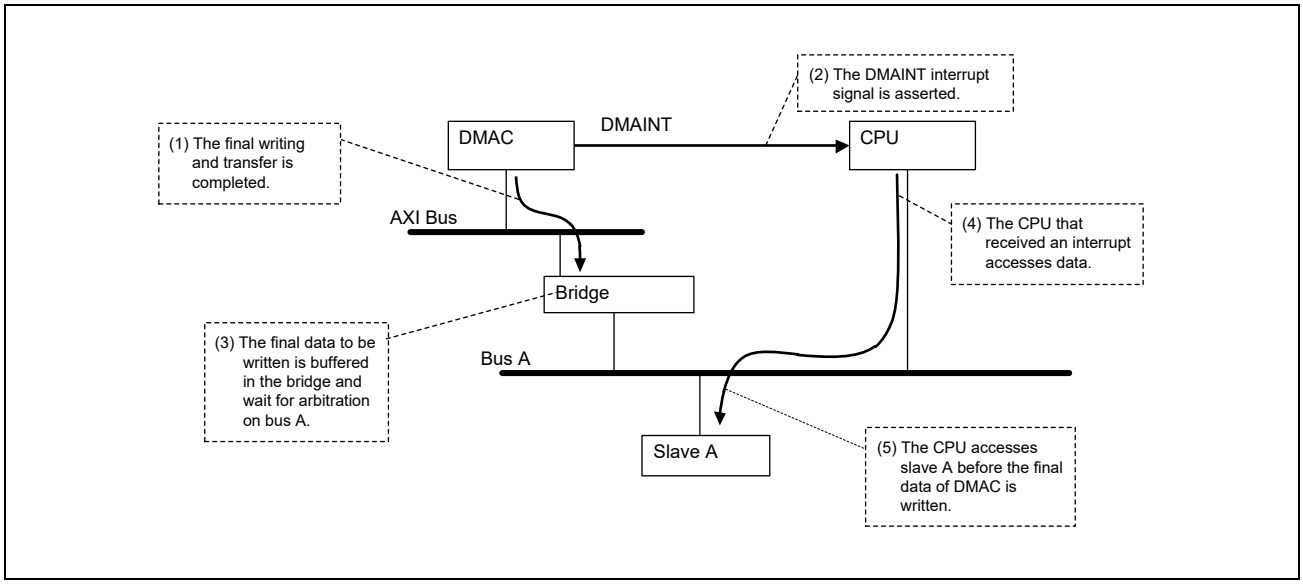

Figure 4.7-38 Example when Access by the CPU Overtakes Writing of the Final Data by the DMAC

(2) Workaround

The following describes workaround for the above problems.

Setting AWCACHE as non-bufferable

Set the AWCACHE signal as non-bufferable for DMA transactions. By doing this, the above problems can be avoided because the DMAINT interrupt signal will only be asserted after the completion of writing to the device for access.

Setting all transfers to non-bufferable may reduce the efficiency of transfer. In such cases, divide up the register sets or descriptors by setting most of the transactions to bufferable for transfer, and then set only the last transfer to non-bufferable.

Exception)

The effect is not obtained if the device in the access path does not refer to AWCACHE.

SECTION 4 SYSTEM

4.8 Renesas Secure IP (RSIP-E50B)

The Renesas Security IP (RSIP-E50B) consists of the access management circuit, encryption engine, and random number generation circuit. In combination with the RSIP-E50B library, the RSIP-E50B can prevent eavesdropping (to maintain confidentiality), falsification of information (to ensure integrity), and impersonation (to verify authenticity).

Because key information required for encryption and decryption is stored only in the RSIP-E50B and all accesses from the outside can be blocked, RSIP-E50B enables building a more robust security system.

4.8.1 Overview

Table 4.8-1 summarizes the specifications of the RSIP-E50B. **Figure 4.8-1** shows a block diagram of the RSIP-E50B.

Table 4.8-1 Specifications of RSIP-E50B (1/2)

Item	Description
Access control	Access management circuit • In case of irregular access to the RSIP-E50B due to a tampered program or CPU runaway, this circuit blocks all subsequent accesses and stops data output from the RSIP-E50B.
Encryption engine	AES: Compliant with NIST FIPS PUB 197 • Key length: 128, 192, or 256 bits • Data block size: 128 bits • AES supports following block cipher mode – ECB, CBC, CTR: Compliant with NIST SP 800-38A – CCM: Compliant with NIST SP 800-38C – GCM: Compliant with NIST SP 800-38D – XTS: Compliant with IEEE 1619-2007 • AES supports following authentication algorithm – CMAC: Compliant with NIST SP 800-38B – GMAC: Compliant with NIST SP 800-38D AES does not support the KEY size of 192-bit in XTS, CMAC, GMAC, CCM, GCM and CMAC. ChaCha/Ploy • Block size: 512-bit • Key size: 256bit • ChaCha/Poly supports the following algorithms – ChaCha20: Compliant with RFC7539 – ChaCha20-Poly1305: Compliant with RFC7539
Random number generation	128-bit true random number generation circuit: Compliant with NIST SP800-90B
Signature generation and verification	RSA • Maximum number of operable bits: 4224 bits • Signature generation, signature verification, public-key encryption, private-key decryption (Add RSA compliance specification(s)) ECC • Maximum number of operable bits: 576 bits • Signature generation, signature verification, key generation

Table 4.8-1 Specifications of RSIP-E50B (2/2)

Item	Description
Message digest computation	HASH • Block size: – 512-bit (SHA-1, SHA-224, SHA-256) – 1024-bit (SHA-512/224, SHA-512/256, SHA-384, SHA-512) – 1,152-bit (SHA3-224), 1,088-bit (SHA3-256), 832-bit (SHA3-384), 576-bit (SHA3-512), 1,344-bit (SHAKE128), 1,088-bit (SHAKE256) • Key size: 512-bit or less • HASH supports following secure hash algorithms – SHA-1, SHA-224, SHA-256, SHA-512/224, SHA-512/256, SHA-384 and SHA-512: Compliant with FIPS PUB 180-4 – SHA3-224, SHA3-256, SHA3-384, SHA3-512, SHAKE128, SHAKE256: Compliant with FIPS PUB 202 • HASH supports following message authentication algorithm – HMAC: Compliant with FIPS PUB 198
Hardware Unique Key	• Key derivation functions combine the Hardware Unique Key with the key generation information. The derived keys implement the key wrapping for user key secure storage. • The HUK uniqueness prevents the illicit cloning and copying of keys to another LSI of the LSI group. • The HUK itself is stored in wrapped (encrypted, non-plain) format in an isolated memory area. Therefore it is protected from illicit access and copy.
Application Key Management	• Wrapped keys are only valid within the RSIP-E50B.
Unique ID	• An LSI (Unique ID) is accessible from the access management circuit. • Key derivation functions combine the Unique ID with the key generation information. Such derived keys are used to unwrap the HUK within the RSIP-E50B boundary.
SPA/DPA Protections	• SPA/DPA protections can optionally be enabled for crypto engine processing.
Low power consumption	• Setting of the module stop state is possible.

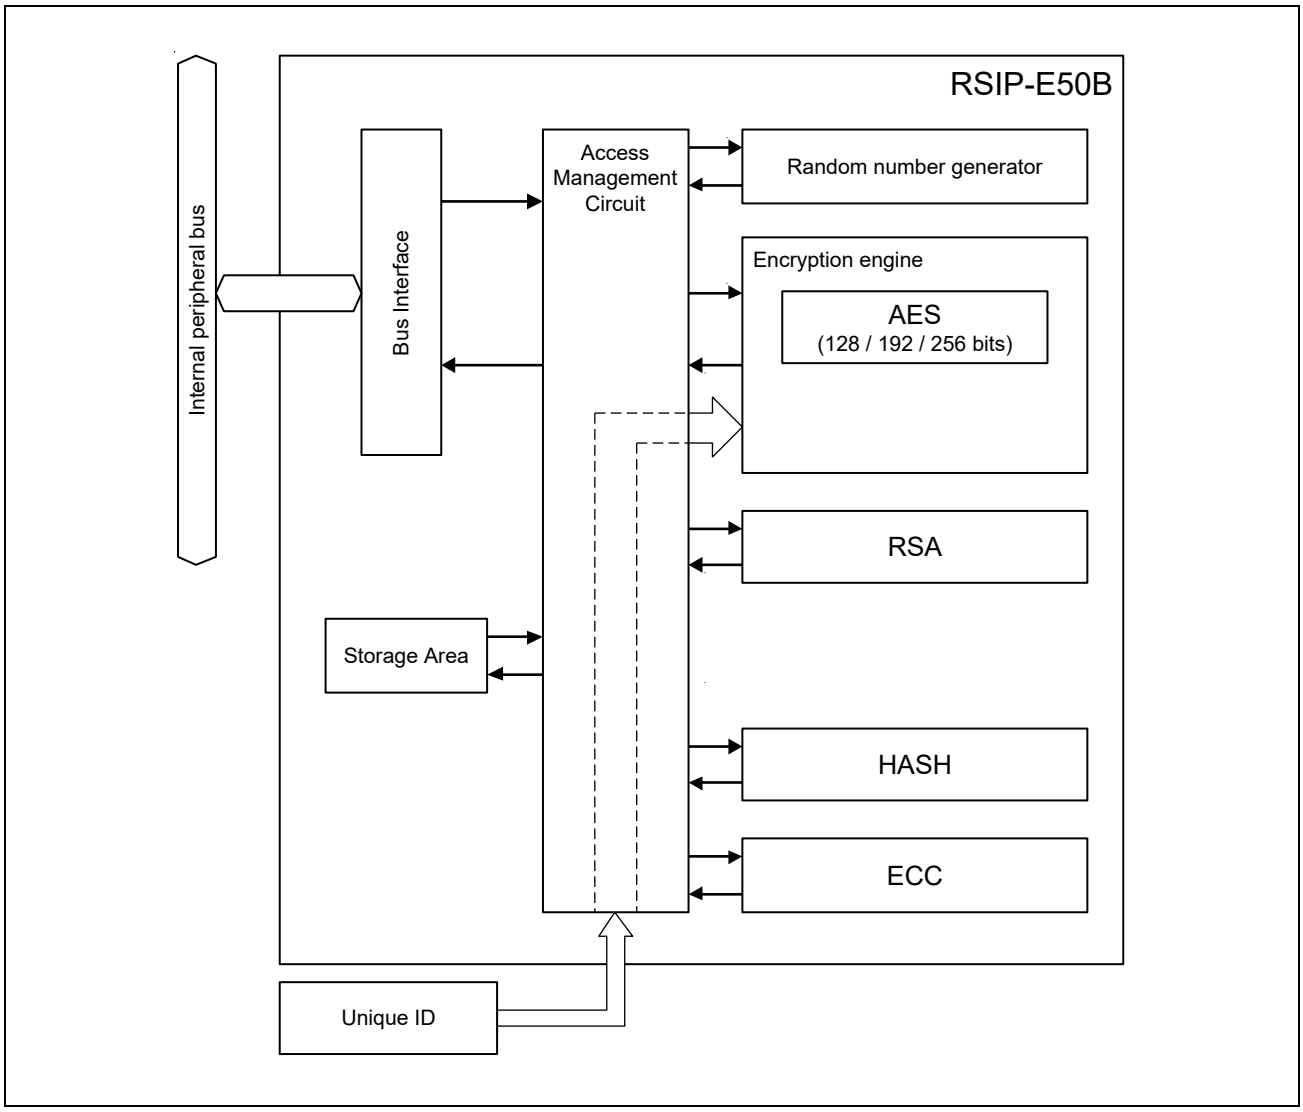

Figure 4.8-1 RSIP-E50B Block Diagram

4.8.2 Operation

4.8.2.1 Encryption Engine

Figure 4.8-2 shows conceptual block diagram of the encryption engine installed in the RSIP-E50B.

The encryption engine uses the input key information, and converts the plaintext data to ciphertext or ciphertext data to plaintext through the hardware.

The encryption/decryption process can be completed without exposing the key data and the process's intermediate data outside of the RSIP-E50B. This process is performed by the secure engine and storage area of the RSIP-E50B internally.

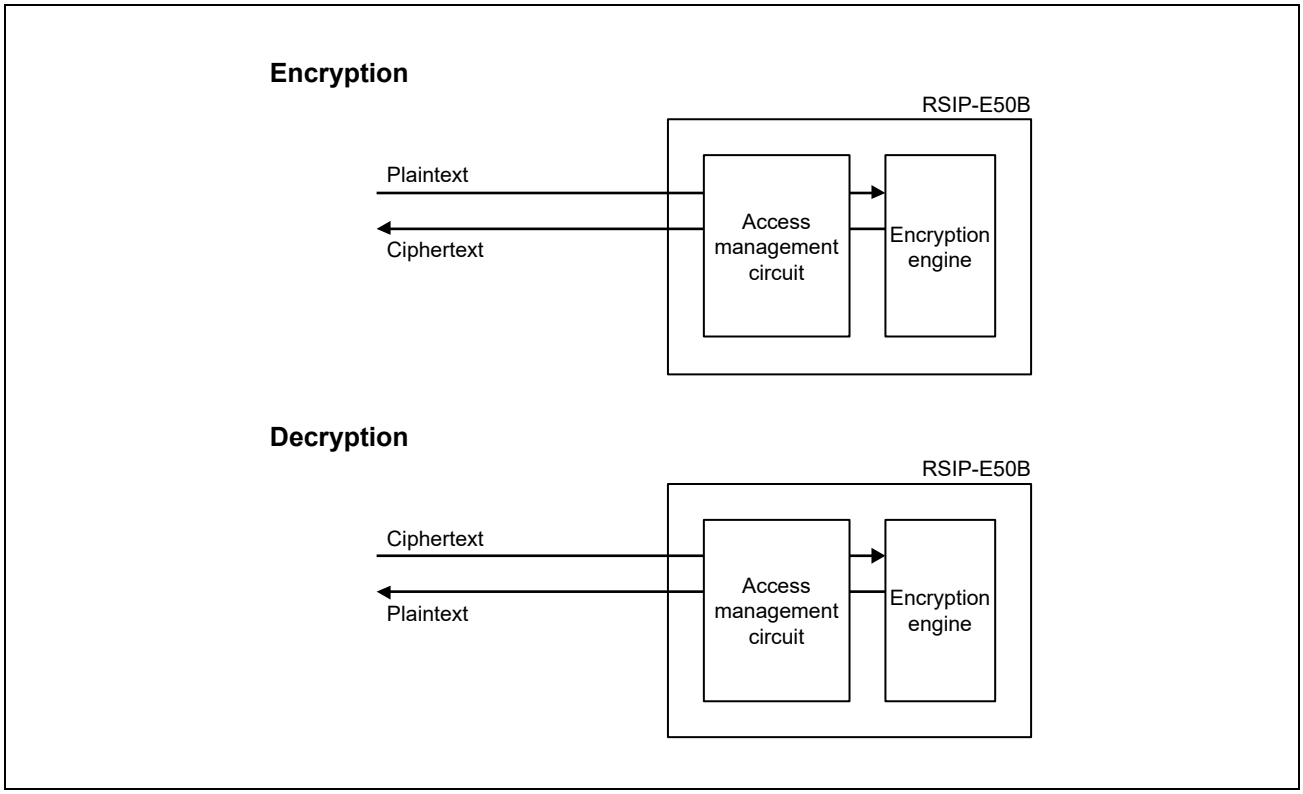

Figure 4.8-2 Encryption and Decryption Processing by Encryption Engine

4.8.2.2 Encryption and Decryption

Follow the procedure below to encrypt and decrypt the data:

(1) Input the key information to the RSIP-E50B.

(2) Input the target data to the RSIP-E50B. Plaintext data is converted to ciphertext and ciphertext data to plaintext.

(3) Read the converted data.

The encryption engine has input and output buffers, and can perform encryption/decryption in parallel with data input/output. **Figure 4.8-3** shows the encryption engine timing.

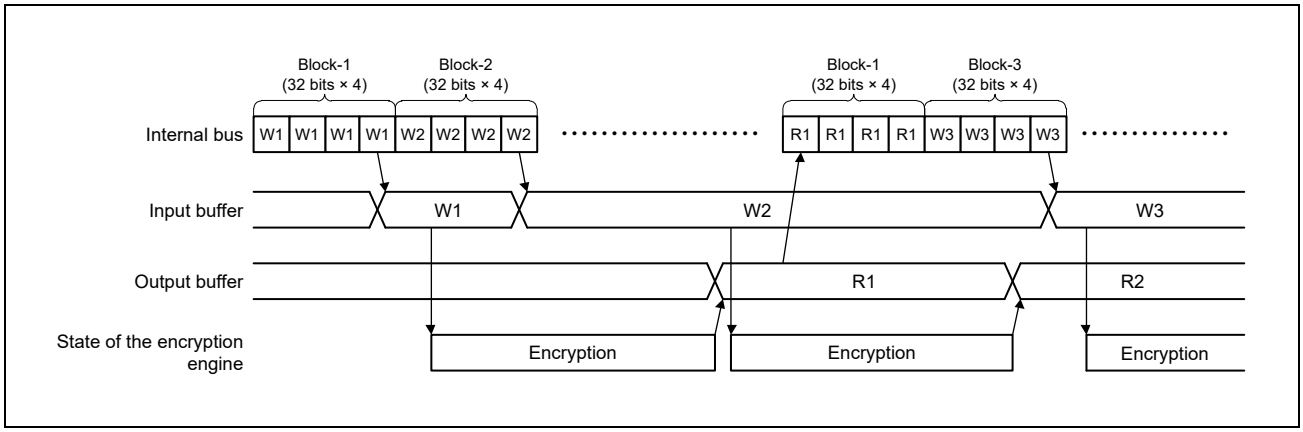

Figure 4.8-3 Encryption and Decryption Timing Diagram

4.8.3 Usage Notes

4.8.3.1 SPA/DPA Protections

SPA/DPA protections can optionally be enabled for crypto engine processing.

4.8.3.2 Renesas Secure IP(RSIP-E50B) Driver

Use of the RSIP-E50B requires the RSIP-E50B driver provided by Renesas Electronics. Please contact our sales office for information regarding the RSIP-E50B driver.

SECTION 4 SYSTEM

4.9 Debug Interface

4.9.1 Overview

This LSI has a debug interface for boundary scan function and debug support for Cortex-A55 and Cortex-M33.

4.9.1.1 Features

The functions of the debug interface of this LSI are shown below.

- Debug Interface
  - Support JTAG and SWD
- Debugger control function (DAP function)
  - Direct control of IP without going through CPU by switching Access Port (AP)
- Trace data support
  - Cortex-A55 trace output
  - Cortex-M33 trace output
  - Buffer function of trace data by ETF
  - Trace data output to system bus by using ETR
- Boundary Scan
  - Connection test between this LSI and other LSIs on the user board
- Other functions
  - Interlocking operation of Cortex-A55, Cortex-M33, system counter (SYC), watchdog timer, general timer (GTM), and debug component by cross trigger
  - Support WDT counter stop control function
  - Add time information to trace data by Time Stamp (24 MHz operation)

4.9.1.2 Block Diagram

Figure 4.9-1 shows the block diagram of the debug interface, and **Figure 4.9-2** shows the block diagram of the Core Sight System (CST).

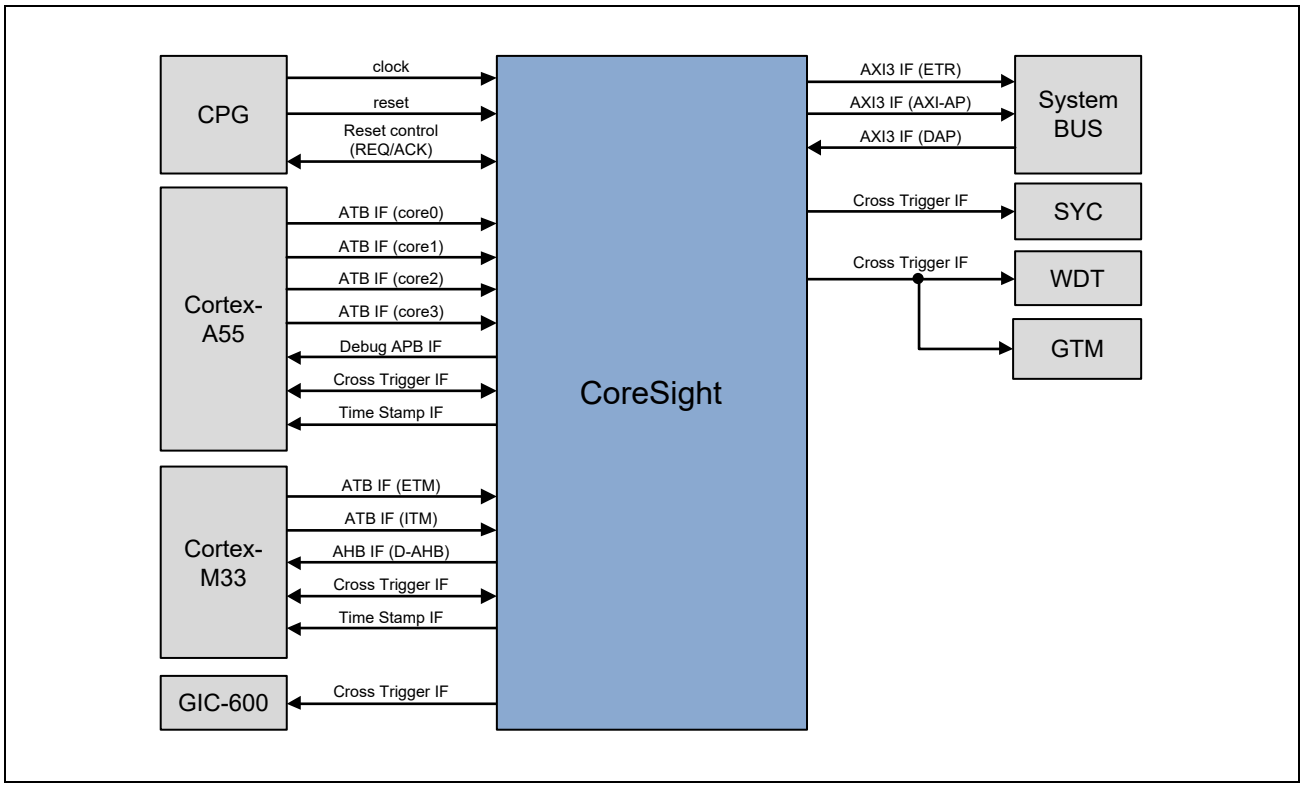

Figure 4.9-1 Debug System Block Diagram

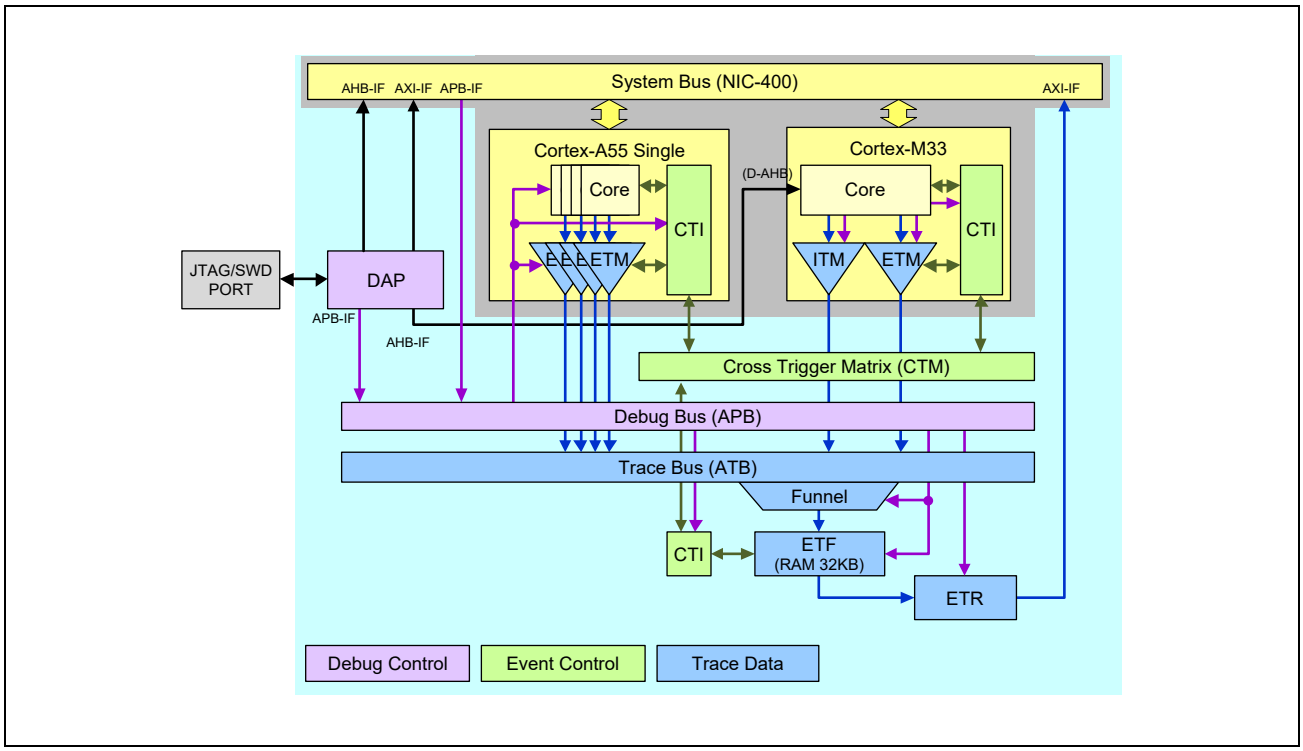

Figure 4.9-2 Core Sight System Block Diagram

- Debug Bus (APB)

  Bus used for controlling debug functions and acquiring debug data (register values and trace data in On-Chip Buffer)

  - DAP: Debug Access Port

- Cross Trigger Matrix (CTM)

  Functions required for co-debugging triggered by mutual events between CPU and Component

  - CTI: Cross Trigger Interface

- Trace Bus (ATB)

  A data bus which the trace data output by ETM flows

  - ETM: Embedder Trace Macrocell
  - ETR: Embedder Trace Router
  - ETF: Embedder Trace FIFO
  - Funnel: Trace data merge function

For details on ETM, ETR, and ETF, refer to “CoreSight Trace Memory Controller Technical Reference Manual”.

4.9.1.3 External Pins

- JTAG pins

The debug interface supports JTAG IF and SWD IF. **Table 4.9-1** shows the JTAG pins and their functions.

Table 4.9-1 JTAG Pins

Pin Name	Input/Output	Function		Functional Description
		JTAG IF	SWD IF	
JTAG_TCK_SWCLK	Input	TCK	SWCLK	Test clock (TCK), Serial wire clock (SWCLK)
JTAG_TMS_SWDIO	Input (TMS), Input/Output (SWDIO)	TMS	SWDIO	Test mode select (TMS), Serial wire data input/output (SWDIO)
JTAG_TDI	Input	TDI	—	Test data input
JTAG_TDO	Output	TDO	—	Test data output
JTAG_TRST#	Input	TRST	—	Test reset

- BOOT_MODE3 pins

Table 4.9-2 shows the functions of the BOOT_MODE3 pin.

Table 4.9-2 BOOT_MODE3 Pins

Pin Name	I/O	Function
BOOT_MODE3	Input	Switches between normal operation and debug operation. 0: Normal operation 1: Debug operation

The BOOT_MODE3 value must be fixed before releasing the power-on reset (SYS_RST#). **Table 4.9-3** shows the difference in operation between normal operation and debug operation.

Table 4.9-3 Difference in Operation by BOOT_MODE3

	Normal Operation (BOOT_MODE3 = 0)	Debug Operation (BOOT_MODE3 = 1)	Related Module
Debug function module (CoreSight (other than DAP))	Boot impossible (Reset state)	Boot (Refer **4.9.5.1 Debug Related Reset** for reset condition and range)	CPG (Reset control)

- BSCAN_EN pins

Table 4.9-4 shows the functions of the BSCAN_EN pin.

Table 4.9-4 BSCAN_EN Pins

Pin Name	I/O	Function
BSCAN_EN	Input	Switches between normal operation and boundary scan test mode. 0: Normal operation 1: Boundary scan test mode

Boundary scan test mode is a mode in which a connection test is performed between the terminals of this LSI and other ICs connected on the customer's board and is performed when BSCAN_EN = 1.

The actual access is controlled by the 5 terminals of JTAG when BSCAN_EN = 1.

Table 4.9-5 shows the operation modes of this LSI according to the values of the BOOT_MODE3 pin and BSCAN_EN pin.

Table 4.9-5 Operating Mode

Pin Name		
BSCAN_EN	BOOT_MODE3	Operating Mode
0	0	Normal operation
0	1	Debug operation
1	*	Boundary scan test mode

4.9.1.4 Treatment of Unused Pins

When the external terminal of the debug interface is not used, handle it as shown in **Table 4.9-6**.

Table 4.9-6 Handling of Unused Pins

Pin Name	Handle*1
JTAG_TCK_SWCLK	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
JTAG_TMS_SWDIO	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
JTAG_TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
JTAG_TDO	Open-circuit
JTAG_TRST#*2	Fix this pin at a low level (pull down or connect to the ground level)
BOOT_MODE3	Fix this pin at a low level (pull down or connect to the ground level)
BSCAN_EN	Fix this pin at a low level (pull down or connect to the ground level)

Note 1. Mount the pull-up/pull-down resistors on the board side.

Note 2. JTAG_TRST# should be fixed at low level in non-debug mode, and JTAG_TRST# should be changed from low level to high level in debug mode.

4.9.2 Address Space

The CoreSight of this LSI has a 4 MB debug system address space. The address space of the debug system is shown in **Table 4.9-7**.

Table 4.9-7 Address Space of the Debug System (1/2)

Address	Component*1
CoreSight Debug Components (Overall Address Space of this LSI)	
H'0_1F00_0000 ~ H'0_1F00_FFFF	CoreSight: ROM table
H'0_1F01_0000 ~ H'0_1F01_FFFF	CoreSight: Timestamp generator

H'E004_3000 ~ H'E00F_EFFF	Reserved
H'E00F_F000 ~ H'E00F_FFFF	Cortex-M33: ROM Table

Note 1. Access to the Reserved area is prohibited. Operation is not guaranteed when accessed.

NOTE

- The CoreSight Debug Components area and Cortex-A55 Debug Components area can be accessed via the system bus and APB-AP.
  APB-AP is connected to port-0 of DAP. For the port configuration of DAP, refer to **4.9.5.2 DAP**.
- Each component is placed on a 64KB address boundary according to the ARMv8 Debug memory map. As an entity, the first 4 KB is valid.

4.9.2.1 List of Registers

The register is listed below.

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
ID Register	CST_BSID	—	H'087D_9447	—	32

4.9.2.2 Register Descriptions

4.9.2.2.1 ID Register (BSID)

The BSID register is a 32-bit register that cannot be accessed from the CPU. When the BSCAN_EN pin is 1, it can be read from the JTAG_TDO pin by setting the IDCODE command on the TAP controller. It cannot be written.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BSID[31:16]															
Initial Value	0	0	0	0	1	0	0	0	0	1	1	1	1	1	0	1
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSID[15:0]															
Initial Value	1	0	0	1	0	1	0	0	0	1	0	0	0	1	1	1
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BSID[31:0]	H'087D_9447	—	This is the ID register specified in JTAG. The upper 4 bits (bit31-28) may change depending on the chip version.

4.9.2.2.2 Other Registers

For details on each register other than the BSID register, refer to "ARM CoreSight SoC-400 Technical Reference Manual" and "CoreSight Trace Memory Controller Technical Reference Manual".

4.9.3 Debug Connection

4.9.3.1 Debug Connection Mode

There are the following four modes for the debug connection method of this LSI.

Authentication Mode	Method
No authentication	Allow access from the debugger without authentication (initial setting)
SEC authentication*1	Allow access from the debugger after authentication is OK. (authentication method is security authentication by security IP)
Authentication refusal*1	Block access from the debugger

Note 1. SEC authentication and Authentication refusal can only be authenticated with secure products.

For SEC authentication modes, enter the authentication code from the debugger is needed.

For information on the authentication function of secure products, please contact our sales.

4.9.4 Debug Access Range

The debug access range by CoreSight is for all slaves as well as Cortex-A55. For details, refer to **1.7.2 Accessible Areas**.

4.9.5 Operation

4.9.5.1 Debug Related Reset

Please refer to **4.4 Clock Pulse Generator (CPG)** for the debug-related reset and reset range.

4.9.5.2 DAP

DAP is equipped with SWJ-DP as Debug Port (DP) and APB-AP, AXI-AP, AHB-AP as Access Port (AP).

The DAP port numbers are shown in **Table 4.9-8**. Indicates the correspondence between the port number specified in the DP SELECT register and the AP, and its usage.

Table 4.9-8 DAP Port Number

Port number	AP	Usage
Port-0	APB-AP	Debug Component recognition and settings
Port-1	AXI-AP	System IP control (access to system bus)
Port-3	AHB-AP	Cortex-M33 settings

4.9.5.3 Trace

4.9.5.3.1 Data Flow

In CoreSight, all trace data is aggregated once by Trace Funnel, and stored in ETF, or output to the system bus via ETR in the subsequent stage. Setting this port number to the Trace Funnel according to the route of the trace data is needed. The Trace Funnel port numbers are shown in **Table 4.9-9**.

Table 4.9-9 Trace Funnel Port Number

Port Number	Source Components
Port-0	Cortex-A55: Core0 ETM
Port-1	Cortex-A55: Core1 ETM
Port-2	Cortex-A55: Core2 ETM
Port-3	Cortex-A55: Core3 ETM
Port-4	Cortex-M33: ITM
Port-5	Cortex-M33: ETM

4.9.5.3.2 Timestamp

If time information want to be included in the trace data, the Timestamp Generator can be used. The timestamp replicator port numbers are shown in **Table 4.9-10**. The Timestamp Generator runs on a 24-MHz clock.

Table 4.9-10 Timestamp Replicator Port Number

Port Number	Target Components
Port-0	Cortex-A55: Core0/1/2/3 ETM
Port-1	Cortex-M33

4.9.5.4 Cross Trigger

The CTI (Cross Trigger Interface) implemented in CoreSight, Cortex-A55 and Cortex-M33 is used to communicate debug events.

4.9.5.4.1 CoreSight Cross Trigger Connection

CoreSight has two CTIs. The connection specifications are shown in **Table 4.9-11** to **Table 4.9-14**.

[0]	Cortex-M33:Processor	Processor debug request

4.9.5.5 WDT Counter Stop Control

This LSI has a WDT counter stop control function linked with a debug event to prevent an unintended reset by WDT during debug operation. When a debug event occurs, CoreSight asserts the WDT counter stop request signal, controls the WDT counter stop signal (CNTSTOP), and stops counting. The target WDT is all WDT. For details on the WDT count stop function, refer to **4.3.4.2 WDT Stop Control Function**.

Counter Stopping:

The event trigger indicating that a core has transitioned to the Halt state is input to Trigger input bit[0] of the CTI owned by each core. Propagating this event trigger to Trigger output bit[4] of CoreSight CTI0 stops the WDT counter operation.

After the count has stopped, it is necessary to clear the trigger status before instructing the core to resume. Operating the CTI Interrupt Acknowledge register (CTIITACK) of CoreSight CTI0 clears Trigger output bit[4].

Counter Resumption:

The event trigger to instruct a core to resume from the Halt state is output from Trigger output bit[1] of the CTI owned by each core. Propagating this event trigger to Trigger output bit[5] of CoreSight CTI0 resumes the WDT counter.

NOTE

- For cross-trigger connections, refer to **4.9.5.4 Cross Trigger**.
- For details on cross-trigger configuration methods, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual*, the *Arm® Cortex®-A55 Core Technical Reference Manual*, and *Arm® Cortex®-M33 Processor Technical Reference Manual*.
- For operation methods from the debugger in use, contact the debugger vendor as needed.

4.9.5.6 GTM Counter Stop Control

This LSI has a GTM counter stop control function linked with debug events to prevent unintended GTM counts during debug operation. When a debug event occurs, CoreSight asserts a GTM counter stop request signal to stop the GTM count.

Counter Stopping:

The event trigger indicating that a core has transitioned to the Halt state is input to Trigger input bit[0] of the CTI owned by each core. Propagating this event trigger to Trigger output bit[4] of CoreSight CTI0 stops the GTM counter operation.

After the count has stopped, it is necessary to clear the trigger status before instructing the core to resume. Operating the CTI Interrupt Acknowledge register (CTIITACK) of CoreSight CTI0 clears Trigger output bit[4].

Counter Resumption:

The event trigger to instruct a core to resume from the Halt state is output from Trigger output bit[1] of the CTI owned by each core. Propagating this event trigger to Trigger output bit[5] of CoreSight CTI0 resumes the GTM counter.

NOTE

- For cross-trigger connections, refer to **4.9.5.4 Cross Trigger**.
- For details on cross-trigger configuration methods, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual*, the *Arm® Cortex®-A55 Core Technical Reference Manual*, and *Arm® Cortex®-M33 Processor Technical Reference Manual*.
- For operation methods from the debugger in use, contact the debugger vendor as needed.

4.9.5.7 SYC Counter Stop Control

This LSI has a SYC counter stop control function linked with debug events to prevent unintended SYC counts during debug operation. When a debug event occurs, CoreSight asserts a SYC counter stop request signal to stop the SYC count.

Counter Stopping:

The event trigger indicating that a core has transitioned to the Halt state is input to Trigger input bit[0] of the CTI owned by each core. Propagating this event trigger to Trigger output bit[6] of CoreSight CTI0 stops the SYC counter operation.

After the count has stopped, it is necessary to clear the trigger status before instructing the core to resume. Operating the CTI Interrupt Acknowledge register (CTIITACK) of CoreSight CTI0 clears Trigger output bit[6].

Counter Resumption:

The event trigger to instruct a core to resume from the Halt state is output from Trigger output bit[1] of the CTI owned by each core. Propagating this event trigger to Trigger output bit[7] of CoreSight CTI0 resumes the SYC counter.

NOTE

- For cross-trigger connections, refer to **4.9.5.4 Cross Trigger**.
- For details on cross-trigger configuration methods, refer to the *Arm® CoreSight™ SoC-400 Technical Reference Manual*, the *Arm® Cortex®-A55 Core Technical Reference Manual*, and *Arm® Cortex®-M33 Processor Technical Reference Manual*.
- For operation methods from the debugger in use, contact the debugger vendor as needed.

SECTION 4 SYSTEM

4.10 Battery Backup Function (VBATTB)

Backup power supplied by a battery can keep the realtime clock (RTC) operating and retain the important data while the VCC power is turned off. The tamper detection function can be used to erase the backed-up data in cases where an intrusion to the system has been detected.

Regarding the Real time clock, refer to **4.11 Realtime Clock (RTCA-3)** for details.

4.10.1 Overview

Table 4.10-1 shows the specifications of the VBATTB.

Table 4.10-1 VBATTB Specifications

Item	Description
Scope of backup	All modules in the backup domain (PD_VBATT) • Backup registers • 32kHz-clock oscillator • Tamper detector • Realtime clock (RTC)
Backup registers	128 bytes • The backup registers can immediately be erased in response to the detection of physical tampering.
Tamper event detection	When the tamper detector has detected an intrusion to the system, it indicates this by setting a flag and, if this is selected, generating an interrupt and outputting a signal for PMIC (VBAT_RTC_WKUP). • Tamper event can acquire a timestamp on tamper detection. • Tamper input pin (VBAT_TAMPER) • Software trigger • Noise filter (sampling rate: 32.768 kHz; passes signal transitions in response to three consecutive samples with the same level)

Figure 4.10-1 shows a block diagram of the VBATTB, and **Table 4.10-1** shows the external pins of the VBATTB.

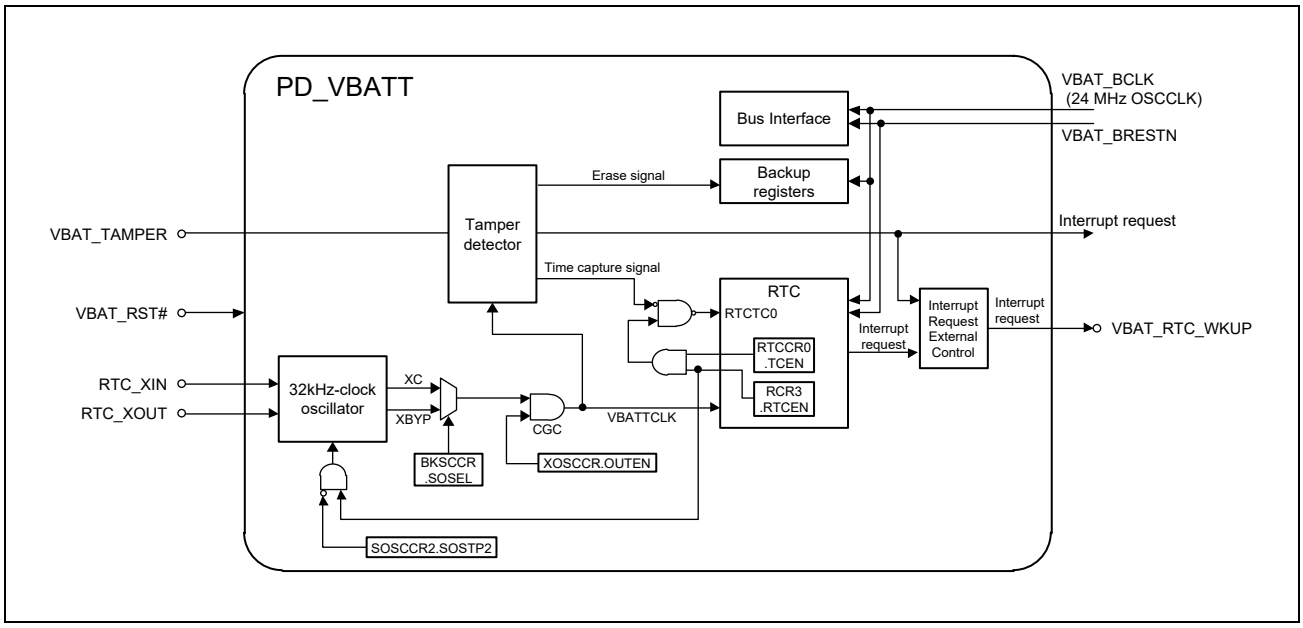

Figure 4.10-1 Block Diagram of VBATTB

Table 4.10-2 External Pins

Pin Name	Input/Output	Function
VBAT_RST#	Input	Backup domain reset
RTC_XIN	Input	Pins for the 32kHz-clock • Oscillation mode : Connect 32.768-kHz crystal to RTXIN and RTXOUT pins. • Bypass mode (RTXOUT to XBYP): Connect external clock to RTXOUT pin.
RTC_XOUT	I/O	
VBAT_TAMPER	Input	Tamper input pin (VBAT_TAMPER) / Time capture event input pin for RTC (RTCTC0)
VBAT_RTC_WKUP	Output	RTC wakeup output pin Selected RTC interrupt and Tamper interrupt can be outputted.

4.10.2 Register Configuration

NOTE

- Registers in the battery backup function (VBATTB) can only be initialized by the backup domain reset (VBAT_RST#).
- Resets generated by other sources such as the SYS_RST# pin or software will not affect these registers.

The Base Address is as follows.

Base Address: H'0_1005_C000 (Cortex-A55 Address Space)
Base Address: H'4005_C000 (Cortex-M33 Address Space Secure)
Base Address: H'5005_C000 (Cortex-M33 Address Space Non-Secure)

Table 4.10-3 shows the register list of the VBATTB. Prohibit to access the undefined area.

Table 4.10-3 Register List

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size	Note
Backup Domain Power Status Register	BKPSR	R/W	H'0000_00x1	H'00	32	
Tamper Status Register	TAMPSR	R/W	H'0000_0007	H'04	32	
Tamper Control Register	TAMPCR	R/W	H'0000_0000	H'08	32	
Time Capture Event Control Register	TCECR	R/W	H'0000_0000	H'0C	32	*1
Tamper/RTCTC Input Control Register 1	TAMPICR1	R/W	H'0000_0000	H'10	32	
Tamper/RTCTC Input Control Register 2	TAMPICR2	R/W	H'0000_0070	H'14	32	
Tamper/RTCTC Input Monitoring Register	TAMPIMR	R	H'0000_000x	H'18	32	
Backup Domain 32kHz-Clock Control Register	BKSCCR	R/W	H'0000_0000	H'1C	32	
32kHz-Clock Oscillator Control Register 2	SOSCCR2	R/W	H'0000_0000	H'24	32	
Isolation Enable Control Register	ISOEN	R/W	H'0000_0000	H'28	32	
Isolation Enable Write Protect Control Register	ISOENPROT	R/W	H'0000_0000	H'2C	32	
Oscillator Control Register	XOSCCR	R/W	H'0000_0100	H'30	32	
External Interrupt Control Register	EXTINTCR	R/W	H'0000_0000	H'40	32	*2
External Interrupt Attribute Register	EXTINTATR	R/W	H'0000_0000	H'44	32	*2
External Interrupt Source Select Register 1	EXTINTSEL1	R/W	H'0000_0000	H'48	32	
External Interrupt Source Select Register 2	EXTINTSEL2	R/W	H'0000_0000	H'4C	32	*2
External Interrupt Status Register 1	EXTINTSR1	R/W	H'0000_0000	H'50	32	
External Interrupt Status Register 2	EXTINTSR2	R	H'0000_0000	H'54	32	
Zeroization Execute Control Register	ZEROIZCR	R/W	H'0000_0000	H'78	32	
Zeroization Execute Status Register	ZEROIZSR	R	H'0000_0000	H'7C	32	
Backup Register n (n = 0 to 31)	BKRn	R/W	H'0000_0000	H'80 to H'FC	32	

Note 1. When TAMPCR.TAMPCRWP is 1, this register cannot be rewritten.

Note 2. When EXTINTCR.EXTINTREGWP is 1, this register cannot be rewritten.

4.10.3 Register Descriptions

4.10.3.1 Backup Domain Power Status Register (BKPSR)

The BKPSR register indicates the VBAT_RST# status monitor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VBT RSTF
Initial Value	0	0	0	0	0	0	0	0	0	0	x	1	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	—	x	R	Reserved When read, the initial value is undefined. The written value will be ignored.
4	—	1	R	Reserved When read, the initial value is read. The written value will be ignored.
3 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	VBTRSTF	1	R/W	VBAT_RST# status flag. This bit indicates VBAT_RST# status. When an assert of VBAT_RST# is detected, VBTRSTF is set to 1. This status flag can be cleared writing 0. [Read Operation] 0: VBAT_RST# is de-asserted. 1: VBAT_RST# is asserted. [Write operation] 0: VBTRSTF status flag is cleared (VBTRSTF is set to 0). 1: VBTRSTF is set to 1.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.2 Tamper Status Register (TAMPSR)

The TAMPSR register indicates the status of the tamper detection events.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TAMP0F
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 1	—	H'3	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	TAMP0F	1	R/W	Tamper 0 Detection Flag 0: Tamper 0 event has not been detected. 1: Tamper 0 event has been detected. Only 0 can be written to this bit, to clear the flag. To clear this flag, confirm that its value is 1 and then write 0 to it. TAMP0F flag indicates that a trigger (an effective edge) was input to the VBAT_TAMPER pin. The trigger is selected by the TAMPICR2.CH0TRG bit. [Setting condition] • The trigger set by the TAMPICR2.CH0TRG bit being detected on the VBAT_TAMPER pin. [Clearing conditions] • 0 being written to the TAMP0F flag after having confirmed that its value is 1.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.3 Tamper Control Register (TAMPCR)

The TAMPCR register controls operations in response to the detection of tampering.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TAMPCRWP	—	—	TAMP0EE	—	—	—	TAMP0IE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	TAMPCRWP	0	R/W	Tamper Control Register Write Protect 0: Disable 1: Enable
6, 5	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
4	TAMP0EE	0	R/W	Tamper 0 Erase Enable 0: Backup registers are not erased in response to a tamper 0 event. 1: Backup registers are erased in response to a tamper 0 event. The TAMP0EE bit selects whether the backup registers should be or should not be erased in response to a tamper 0 event.
3 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	TAMP0IE	0	R/W	Tamper 0 Detection Interrupt Enable. 0: Tamper 0 detection interrupt is disabled. 1: Tamper 0 detection interrupt is enabled. The TAMP0IE bit enables or disables the tamper n detection interrupt.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

Note: This register cannot be rewritten when TAMPCRWP bit is 1.

4.10.3.4 Time Capture Event Control Register (TCECR)

The TCECR register selects the sources for time capture events of the RTC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCE0S
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	TCE0S	0	R/W	Time Capture Event 0 Source Select 0: Input signal from the RTCTC0 pin 1: Tamper 0 event The TCE0S bit selects the source of time capture event 0 for the RTC. When this bit is set to 0, a signal input to the RTCTC0 pin is input to the RTC. Selection of this setting is recommended when tamper detection is not to be used. When this bit is set to 1, the tamper 0 event detection signal is input to the RTC. Selection of this setting is recommended when a tamper event is to cause a timestamp to be recorded.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.5 Tamper/RTCTC Input Control Register 1 (TAMPICR1)

The TAMPICR1 register enables or disables input from the VBAT_TAMPER/RTCTC0 pins.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CH0EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	CH0EN	0	R/W	Channel 0 Input Enable 0: The VBAT_TAMPER/RTCTC0 signal input is disabled. 1: The VBAT_TAMPER/RTCTC0 signal input is enabled. The CH0EN bit enables or disables the input from the VBAT_TAMPER/RTCTC0 pin. Set each bit to 1 not only if tamper events are to be detected but also if the RTC time capture function is to be used.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.6 Tamper/RTCTC Input Control Register 2 (TAMPICR2)

The TAMPICR2 register is used to enable or disable the noise filters for the VBAT_TAMPER/RTCTC0 pin and select the triggers for tamper event detection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CH0 TRG	—	—	—	CH0 NFE
Initial Value	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6 to 5	—	11b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
4	CH0TRG	1	R/W	Channel 0 Trigger Select Select the trigger for tamper 0 event detection. 0: A falling edge of the input on the VBAT_TAMPER pin 1: A rising edge of the input on the VBAT_TAMPER pin The CH0TRG bit is used to select the effective edge for the input signal from the VBAT_TAMPER pin for use as a trigger of tamper event detection.
3 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	CH0NFE	0	R/W	Channel 0 Noise Filter Enable 0: Noise filter for the VBAT_TAMPER/RTCTC0 pin is disabled. 1: Noise filter for the VBAT_TAMPER/RTCTC0 pin is enabled. The CH0NFE bit enables or disables the noise filter for the VBAT_TAMPER/RTCTC0 pin. When tamper 0 event detection is not to be used, set the bit to 0. Five cycles of the 32kHz-clock are necessary for the output of the noise filter to become stable after this bit has been set to 1.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.7 Tamper/RTCTC Input Monitoring Register (TAMPIMR)

The TAMPIMR register is used to monitor the input levels on the VBAT_TAMPER pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CH0LV
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 3	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2 to 1	—	x	R	Reserved When read, the initial value is undefined. The written value will be ignored.
0	CH0LV	x	R	Channel 0 Level Monitoring Flag 0: The low level is being input on the VBAT_TAMPER pin. 1: The high level is being input on the VBAT_TAMPER pin. CH0LVL flag indicates the input level on a VBAT_TAMPER pin.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.8 Backup Domain 32kHz-Clock Control Register (BKSCCR)

The BKSCCR register is used to select the output of the 32kHz-clock oscillator provided to each module in the backup domain.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SOSEL	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	SOSEL	0	R/W	32kHz-Clock Oscillator output Select 0: The 32kHz-clock oscillator XC output is selected. 1: The 32kHz-clock oscillator XBYP output is selected. The SOSEL bit is used to select the output of the 32kHz-clock oscillator provided to each module in the backup domain. When using external clock, select the XBYP output.
5 to 0	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.9 32kHz-Clock Oscillator Control Register 2 (SOSCCR2)

The SOSCCR2 register controls the 32kHz-clock oscillation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOSTP2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 1	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	SOSTP2	0	R/W	32kHz-Clock Oscillator Stop 0: 32kHz-clock oscillator is operating.*1 1: 32kHz-clock oscillator is stopped.

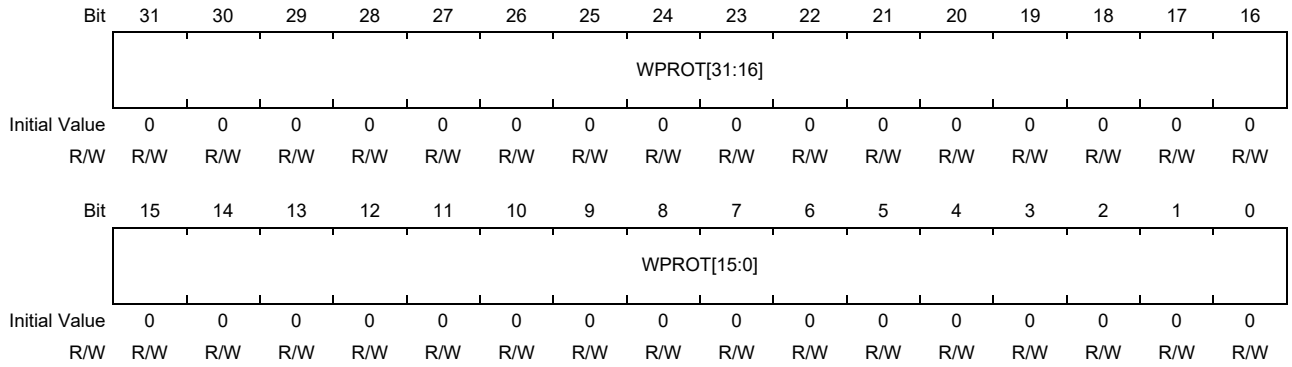
Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

Note 1. Oscillator Control is valid only for crystal oscillator.
If an external clock is used, set the SOSTP2 bit to 1.

4.10.3.10 Isolation Enable Control Register (ISOEN)

The ISOEN register controls the isolation enable signal before entering the battery backup mode.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R



Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ISOEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	ISOEN	0	R/W	Isolation Enable 0: Isolation OFF 1: Isolation ON The ISOEN bit should be set to 1 before entering the battery backup mode. This register can be written when it was released the write protection by the ISOENPROT register.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.11 Isolation Enable Write Protect Control Register (ISOENPROT)

The IOSENPROT register is used to remove write-protection from the ISOEN register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	WPROT	0	R/W	ISOEN register write protect control After writing H'15AF_FA51 to this register, ISOEN register can be written. When ISOEN register is written, this register is cleared to zero.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.12 Oscillator Control Register (XOSCCR)

The Oscillator Control register controls the 32-kHz oscillator.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	TAMPINTSEL	0	R/W	Source selection of Tamper external interrupt request for VBAT_RTC_WKUP pin. 0: Disable (Interrupt Request Invalid) 1: Enable (Interrupt Request valid)

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

Note: This register cannot be rewritten when EXTINTCR.EXTINTREGWP is 1.

4.10.3.17 External Interrupt Status Register 1 (EXTINTSR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RTCINTSR						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 0	RTCINTSR	0	R/W	The status of RTC external interrupt events. 0: RTC interrupt has not been detected 1: RTC interrupt has been detected [6]: Carry interrupt [5]: Periodic interrupt [4 to 3]: Should be set to 0 [2]: Alarm interrupt [1 to 0]: Should be set to 0 Write 0 to clear the status.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.18 External Interrupt Status Register 2 (EXTINTSR2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

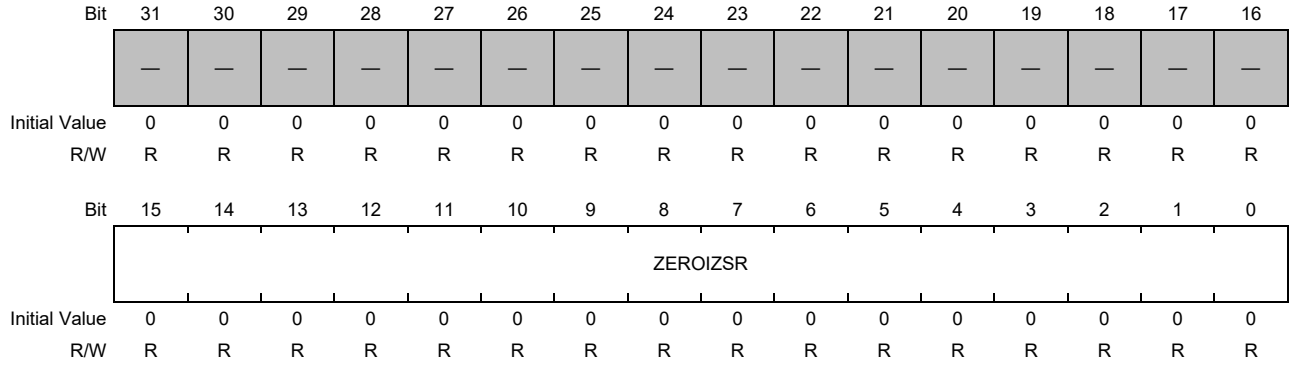
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TAMPINTSR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 1	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	TAMPINTSR	0	R	The status of Tamper external interrupt event. 0: Tamper interrupt has not been detected 1: Tamper interrupt has been detected In case of the tamper detection, write 0 to the TAMPSR.TAMP0F to clear the status. In case of the emulated tamper detection by ZERIZCR register, write 0 to the ZEROIZCR.ZEROIZCR.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.19 Zeroization Execute Control Register (ZEROIZCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R



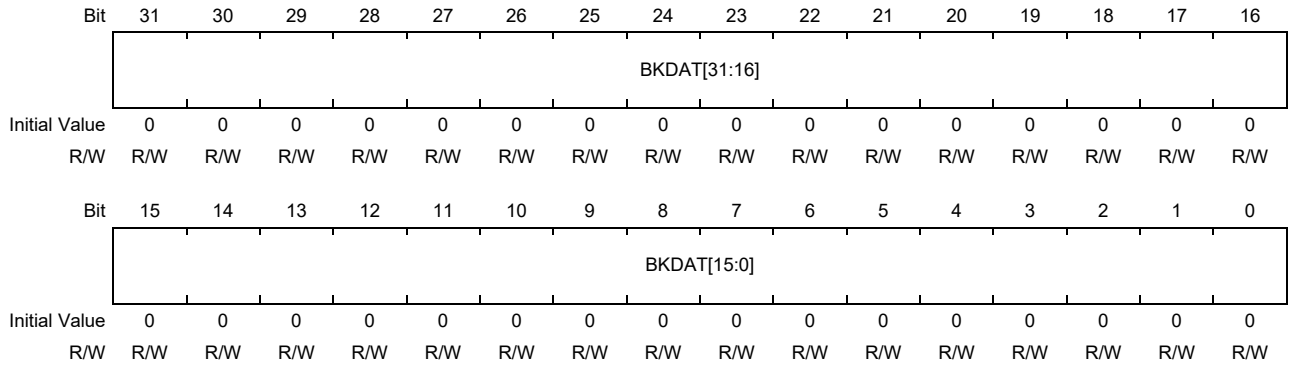
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ZEROIZCR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	ZEROIZCR	0	R/W	Zeroization execution 0: Normal 1: Forcing Tamper Detected

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

Note: The tamper detection state enforced by ZEROIZCR is not cleared by TAMPSR.TAMP0F. To clear it, ZEROIZCR should be set to 0 again.

4.10.3.20 Zeroization Execute Status Register (ZEROIZSR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	ZEROIZSR	0	R	History of erasing backup register H'0000: Backup register haven't erased H'F0F0: Backup register have been erased

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.3.21 Backup Register n (BKRn) (n = 0 to 31)

The BKRn (0 to 31) registers are backup registers.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BKDAT	0	R/W	Backup Data The contents of the BKRn registers are retained even in the battery backup mode. The BKRn registers can be erased when a tamper event is detected.

Note: This register can only be initialized by the backup domain reset (VBAT_RST# pin).

4.10.4 Operation

4.10.4.1 Battery Backup Function

This function is used to retain the operations of the modules in the backup domain by supplying power from the VBATTB pin while the main power supply is turned off.

The following modules are in the backup domain.

- Backup registers
- 32kHz-clock oscillator
- Tamper detector
- RTC
- RTC_WKUP_OUT Control
- Zeroization Execute

4.10.4.2 Tamper Detector

This LSI has VBAT_TAMPER pin which remains functional in the battery backup mode and can detect physical intrusions.

The tamper inputs can be configured for rising or falling edge detection and with or without noise filtering.

The following operations can be selected in response to the detection of tampering.

- Generating an interrupt request
- Erasing the backup registers
- Generating RTC timestamp events

Figure 4.10-2 is a block diagram of the tamper detector.

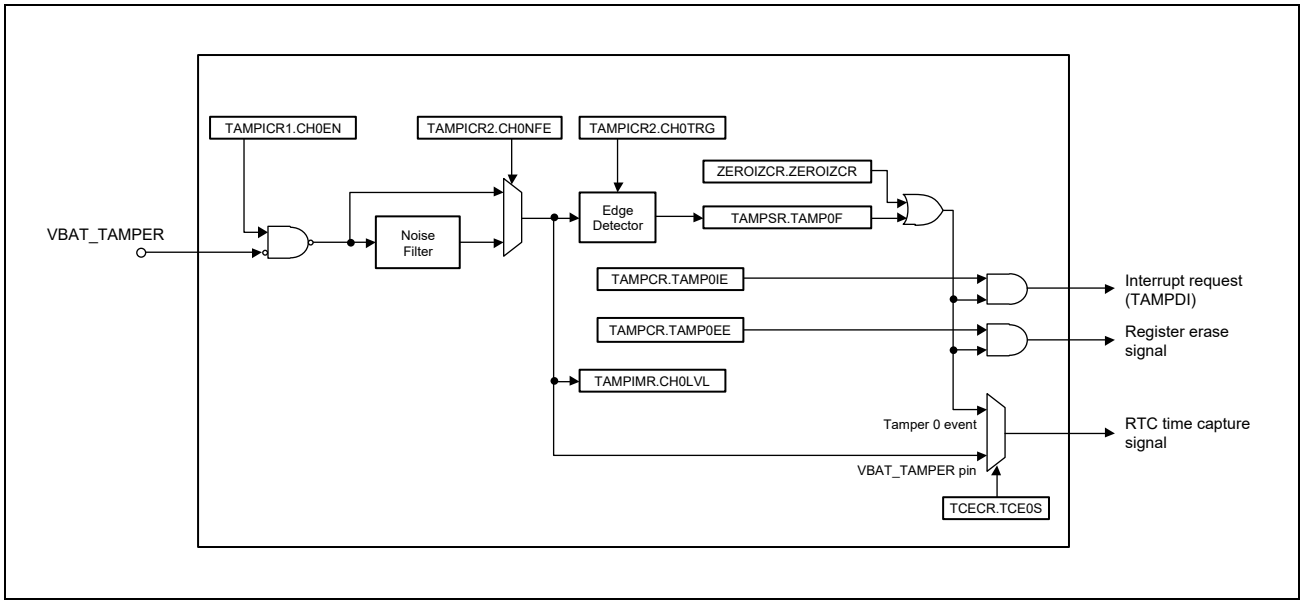


Figure 4.10-2 Tamper Detector

If the value of the TAMPICR1.CH0EN bit or the CH0NFE or CH0TRG bit in the TAMPICR2 register is changed, a TAMPSR.TAMP0F flag may become 1. Set the TAMP0IE and TAMP0EE bits in the TAMPCR register to 0 before setting these bits. Clear the TAMP0F flags after setting these bits.

The TAMPIMR.CH0LVL flags are for monitoring the levels being input on the VBAT_TAMPER pin.

When an effective edge is detected, the TAMP0F flag becomes 1. If the TAMP0IE bit is 1 at this point, the TAMPDI interrupt is generated. If the TAMP0EE bit is 1, the backup registers are erased to H'00.

Once backup registers are erased, ZEROIZSR is set to H'F0F0. Its value is saved unless backup domain reset (VBAT_RST#) is asserted.

Setting the TCECR.TCE0S bit to 1 enables a timestamp on tamper detection by using the time capture function of the RTC. For details on the time capture function, refer to **4.11 Realtime Clock (RTCA-3)**.

Figure 4.10-3 shows the setting flow when using the tamper detector.

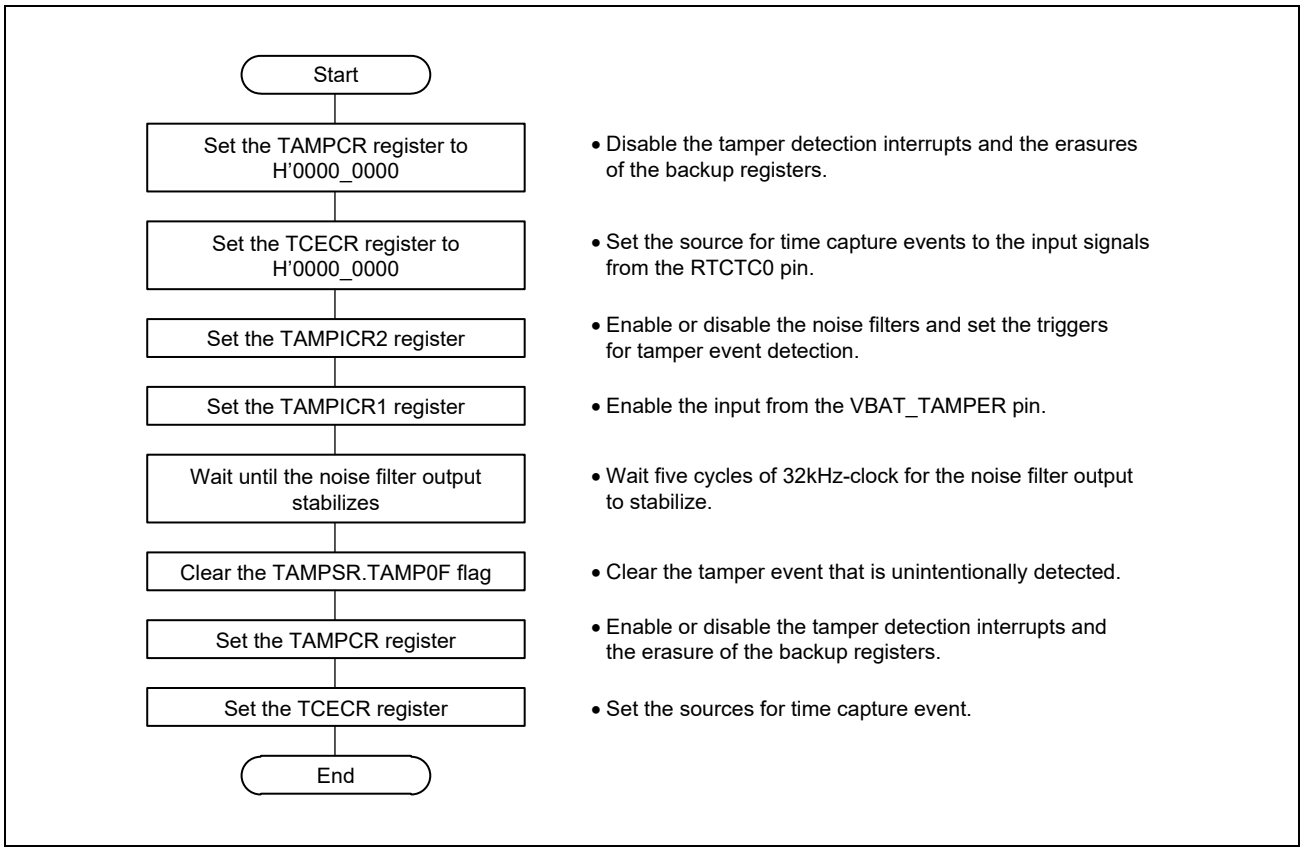

Figure 4.10-3 Setting for Tamper Detector

4.10.4.3 Zeroization Execute

The tamper detection can be emulated by writing Zeroization Execute Control Register (ZEROIZCR) to 1.

At this time, VBATTB behaves in the same way as if Tamper had been detected.

The tamper detection state enforced by ZEROIZCR is not cleared by TAMPSR.TAMP0F because TAMPSR.TAMP0F is not set. To clear the tamper detection state, ZEROIZCR should be set to 0.

4.10.4.4 VBAT_RTC_WKUP Control

The selected RTC Interrupt and Tamper Interrupt can be output from the VBAT_RTC_WKUP pin.

The following is the procedure to use this function.

1. Enable the RTC and Tamper interrupt.
   Set the RCR1 register. See **4.11.3.18 RTC Control Register1**.
   Set the TAMPCR register.
2. Select the interrupt request source to VBAT_RTC_WKUP pin.
   Set the EXTINTSEL1 register for RTC interrupt request.
   Set the EXTINTSEL2 register for Tamper interrupt request.
3. Set the interrupt attribute for VBAT_RTC_WKUP pin.
   Set the EXTINTATR register.
4. Set the drive strength and enable the output for VBAT_RTC_WKUP pin.
   Set the EXTINTCR register.

   Even after transitioning to VBATT mode, the interrupt output from the VBAT_RTC_WKUP pin is valid.
5. How to clear the VBAT_RTC_WKUP pin status
   In case of the RTC interrupt, set the EXTINTSR1.RTCINTSR to 0.
   In case of the tamper detection, set the TAMPSR.TAMP0F to 0.
   In case of the emulated tamper detection by ZEROIZCR register, set the ZEROIZCR.ZEROIZCR to 0.

4.10.4.5 Isolation Control

Before entering the battery backup mode (VBATT mode), the following procedure should be performed.

1. Write “H’15AF_FA51” to ISOENPROT register to release the write protection of ISOEN register.
2. Set the ISOEN bit of ISOEN register to 1.

Refer to **4.5 Low Power Management** regarding to the battery backup mode.

4.10.4.6 Interrupt

The VBATTB has interrupt source listed in **Table 4.10-4**.

Table 4.10-4 VBATTB Interrupt Source

Name	Symbol	Interrupt Source	Interrupt Flag	Interrupt Enable Bit
Tamper detection interrupt	TAMPDI	Tamper 0 detection	TAMP0F	TAMP0IE

SECTION 4 SYSTEM

4.11 Realtime Clock (RTCA-3)

4.11.1 Overview

The RTC has two types of counting modes: calendar count mode and binary count mode. They are used by switching the register settings.

For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years.

For binary count mode, the RTC does not count in terms of years, months, dates, day-of-week, hours, or minutes; it counts seconds, and retains the information as a serial value. This mode can be used for calendars other than the Gregorian calendar.

4.11.1.1 Features

Table 4.11-1 lists the specifications of the RTC.

Table 4.11-1 RTC Specifications (1/2)

Item	Description
Count mode	Calendar count mode/binary count mode
Count source*1	32 kHz clock (RTXIN)
Clock and calendar functions	• Calendar count mode – Year, month, date, day-of-week, hour, minute, second are counted, BCD display – 12 hours/24 hours mode switching function – 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to one minute) – Automatic adjustment function for leap years • Binary count mode – Count seconds in 32 bits, binary display • Common to both modes – Start/stop function – The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz). – Clock error correction function (Minimum correction amount = 1 cycle of 32 kHz clock)
Interrupts	• Alarm interrupt (ALM) As an alarm interrupt condition, selectable which of the below is compared with: – Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected – Binary count mode: Each bit of the 32-bit binary counter • Periodic interrupt (PRD) – 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second can be selected as an interrupt period. • Carry interrupt (CUP) An interrupt is generated at either of the following timings: – When a carry from the 64-Hz counter to the second counter/ binary counter0 is generated. – When a carry occurs from the prescaler to the 64Hz counter when reading the 64Hz counter.

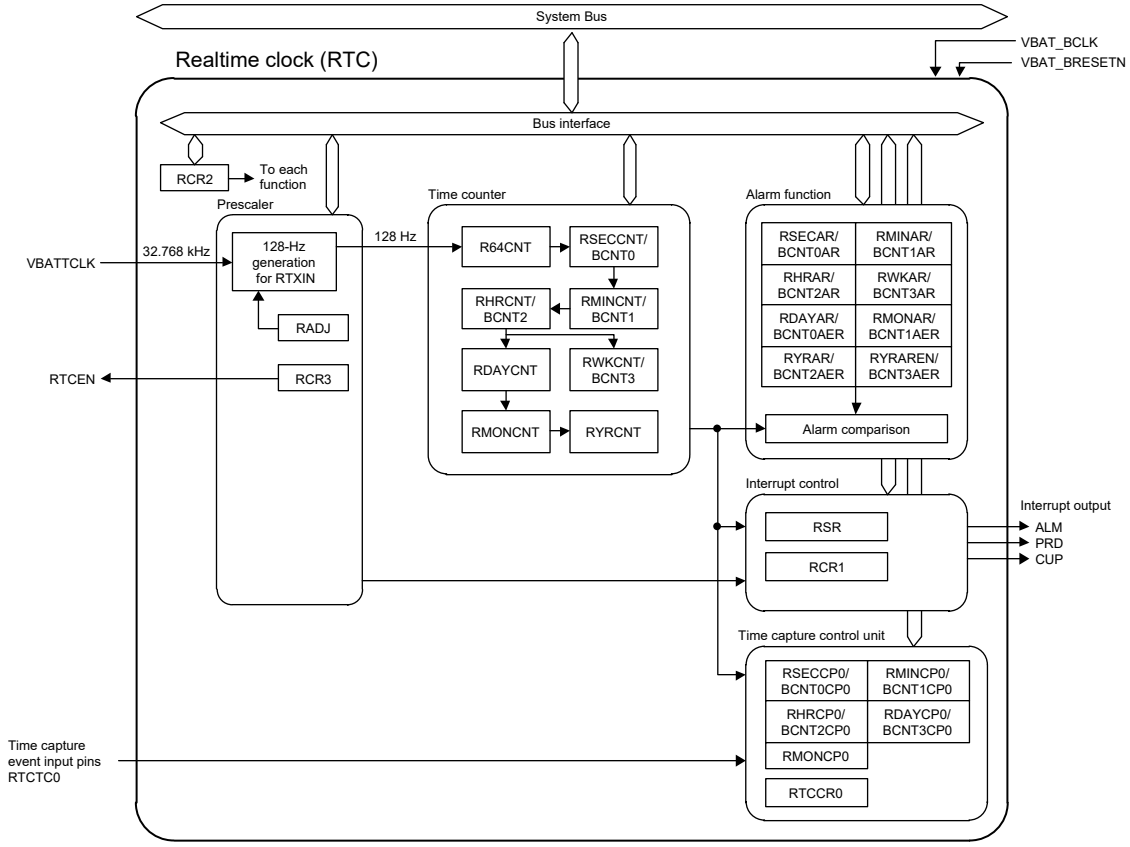

Table 4.11-1 RTC Specifications (2/2)

Item	Description
Time capture function	Time can be captured by event input. For event input, month, date, hour, minute, and second are captured or 32-bit binary counter value is captured.

Note 1. Satisfy the frequency of the peripheral module clock ≥ the frequency of the count source.

4.11.1.2 Block diagram

Figure 4.11-1 shows a block diagram of the RTC.

R64CNT:	64-Hz counter
RSECCNT/BCNT0:	Second counter/Binary counter 0
RMINCNT/BCNT1:	Minute counter/Binary counter 1
RHRCNT/BCNT2:	Hour counter/Binary counter 2

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Date Capture Register 0/ BCNT3 Capture Register 0	RDAYCP0/ BCNT3CP0	R	H'xx	H'5A	8
Month Capture Register 0	RMONCP0	R	H'xx	H'5C	8

Note 1. Refer to **4.11.3.17 RTC Status Register (RSR)**.

Note 2. The bit of the following registers are initialized by VBAT_BRESETN controlled by CPG_RST_VBAT register.
RSR register: [0]AF, [1]CF, [2]PF
RCR1 register: [1]CIE
RCR2 register: [1]RESET, [2]ADJ30

Note: x: Undefined. These bits are not initialized by reset.

4.11.3 Register Description

When writing to or reading from RTC registers, do so in accordance with **4.11.6.4 Notes on Writing to and Reading from Registers**.

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power consumption state during counting operations (i.e. while the RCR2.START bit is 1), the year, month, day of the week, date, hours, minutes, seconds counters in 64Hz counter and calendar count mode, and binary counter in binary count mode continue to operate. Note that a reset generated during writing to or updating of a register might destroy the register value. For details, refer to **4.11.6.3 Transitions to Low Power Consumption Modes after Setting Registers**.

4.11.3.1 64-Hz Counter (R64CNT)

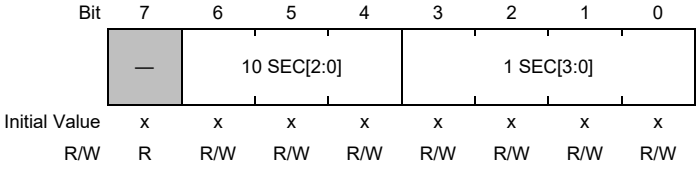
Bit	7	6	5	4	3	2	1	0
	—	1HZ	2HZ	4HZ	8HZ	16HZ	32HZ	64HZ
Initial Value	0	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
0	64HZ	x	R	Indicate the state between 1 Hz and 64 Hz.
1	32HZ	x	R	
2	16HZ	x	R	
3	8HZ	x	R	
4	4HZ	x	R	
5	2HZ	x	R	
6	1HZ	x	R	
7	—	0	R	Reserved This bit is read as 0. Writing to this bit has no effect.

The R64CNT counter is used in both calendar count mode and in binary count mode.

The 64-Hz counter (R64CNT) generates a period of one second by counting the 128-Hz clock.



The state in the sub-second range can be confirmed by reading this counter.

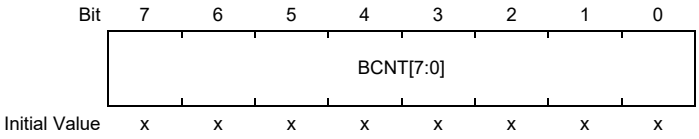
This counter is set to H'00 by an RTC software reset or executing 30-second adjustment.

To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

4.11.3.2 Second Counter (RSECCNT)/Binary Counter 0 (BCNT0)

a. In calendar count mode:

x: Undefined



Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 SEC[3:0]	x	R/W	1-Second Count Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place.
6 to 4	10 SEC[2:0]	x	R/W	10-Second Count Counts from 0 to 5 for 60-second counting.
7	—	x	R	Reserved Set this bit to 0. It is read as undefined value.

The RSECCNT counter is used for setting and counting the BCD-coded second value. It counts carries generated once per second in the 64-Hz counter.

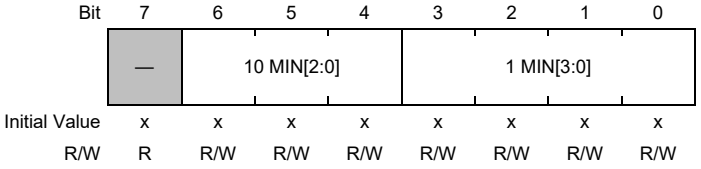
The setting range is decimal 00 to 59. The RTC will not operate normally if any other value is set. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

Refer to **4.11.4.5 Reading 64-Hz Counter and Time** for notes on accessing registers.

b. In binary count mode:

x: Undefined

The BCNT0 counter is a readable/writable 32-bit binary counter b7 to b0.



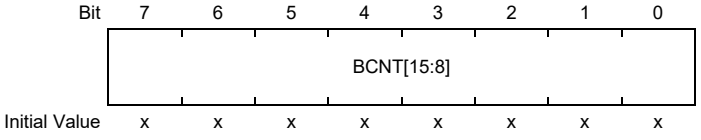
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.

Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

4.11.3.3 Minute Counter (RMINCNT)/Binary Counter 1 (BCNT1)

a. In calendar count mode:



x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	MIN1[3:0]	x	R/W	1-Minute Count Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place.
6 to 4	MIN10[2:0]	x	R/W	10-Minute Count Counts from 0 to 5 for 60-minute counting.
7	—	x	R	Reserved Set this bit to 0. It is read as undefined value.

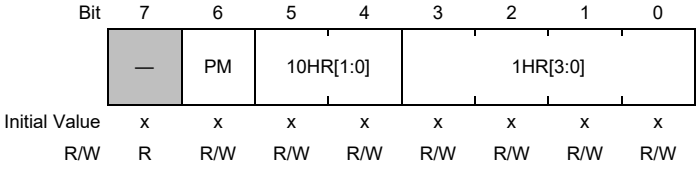
The RMINCNT counter is used for setting and counting the BCD-coded minute value. It counts carries generated once per minute in the second counter.

A value from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

b. In binary count mode:

x: Undefined

The BCNT1 counter is a readable/writable 32-bit binary counter b15 to b8.



The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.

Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

4.11.3.4 Hour Counter (RHRCNT)/Binary Counter 2 (BCNT2)

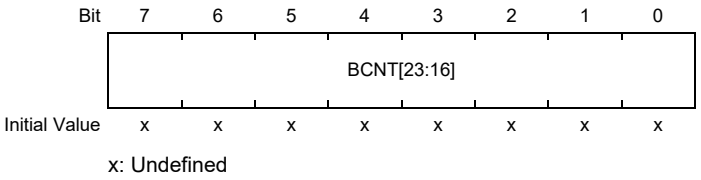
a. In calendar count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	HR1[3:0]	x	R/W	1-Hour Count Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place.
5, 4	HR10[1:0]	x	R/W	10-Hour Count Counts from 0 to 2 once per carry from the ones place.
6	PM	x	R/W	PM Time Counter Setting for a.m./p.m. 0: a.m. 1: p.m.
7	—	x	R	Reserved Set this bit to 0. It is read as undefined value.

The RHRCNT counter is used for setting and counting the BCD-coded hour value. It counts carries generated once per hour in the minute counter.

The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24).



When the RCR2.HR24 bit is 0: From 00 to 11 (in BCD)
When the RCR2.HR24 bit is 1: From 00 to 23 (in BCD)

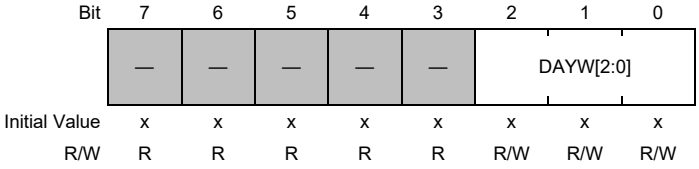
If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

The PM bit is only enabled when the RCR2.HR24 bit is 0. Otherwise, the setting in the PM bit has no effect.

After writing to the RHRCNT counter, confirm that its value has actually changed before proceeding with further processing. To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

b. In binary count mode:

The BCNT2 counter is a readable/writable 32-bit binary counter b23 to b16.



The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.

Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

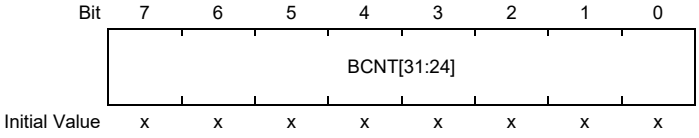
To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

4.11.3.5 Day-of-Week Counter (RWKCNT)/Binary Counter 3 (BCNT3)

a. In calendar count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	DAYW[2:0]	x	R/W	Day-of-Week Counting b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting Prohibited
7 to 3	—	x	R	Reserved Set these bits to 0. They are read as undefined value



The RWKCNT counter is used for setting and counting in the coded day-of-week value. It counts carries generated once per day in the hour counter.

A value from 0 through 6 can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

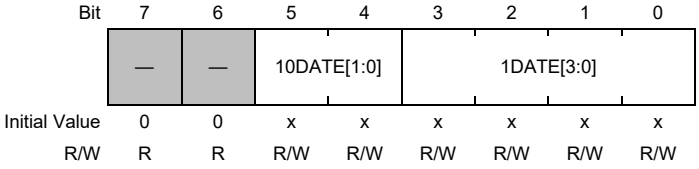
To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

b. In binary count mode:

Address(es): RTC.BCNT3 H'0008_C408

x: Undefined

The BCNT3 counter is a readable/writable 32-bit binary counter b31 to b24.



The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.

Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

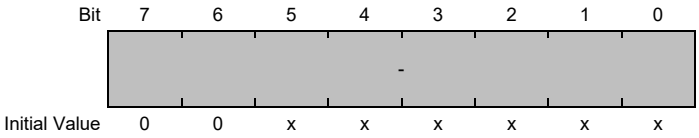
To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

4.11.3.6 Data Counter (RDAYCNT)

a. In calendar count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	DATE1[3:0]	x	R/W	1-Day Count Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place.
5, 4	DATE10[1:0]	x	R/W	10-Day Count Counts from 0 to 3 once per carry from the ones place.
7, 6	—	x	R	Reserved These bits are read as 0. The write value should be 0.



The RDAYCNT counter is used for setting and counting the BCD-coded date value. It counts carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year.

Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. (When specifying a value, note that the range of specifiable days depends on the month and whether the year is a leap year.) Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

b. In binary count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	—	x	R	Reserved Set these bits to 0. They are read as Undefined value.
7, 6	—	0	R	Reserved These bits are read as 0. The write value should be 0.

The RDAYCNT counter is not used in binary count mode.

4.11.3.7 Month Counter (RMONCNT)

a. In calendar count mode:

Bit	7	6	5	4	3	2	1	0
	—	—	—	10MON	1MON[3:0]			
Initial Value	0	0	0	x	x	x	x	x
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1MON[3:0]	x	R/W	1-Month Count Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place.
4	10MON	x	R/W	10-Month Count Counts from 0 to 1 once per carry from the ones place.
7 to 5	—	x	R	Reserved These bits are read as 0. The write value should be 0.

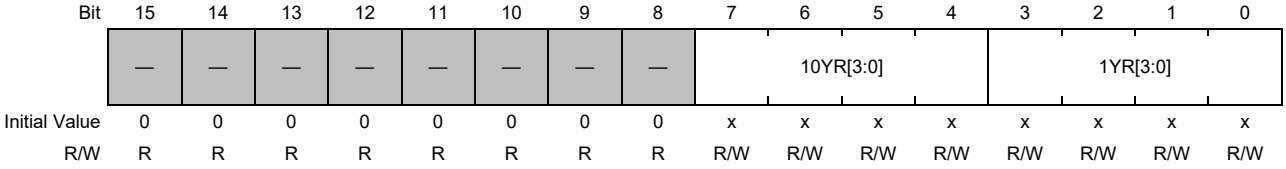
The RMONCNT counter is used for setting and counting the BCD-coded month value. It counts carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

b. In binary count mode:

Bit	7	6	5	4	3	2	1	0
	-							
Initial Value	0	0	0	x	x	x	x	x



x: Undefined

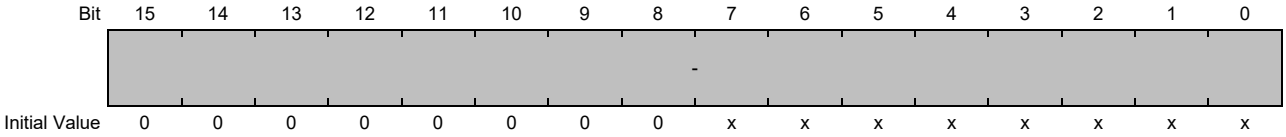
Bit	Bit Name	Initial Value	R/W	Description
4 to 0	—	x	R	Reserved Set these bits to 0. They are read as Undefined value.
7 to 5	—	0	R	Reserved These bits are read as 0. The write value should be 0.

The RMONCNT counter is not used in binary count mode.

4.11.3.8 Year Counter (RYRCNT)

a. In calendar count mode:

x: Undefined



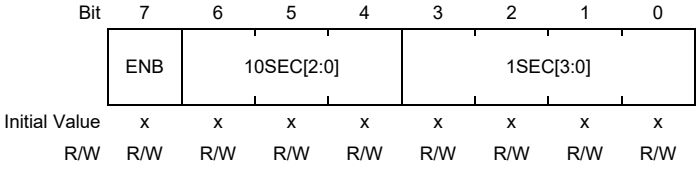
Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1YR[3:0]	x	R/W	1-Year Count Counts from 0 to 9 once per year.
7 to 4	10YR[3:0]	x	R/W	10-Year Count Counts from 0 to 9 once per carry from ones place.
15 to 8	—	0	R	Reserved These bits are read as 0. The write value should be 0.

The RYRCNT counter is used for setting and counting the BCD-coded year value. It counts carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.

To read this counter, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.

b. In binary count mode:



x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	x	R	Reserved Set these bits to 0. They are read as Undefined value.
15 to 8	—	0	R	Reserved These bits are read as 0. The write value should be 0.

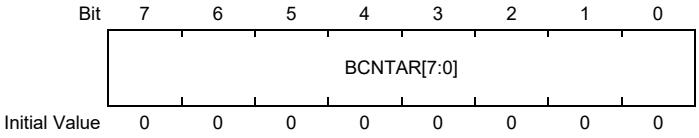
The RYRCNT counter is not used in binary count mode.

4.11.3.9 Second Alarm Register (RSECAR)/Binary Counter 0 Alarm Register (BCNT0AR)

a. In calendar count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1SEC[3:0]	x	R/W	1 Second Value for the ones place of seconds
6 to 4	10SEC[2:0]	x	R/W	10 Seconds Value for the tens place of seconds
7	ENB	x	R/W	ENB 0: The register value is not compared with the RSECCNT counter value. 1: The register value is compared with the RSECCNT counter value.



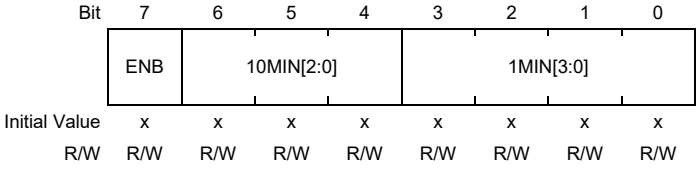
The RSECAR register is an alarm register corresponding to the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR is set to 1.

RSECAR values from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

This register is set to H’00 by an RTC software reset.

b. In binary count mode:

Address(es): RTC.BCNT0AR H'0008_C410



x: Undefined

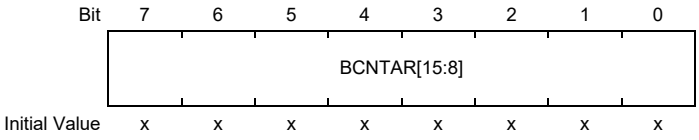
The BCNT0AR counter is a readable/writable alarm register corresponding to 32-bit binary counter b7 to b0.

This register is set to H'00 by an RTC software reset.

4.11.3.10 Minute Alarm Register (RMINAR)/Binary Counter 1 Alarm Register (BCNT1AR)

a. In calendar count mode:

x: Undefined



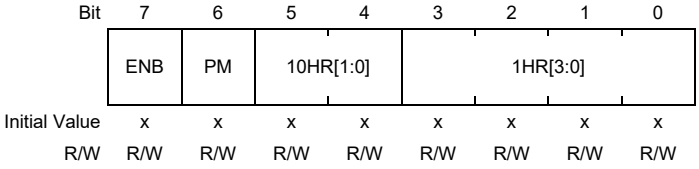
Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1MIN[3:0]	x	R/W	1 Minute Value for the ones place of minutes
6 to 4	10MIN[2:0]	x	R/W	10 Minutes Value for the tens place of minutes
7	ENB	x	R/W	ENB 0: The register value is not compared with the RMINCNT counter value. 1: The register value is compared with the RMINCNT counter value.

The RMINAR register is an alarm register corresponding to the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR is set to 1.

RMINAR values from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

This register is set to H’00 by an RTC software reset.

b. In binary count mode:



x: Undefined

The BCNT1AR counter is a readable/writable alarm register corresponding to 32-bit binary counter b15 to b8.

This register is set to H'00 by an RTC software reset.

4.11.3.11 Hour Alarm Register (RHRAR)/Binary Counter 2 Alarm Register (BCNT2AR)

a. In calendar count mode:

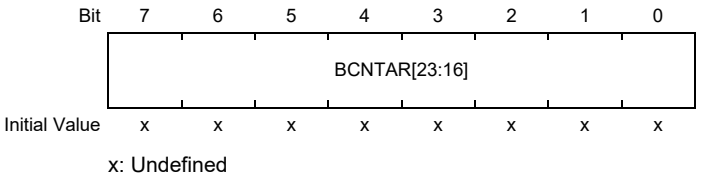
x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1HR[3:0]	x	R/W	1 Hour Value for the ones place of hours
5, 4	10HR[1:0]	x	R/W	10 Hours Value for the tens place of hours
6	PM	x	R/W	PM Time Alarm Setting for a.m./p.m. 0: a.m. 1: p.m.
7	ENB	x	R/W	ENB 0: The register value is not compared with the RHRCNT counter value. 1: The register value is compared with the RHRCNT counter value.

The RHRAR register is an alarm register corresponding to the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR is set to 1.

The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24).

When the RCR2.HR24 bit is 0: From 00 to 11 (in BCD)
When the RCR2.HR24 bit is 1: From 00 to 23 (in BCD)



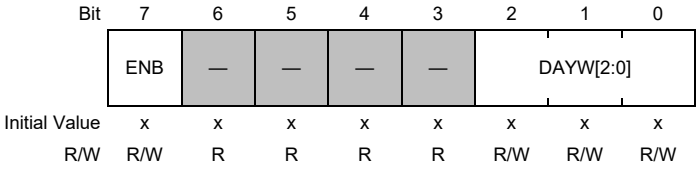
If a value outside of this range is specified, the RTC does not operate correctly.

When the RCR2.HR24 bit is 0, be sure to set the PM bit.

When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect.

This register is set to H'00 by an RTC software reset.

b. In binary count mode:



x: Undefined

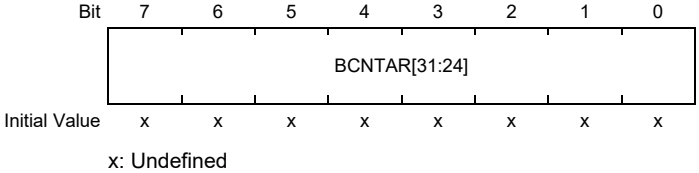
The BCNT2AR counter is a readable/writable alarm register corresponding to 32-bit binary counter b23 to b16.

This register is set to H’00 by an RTC software reset.

4.11.3.12 Day-of-Week Alarm Register (RWKAR)/Binary Counter 3 Alarm Register (BCNT3AR)

a. In calendar count mode:

x: Undefined



Bit	Bit Name	Initial Value	R/W	Description
2 to 0	DAYW[2:0]	x	R/W	Day-of-Week Setting b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting Prohibited
6 to 3	—	x	R	Reserved Set these bits to 0. They are read as the Undefined value.
7	ENB	x	R/W	ENB 0: The register value is not compared with the RWKCNT counter value. 1: The register value is compared with the RWKCNT counter value.

The RWKAR register is an alarm register corresponding to the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR is set to 1.

RWKAR values from 0 through 6 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

This register is set to H'00 by an RTC software reset.

b. In binary count mode:

x: Undefined

The BCNT3AR counter is a readable/writable alarm register corresponding to 32-bit binary counter b31 to b24.

This register is set to H'00 by an RTC software reset.

4.11.3.13 Date Alarm Register (RDAYAR)/Binary Counter 0 Alarm Enable Register (BCNT0AER)

a. In calendar count mode:

Bit	7	6	5	4	3	2	1	0
	ENB	—	10 DATE[1:0]		1 DATE[3:0]			
Initial Value	x	x	x	x	x	x	x	x
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 DATE[3:0]	x	R/W	1 Day Value for the ones place of days
5, 4	10 DATE[1:0]	x	R/W	10 Days Value for the tens place of days
6	—	x	R	Reserved Set this bit to 0. It is read as Undefined value.
7	ENB	x	R/W	ENB 0: The register value is not compared with the RDAYCNT counter value. 1: The register value is compared with the RDAYCNT counter value.

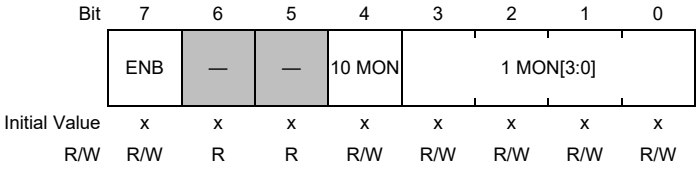
The RDAYAR register is an alarm register corresponding to the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR is set to 1.

RDAYAR values from 01 through 31 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

This register is set to H'00 by an RTC software reset.

b. In binary count mode:

Bit	7	6	5	4	3	2	1	0
	ENB[7:0]							
Initial Value	x	x	x	x	x	x	x	x



x: Undefined

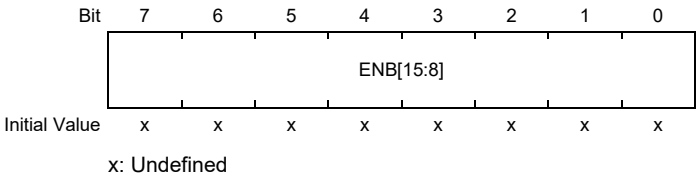
The BCNT0AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b7 to b0. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the alarm flag of RSR is set to 1.

This register is set to H'00 by an RTC software reset.

4.11.3.14 Month Alarm Register (RMONAR)/Binary Counter 1 Alarm Enable Register (BCNT1AER)

a. In calendar count mode:

x: Undefined



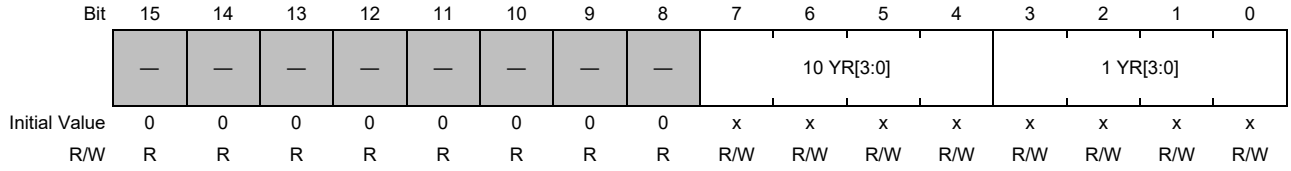
Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 MON[3:0]	x	R/W	1 Month Value for the ones place of months
4	10 MON	x	R/W	10 Months Value for the tens place of months
6, 5	—	x	R	Reserved Set these bits to 0. They are read as the set value.
7	ENB	x	R/W	ENB 0: The register value is not compared with the RMONCNT counter value. 1: The register value is compared with the RMONCNT counter value.

The RMONAR register is an alarm register corresponding to the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR is set to 1.

RMONAR values from 01 through 12 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

This register is set to H’00 by an RTC software reset.

b. In binary count mode:



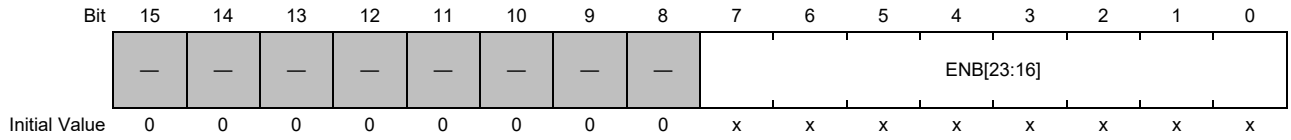
x: Undefined

The BCNT1AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b15 to b8. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the alarm flag of RSR is set to 1.

This register is set to H’00 by an RTC software reset.

4.11.3.15 Year Alarm Register (RYRAR)/Binary Counter 2 Alarm Enable Register (BCNT2AER)

a. In calendar count mode:



x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 YR[3:0]	x	R/W	1 Year Value for the ones place of years
7 to 4	10 YR[3:0]	x	R/W	10 Years Value for the tens place of years
15 to 8	—	0	R	Reserved These bits are read as 0. The write value should be 0.

The RYRAR register is an alarm register corresponding to the BCD-coded year counter RYRCNT.

RYRAR values from 00 through 99 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

b. In binary count mode:

x: Undefined

The BCNT2AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b23 to b16. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the alarm flag of RSR is set to 1.

This register is set to H'0000 by an RTC software reset.

4.11.3.16 Year Alarm Enable Register (RYRAREN)/Binary Counter 3 Alarm Enable Register (BCNT3AER)

a. In calendar count mode:

Bit	7	6	5	4	3	2	1	0
	ENB	—	—	—	—	—	—	—
Initial Value	x	x	x	x	x	x	x	x
R/W	R/W	R	R	R	R	R	R	R

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	—	x	R	Reserved Set these bits to 0. They are read as Undefined value.
7	ENB	x	R/W	ENB 0: The register value is not compared with the RYRCNT counter value. 1: The register value is compared with the RYRCNT counter value.

The RYRAREN register is an enable register of Year Alarm.

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the alarm flag of RSR is set to 1.

This register is set to H'00 by an RTC software reset.

b. In binary count mode:

Bit	7	6	5	4	3	2	1	0
	ENB[31:24]							
Initial Value	x	x	x	x	x	x	x	x

x: Undefined

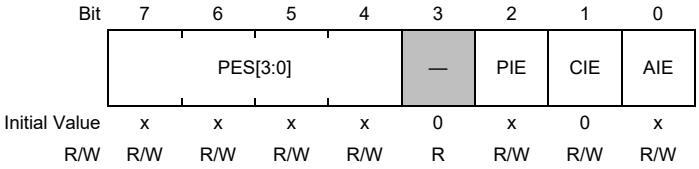
The BCNT3AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b31 to b24. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the alarm flag of RSR is set to 1.

This register is set to H'00 by an RTC software reset.

4.11.3.17 RTC Status Register (RSR)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	PF	CF	AF
Initial Value	0	0	0	0	0	0*1	0*1	0*1
R/W	R	R	R	R	R	R/W	R/W	R/W

x: Undefined



Bit	Bit Name	Initial Value	R/W	Description
0	AF	0*1	R/W	Alarm flag The alarm time set in the alarm registers (calendar count mode: RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAR, binary count mode: BCNT0AR, BCNT1AR, BCNT2AR, BCNT3AR) (only for registers with the ENB bit set to 1) and Set to 1 when the counters match. [Condition to become 0] • When 0 is written to AF. [Condition to become 1] • When the alarm register (only for registers with the ENB bit set to 1) matches the counter. 0: Alarm register and counter do not match. 1: Alarm register and counter match.*2
1	CF	0*1	R/W	Carry flag When the CF flag is set to 1, it indicates that a carry to Second Counter/Binary Counter 0 or a carry to 64-Hz counter has occurred when reading the 64-Hz counter, and the count register read at this time. The value of is not guaranteed. Need to read again. [Condition to become 0] • When 0 is written to the CF flag. [Condition to become 1] • When a carry to the second counter/binary counter 0 or a carry to the 64-Hz counter occurs when reading the 64-Hz counter. • When 1 is written to the CF flag. 0: No carry to the second counter/binary counter 0 and no carry to the 64-Hz counter when reading the 64-Hz counter. 1: With carry to the second counter/binary Counter 0 and carry to the 64-Hz counter when reading the 64-Hz counter.
2	PF	0*1	R/W	Periodic flag The PF flag is a flag that indicates interrupt generation at the cycle set by the RCR1.PES[3:0] bits. When this flag is set to 1, a periodic interrupt is generated. [Condition to become 0] • When 0 is written to the PF flag. [Condition to become 1] • When an interrupt occurs at the cycle set by the RCR1.PES[3:0] bits. 0: No interrupt occurs at the cycle set by the RCR1.PES[3:0] bits. 1: An interrupt occurs at the cycle set by the RCR1.PES[3:0] bits.*2
7 to 3	—	0	R	Reserved These bits are read as 0. The write value should be 0.

Note 1. The read value may be 1 after reset release.
Each flag is set to 1 when the prescaler and watch counter match each interrupt setting condition. Since the prescaler, clock counter, and each interrupt setting register are not reset, flags may be set before each flag is read.

Note 2. Writing 1 to this bit has no effect.

The RSR register is a periodic interrupt, carry and alarm flag register. The RCR1 register is used in both calendar count mode and in binary count mode. This register is set to H'00 by an RTC software reset.

4.11.3.18 RTC Control Register 1 (RCR1)

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
0	AIE	x	R/W	Alarm Interrupt Enable This bit enables or disables alarm interrupt requests. 0: An alarm interrupt request is disabled. 1: An alarm interrupt request is enabled.
1	CIE	0	R/W	Carry Interrupt Enable This bit enables and disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter. 0: A carry interrupt request is disabled. 1: A carry interrupt request is enabled.
2	PIE	x	R/W	Periodic Interrupt Enable This bit enables or disabled a periodic interrupt. 0: A periodic interrupt request is disabled. 1: A periodic interrupt request is enabled.
3	—	0	R	Reserved This bit is read as 0. The write value should be 0.
7 to 4	PES[3:0]	x	R/W	Periodic Interrupt Select These bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified by these bits. b7 b4 0 1 1 0: A periodic interrupt is generated every 1/256 second. 0 1 1 1: A periodic interrupt is generated every 1/128 second. 1 0 0 0: A periodic interrupt is generated every 1/64 second. 1 0 0 1: A periodic interrupt is generated every 1/32 second. 1 0 1 0: A periodic interrupt is generated every 1/16 second. 1 0 1 1: A periodic interrupt is generated every 1/8 second. 1 1 0 0: A periodic interrupt is generated every 1/4 second. 1 1 0 1: A periodic interrupt is generated every 1/2 second. 1 1 1 0: A periodic interrupt is generated every 1 second. 1 1 1 1: A periodic interrupt is generated every 2 seconds. Other than above: No periodic interrupts are generated.

The RCR1 register is used in both calendar count mode and in binary count mode.

Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits have been updated before proceeding to the next processing.

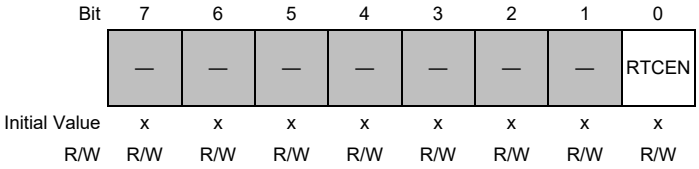
4.11.3.19 RTC Control Register 2 (RCR2)

Bit	7	6	5	4	3	2	1	0
	CNTMD	HR24	AADJP	AADJE	—	ADJ30	RESET	START
Initial Value	x	x	x	x	0	0	0	x
R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
0	START	x	R/W	Start*3 This bit stops or restarts the prescaler or counter (clock) operation. The START bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding to the next processing. 0: Prescaler and counter are stopped. 1: Prescaler and counter operate normally.
1	RESET	0	R/W	RTC Software Reset This bit initializes the prescaler and registers to be reset by RTC software reset. When 1 is written to the RESET bit, the initialization starts in synchronization with the count source. When the initialization is completed, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is set to 0, and then make next settings. • In writing 0: Writing is invalid. 1: The prescaler and the target registers for RTC software reset*1 are initialized. • In reading 0: In normal time operation, or an RTC software reset has completed. 1: During an RTC software reset
2	ADJ30	0	R/W	30-Second Adjustment*2 This bit is for 30-second adjustment. When 1 is written to the ADJ30 bit, the RSECCNT value of 30 seconds or less is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute. The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment is completed. In case when 1 is written to the ADJ30 bit, check that the bit is set to 0, and then make next settings. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is set to 0 by an RTC software reset. This bit is reserved in binary counter mode. The write value should be 0. • In writing 0: Writing is invalid. 1: 30-second adjustment is executed. • In reading 0: In normal time operation, or 30-second adjustment has completed. 1: During 30-second adjustment
3	—	0	R	Reserved This bit is read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	AADJE	x	R/W	Automatic Adjustment Enable*3 This bit controls (enables or disables) automatic adjustment. Set the plus–minus bits (RADJ.PMADJ[1:0]) to H'00 (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is set to 0 by an RTC software reset. 0: Automatic adjustment is disabled. 1: Automatic adjustment is enabled.
5	AADJP	x	R/W	Automatic Adjustment Period Select*3 This bit selects the automatic-adjustment period. Set the plus–minus bits (RADJ.PMADJ[1:0]) to H'00 (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is set to 0 by an RTC software reset. 0: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every minute (every 32 seconds in binary counter mode). 1: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every 10 seconds (every 8 seconds in binary counter mode).
6	HR24	x	R/W	Hours Mode*2,*3 This bit specifies whether the RTC will operate in 12- or 24-hour mode. Use the START bit to stop counting by the counters before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time. This bit is reserved in binary counter mode. The write value should be 0. 0: The RTC operates in 12-hour mode. 1: The RTC operates in 24-hour mode.
7	CNTMD	x	R/W	Count Mode Select*3 This bit specifies whether the RTC count mode is operated in calendar count mode or in binary count mode. After setting the count mode, execute an RTC software reset and start again from the initial settings. The CNTMD bit is updated in synchronization with the count source, so when the value of the CNTMD bit has been changed, check that the value of the bit has actually been updated before applying the RTC software reset. The count mode changes to that which was specified beforehand in the CNTMD bit after the RTC software reset is applied. For details on initial settings, refer to **4.11.4.1 Outline of Initial Settings of Registers after Power On**. 0: The calendar count mode. 1: The binary count mode.

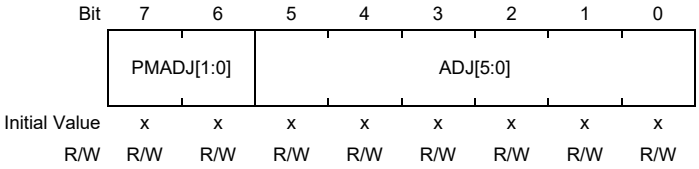


Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RTCCR0, RSECCP0/BCNT0CP0, RMINCP0/BCNT1CP0, RHRCP0/BCNT2CP0, RDAYCP0/BCNT3CP0, RMONCP0, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP

Note 2. This bit is reserved in binary counter mode. The write value should be 0.

Note 3. After writing to this bit, confirm that its value has actually changed before proceeding with further processing.
Refer to **4.11.6.4 Notes on Writing to and Reading from Registers** regarding changes to the values of the AADJE, AADJP, and HR24 bits.

The RCR2 register is related to hours mode, automatic adjustment function, 30-second adjustment, RTC software reset, and controlling count operation.



4.11.3.20 RTC Control Register 3 (RCR3)

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
0	RTCEN	x	R/W	This bit enable or disable 32KHz OSC and RTC time capture function. 0: 32KHz OSC and RTC time capture function are disabled. 1: 32KHz OSC and RTC time capture function are enabled. *Note*: When using the RTC, this setting should be set to 1.
7 to 1	—	—	R/W	Reserved This bit is read as 0. The write value should be 0.

4.11.3.21 Time Error Adjustment Register (RADJ)

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	ADJ[5:0]	x	R/W	Adjustment Value These bits specify the adjustment value (the number of sub-clock cycles) from the prescaler.
7, 6	PMADJ[1:0]	x	R/W	Plus–Minus These bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits. b7 b6 0 0: Adjustment is not performed. 0 1: Adjustment is performed by the addition to the prescaler. 1 0: Adjustment is performed by the subtraction from the prescaler. 1 1: Setting prohibited

Adjustment is performed by the addition to or subtraction from the prescaler.

In case when the automatic adjustment enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ.

In case when the RCR2.AADJE bit is 1, adjustment is performed in the interval specified by the automatic adjustment period select (RCR2.AADJP) bit.

The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting and then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits have been updated before continuing with further processing.

This register is set to H’00 by an RTC software reset.

ADJ[5:0] Bits (Adjustment Value)

These bits specify the adjustment value (the number of 32kHz-clock cycles) from the prescaler.

PMADJ[1:0] Bits (Plus–Minus)

These bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

4.11.3.22 Time Capture Control Register (RTCCR0)

Bit	7	6	5	4	3	2	1	0
	TCEN	—	TCNF[1:0]		—	TCST	TCCT[1:0]	
Initial Value	x	0	x	x	0	x	x	x
R/W	R/W	R	R/W	R/W	R	R/W	R/W	R/W

x: Undefined

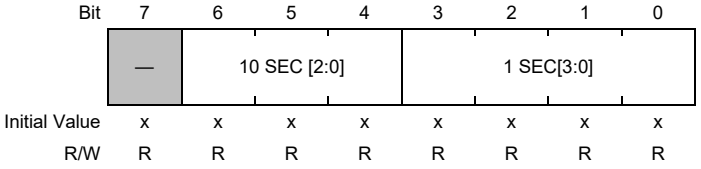
Bit	Bit Name	Initial Value	R/W	Description
1, 0	TCCT[1:0]	x	R/W	Time Capture Control These bits control the edge detection of the time capture event input pins (RTCTC0). The detection edge is selectable. The TCCT[1:0] bits should be set while the TCEN bit is 1. b1 b0 0 0: No event is detected. 0 1: Rising edge is detected. 1 0: Falling edge is detected. 1 1: Both edges are detected.
2	TCST	x	R/W	Time Capture Status This bit indicates that an event of the time capture event input pins (RTCTC0) has been detected. When the TCST bit is 0, no event is detected. When the TCST bit is 1, this bit indicates that an event of the corresponding pin has been detected and the capture register is valid. When multiple events have been detected, the capture time for the first event is retained. Writing 0 sets the TCST bit to 0. In addition, writing any other value except 0 has no effect. Set the TCST bit while the TCCT[1:0] bits are b'00 (no event is detected). The TCST bit is set to 0 in synchronization with the count source. When the TCST bit is set to 0, check that the bit has been updated before continuing with further processing. 0: No event is detected. 1: An event is detected.*1
3	—	x	R	Reserved This bit is read as 0. The write value should be 0.
5, 4	TCNF[1:0]	x	R/W	Time Capture Noise Filter Control These bits control the noise filter of the time capture event input pin (RTCTC0). When the noise filter is on, the count source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined. Set the TCNF[1:0] bits while the TCCT[1:0] bits are b'00 (no event is detected). When the noise filter is used, after setting the TCNF[1:0] bits to 1, wait for three cycles of the specified sampling period, and then set the TCCT[1:0] bits. Set the TCNF[1:0] bits when the TCEN bit is 1. b5 b4 0 0: The noise filter is off. 0 1: Setting prohibited 1 0: The noise filter is on (count source). 1 1: The noise filter is on (count source by divided by 32).
6	—	x	R	Reserved This bit is read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
7	TCEN	x	R/W	Time Capture Event Input Pin Enable This bit enables or disables the time capture event input pin (RTCTC0). To enable the time capture event input pin, set also the TAMPICR1.CH0EN bit*2 to 1. If the TCEN bit is set to 0, set also the TCCT[1:0] bits to 00b. 0: The RTCTC0 pin is disabled as the time capture event input. 1: The RTCTC0 pin is enabled as the time capture event input.

Note 1. Indicates that an event has been detected. Writing 1 to this bit has no effect. Writing 0 sets this bit to 0.

Note 2. For details, refer to **4.10 Battery Backup Function (VBATTB)**.

The RTCCR0 register is used both in calendar count mode and in binary count mode.



RTCCR0 control the RTCTC0 pin, respectively.

RTCCR0 is updated in synchronization with the count source. When RTCCR0 is modified, check that all the bits except for the TCST bit have been updated before continuing with further processing.

This register is set to H’00 by an RTC software reset.

4.11.3.23 Second Capture Register (RSECCP0)/BCNT0 Capture Register (BCNT0CP0)

a. In calendar count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 SEC[3:0]	x	R	1-Second Capture Capture value for the ones place of seconds
6 to 4	10 SEC[2:0]	x	R	10-Second Capture Capture value for the tens place of seconds
7	—	x	R	Reserved This bit is read as undefined.

RSECCP0 is a read-only register that captures the RSECCNT value when a time capture event is detected.

The event detection times detected by the RTCTC0 pin are stored in the RSECCP0 register, respectively.

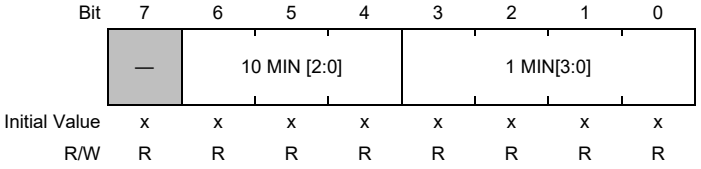
This register is set to H'00 by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

b. In binary count mode:

x: Undefined

BCNT0CP0 is a read-only register that captures the BCNT0 value when a time capture event is detected.



The event detection times detected by the RTCTC0 pin are stored in the BCNT0CP0 register, respectively.

This register is set to H'00 by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

4.11.3.24 Minute Capture Register (RMINCP0) /BCNT1 Capture Register (BCNT1CP0)

a. In calendar count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 MIN[3:0]	x	R	1-Minute Capture Capture value for the ones place of minutes
6 to 4	10 MIN [2:0]	x	R	10-Minute Capture Capture value for the tens place of minutes
7	—	x	R	Reserved This bit is read as undefined.

RMINCP0 is a read-only register that captures the RMINCNT value when a time capture event is detected.

The event detection times detected by the RTCTC0 pin are stored in the RMINCP0 register, respectively.

This register is set to H’00 by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

b. In binary count mode:

x: Undefined

BCNT1CP0 is a read-only register that captures the BCNT1 value when a time capture event is detected.

The event detection times detected by the RTCTC0 pin are stored in the BCNT1CP0 register, respectively.

This register is set to H’00 by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

4.11.3.25 Hour Capture Register (RHRCP0) /BCNT2 Capture Register (BCNT2CP0)

a. In calendar count mode:

Bit	7	6	5	4	3	2	1	0
	—	PM	10 HR [1:0]		1 HR [3:0]			
Initial Value	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 HR [3:0]	x	R	1-Hour Capture Capture value for the ones place of hours
5, 4	10 HR [1:0]	x	R	10-Hour Capture Capture value for the tens place of hours
6	PM	x	R	PM 0: a.m. 1: p.m.
7	—	x	R	Reserved This bit is read as undefined.

RHRCP0 is a read-only register that captures the RHRCNT value when a time capture event is detected.

The event detection times detected by the RTCTC0 pin are stored in the RHRCP0 register, respectively.

The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

This register is set to H'00 by an RTC software reset.

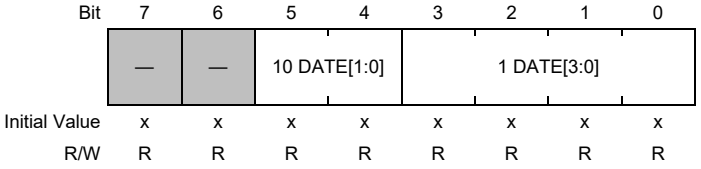
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

b. In binary count mode:

Bit	7	6	5	4	3	2	1	0
	BCNTCP0[23:16]							
Initial Value	0	0	0	0	0	0	0	0

x: Undefined

BCNT2CP0 is a read-only register that captures the BCNT2 value when a time capture event is detected.



The event detection times detected by the RTCTC0 pin are stored in the BCNT2CP0 register, respectively.

This register is set to H'00 by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

4.11.3.26 Date Capture Register (RDAYCP0) /BCNT3 Capture Register (BCNT3CP0)

a. In calendar count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 DATE[3:0]	x	R	1-Day Capture Capture value for the ones place of days
5, 4	10 DATE[1:0]	x	R	10-Day Capture Capture value for the tens place of days
7, 6	—	x	R	Reserved These bits are read as undefined.

RDAYCP0 is a read-only register that captures the RDAYCNT value when a time capture event is detected.

The event detection times detected by the RTCTC0 pin are stored in the RDAYCP0 register, respectively.

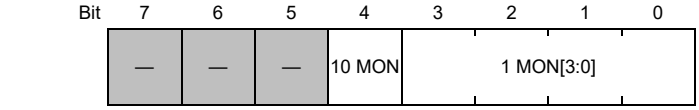
This register is set to H’00 by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

b. In binary count mode:

x: Undefined

BCNT3CP0 is a read-only register that captures the BCNT3 value when a time capture event is detected.



The event detection times detected by the RTCTC0 pin are stored in the BCNT3CP0 register, respectively.

This register is set to H’00 by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

4.11.3.27 Month Capture Register (RMONCP0)

a. In calendar count mode:

x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	1 MON[3:0]	x	R	1-Month Capture Capture value for the ones place of months
4	10 MON	x	R	10-Month Capture Capture value for the tens place of months
7 to 5	—	0	R	Reserved These bits are read as 0.

RMONCP0 is a read-only register that captures the RMONCNT value when a time capture event is detected.

The event detection times detected by the RTCTC0 pin are stored in the RMONCP0 register, respectively.

This register is set to H'00 by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCR0.TCCT[1:0] bits.

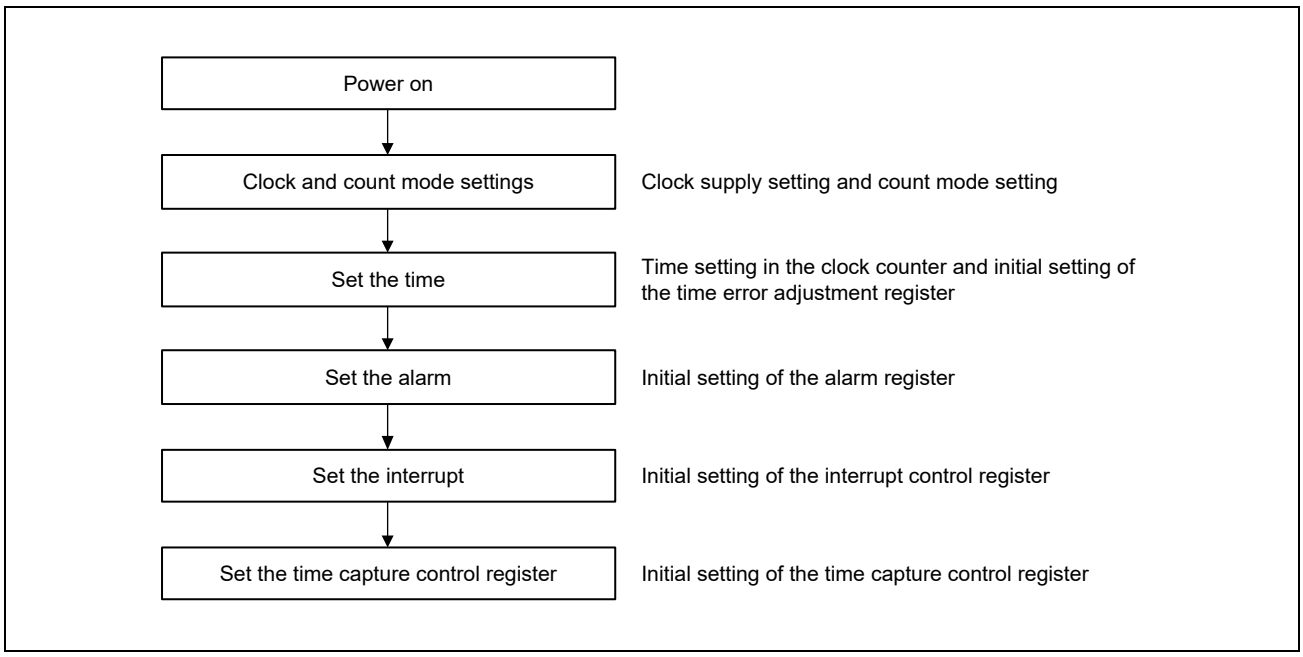
CAUTION

This register is not used in binary count mode.

4.11.4 Operation

4.11.4.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, the initial settings for the clock setting, count mode setting, time error adjustment, time setting, alarm, interrupt, and time capture control register should be performed.



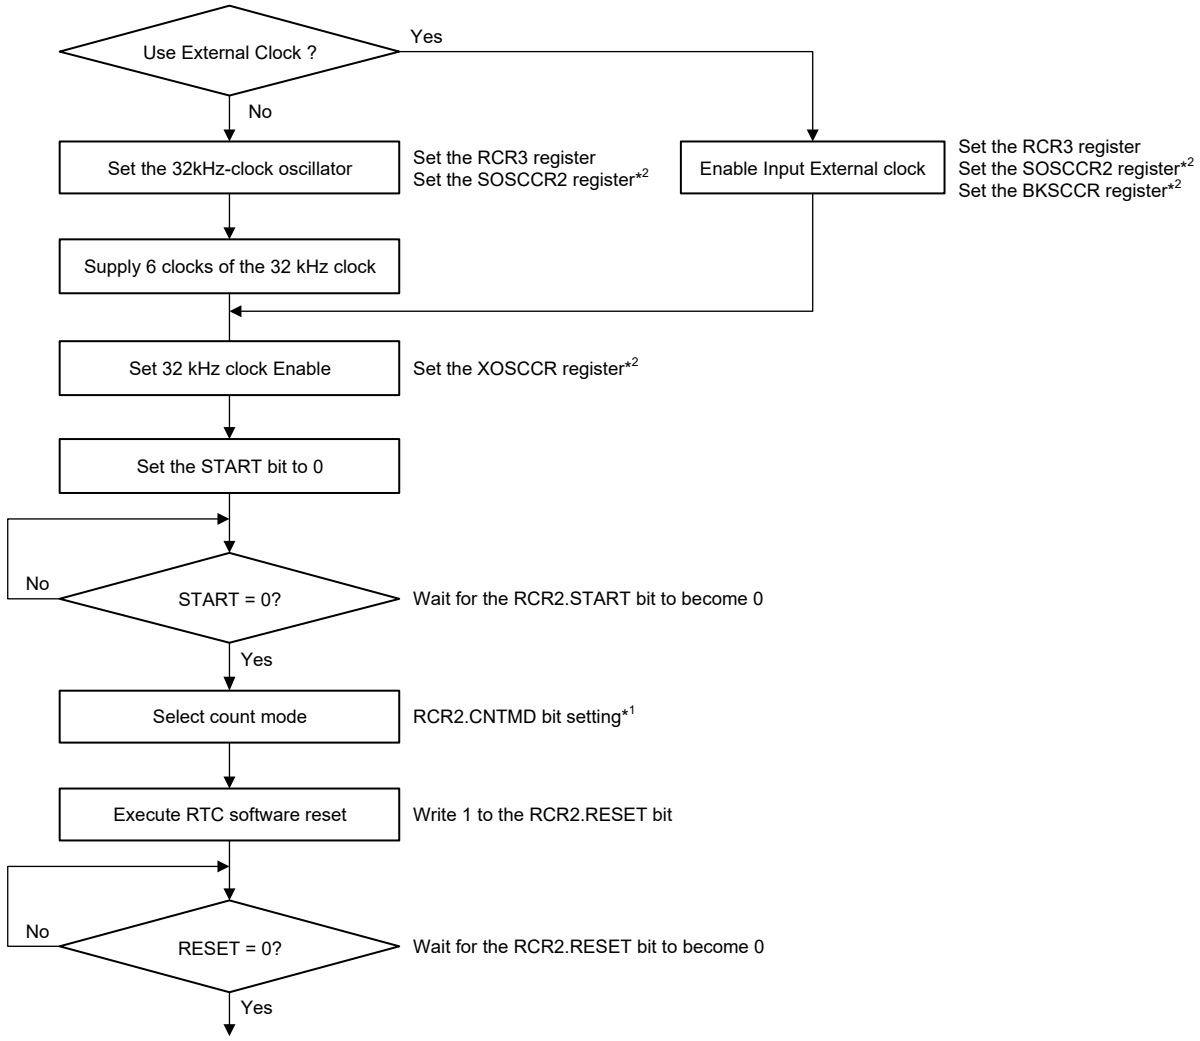


Figure 4.11-2 Outline of Initial Settings after Power On

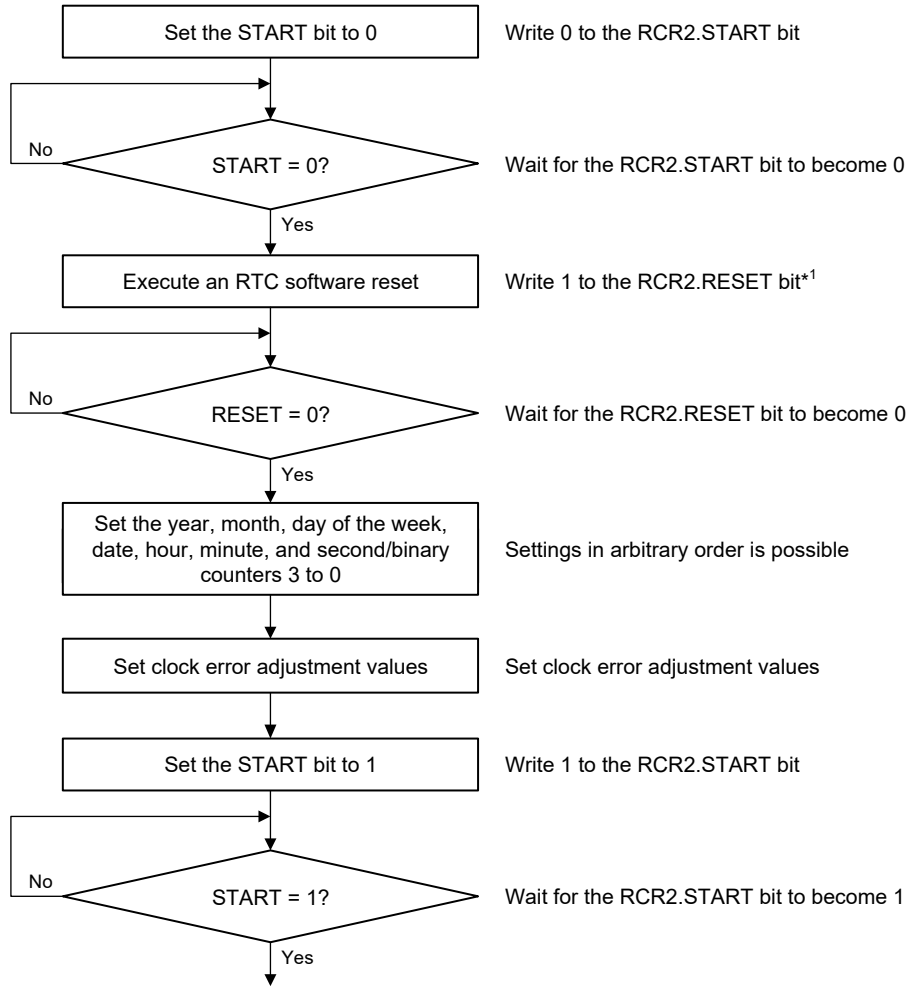
4.11.4.2 Clock and Count Mode Setting Procedure

Figure 4.11-3 shows how to set the clock and the count mode.



Note 1. This step is not necessary if the count mode has been set concurrently with setting the START bit to 0. A value corresponding to the count mode setting must be written to the RCR2.CNTMD bit.

Note 2. For details, refer to **4.10.1 Battery Backup Function (VBATTB)**.

Figure 4.11-3 Clock and Count Mode Setting Procedure

4.11.4.3 Setting the Time

Figure 4.11-4 shows how to set the time.

Note 1. This step is not necessary for the time-setting procedure because an RTC software reset is executed in the clock setting procedure of the initial settings for the power supply.

Figure 4.11-4 Setting the Time

4.11.4.4 30-Second Adjustment

Figure 4.11-5 shows how to execute 30-second adjustment.

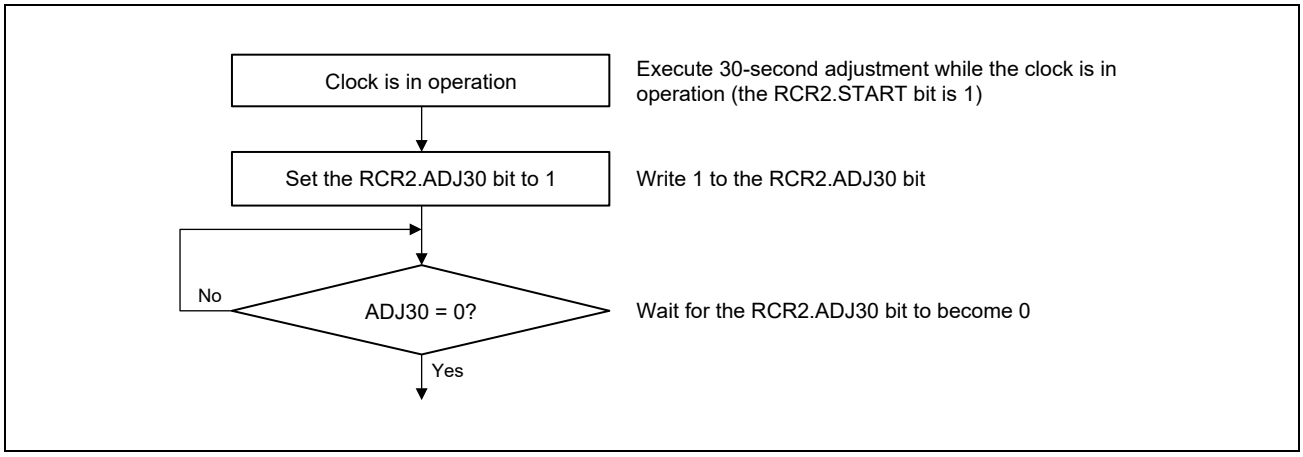


Figure 4.11-5 30-Second Adjustment

4.11.4.5 Reading 64-Hz Counter and Time

Figure 4.11-6 shows how to read the 64-Hz counter and time.

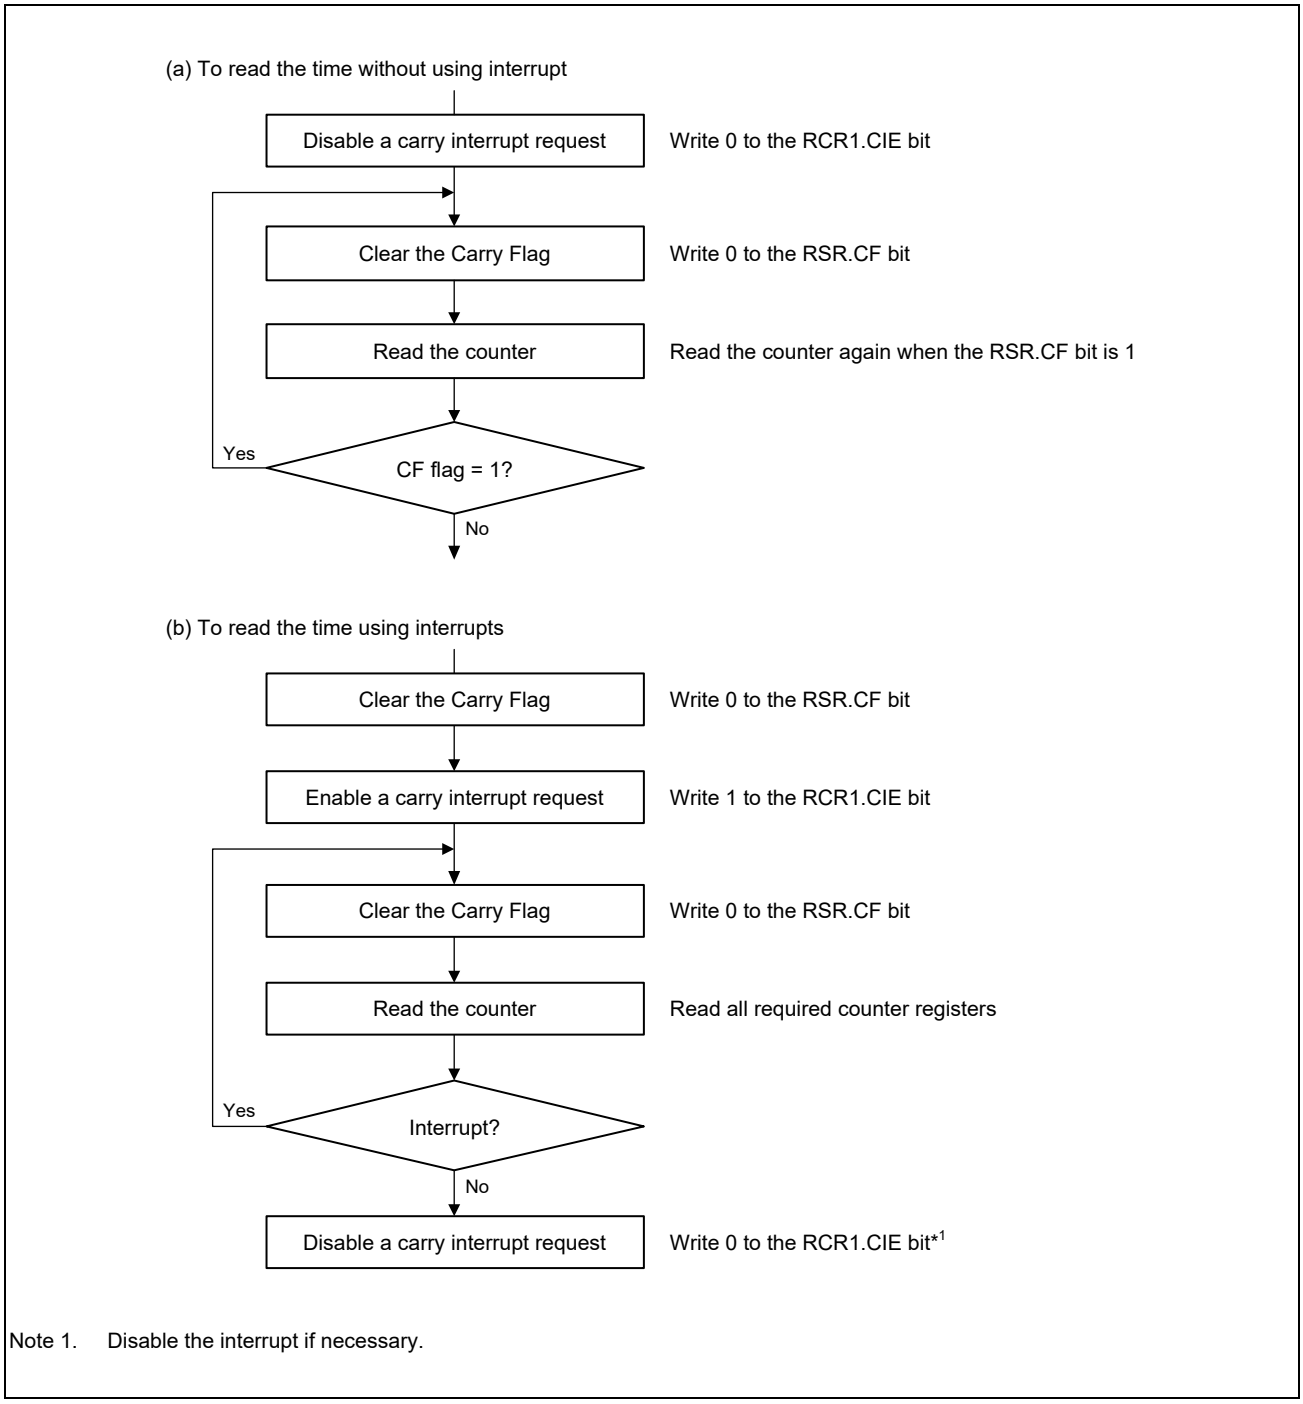

Figure 4.11-6 Reading Time

If a carry occurs while the 64-Hz counter and time are being read, the correct time will not be obtained, so they must be read again. The procedure for reading the time without using interrupts is shown in (a) in **Figure 4.11-6**, and the procedure using carry interrupts in (b). To keep the program simple, method (a) should be used in most cases.

4.11.4.6 Alarm Function

Figure 4.11-7 shows how to use the alarm function.

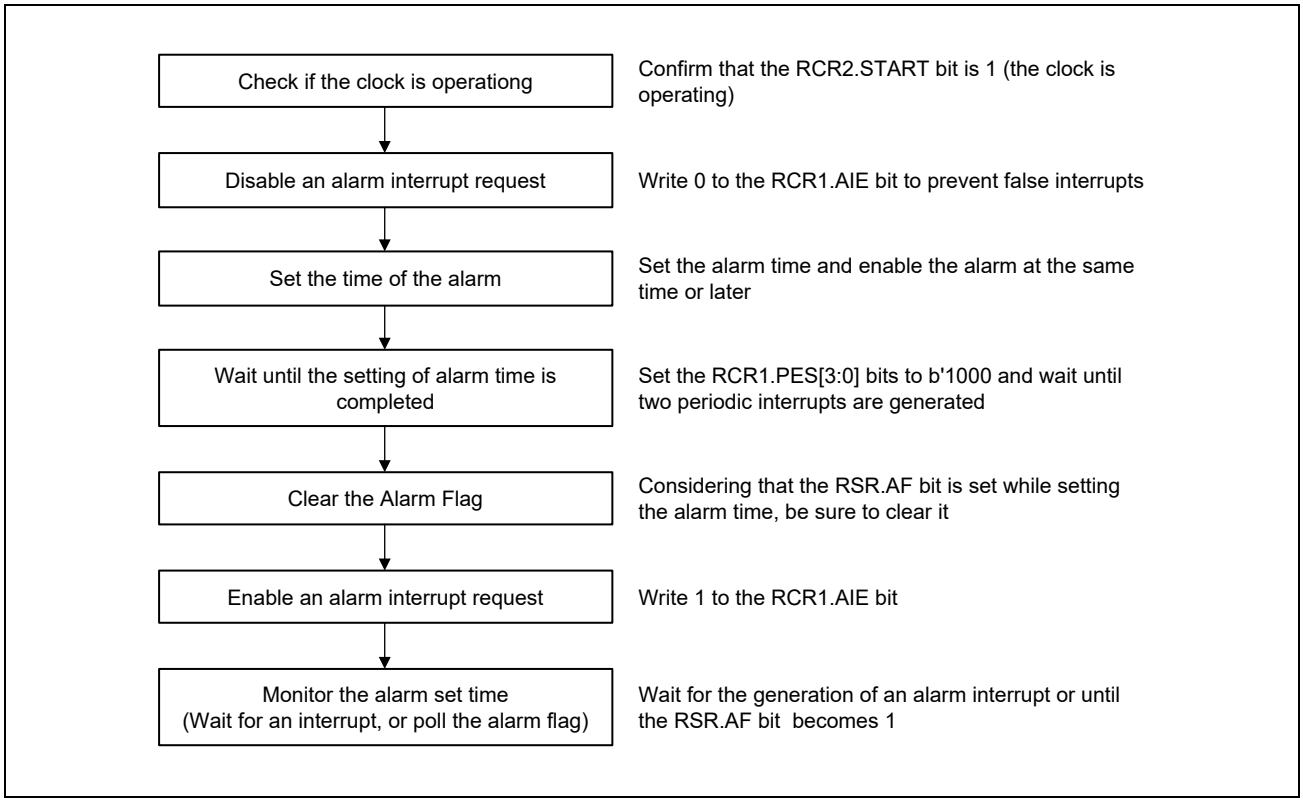

Figure 4.11-7 Using Alarm Function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the alarm enable register corresponding to the target bit of the alarm, and set the alarm time to the alarm register. For bits that are not target of the alarm, write 0 to the ENB bit of the alarm enable register.

When the counter and the alarm time match, the Alarm flag in RSR is set to 1. Alarm detection can be confirmed by reading this bit, but an interrupt should be used in most cases. If 1 has been set in the AIE bit in RCR1 register, an alarm interrupt is generated in the event of alarm, enabling the alarm to be detected.

Writing 0 sets the Alarm flag in RSR to 0.

4.11.4.7 Time Error Adjustment Function

The time error adjustment function is used to correct errors (running fast or slow) in the time due to the precision of oscillation by the 32kHz-clock. Since 32,768 cycles of the 32kHz-clock constitute 1 second of operation, the clock runs fast if the 32kHz-clock frequency is high and slow if the 32kHz-clock frequency is low. This function can be used to correct errors due to the clock running fast or slow.

Two types of time error adjustment functions are provided: automatic adjustment and adjustment by software.

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

4.11.4.7.1 Automatic Adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.

Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJE bit elapses.

Examples are shown below.

[Example 1] 32kHz-clock running at 32.769 kHz

- Adjustment procedure:

  When the 32kHz-clock is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

- Register settings (when RCR2.CNTMD = 0):
  - RCR2.AADJP = 0 (adjustment every minute)
  - RADJ.PMADJ[1:0] = b’10 (adjustment is performed by the subtraction from the prescaler.)
  - RADJ.ADJ[5:0] = 60 (H’3C)

[Example 2] 32kHz-clock running at 32.766 kHz

- Adjustment procedure:

  When the 32kHz-clock is running at 32.766 kHz, 1 second elapses every 32,766 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by two clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

- Register settings (when RCR2.CNTMD = 0):
  - RCR2.AADJP = 1 (adjustment every 10 seconds)
  - RADJ.PMADJ[1:0] = b’01 (adjustment is performed by the addition to the prescaler.)
  - RADJ.ADJ[5:0] = 20 (H’14)

[Example 3] 32kHz-clock running at 32.764 kHz

- Adjustment procedure:

  When the 32kHz-clock is running at 32.764 kHz, 1 second elapses every 32,764 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by four clock cycles every second. The time on the clock is slow by 32 clock cycles every 8 seconds, so adjustment can take the form of setting the clock forward by 32 cycles every 8 seconds.

- Register settings (when RCR2.CNTMD = 1):
  - RCR2.AADJP = 1 (adjustment every 8 seconds)
  - RADJ.PMADJ[1:0] = b’01 (adjustment is performed by the addition to the prescaler.)
  - RADJ.ADJ[5:0] = 32 (H’20)

4.11.4.7.2 Adjustment by Software

Enable adjustment by software by setting the RCR2.AADJE bit to 0.

Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register at the time of execution of an instruction for writing to the RADJ register.

An example is shown below.

[Example 1] 32kHz-clock running at 32.769 kHz

- Adjustment procedure:

  When the 32kHz-clock is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by one clock cycle per second, so adjustment can take the form of setting the clock back by one cycle every second.

- Register settings:
  - RADJ.PMADJ[1:0] = b’10 (adjustment is performed by the subtraction from the prescaler.)
  - RADJ.ADJ[5:0] = 1 (H’01)
    This is written to the RADJ register once per 1-second interrupt.

4.11.4.7.3 Procedure for Changing the Mode of Adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to b’00 (adjustment is not performed).

Changing from adjustment by software to automatic adjustment:

(1) Set the RADJ.PMADJ[1:0] bits to b’00 (adjustment is not performed).

(2) Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).

(3) Use the RCR2.AADJP bit to select the period of adjustment.

(4) In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

Changing from adjustment by software to automatic adjustment:

(1) Set the RADJ.PMADJ[1:0] bits to b’00 (adjustment is not performed).

(2) Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).

(3) Proceed with adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the desired time. After that, the time is adjusted every time a value is written to the RADJ register.

4.11.4.7.4 Procedure for Stopping Adjustment

Stop adjustment by setting the RADJ.PMADJ[1:0] bits to b’00 (adjustment is not performed).

4.11.4.8 Time Capture Function

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin.

The noise filter transmits the matched level to the inside of the RTC when the level of the pin sampled according to the set sampling period matches 3 times, and the level inside the RTC is maintained until the level of the sampled pin matches 3 times.

The noise filter can be switched on or off for each of the time capture event input pins. Operation when the noise filter is off is shown in **Figure 4.11-8** and operation when the noise filter is on is shown in **Figure 4.11-9**.

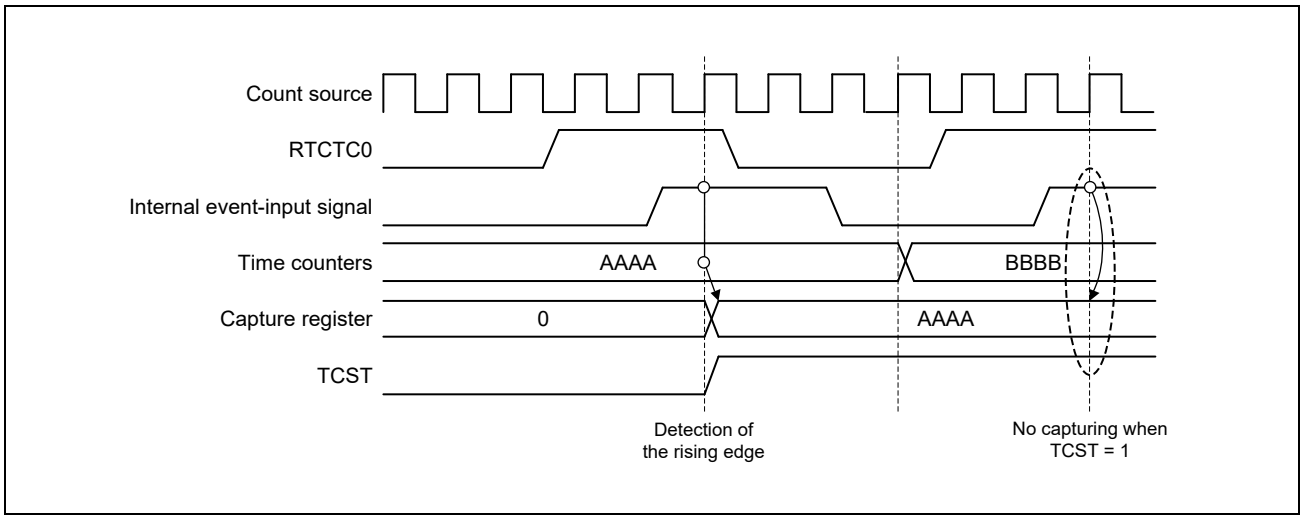

Figure 4.11-8 Timing of a Time Capture Operation (with the Filter Off)

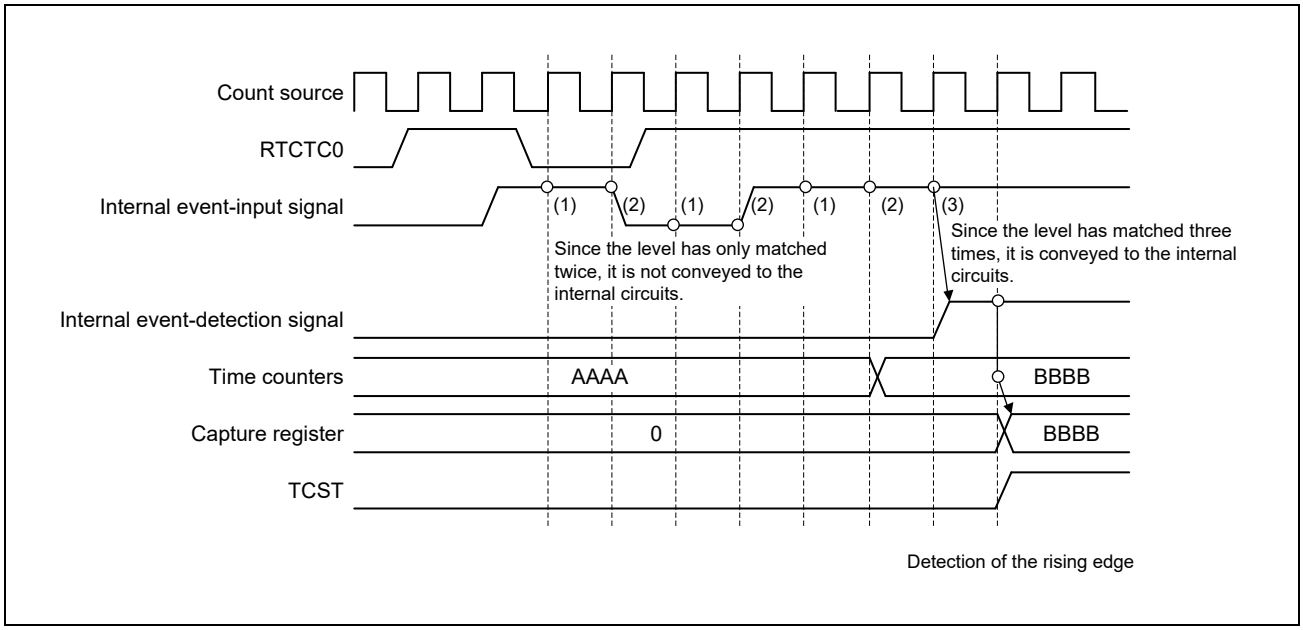

Figure 4.11-9 Timing of a Time Capture Operation (with the Filter On)

4.11.5 Interrupt Sources

There are three interrupt sources in the realtime clock. **Table 4.11-4** lists interrupt sources for the RTC.

Table 4.11-4 RTC Interrupt Sources

Name	Interrupt Sources	Interrupt Status Flag
ALM	Alarm interrupt	RSR.AF
PRD	Periodic interrupt	RSR.PF
CUP	Carry interrupt	RSR.CF

4.11.5.1 Alarm Interrupt (ALM)

This interrupt is generated according to the result of comparison between the alarm registers and realtime clock counters (for details, refer to **4.11.4.6 Alarm Function**).

Since there is a possibility that the interrupt flag may be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and set the Alarm Flag in RSR to 0 again after modifying values of the alarm registers. Once the interrupt flag for the alarm interrupt has been set to 1 and the state has returned to non-matching of the alarm registers and clock counters, the flag will not be set again until there is a further match or the values of the alarm registers are modified again.

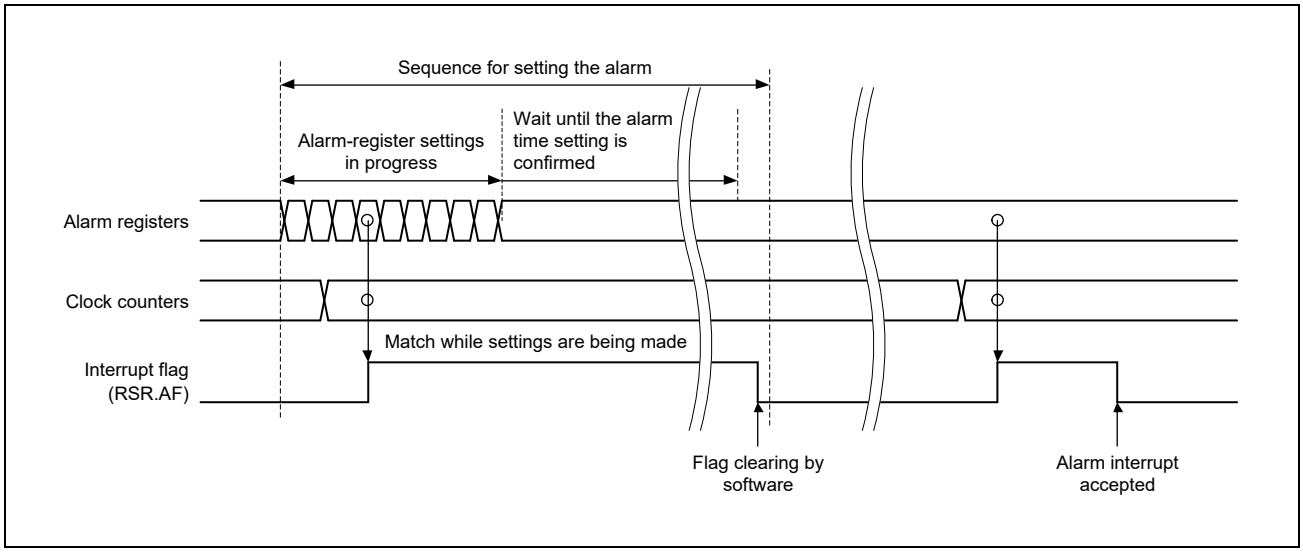

Figure 4.11-10 Timing Chart for the Alarm Interrupt (ALM)

4.11.5.2 Periodic Interrupt (PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected through the RCR1.PES[3:0] bits.

4.11.5.3 Carry Interrupt (CUP)

This interrupt is asserted when a carry to the seconds counter/binary counter 0 occurs, or when a carry from the prescaler to R64CNT occurs on a read access to the 64-Hz counter.

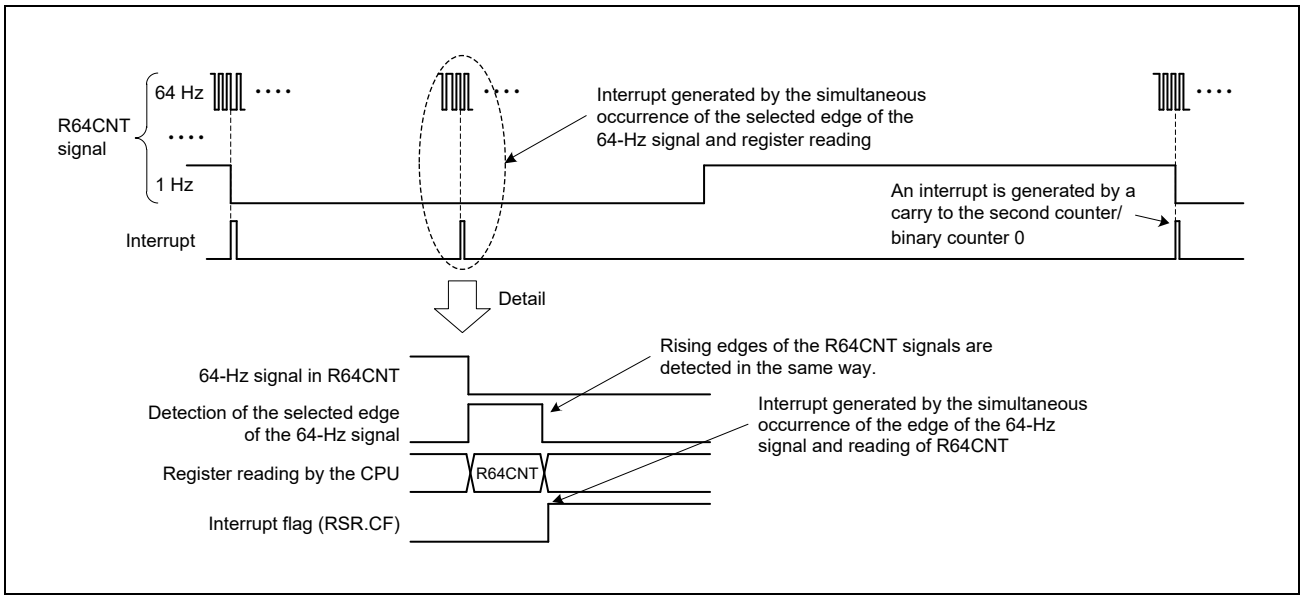

Figure 4.11-11 Carry Interrupt (CUP) Timing Chart

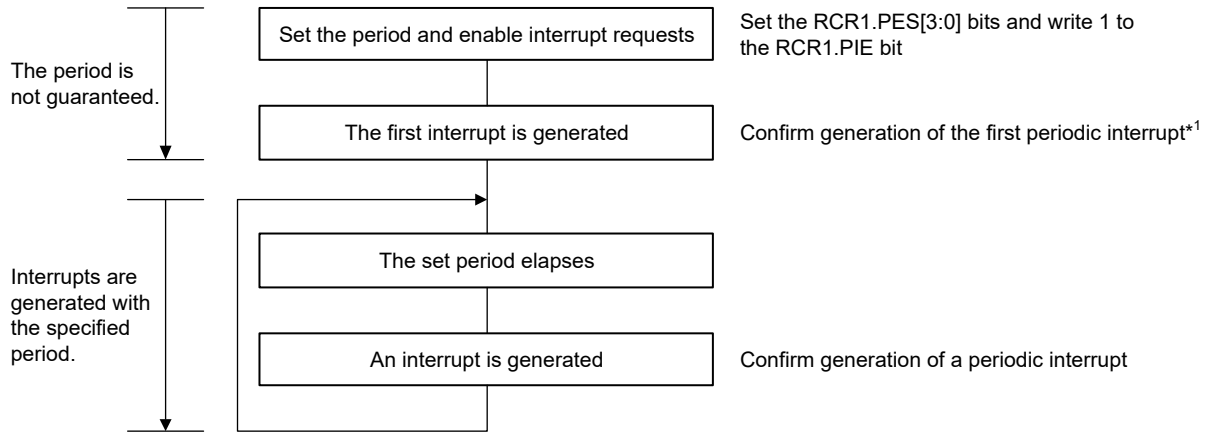
4.11.6 Usage Notes

4.11.6.1 Register Writing during Counting

The following registers should not be written to during counting (while the RCR2.START bit = 1).

RSECCNT/BCNT0, RMINCNT/BCNT1, RHRCNT/BCNT2, RDAYCNT, RWKCNT/BCNT3, RMONCNT, RYRCNT, RCR2.HR24



The counter must be stopped before writing to any of the above registers.

4.11.6.2 Use of Periodic Interrupts

The procedure for using periodic interrupts is shown in **Figure 4.11-12**.

The generation and period of the periodic interrupt can be changed by the setting of the RCR1.PES[3:0] bits. However, since the prescaler, R64CNT, and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting of the RCR1.PES[3:0] bits.

Furthermore, stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the interrupt period. When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted according to the adjustment value.

Note 1. When an interrupt generation period is changed while the periodic interrupt is used, an interrupt may be generated at the completion of the setting. If the interrupt is generated immediately after the setting, the period is not guaranteed for two interrupts including the current interrupt.

Figure 4.11-12 Using Periodic Interrupt Function

4.11.6.3 Transitions to Low Power Consumption Modes after Setting Registers

A transition to a low power consumption state (battery backup) during writing to or updating of an RTC register might destroy the register's value. After setting a register, be sure to confirm that the setting is in place before initiating a transition to a low power consumption state.

4.11.6.4 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter/binary counter 0 after having written to the counter register, follow the procedure in **4.11.4.5 Reading 64-Hz Counter and Time**.
- After written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24 register, the read value will be reflected from the read after 3 empty reads.
- The values written to the RSR register, RCR1.CIE bit can be read immediately after writing.
- To read the value from the timer counter after return from a reset, low power consumption state, wait for 1/128 second while the clock is operating (RCR2.START bit = 1).

  * Low power consumption states refer to the following modes: battery backup function
- After a reset is generated, write to the RTC register when six cycles of the count source have elapsed.

4.11.6.5 Changing the Count Mode

When changing the count mode (calendar/binary), set the RCR2.START bit to 0, stop counting operation, then start again from the initial setting. For details on initial setting, refer to **4.11.4.1 Outline of Initial Settings of Registers after Power On**.

4.11.6.6 32 KHz-Clock Off Control

In crystal oscillator mode, set the SOSCCR2.SOSTP2 to 1 to stop the oscillator.

In external clock (bypass) mode, set the XOSCCR.OUTEN to 0 to disable clock propagation.

SECTION 4 SYSTEM

4.12 OTP

This section describes the functions of the one-time programmable memory (OTP).

4.12.1 OTP Function Specification

The following describes the OTP function.

4.12.1.1 Functional Overview

The OTP unit is used to write to and read from the various setting areas listed in **Table 4.12-1**.

Writing to the non-volatile OTP memory macro (core) of the OTP unit proceeds in 32-bit units. However, the same bit can be written only once.

For OTP writing or reading, turn the OTP power setting on before starting the operation.

Table 4.12-1 Overview of Functions

Functions	Description
OTP writing	Addresses and data set in registers are written in 32-bit units.
OTP reading	Addresses set in registers are read in 32-bit units.

4.12.1.2 Initialization Sequence at OTP Unit Startup

After power is supplied to this LSI, the hardware automatically controls the followings as shown below.

<1> The reset release sequencer starts the operation.
When power is supplied, the processing following <2> is automatically executed following input of the LSI internal clock for OTP control and release from the system reset state.

<2> Power-on setting of the OTP memory core

<3> Initial reading of the OTP
The data stored in the OTP is automatically loaded into the internal temporary holding register (load_ff).

<4> Power-off setting of the OTP memory core

The operation of the initialization sequence is shown in **Figure 4.12-1**.

When the initialization sequence is completed, the OTP unit can be accessed and the registers can be set.

After the initialization sequence has been executed, the OTP unit enters the power-off state.

Use software to check for this state by reading the OTPFLAG register.

Make the setting to turn on the OTP power (OTPPWR) in advance of OTP writing or reading.

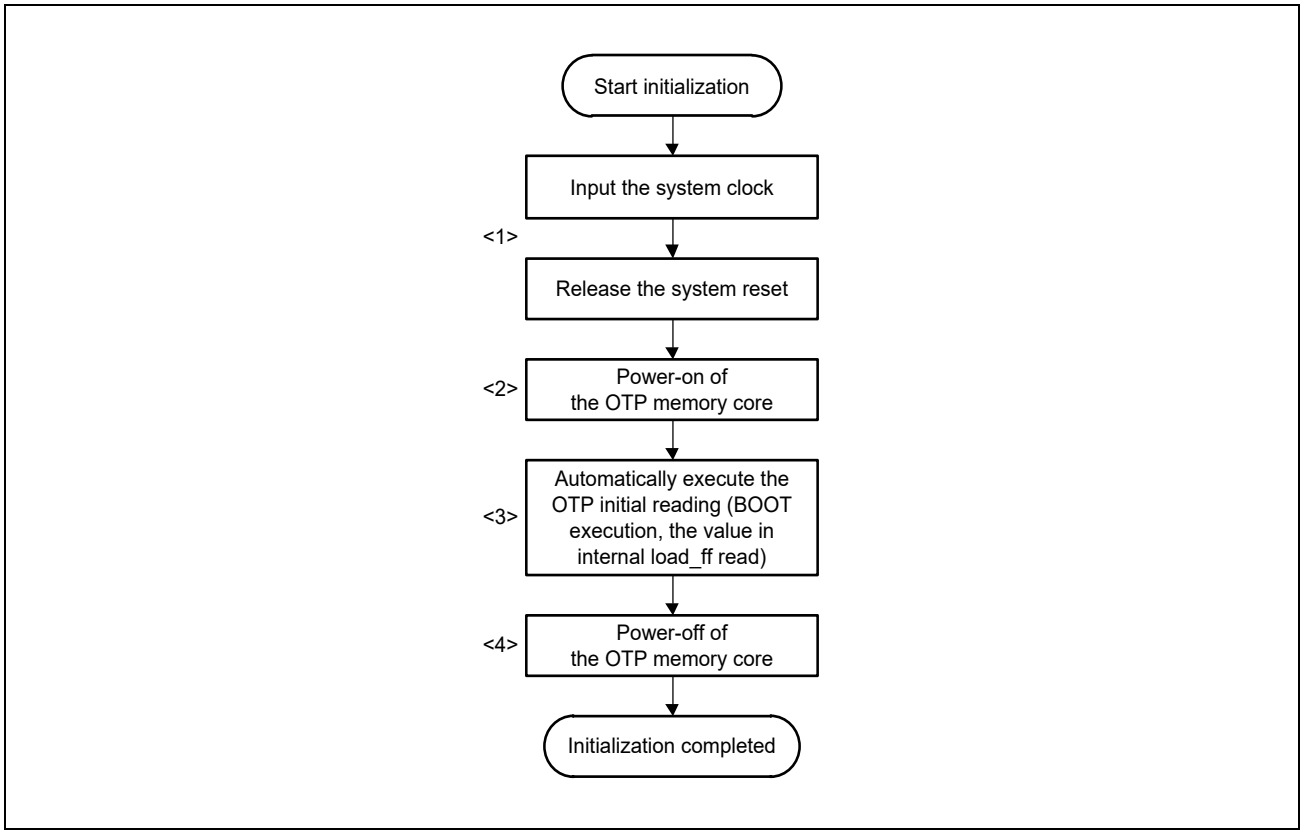


Figure 4.12-1 Initialization Sequence

4.12.1.3 Operation Specifications

Table 4.12-2 lists the specifications of the operation of the OTP unit after initialization sequence.

Table 4.12-2 Operation Specifications

Type	Operation	Control Method	Supplementary Explanation
Standby	State after the OTP initialization sequence (the state becomes OTP PWROFF)	—	Set PWR to 1b in the OTP power configuration register for access to the OTP in this state.
OTP Writing (Program and Verify)	OTP is written by the system firmware.	Set the target address and data to be written in the OTP control register, and set the write start bit to execute the writing.	For details, see **4.12.3.1 OTP Write**. Writing width: 32 bits
OTP Reading	OTP is read by the system firmware.	Set the target address to be read in the OTP control register and the data will be stored in the appropriate register.	For details, see **4.12.3.2 OTP Read**. Reading width: 32 bits
Register Writing	Writing to the register via the APB I/F	The hardware automatically controls the system.	Access to the register may not be possible due to the access prohibited setting. In such cases, check the state in the OTPSTR register.
Register Reading	Reading of the register via the APB I/F		

4.12.2 Register Description

Table 4.12-4 is a list of registers for this unit. Use the addresses produced by adding the offset addresses to the OTP base address shown below.

Table 4.12-3 Register Base Addresses

Base Address Name	Base Address
<OTP_base>	0_1186_0000 (5186_0000*1, 4186_0000*2)

Note 1. CM33 address space (non-secure)

Note 2. CM33 address space (secure)

■ OTP Control Registers

These registers are used to control OTP reading and writing and to check the state of the OTP unit itself.

Table 4.12-4 List of Registers

Offset Address	Register Name	Abbreviation	Initial Value	Access Unit (bits)
OTP control registers				
0000h	OTP Power Configuration Register	OTPPWR	0000_0000h	32
0004h	OTP Status Register	OTPSTR	0000_0000h	32
0008h	OTP Write Command Start Register	OTPSTAWR	0000_0000h	32
000Ch	OTP Write Address Register	OTPADRWR	0000_0000h	32
0010h	OTP Write Data Register	OTPDATAWR	0000_0000h	32
0014h	OTP Read Address Register	OTPADRRD	0000_0000h	32
0018h	OTP Read Data Register	OTPDATARD	0000_0000h	32
001Ch	OTP Flag Register	OTPFLAG	0000_0001h	32
0020h to 13FFh	Reserved	—	—	—
OTP data storage registers				
1400h to 153Fh	Reserved	—	—	—
1540h	Chip ID Register	OTPCPID0	Chip-specific value	32
1544h		OTPCPID1		32
1548h		OTPCPID2		32
154Ch		OTPCPID3		32
1550h to 155Fh	Reserved	—	—	—
1560h	Product ID Register	OTPPRODID	Product-specific value	32
1564h to 15A7h	Reserved	—	—	—
15A8h	One Time Read Area Enable Setting Register	OTPOTREN	0000_00xxh*1	32
15ACh to 15AFh	Reserved	—	—	—
15B0h	Boot Device Drive Strength Setting Register	OTPPOC	0000_0xxxh*1	32
15B4h to 15FFh	Reserved	—	—	—

Note 1. This list shows the values immediately after shipment of the LSI chip. After writing or changing the settings, the value depends on the state in terms of OTP.

■ OTP Data Storage Registers (Area Accessed by the OTP Control Register)

The OTP setting status can be checked through the control register in **Table 4.12-4**.

When these registers are accessed by software via the memory map, they function as read-only registers for monitoring the various states.

To modify each state, use the OTP write function with the address values listed in **Table 4.12-5**.

The bit assignments for each function at the access addresses are identical to those used for these registers.

Additionally, if an abbreviation shown in **Table 4.12-4** matches that shown in **Table 4.12-5**, the abbreviation itself refers to the same item, but the access route differs.

- Reserved area: Access prohibited
- User area 1: Can be used as desired

Table 4.12-5 List of OTP Map

OTP Map Address	OTP Name	Abbreviation	Initial Value	Access Unit (bits)
OTP data storage area (area accessed by the OTP control register)				
000h to 14Fh	Reserved	—	—	—
150h	Chip ID Register	OTPCPID0	Chip-specific value	32
151h		OTPCPID1		32
152h		OTPCPID2		32
153h		OTPCPID3		32
154h to 157h	Reserved	—	—	—
158h	Product ID Register	OTPPRODID	Product-specific value	32
159h to 15Ch	Reserved	—	—	—
15Dh	Dummy Read Area	—	0000_0000h	32
15Eh to 169h	Reserved	—	—	—
16Ah	One Time Read Area Enable Setting Register	OTPOTREN	0000_00xxh*1	32
16Bh	Reserved	—	—	—
16Ch	Boot Device Drive Strength Setting Register	OTPPOC	0000_0xxxh*1	32
16Dh to 17Fh	Reserved	—	—	—
180h to 1FFh	User Area 1 (one-time read area)*2	—	0000_0000h	32

Note 1. This list shows the values immediately after shipment of the LSI chip. After writing or changing the settings, the value depends on the state in terms of OTP.

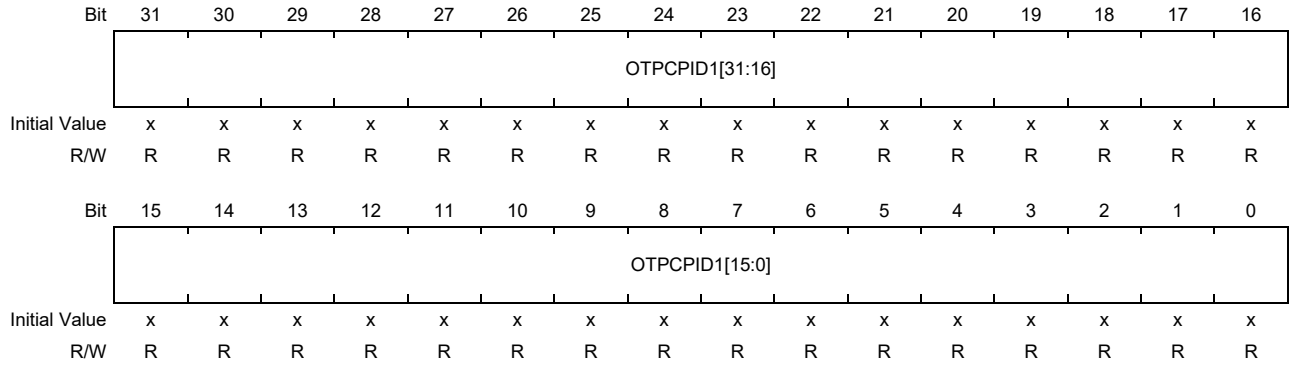
Note 2. When using the secure boot function, the available area is restricted.

4.12.2.1 Register Descriptions: OTP Data Storage Registers

The details of the OTP data storage registers of this unit are described below.

4.12.2.1.1 Chip ID Registers (OTPCPID0 to OTPCPID3)

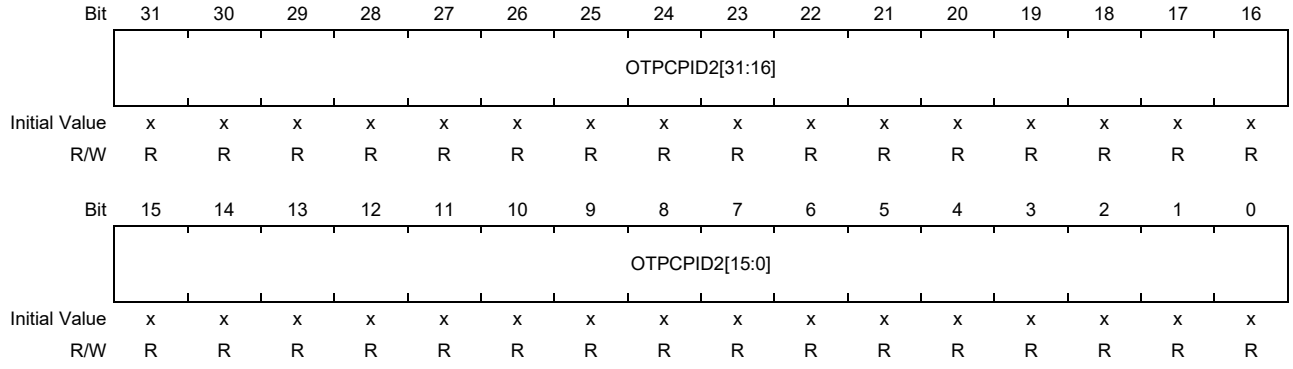
These registers are read-only. These registers store values specific to the LSI chip.



(1) OTPCPID0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OTPCPID0 [31:0]	xh	R	This register stores the chip ID

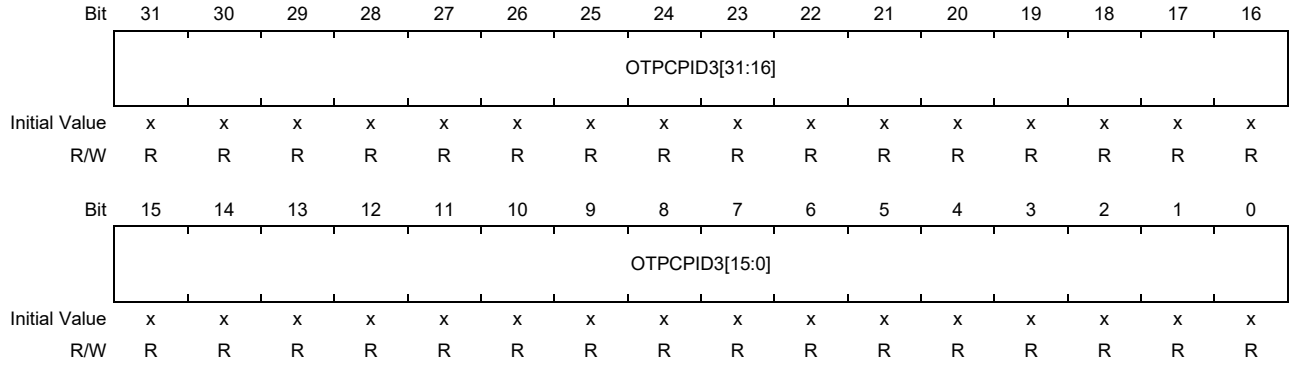
x: Undefined value



(2) OTPCPID1

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OTPCPID1 [31:0]	xh	R	This register stores the chip ID

x: Undefined value

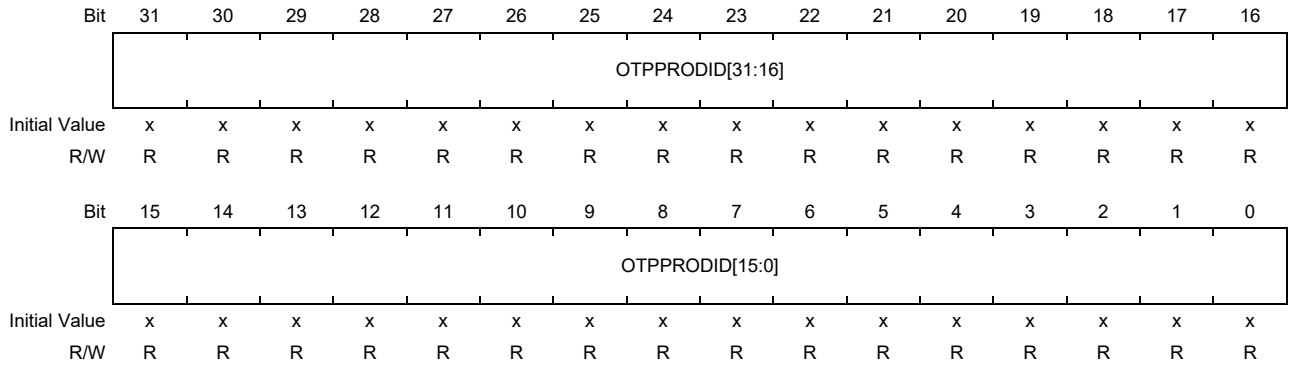


(3) OTPCPID2

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OTPCPID2 [31:0]	xh	R	This register stores the chip ID

x: Undefined value

(4) OTPCPID3



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OTPCPID3 [31:0]	xh	R	This register stores the chip ID

x: Undefined value

4.12.2.1.2 Product ID Registers (OTPPRODID)

This register is read-only.

This register stores values specific to the LSI chip.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OTPPRODID [31:0]	xh	R	This register stores the product ID

x: Undefined value

4.12.2.1.3 One Time Read Area Enable Setting Register (OTPOTREN)

This register is read-only. However, bits can be set to 1b by access to the offset addresses with the OTP writing function.

This register reads the one-time read settings for the specified range of bytes in user area 1 (the area for one-time reading).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
7	OTREN7	xh	R	The setting of User Area 1 (One time read area) [448 to 511 Byte] 0b: Disable the one time read 1b: Enable the one time read
6	OTREN6	xh	R	The setting of User Area 1 (One time read area) [384 to 447 Byte] 0b: Disable the one time read 1b: Enable the one time read
5	OTREN5	xh	R	The setting of User Area 1 (One time read area) [320 to 383 Byte] 0b: Disable the one time read 1b: Enable the one time read
4	OTREN4	xh	R	The setting of User Area 1 (One time read area) [256 to 319 Byte] 0b: Disable the one time read 1b: Enable the one time read
3	OTREN3	xh	R	The setting of User Area 1 (One time read area) [192 to 255 Byte] 0b: Disable the one time read 1b: Enable the one time read
2	OTREN2	xh	R	The setting of User Area 1 (One time read area) [128 to 191 Byte] 0b: Disable the one time read 1b: Enable the one time read
1	OTREN1	xh	R	The setting of User Area 1 (One time read area) [64 to 127 Byte] 0b: Disable the one time read 1b: Enable the one time read
0	OTREN0	xh	R	The setting of User Area 1 (One time read area) [0 to 63 Byte] 0b: Disable the one time read 1b: Enable the one time read

x: Undefined value

4.12.2.1.4 Boot Device Drive Strength Setting Register (OTPPOC)

This register is read-only. However, bits can be set to 1b by access to the offset addresses with the OTP writing function.

This register reads the drive strength setting states of the opposite side accessed in each boot mode and the terminals to which this LSI chip is connected.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

*4 = SCIF0_TXD

4.12.2.2 Register Descriptions: OTP Control Registers

The details of the OTP control registers of this unit are described below.

4.12.2.2.1 OTP Power Configuration Register (OTPPWR)

This register sets the power control and valid access path for OTP.

If 0 is written to the PWR bit during OTP write access, power to the OTP will be cut off after the write access is completed. The PWR bit stays unchanged while access is in progress.

Before setting the ACCL bit to 1, check that the following conditions are satisfied.

- Check that the PWR bit in the OTP power configuration register (OTPPWR) is 0.
- Check that the CMD_RDY bit in the OTP status register (OTPSTR) is 0.
- Check that the OTPFLAG bit in the OTP flag register (OTPFLAG) is 1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
4	ACCL	0h	RW	OTP accses mode 0: Set to zero during a specific operation in the transition from AWO_DDR_RETENTION mode to ALL_ON mode. 1: Normal mode
3 to 1	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
0	PWR	0h	RW	Power setting for the OTP macro 0b: OTP power-off 1b: OTP power-on

4.12.2.2.2 OTP Status Register (OTPSTR)

This register indicates the completion of preparation for accepting commands and the state of error detection.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ERR_RDY_RD	ERR_RDY_WR	—	—	—	ERR_RP	ERR_WP	ERR_WR[1:0]		CMD_RDY
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW0	RW0	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
9	ERR_RDY_RD	0h	RW0	OTP Read command ready error. If an OTP Read access occurs when CMD_RDY = 0b, this bit is set to 1b. This bit can be cleared to 0 by writing 0b.
8	ERR_RDY_WR	0h	RW0	OTP Write command ready error. If an OTP Write access occurs when CMD_RDY = 0b, this bit is set to 1b. This bit can be cleared to 0 by writing 0b.
7 to 5	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
4	ERR_RP	0h	R	Read protection error • OTP read to prohibited area • Two or more OTP read operations at the same address in User Area 1 (one-time read area) when the OTREN bit of the OTPOTREN register is set to 1b. When the next OTP Read command starts, this bit is cleared to 0 if none of the above error conditions apply; otherwise, it is not cleared to 0.
3	ERR_WP	0h	R	Write protection error. • OTP Write to write-protected area Set to 1b when writing. When the next OTP Write command starts, this bit is cleared to 0 if none of the above error conditions apply; otherwise, it is not cleared to 0.
2, 1	ERR_WR[1:0]	0h	R	Displays an error when writing OTP. 00b: Pass 01b: Fail A write-prohibited error is displayed. 10b: Fail If writing is not possible for one write command (address and 1 bit of data), a write failure error is displayed. 11b: Invalid Cleared to 0 when the next command starts.

Bit	Bit Name	Initial Value	R/W	Description
0	CMD_RDY	0h	R	Command ready. Indicates the OTP's command receiving status. When CMD_RDY = 1, commands can be received.

4.12.2.2.3 OTP Write Command Start Register (OTPSTAWR)

This register controls the issuing of OTP write commands.

When a write-protected area is set in the OTP write address register (OTPADRWR) and 1 is written to the OTP write command start register (OTPSTAWR), the value of the STAWR bit does not become 1, and OTP write access does not proceed. In this case, the ERR_WP bit in the OTP status register (OTPSTR) will be set.

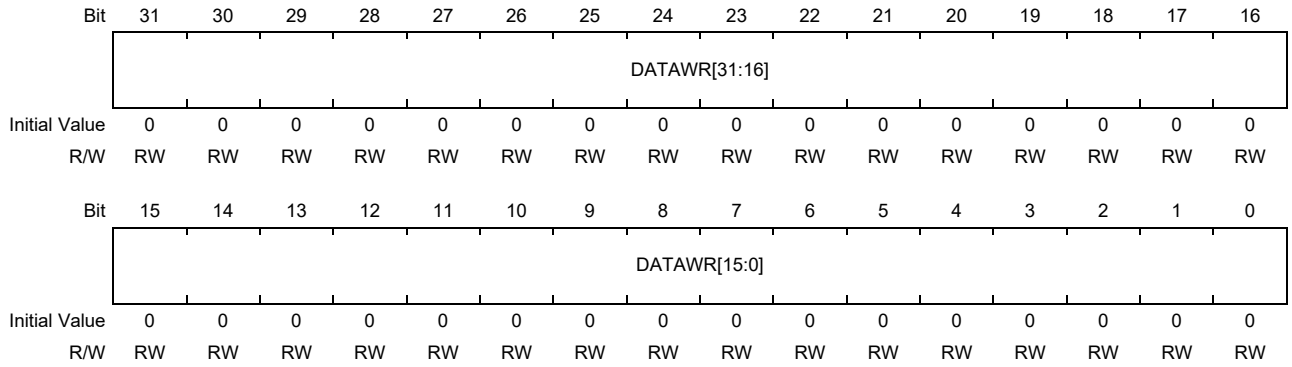
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STAWR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
0	STAWR	0h	RW1	OTP Write start. Only 1b can be written to this bit. Writing 1b to this bit issues an OTP Write command and starts writing data to the OTP. This bit is automatically cleared to 0 after the OTP Write command is completed.

4.12.2.2.4 OTP Write Address Register (OTPADRWR)

This register is for setting the target address when an OTP write command is to be executed.



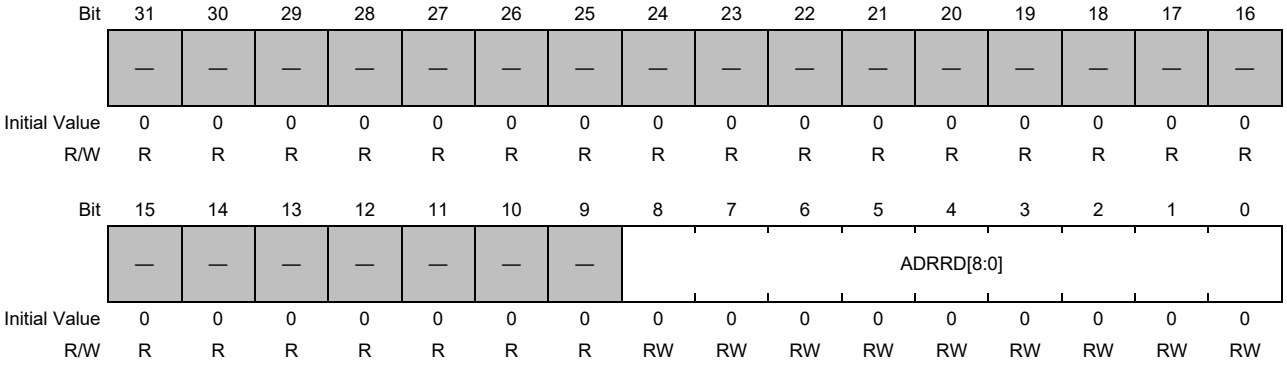
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ADRWR[8:0]								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
8 to 0	ADRWR[8:0]	0h	RW	OTP Write address. Set the OTP address to write in this bit. This address should be the value in word (32-bit) units.

4.12.2.2.5 OTP Write Data Register (OTPDATAWR)

This register is for specifying the data to be written to the target address when an OTP write command is to be executed.

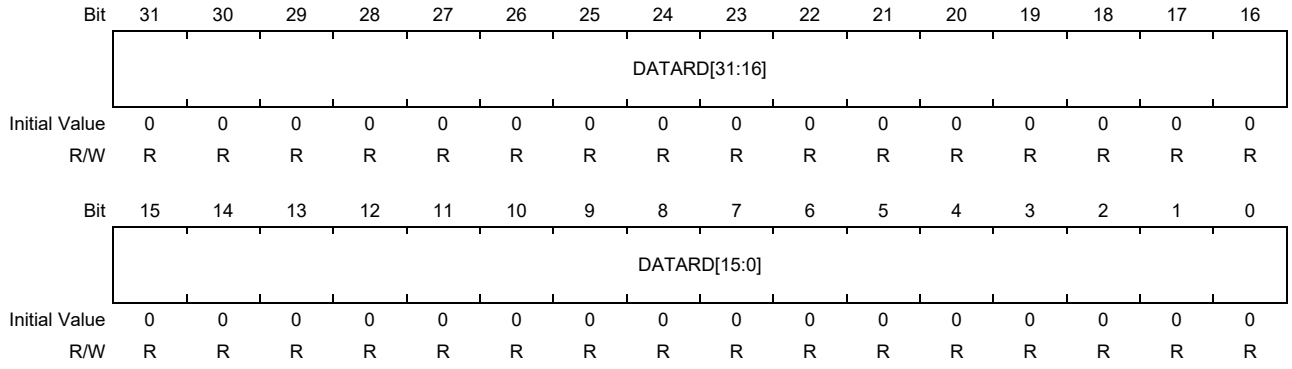


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATAWR [31:0]	0h	RW	OTP Write data. Set the OTP write data in this bit.

4.12.2.2.6 OTP Read Address Register (OTPADRRD)

This register is for setting the target address when an OTP read command is to be executed.

Remark The address is incremented when OTP read access is complete.
In OTP reading, if either of the following conditions are satisfied when reading the OTP read data register (OTPDATARD), OTP read access will not proceed.
— If the address of the OTP read address register (OTPADRRD) is in a read-prohibited area, or
— if the address produced by incrementation during OTP reading is in a read-prohibited area,
OTP read access will not proceed. In these cases, since there is no OTP read access, the address will not be incremented.

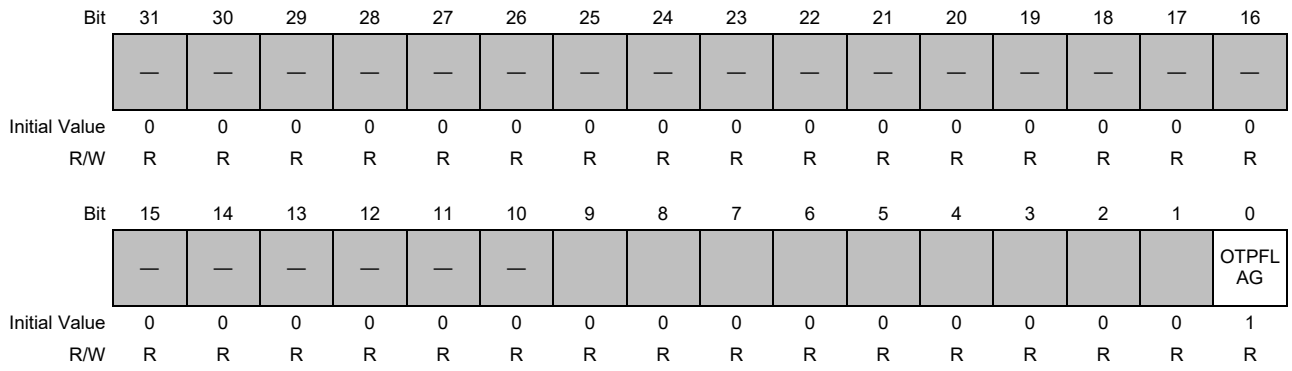


Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
8 to 0	ADRRD[8:0]	0h	RW	OTP Read address. Set the OTP read address in this bit. This address should be the value of WORD (32-bit) units. After reading data from the OTP, this setting's address will be automatically incremented. *Note*: The incremented address can be read by reading.

4.12.2.2.7 OTP Read Data Register (OTPDATARD)

This register holds the data obtained from the OTP by executing an OTP read command.

When reading the OTP read data register (OTPDATARD), if the address in the OTP read address register (OTPADRRD) is in a read-protected area, OTP read access will not proceed. In this case, the ERR_RP bit in the OTP status register (OTPSTR) will be set.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATARD [31:0]	0h	R	OTP Read data. The OTP value specified by the OTP read address is stored in this bit.

4.12.2.2.8 OTP Flag Register (OTPFLAG)

This register reads data from the OTP at startup and indicates whether the OTP power-down setting is complete.

In normal operation, OTPFLAG is read as 1 because it will be read after completion of the setting.

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as 0b. The write value should always be 0b.
0	OTPFLAG	1h	R	Startup initialization process complete Indicates that the OTP boot operation, read, and OTP power-down settings have been completed at LSI startup.

4.12.3 Method of Control

This section describes the method of control for the OTP writing and reading.

For the access address to be specified by the OTP reading and writing and the OTP functions, see **Table 4.12-5**.

The bit assigned for each function in an OTP address is the same as the bit assigned in the state reading register.

In OTP writing, control the writing on the basis of this specification.

4.12.3.1 OTP Write

This section describes the procedure for control in OTP writing.

Writing to OTP (in 32 bits) is executed by setting the address and data, and then setting STAWR in the OTPSTAWR register.

When OTP writing is executed, the hardware automatically executes verification as well. The result (in terms of whether an error did or did not occur) can be checked in the OTPSTR register.

Additional writing to the same address after completion of a write command is disabled.

To have written data reflected in the internal state of the OTP unit, reset the LSI chip after normal completion of an OTP write command.

After setting STAWR in the OTPSTAWR register, the result of judgment can be checked by reading the CMD_RDY and ERR_WR[1:0] bits in the OTPSTR register. The possible results of judgment are listed in **Table 4.12-6**.

Table 4.12-6 Judging the Results of OTP Write Execution

Judgment	CMD_RDY	ERR_WR[1:0]	Description	Response
Normal	1b	00b	Writing and verifying were completed normally.	—
Abnormal	1b	01b	Although an OTP writing has completed, two or more writing operations to the same address were executed.	If an error occurs after setting STAWR in the OTPSTAWR register, the OTP function cannot be used at the given address of the LSI chip.
	0b	01b	While OTP writing was in progress, two or more writing operations to the same address were executed.	
	1b	10b	Although an OTP writing has completed, the OTP writing was not completed normally.	
	0b	10b	While OTP writing was in progress, the OTP writing was not completed normally.	

[Setting example: Writing the value 12345678h to the OTP address 180h]

<1> Supply the OTP internal clocks.
(The default setting is for supply to be enabled.)

<2> Complete the startup initialization process.
PWR of the OTPPWR register (offset address: 0000h) is 0b.
CMD_RDY of the OTPSTR register (offset address: 0004h) is 0b.
OTPFLAG of the OTPFLAG register (offset address: 001Ch) is 1b.

<3> Allow access to OTP from the software.
Set 1b in ACCL of the OTPPWR register (offset address: 0000h).

<4> Power on the OTP.
Set 1b in PWR of the OTPPWR register (offset address: 0000h).

<5> Check whether the execution process can be performed.
Wait until CMD_RDY in the OTPSTR register (offset address: 0004h) changes from 0b to 1b.

<6> Specify the OTP address of the destination for writing.
Set 180h in ADRWR[8:0] of the OTPADRWR register (offset address: 000Ch).

<7> Specify the data for writing.
Set the data for writing (12345678h) in DATAWR[31:0] of the OTPDATAWR register (offset address: 0010h).

<8> Start writing.
Set 1b in STAWR of the OTPSTAWR register (offset address: 0008h). (At the same time, CMD_RDY in the OTPSTR register (offset address: 0004h) is cleared to 0b under hardware control.)

<9> Check the completion of operation (check that access was completed).
Wait until CMD_RDY = 1b in the OTPSTR register (offset address: 0004h).
Wait until STAWR = 0b in the OTPSTAWR register (offset address: 0008h).

<10> Check the completion of operation (check that no errors have occurred).
Check that ERR_WR[1:0] = 00b and ERR_WP = 0b in the OTPSTR register (offset address: 0004h).

<11> To continue OTP writing, repeat steps <6> through <10>.

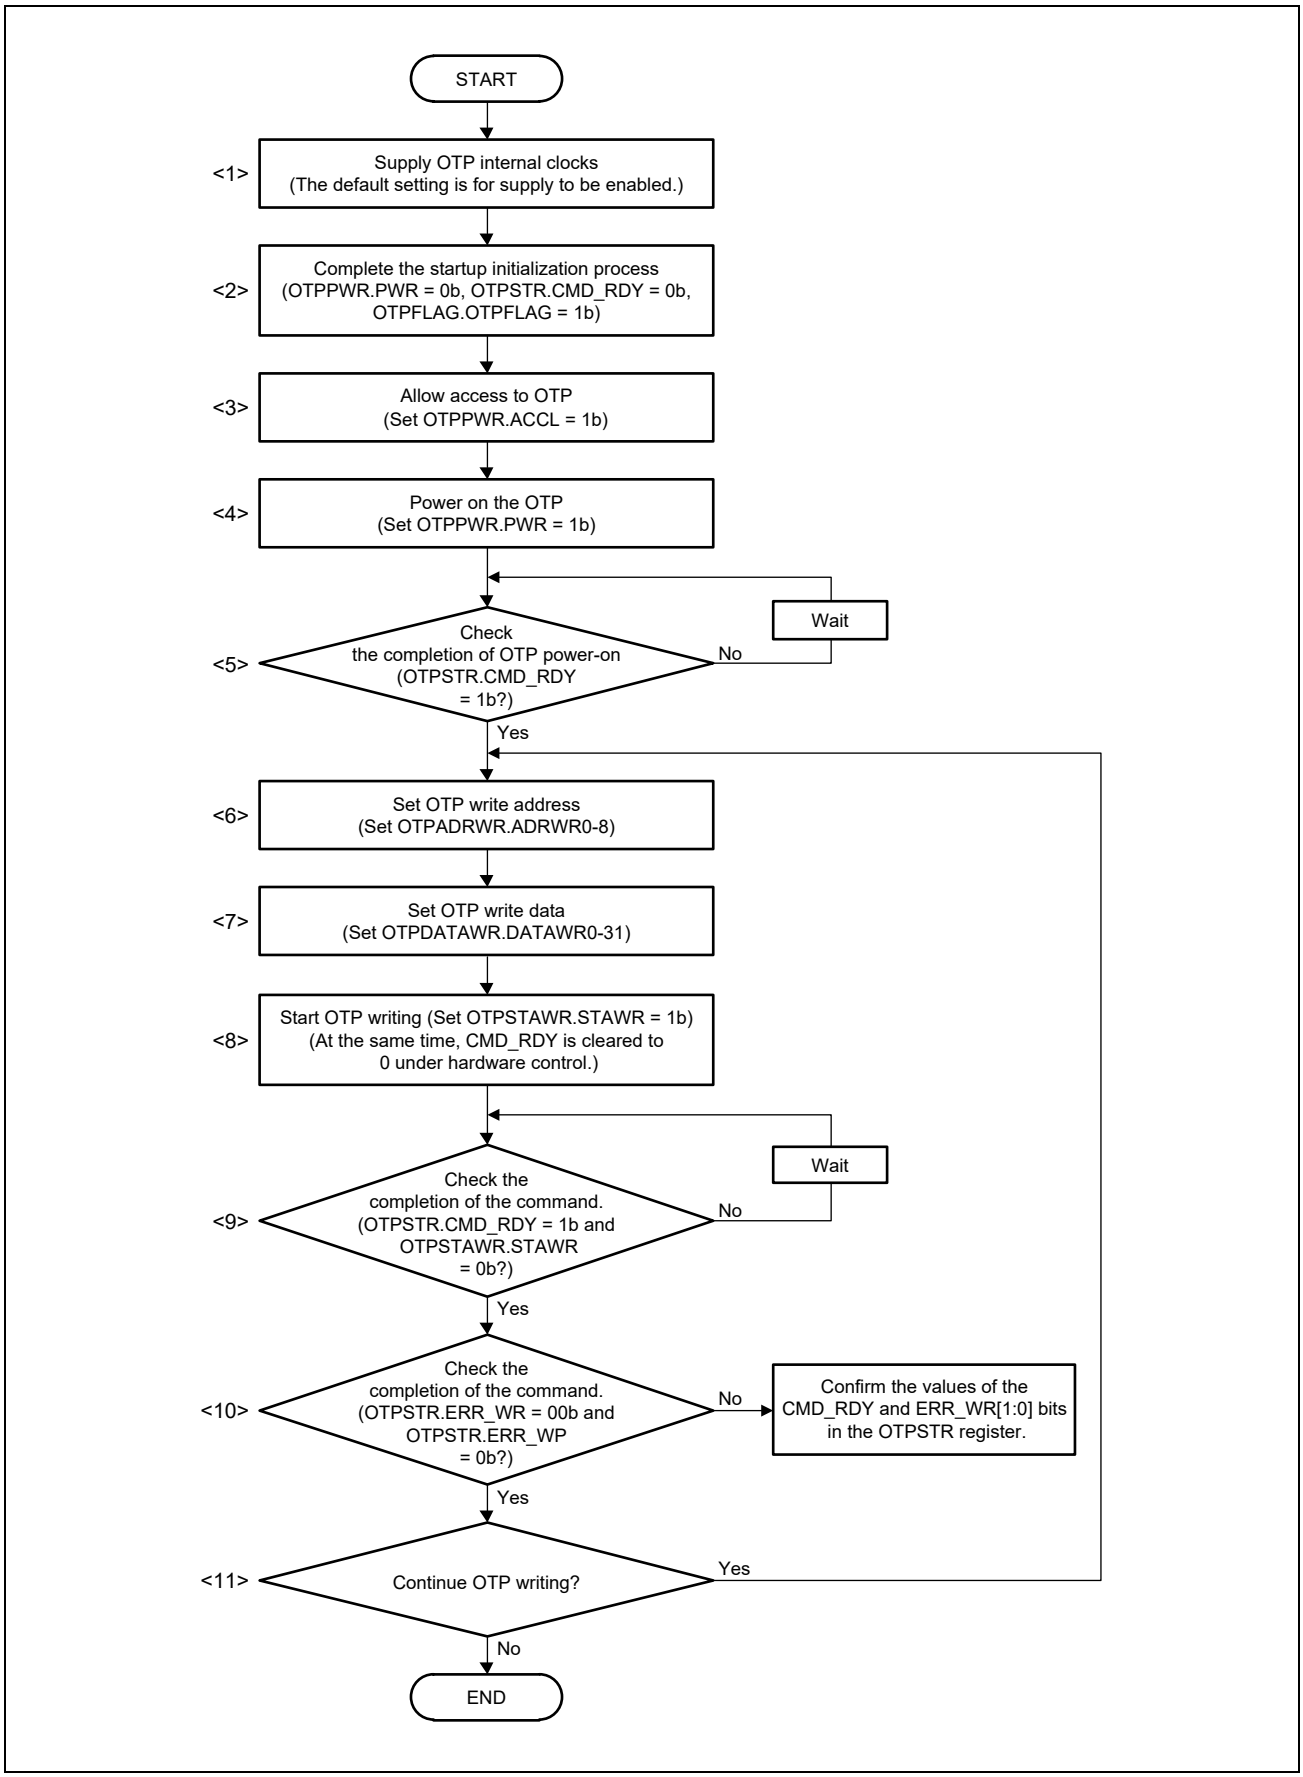


Figure 4.12-2 Flows for an OTP Write Command

4.12.3.2 OTP Read

This section describes the procedure for control in OTP reading.

By setting the address to be read, the OTP data can be obtained from the OTPDATARD register (offset address: 0018h).

[Setting example: Obtaining the data from OTP address 180h]

<1> Supply the OTP internal clocks.
(The default setting is for supply to be enabled.)

<2> Complete the startup initialization process.
PWR in the OTP power configuration register (OTPPWR) is 0.
CMD_RDY in the OTP status register (OTPSTR) is 0.
OTPFLAG in the OTP flag register (OTPFLAG) is 1.

<3> Allow access to OTP from the software.
Set 1b in ACCL of the OTPPWR register (offset address: 0000h).

<4> Power on the OTP.
Set 1b in PWR of the OTPPWR register (offset address: 0000h).

<5> Check the state in terms of executability.
Wait until CMD_RDY in the OTPSTR register (offset address: 0004h) changes from 0b to 1b.

<6> Specify the OTP address of the destination for reading.
Set 180h in ADRRD[8:0] of the OTPADRRD register (offset address: 0014h).

<7> Obtain the read data.
Wait until DATARD[31:0] are obtained from the OTPDATARD register (offset address: 0018h).
Continuing with the OTP writing after the OTP reading has been completed is also possible.

<8> Check that ERR_RP in the OTP status register (OTPSTR) is 0.

<9> To read continuous addresses, repeat steps <7> through <8>.
Because the address of the OTP read address register (OTPADRRD) is automatically incremented, it does not need to be changed.

<10> To read the other addresses , repeat steps <6> through <8>.

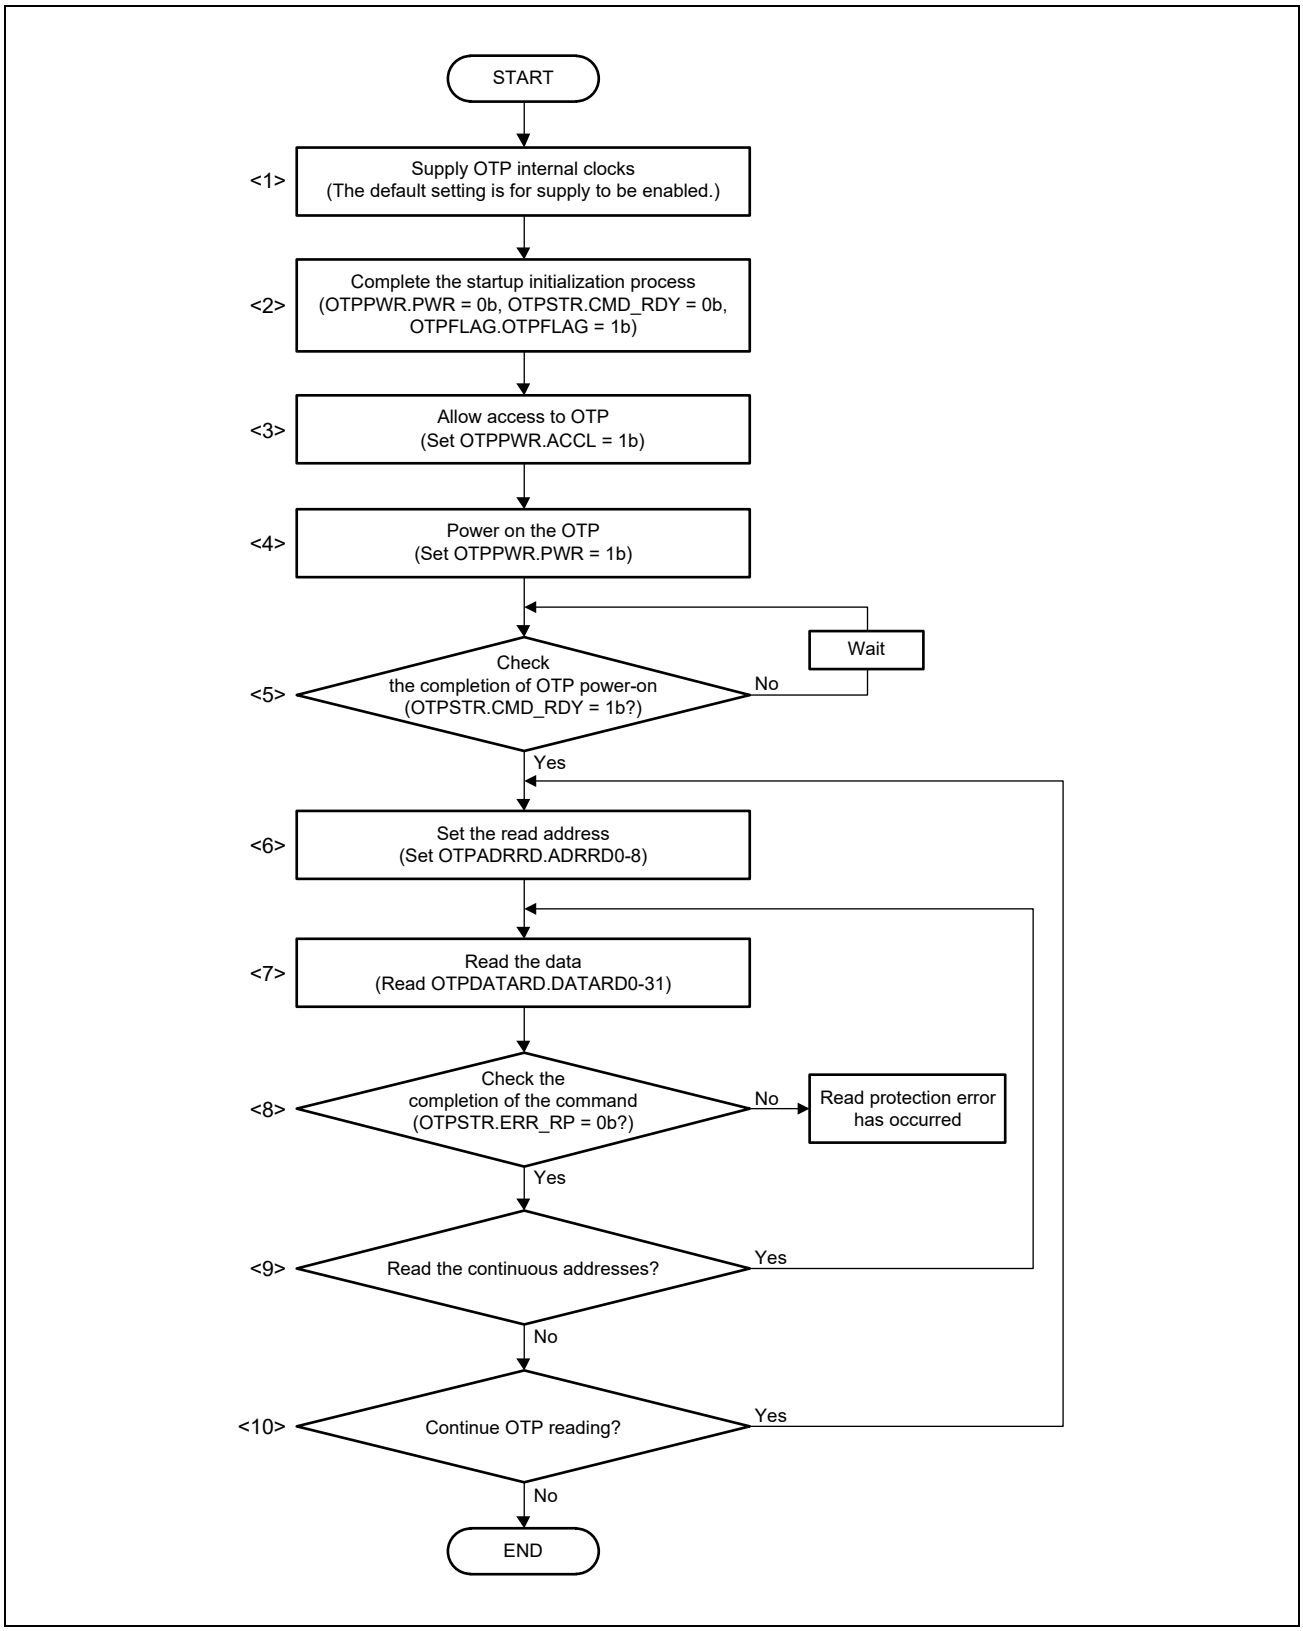

Figure 4.12-3 Flows for an OTP Read Command

4.12.3.3 OTP Stop Control

Apply control as described below to stop controlling to the OTP unit.

<1> If an OTP read is to be executed after power on (PWR = 1b), perform an OTP dummy read to prevent unintended reads.
Set 15Dh in ADRRD[8:0] of the OTPADRRD register (offset address: 0014h).
[15Dh: Dummy Read Area]
If an OTP read is not to be executed after power on (PWR = 1b), it is not necessary to perform an OTP dummy read.

<2> When turning the power off
Set PWR of the OTPPWR register to 0b (offset address: 0000h).
Set ACCL of the OTPPWR register to 0b (offset address: 0000h).

<3> Check that the OTP unit has stopped operating.
Wait until CMD_RDY in the OTPSTR register (offset address: 0004h) changes from 1b to 0b.

SECTION 5 TIMER

5.1 Timer Overview

This sections describes the timer unit of this LSI. For details, refer to the section of each unit.

■ System Counter (SYC) (See 5.2)

SYC provides count values for CA55 and GE3D.

■ Watchdog Timer (WDT) (See 5.4)

This LSI equips 3ch of WDT. Available for CA55 (Non-Secure/Secure), and CM33 respectively.

■ General Timer (GTM) (See 5.5)

This LSI equips 3ch of GTM.

■ General Purpose Timer (GPT) (See 5.7)

This LSI equips 8ch of GPT. This unit can output PWM waveform in PWM mode.

Enabling control of each GPT external pin is possible by using POEG.

■ Port Output Enable for GPT (POEG) (See 5.8)

The output pins of the general PWM timer (GPT) can be disabled by using the port output enabling function for the GPT (POEG).

■ Multi-Function Timer Pulse Unit 3 (MTU3a) (See 5.9)

This LSI has an on-chip multi-function timer pulse unit 3 (MTU3a), consisting of eight 16-bit timer channels and one 32- bit timer channel.

Enabling control of each MTU3a external pin is possible by using POE3.

■ Port Output Enable 3 (POE3) (See 5.10)

The port output enable 3 (POE3) can be used to place output pins for the MTU3a in the high-impedance state in response to various conditions.

SECTION 5 TIMER

5.2 System Counter (SYC)

SYC generates the count value used by the generic timer built into Cortex-A55.

It uses the Timestamp generator, which is one of the components of Arm CoreSight SoC-400, to generate a 64-bit count value. For more information on the Timestamp generator, please refer to the *ARM CoreSight SoC-400 Technical Reference Manual*.

5.2.1 Overview

5.2.1.1 Features

- Count by 24 MHz clock (SYC_CNT_CLK)
- 64 bits gray code counter value generation
  - Convert the value generated by Timestamp generator to Gray code and output
- Access control
  - Access control for the two interfaces of the Timestamp generator
  - Control secure access/non-secure access
- Halt on Debug function
  - Counting can be stopped/restarted during debugging according to request from CoreSight

5.2.1.2 Block Diagram of SYC

The SYC connection diagram is shown in **Figure 5.2-1** and the SYC block diagram is shown in **Figure 5.2-2**.

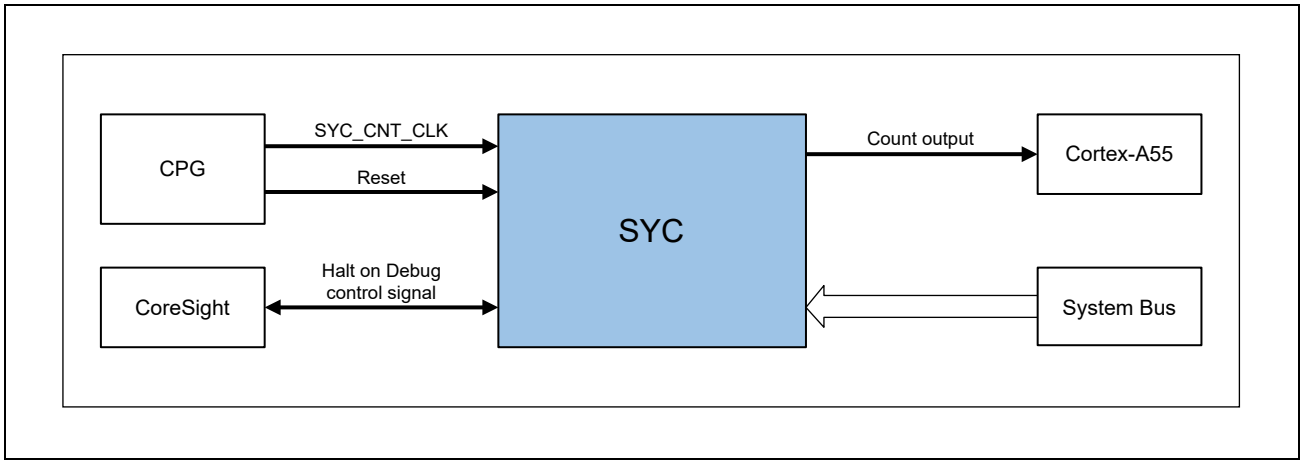

Figure 5.2-1 SYC Connection Diagram

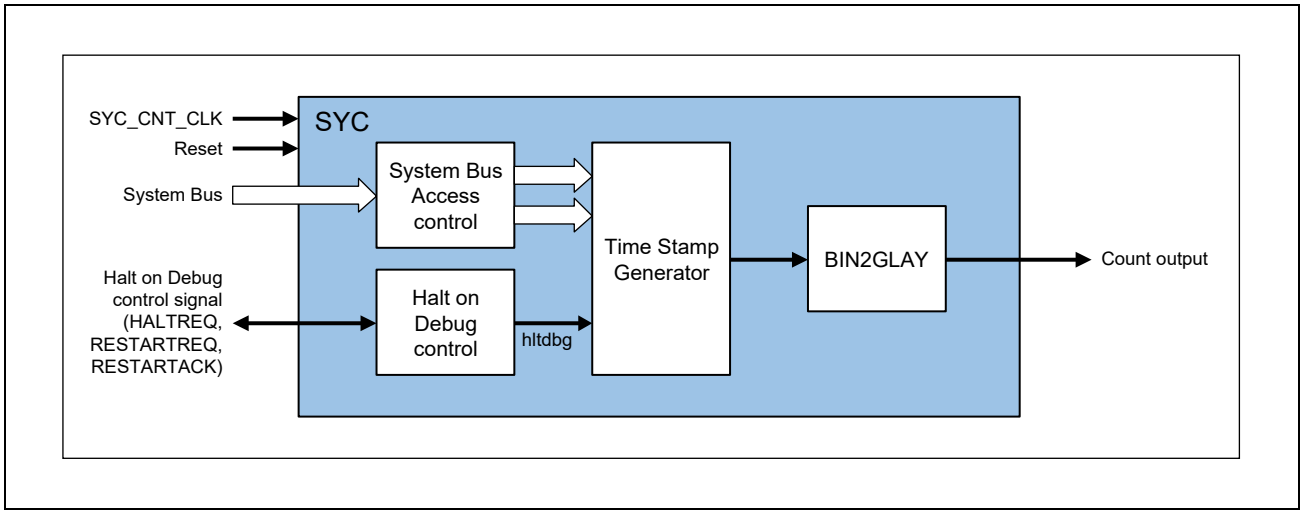

Figure 5.2-2 SYC Block Diagram

5.2.2 Address Space

Table 5.2-1 shows the SYC address space. SYC has an address space of 8 KB. The SYC address space is offset from the base address. The base address of SYC is as follows.

SYC base address: H'0_1100_0000 (Overall Address Space)
SYC base address: H'4100_0000 (Cortex-M33 Address Space Secure)
SYC base address: H'5100_0000 (Cortex-M33 Address Space Non-Secure)

Table 5.2-1 SYC Address Space

Offset Address	Region Name	Access Target
H'0000 to H'0FFF	PSELCTRL region	PSELCTRL region & PSELCTRL region Management registers
H'1000 to H'1FFF	PSELREAD region	PSELREAD region & PSELREAD region Management registers

Note: Secure access and non-secure access are possible for the PSELCTRL region and PSELREAD region.

5.2.3 Register Descriptions

For more information on SYC registers, please refer to the *ARM CoreSight SoC-400 Technical Reference Manual 3.10 Timestamp generator*.

5.2.4 Operation

5.2.4.1 System Bus Access Control

Access control from one system bus interface of SYC to two APB interfaces of Timestamp Generator is performed.

Controls so that the PSELCTRL area can be accessed when accessing the first half 4 KB of the 8 KB address area of SYC, and the PSELREAD area can be accessed when accessing the latter 4 KB.

The PSELCTRL area and PSELREAD area accept secure access and non-secure access.

5.2.4.2 Halt on Debug Function

SYC supports the Halt on Debug function included in Timestamp Generator. When HALTREQ is asserted from CoreSight, the counting operation of Timestamp Generator is stopped.

When RESTARTREQ is asserted from CoreSight, the counting operation of Timestamp Generator is restarted.

HALTREQ and RESTARTREQ are controlled by CoreSight's CTI (Cross Trigger Interface).

SECTION 5 TIMER

5.4 Watchdog Timer (WDT)

This LSI has 3 channels of watchdog timer as **Table 5.4-1** and generates a reset request signal when the counter value is not rewritten and overflows due to system runaway.

Table 5.4-1 WDT Channels

Channel	Functions
WDT CH0	WDT to check the operation of Cortex-A55-CPU Non-Secure
WDT CH1	WDT to check the operation of Cortex-A55 CPU Secure
WDT CH2	WDT to check the operation of Cortex-M33 CPU

Also, a reset request signal or interrupt signal can be generated by inputting a parity error signal due to a parity error in the CPU of this LSI.

5.4.1 Features

All WDT modules have the following functions implemented in common as basic WDT functions.

5.4.1.1 Normal Watchdog Timer Function

- Bus interface: Compatible with AMBA® 2.0 APB.
- Operating frequency: Bus interface 100 [MHz], counter control 24 [MHz]
- The counter operation and the bus interface are asynchronous and can operate without depending on the size relationship of the clock cycles of each other.
- A 32-bit counter that operates with the clock (WDTn_CLK (n = 0, 1, 2)) input to this module.
- An interrupt request signal is generated every cycle set in the counter of this module.
- When WDTn_CLK (n = 0, 1, 2) = 24 MHz, the counter cycle can be set in 43.69 msec unit from 43.69 msec to 178956.97 msec.
- After the interrupt request signal is generated, if the software does not clear the watchdog timer until the next counter overflow, the reset request signal is generated.
- The set value of each register and the Elapsed time of the watchdog timer can be read.

5.4.1.2 Reset Request Function due to CPU Parity Error

- A reset request signal (WDTRSTB) or interrupt signal (PERROUT) is generated by inputting a parity error signal.
- The reset request signal is generated as the OR of the reset request of this module and the reset request of the parity error circuit.
- The polarity of the parity error signal can be set with this module.
- Function can be turned ON/OFF for each 32-bit parity error signal.
- The output of the reset request signal and the interrupt signal can be switched by inputting the parity error signal.
- It is possible to force a parity error to occur by register setting.

5.4.1.3 Internal Block Diagram

Figure 5.4-1 shows the internal block of WDT. WDT consists of a WDT-CORE part that implements the function of a normal watchdog timer and a part that detects a parity error.

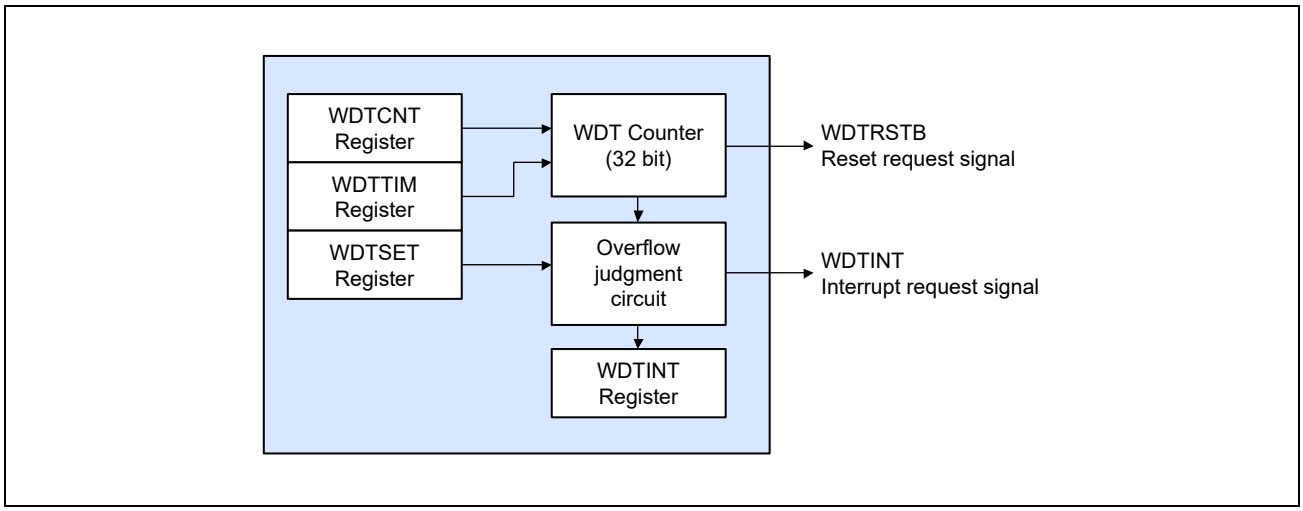

Figure 5.4-1 WDT_CORE Internal Block

In addition to the above WDT-Core function, WDT receives a parity error interrupt signal generated by the CPU when a Parity Error occurs in the CPU monitored by WDT and generates a reset request signal or interrupt request signal.

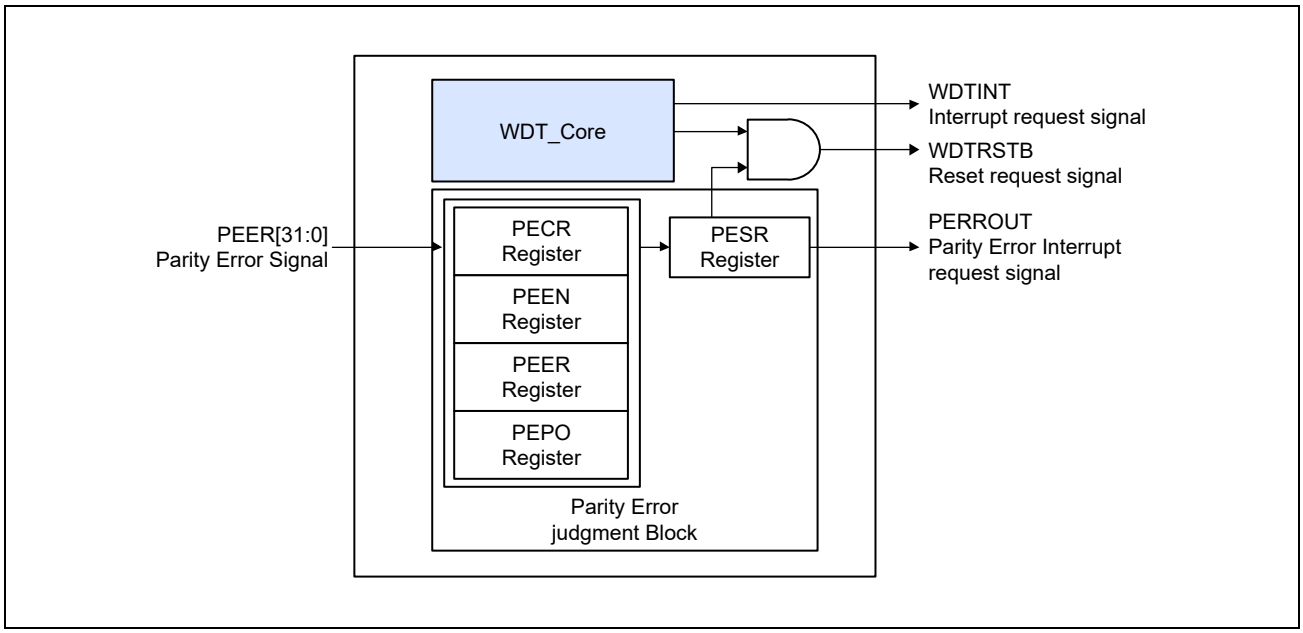

Figure 5.4-2 WDT_CORE and Parity Error Handling Block

5.4.1.4 Input/Output Pin

Table 5.4-2 shows the pin configuration.

Table 5.4-2 Pin Configuration

Item	Pin Name	Signal Name in This Section	Input/Output	Functional Description
Watchdog timer overflow/ CPU parity error	WDT_OVF_PERROUT#	WDTOVF_PERROUT#	Output	Watchdog timer counter overflow signal output/ Interrupt signal output when CPU parity error occurs

5.4.2 Register Configuration

Table 5.4-3 shows the base address for each WDT channel.

Table 5.4-3 Base Address for Each WDT Channel

Address Space	Channel	WDT Function	Base Address
Cortex-A55 Address Space	WDT CH0	WDT to check the operation of Cortex-A55-CPU Non-Secure	H'0_1280_0800
	WDT CH1	WDT to check the operation of Cortex-A55 CPU Secure	H'0_1280_0400
	WDT CH2	WDT to check the operation of Cortex-M33 CPU	H'0_1280_0000
Cortex-M33 Address Space Secure	WDT CH0	WDT to check the operation of Cortex-A55-CPU Non-Secure	H'4280_0800
	WDT CH1	WDT to check the operation of Cortex-A55 CPU Secure	H'4280_0400
	WDT CH2	WDT to check the operation of Cortex-M33 CPU	H'4280_0000
Cortex-M33 Address Space Non-Secure	WDT CH0	WDT to check the operation of Cortex-A55-CPU Non-Secure	H'5280_0800
	WDT CH1	WDT to check the operation of Cortex-A55 CPU Secure	H'5280_0400
	WDT CH2	WDT to check the operation of Cortex-M33 CPU	H'5280_0000

Table 5.4-4 shows WDT Register Configuration on all WDT Channels.

Table 5.4-4 WDT Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size

	Party Status Register_2	PESR_2	R/W	H'0000_0000	H'0018	32
	Parity Error Enable Register_2	PEER_2	R/W	H'0000_0000	H'001C	32
	Parity Error Polarity setting Register_2	PEPO_2	R/W	H'0000_0000	H'0020	32

5.4.3 Register Descriptions

5.4.3.1 WDT Control Register_n (WDTCNT_n) (n = 0, 1, 2)

This register sets the operation enable of the watchdog timer function. Once the software activates the watchdog timer, the watchdog timer does not stop*1 until it is reset. Also, the setting register*2 of the watchdog timer cannot be changed. The setting register change must be completed*3 before enabling the watchdog timer operation.

Note 1. For debugging, the internal counter can be paused with the CNTSTOP signal.

Note 2. WDT cycle setting register (WDTSET) and WDT Elapsed time register (WDTTIM)

Note 3. When changing the setting register, wait until the write data value of the setting register is reflected before enabling the watchdog timer operation. The reflection time of the setting register is 6 × P0ϕ + 9 × OSCCLK or more. If this reflection time is not observed, the setting register value will not be reflected and will be ignored.

0	WDTEN	0	R/W	Watchdog timer enable register 1: Watchdog timer operation enabled 0: Disabled

5.4.3.2 WDT Period Setting Register_n (WDTSET_n) (n = 0, 1, 2)

This register is used to set the cycle of the 32-bit counter that composes the watchdog timer. Writing is not possible while the watchdog timer is running. If you write continuously, the data written later will be valid. Calculate the watchdog timer cycle using the following formula.

$$\text{Watchdog timer cycle} = \text{WDTn_CLK (n} = 0, 1, 2\text{) cycle} \times 1024 \times 1024 \times (\text{WDTTIME setting value} + 1)$$

$$\text{WDTTIME setting value} = \frac{\text{WDT cycle}}{(\text{WDTn_CLK (n} = 0, 1, 2\text{) cycle} \times 1024 \times 1024)} - 1$$

For example, WDTn_CLK (n = 0, 1, 2) = 24 MHz, the counter cycle can be set in 43.69 msec unit from 43.69 msec to 178956.97 msec.

It can be set in units. The setting value of WDTTIME is the value set in WDTSET[31:20], and the value from H'000 to H'FFF can be set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WDTTIME11	WDTTIME10	WDTTIME9	WDTTIME8	WDTTIME7	WDTTIME6	WDTTIME5	WDTTIME4	WDTTIME3	WDTTIME2	WDTTIME1	WDTTIME0	—	—	—	—
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	WDTTIME [11:0]	All 1	R/W	Watchdog timer period cycle setting It cannot be written while the watchdog timer is running.
19 to 0	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.

CAUTION

The value that the watchdog timer compares when an interrupt occurs is "WDTSET[31:0] + H'000F_FFFF". Therefore, when the setting value of this register is H'0010_0000, the interrupt occurrence count is "H'001F_FFFF" (not H'0010_0000).

5.4.3.3 WDT Elapsed Time Register_n (WDTTIM_n (n = 0, 1, 2))

This register indicates the 32-bit count value that composes the watchdog timer. If the watchdog timer is read during operation, the Elapsed time from the time it is cleared to the time of reading can be read.

By writing to this register when the watchdog timer is stopped, the value at the start of counting can be set in the 32-bit counter that configures the watchdog timer. When a value larger than the counter cycle (value when clearing) set in the WDT cycle setting register is written and the watchdog timer operation is started, the 32-bit counter once overflows and returns to 0. It operates at the set correct cycle.

You cannot write while the watchdog timer is running. If you write continuously, the data written later will be valid.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTTIME [31:0]	All 0	R/W	Watchdog timer count value. It cannot be written while the watchdog timer is running.

CAUTION

When setting a value in the WDTTIM register, do not set a value that is WDTSET[31:0] register + H'000F_FFFF.

5.4.3.4 WDT Interrupt Control Register_n (WDTINT_n (n = 0, 1, 2))

This register reads the interrupt status of the watchdog timer, clears interrupts, and clears the counters that compose the watchdog timer. Set the INTDISP bit of this register to “1” within the time set by WDTSET. If not set, the WDTINT pin is asserted. After that, within the time set by WDTSET

When the INTDISP bit is not set to “1”, the WDTRSTB pin is asserted.

When performing continuous write access to the WDTINT register, leave a write interval of 5 × P0ϕ + 5 × OSCCLK or more. If the write interval is not observed, the register will not be written.

5.4.3.10 Register Setting Order for Each WDT Channel

The following shows the register setting sequence for controlling the watchdog timer and parity error circuit of each channel. The control of the original watchdog timer and the parity error circuit do not affect each other, so there is no restriction on the setting order in the following diagrams (1) and (2).

The parity error circuit cannot accept the parity error that occurred before setting PEER = 1. When rewriting PEEN from 0 to 1, it is possible to rewrite at any timing. However, when rewriting PEEN from 1 to 0, once PEER = 0 and (2) flow execution is required.

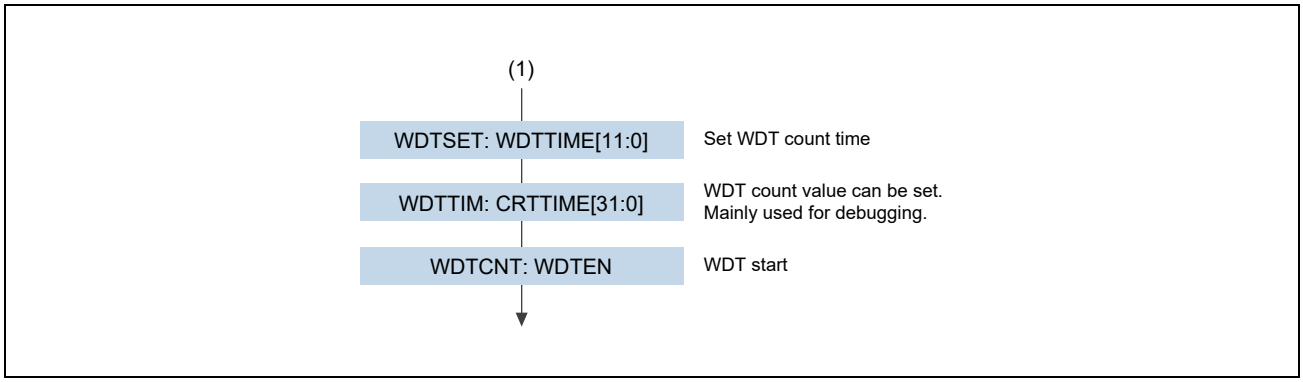

Figure 5.4-3 WDT Register Setting Order

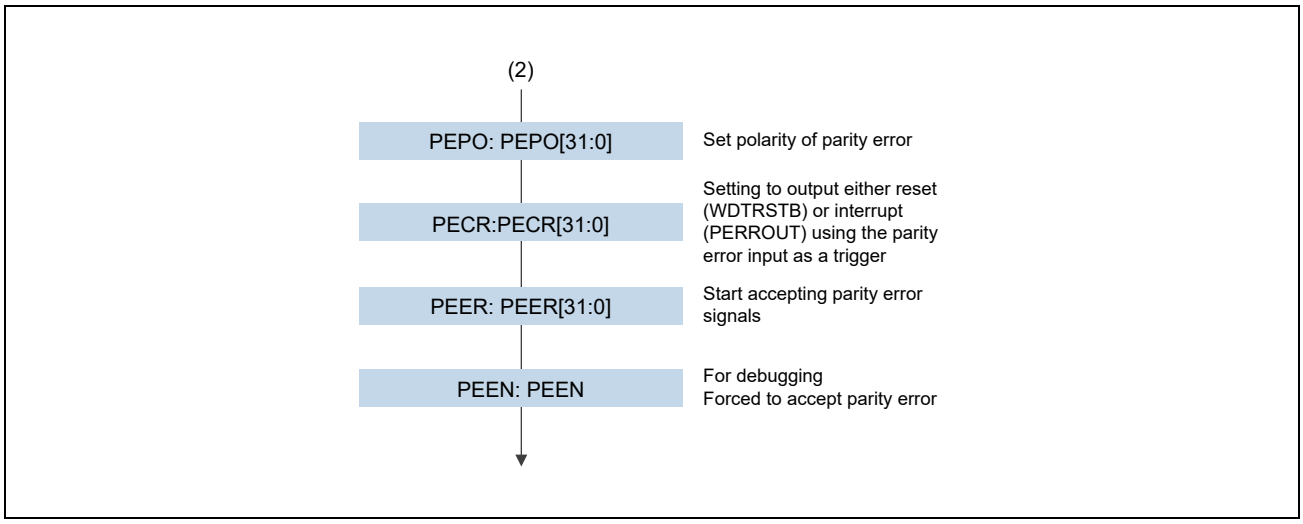

Figure 5.4-4 Parity Error Circuit Register Setting Order

5.4.4 Operation

5.4.4.1 WDT_CORE Operaton Timing

Figure 5.4-5 shows the operation diagram of the WDT-Core block. When 1 is set in Bit [0] of the WDTCNT register, the 32-bit internal counter WDT-Counter starts counting. If the counter value matches the value set in the WDTSET register, the counter becomes overflow, clears the counter to 0, and then generates an interrupt request signal.

An interrupt signal is output at the first counter overflow, and a reset request signal is output if the counter is not cleared and the second counter overflow occurs.

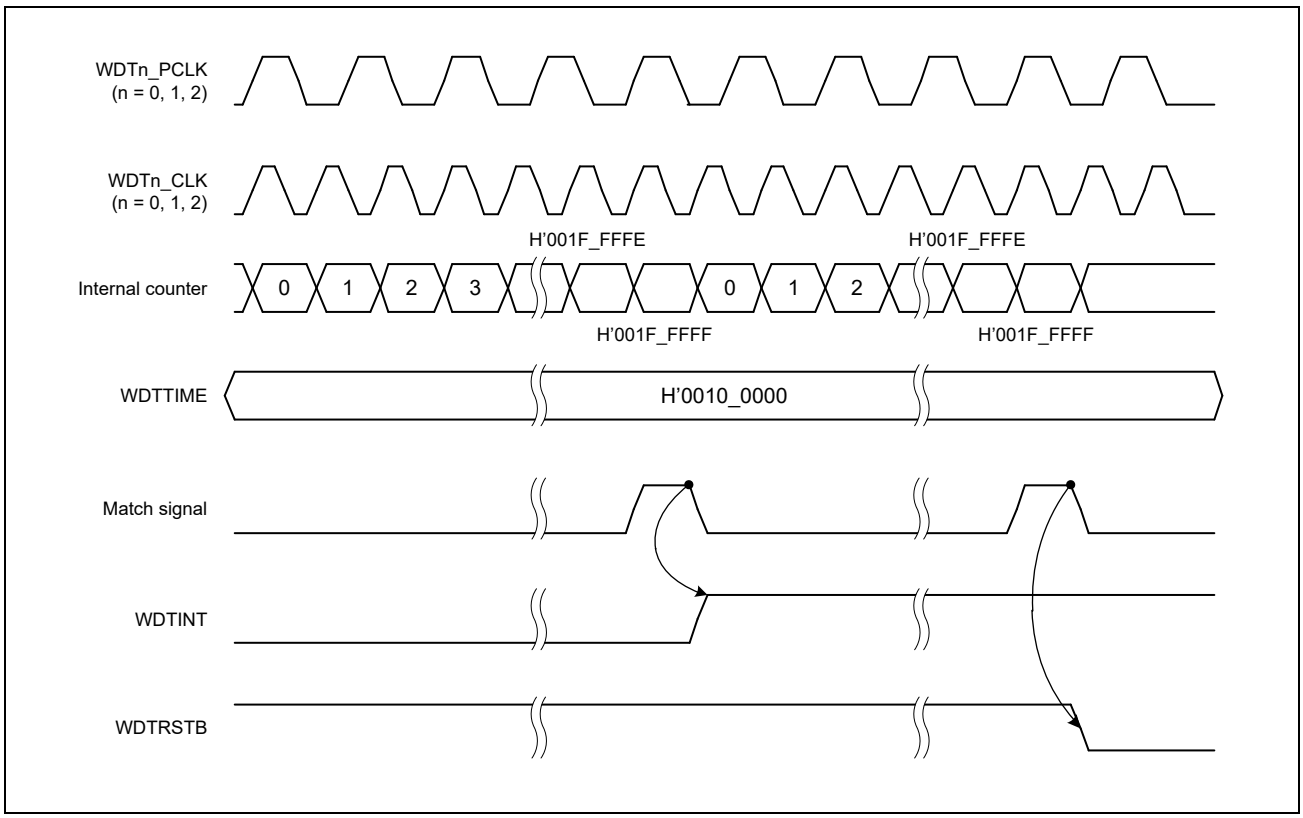

Figure 5.4-5 WDT Output Signal Operation Timing

5.4.4.2 WDT Interrupt Control Register (WDTINT) Specification for Write Access Interval

After the write access to the WDT interrupt control register is completed, the written data is synchronized with WDTn_CLK (n = 0, 1, 2), so a synchronization period is required. When performing write access to the WDTINT register, it is necessary to leave a write interval of 5 × P0ϕ + 5 × OSCCLK or more between the next write access.*1

Note 1. If the write interval is not observed, the interrupt request may not be cleared.
In this case, after making a write access and confirming that the interrupt factor has been cleared, perform the following write access.

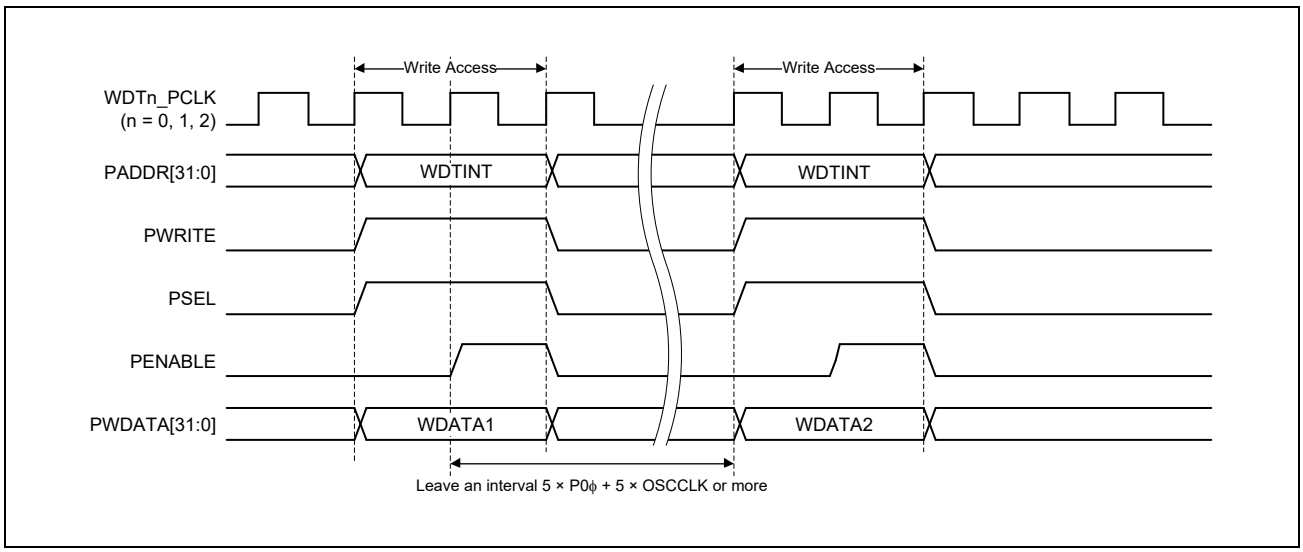

Figure 5.4-6 WDTINT Write Access Interval Regulation

5.4.4.3 Watchdog Timer Operation Reflection Timing of Register Setting Value

Each register other than the WDT interrupt control register (WDTINT) is always synchronized with WDTn_CLK (n = 0, 1, 2) at regular intervals. The timing at which the written data is reflected in the watchdog timer operation is in the range of small 2 × P0ϕ + 4 × OSCCLK) to large value (6 × P0ϕ +9 × OSCCLK).

Figure 5.4-7 (Watchdog timer operation reflection timing 1 of register setting value) shows how write data is small and synchronized.

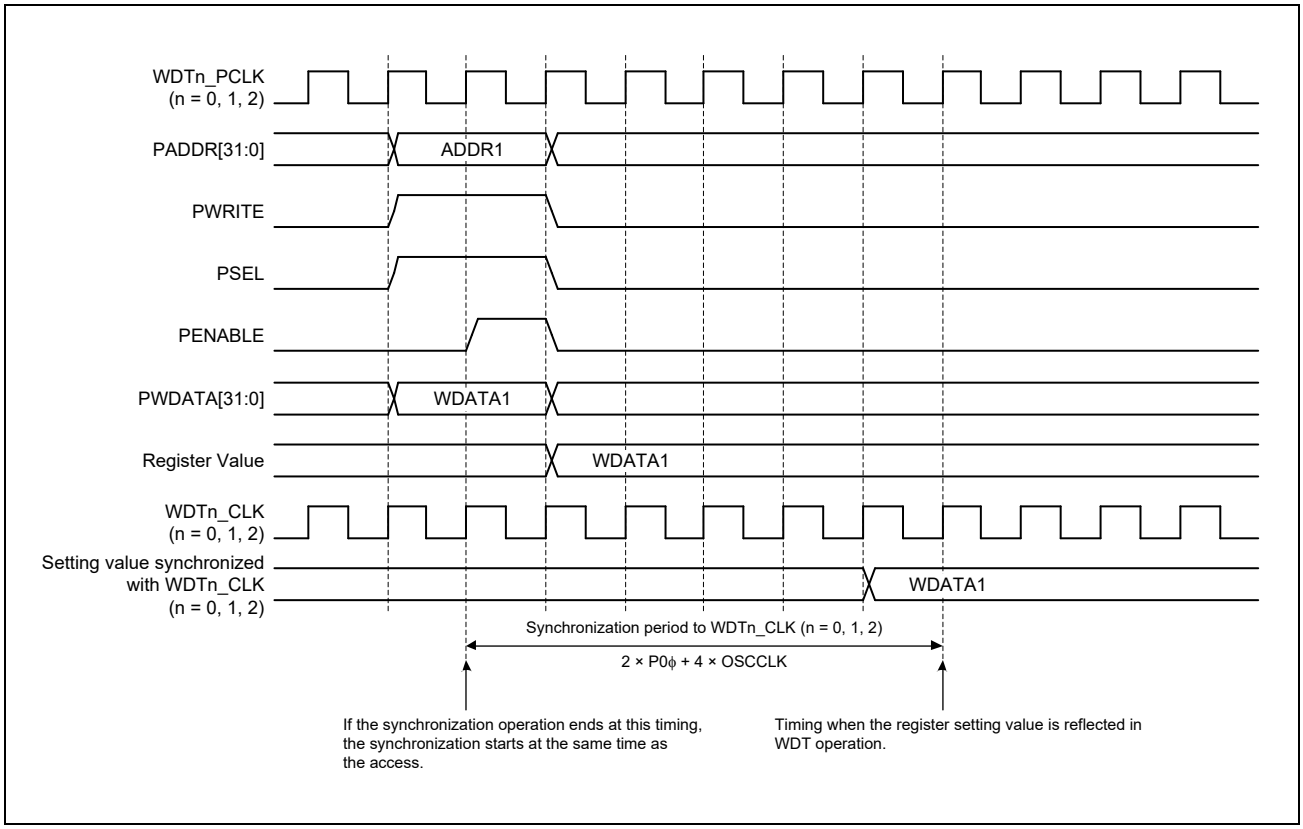

Figure 5.4-7 Watchdog Timer Operation Reflection Timing of Register Setting Value - 1

In addition, **Figure 5.4-8** (Watchdog timer operation reflection timing 2 of register setting value) shows how write data is large and synchronized.

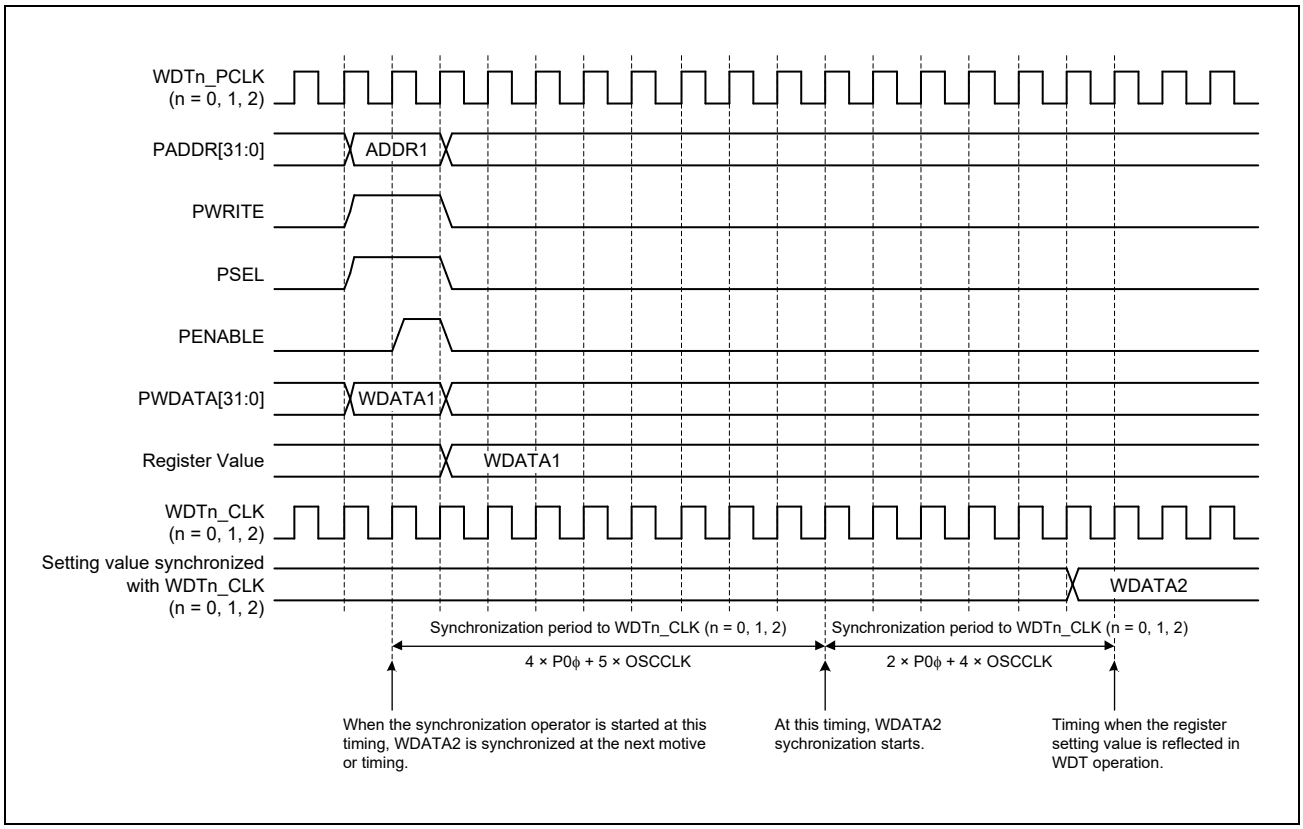

Figure 5.4-8 Watchdog Timer Operation Reflection Timing of Register Setting Value - 2

5.4.4.4 Timing of Reflecting WDT Counter Value to WDTTIM Register

The value stored in the WDTTIM register is the value obtained by synchronizing the counter value with P0φ. Therefore, the interval at which the value is updated in the WDTTIM register is 5 × OSCCLK+5 × P0ϕ at most, and the value before the actual counter value is read.

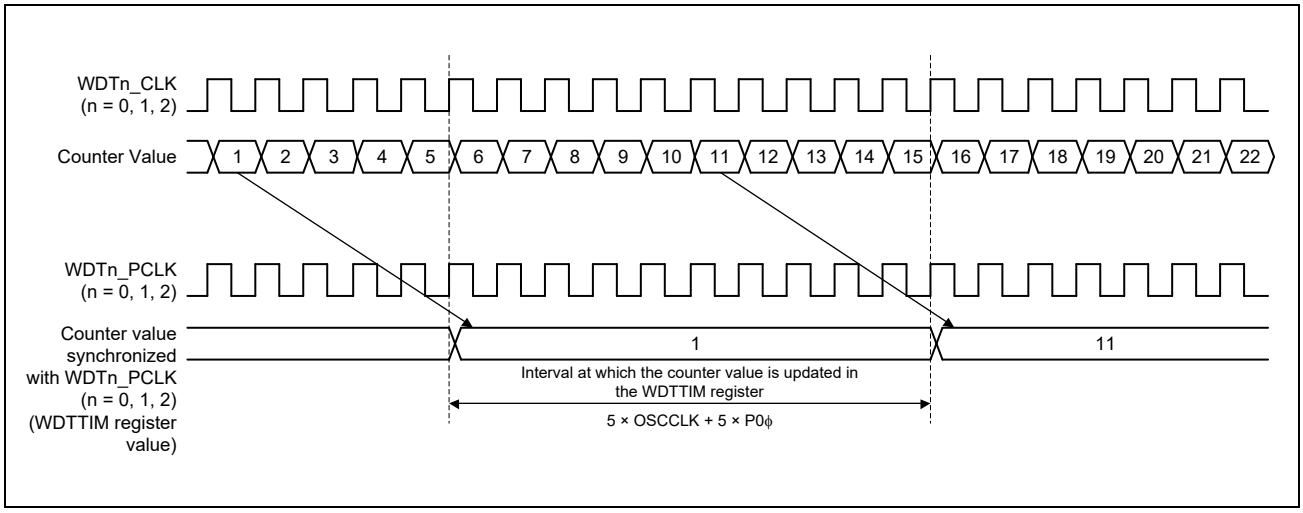

Figure 5.4-9 Timing of Reflecting the Counter Value to the WDTTIM Register

5.4.4.5 Conditions Under which WDTRSTB and PERROUT Operate

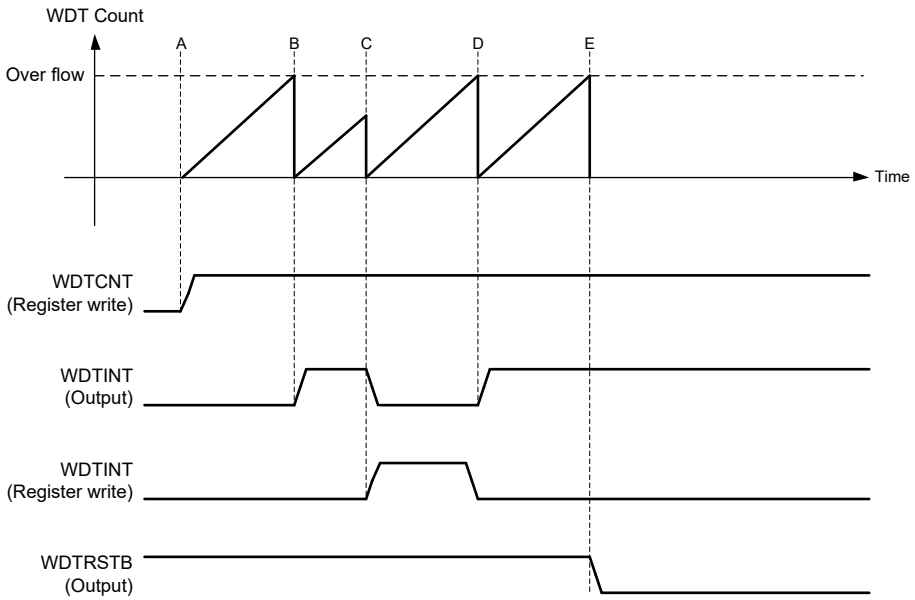

Table 5.4-5 shows the conditions under which WDTRSTB and PERROUT operate.

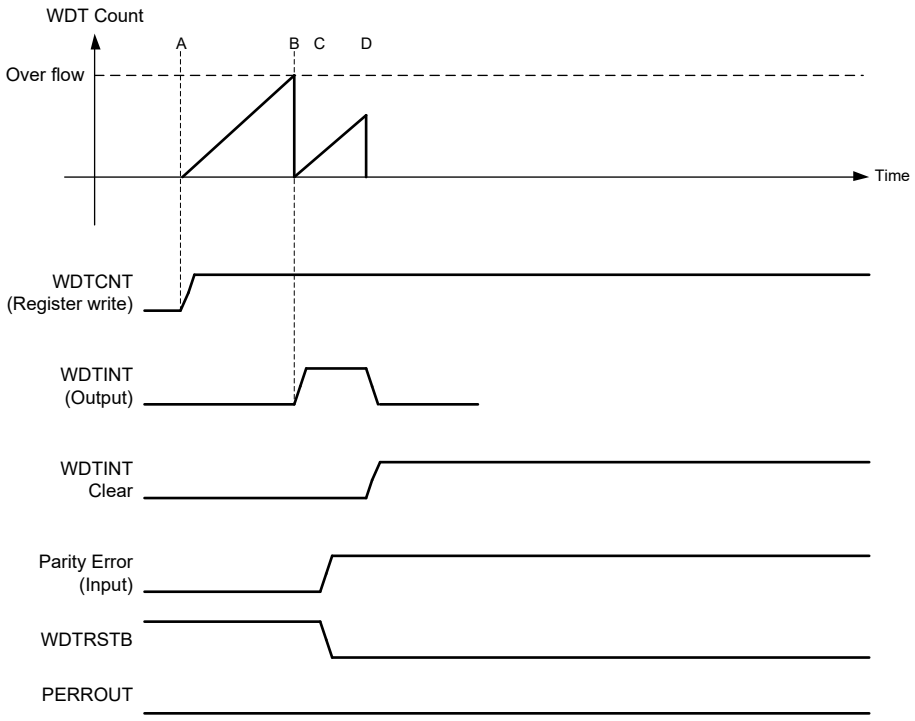
When PEER = 0, WDTRSTB follows the watchdog timer operation described in **Section 5.4.4.1** to **Section 5.4.4.5** regardless of the occurrence of parity error. PERROUT holds 0. (No. 1, No. 2) No. 3 to No. 6 show the operating conditions when the parity error input is enabled by PEER = 1. When a parity error occurs (No. 3, No. 4), PESR holds the error status, and WDTRSTB or PERROUT is asserted depending on the value of PECR. If no parity error occurs, PESR = 0, WDTRSTB propagates the WDT-Core logic, and PERROUT is in the unasserted state. (No. 5, No. 6) When PEEN = 1 forces a parity error to occur, WDTRSTB or PERROUT is asserted depending on the PECR value regardless of the parity error.

Table 5.4-5 WDTRSTB/PERROUT Operating Conditions

No.	PEERR	PEPO	PEER	PEEN	PECR	PESR	WDTRSTB	PERROUT
1	X	1/0	0	0	0	0 (Fixed)	Original WDT	0: de-assert
2		1/0	0	0	1	0 (Fixed)	Original WDT	0: de-assert
3	With parity	1/0	1	0	0	1	0: assert	0: de-assert
4		1/0	1	0	1	1	Original WDT	1: assert
5	No parity	1/0	1	0	0	0	Original WDT	0: de-assert
6		1/0	1	0	1	0	Original WDT	0: de-assert
7	X	X	X	1	0	X	0: assert	0: de-assert
8		X	X	1	1	X	Original WDT	1: assert

The timing waveforms for No. 1 to No. 4 in **Table 5.4-5** are shown below.

Note: A) Set WDTCNT = 1 to start WDT counting.



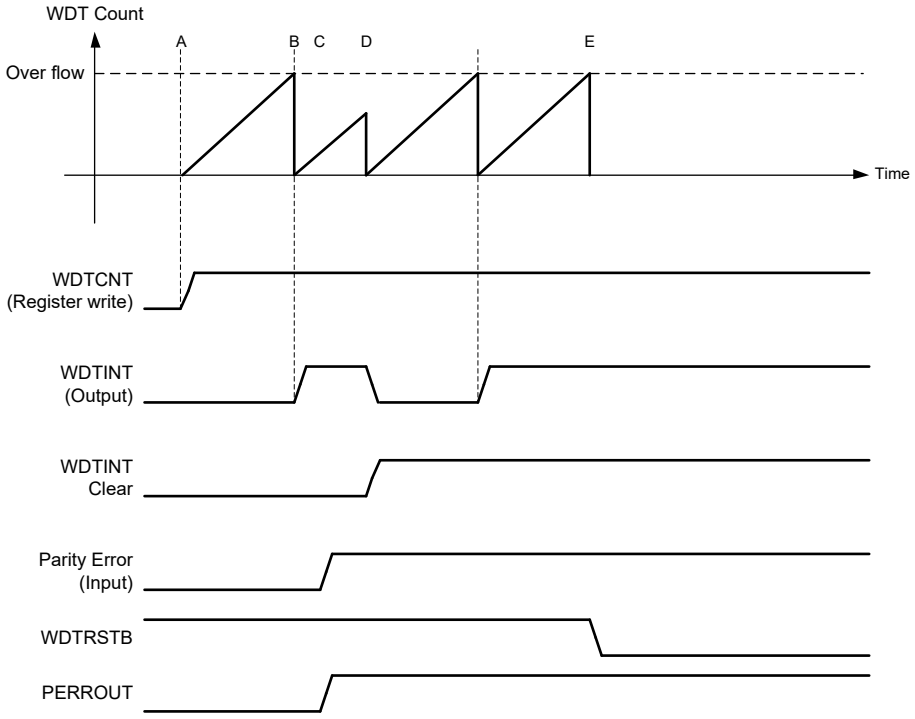
B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) If WDTINT (INTDISP) = 1 is written before the WDT count overflows, the interrupt request is cleared and the WDT count becomes zero.

D) Again, the interrupt request signal is asserted at the first overflow.

E) When the WDT count overflows for the second time, WDTRSTB is asserted.

Figure 5.4-10 Normal Watchdog Timer Operation No. 1/No. 2



Note: A) Set WDTCNT = 1 to start WDT counting.

B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) When a parity error occurs, WDTRSTB = 0. At the same time, hold PERROUT = 0.

D) Even if WDT Count is reset by WDTINT = 1, WDTRSTB = 0 and PERROUT = 0 are retained.

Figure 5.4-11 Watchdog Timer Operation when a Parity Error Signal Occurs No. 3

Note: A) Set WDTCNT = 1 to start WDT counting.

B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) When a parity error occurs, WDTRSTB = 1. At the same time, hold PERROUT = 1.

D) Even if WDT Count is reset by WDTINT = 1, WDTRSTB = 1 and PERROUT = 1 are retained.

E) WDTRSTB = 0 is asserted due to WDT Count overflow.

Figure 5.4-12 Watchdog Timer Operation when a Parity Error Signal Occurs No. 4

5.4.5 Reset Control

5.4.5.1 WDTRST Control of Each WDT Channels

WDT CH0 generates WDTINT every cycle set in WDTSET. The CPU (Cortex-A55 Non-Secure) receives the WDT CH0 interrupt signal WDTINT, clears the WDT CH0 counter at regular intervals, and suppresses the overflow of the WDT counter.

WDT CH1 generates WDTINT every cycle set in WDTSET. The CPU (Cortex-A55 Secure) receives the WDT CH1 interrupt signal WDTINT and clears the WDT CH1 counter at regular intervals to suppress the overflow of the WDT counter.

WDT CH2 generates WDTINT every cycle set in WDTSET. The CPU (Cortex-M33) receives the WDT CH2 interrupt signal WDTINT and clears the WDT CH2 counter at regular intervals to prevent the WDT counter from overflowing.

If the counter is not cleared before the cycle set for each WDT elapses, the uncleared WDT sends a reset request signal to the CPG. Based on the setting of the built-in register CPG_WDTRST_SEL, CPG can select whether to reset only the CPU corresponding to the WDT that caused the reset from the WDT reset request signal from each channel, or to reset the entire system. is. You can also choose whether to assert the WDTOVF_PERROUT# pin to notify the outside world that the entire system has been reset.

(For details about CPG_WDTRST_SEL register in CPG, refer to the CPG chapter.)

Table 5.4-6 WDT Reset Target by CPG_WDTRST_SEL Register

Bit	Initial Value	R/W	Reset Factor	Function
CPG_WDTRST_SEL[0]	0	R/W	WDT CH0 (CA55 Non-Secure)	When the target WDT executes a reset request due to overflow etc. 0: Mask system reset assert. 1: System reset assert.
CPG_WDTRST_SEL[1]	0	R/W	WDT CH1 (CA55 Secure)	
CPG_WDTRST_SEL[2]	0	R/W	WDT CH2 (CM33)	
CPG_WDTRST_SEL[4]	0	R/W	WDT CH0 (CA55 Non -Secure)	When the target WDT executes a reset request due to overflow etc. 0: Mask WDTOVF_PERROUT assert. 1: WDTOVF_PERROUT assert.
CPG_WDTRST_SEL[5]	0	R/W	WDT CH1 (CA55 Secure)	
CPG_WDTRST_SEL[6]	0	R/W	WDT CH2 (CM33)	
CPG_WDTRST_SEL[8]	0	R/W	WDT CH0 (CA55 Non-Secure)	When WDT CH0 makes a reset request 0: Mask the Cold-Reset of Cortex-A55 (Non-Secure) 1: Implemented Cortex-A55 (Non-Secure) Cold-Reset
CPG_WDTRST_SEL[9]	0	R/W	WDT CH1 (CA55 Secure)	When WDT CH1 makes a reset request 0: Mask the Cold-Reset of Cortex-A55 (Secure) 1: Implemented Cortex-A55 (Secure) Cold-Reset
CPG_WDTRST_SEL[10]	0	R/W	WDT CH2 (CM33)	When WDT CH2 makes a reset request 0: Mask the Cold-Reset of Cortex-M33 1: Implemented Cortex-M33 Cold-Reset

When the WDT system reset is executed, it is also possible to set the CPG_WDTRST_SEL[6:4] bit to notify the system outside the LSI from the WDTOVF_PERROUT# pin of the GPIO pin that the system reset has occurred due to the WDT overflow. When using WDTOVF_PERROUT# as a signal to notify the system reset to the outside, set the CPG_WDTRST_SEL[6:4] bit to 1 when CPG_WDTRST_SEL[2:0] is 1 as shown below.

CPG_WDTRST_SEL[4] Set 1 when CPG_WDTRST_SEL[0] = 1
GPG_WDTRST_SEL[5] Set 1 when CPG_WDTRST_SEL[1] = 1
CPG_WDTRST_SEL[6] Set 1 when CPG_WDTRST_SEL[2] = 1

For example, if CPG_WDTRST_SEL[0] = 0 and WDTRST_SEL[4] = 1 are set, the system reset will not be executed even if WDT CH0 asserts a reset request because CPG_WDTRST_SEL[0] = 0, but WDTRST_SEL[4] = 1 so WDTOVF_PERROUT# pin will be asserted. In other words, the system reset execution status and WDTOVF_PERROUT do not match.

5.4.6 Usage Note

[Cautions]

- When setting a value in the WDTTIM register, do not set a value that is WDTSET register + H'F_FFFF.
- The reset request signal WDTRSTB and WDT interrupt signal WDTINT cannot be masked.

SECTION 5 TIMER

5.5 General Timer (GTM)

5.5.1 Functional Overview

The General timer has the following features.

- Two operating modes
  - Interval timer mode
  - Free-running comparison mode
- Choice between startup of DMA by compare match and generation of interrupt

5.5.1.1 Features of GTM

Channels

This product has the following number of channels of the General timer.

Table 5.5-1 Channels of General Timer

General Timer	
Number of Channels	3
Name	OSTMn

Note: n = 0 to 2

Meaning of n

Throughout this section, the individual channels of the General timer are identified by the index “n” (n = 0 to 2), for example OSTMnTO for the General timer n output register.

Register address

The register addresses of the General timer are given as offsets from the individual base addresses <OSTMn_base>. The register base addresses of each OSTMn are listed in the following table.

Table 5.5-2 Register Base Addresses

Base Address Name	Base Address
<OSTM0_base>	H’0_1280_1000 (H’4280_1000*1, H’5280_1000*2)
<OSTM1_base>	H’0_1280_1400 (H’4280_1400*1, H’5280_1400*2)
<OSTM2_base>	H’0_1280_1800 (H’4280_1800*1, H’5280_1800*2)

Note 1. Cortex-M33 Address Space Secure

Note 2. Cortex-M33 Address Space Non-Secure

Interrupts

The General timers can generate the following interrupt requests.

Table 5.5-3 OSTMn Interrupt Requests

OSTMn Signal	Function	Startup of Direct Memory Access Controller
OSTM0TINT	OSTM0 interrupt	✓
OSTM1TINT	OSTM1 interrupt	✓
OSTM2TINT	OSTM2 interrupt	✓

5.5.2 Registers

The General timer is controlled by the following registers.

5.5.2.1 Registers Overview

The list of OSTMn (n = 0 to 2) registers and the memory addresses are as follows.

For the base addresses, see **Table 5.5-2**.

For the actual addresses, the offset values indicated in the following table are added to the base addresses.

Register Name	Function	R/W	Reset Value	Access Unit (bit)			Address
				8	16	32	
OSTMnCMP	OSTM compare register	R/W	H'0000_0000	—	—	✓	<OSTMn_base> + H'00
OSTMnCNT	OSTM counter register	R	H'FFFF_FFFF	—	—	✓	<OSTMn_base> + H'04
OSTMnTE	OSTM count enable status register	R	H'00	✓	—	—	<OSTMn_base> + H'10
OSTMnTS	OSTM count start trigger register	W	H'00	✓	—	—	<OSTMn_base> + H'14
OSTMnTT	OSTM count stop trigger register	W	H'00	✓	—	—	<OSTMn_base> + H'18
OSTMnCTL	OSTM control register	R/W	H'00	✓	—	—	<OSTMn_base> + H'20

5.5.2.2 Details of OSTM Registers

5.5.2.2.1 OSTM Compare Register (OSTMnCMP)

Depending on the mode of operation, this register holds the start value for the down-counter or the value for comparison with that of the counter.

Access Size: This register is readable/writable in 32-bit units.

Address(es): <OSTMn_base>

Initial Value: H'0000_0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCMP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCMP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OSTMnCMP [31:0]	All 0	R/W	• In interval timer mode: start value of the down-counter • In free-running comparison mode: value for comparison

5.5.2.2.2 OSTM Counter Register (OSTMnCNT)

This register indicates the counter value of the timer.

Access Size: This register is readable in 32-bit units.

Address(es): <OSTMn_base> + H'4

Initial Value: The initial value depends on the operating mode of the General timer. Refer to **Table 5.5-4**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]															
Initial Value	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCNT[15:0]															
Initial Value	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OSTMnCNT [31:0]	*1	R	32-bit counter value

Note 1. The initial value depends on the operating mode of the General timer. Refer to **Table 5.5-4**.

The following table shows the correspondence between operating mode, counting direction and initial value. The initial value is the value read from the counter after a change to the operating mode.

Table 5.5-4 Correspondence between Operating Mode, Counting Direction and Initial Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Initial value
Interval timer mode	0*1	Down	H'FFFF_FFFF
Free-running comparison mode	1	Up	H'0000_0000

Note 1. Value after reset

5.5.2.2.3 OSTM Count Enable Status Register (OSTMnTE)

This register indicates whether the counter is enabled or disabled.

Access Size: This register is readable in 8-bit units.

Address(es): <OSTMn_base>+ H'10

Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTE
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTE	0	R	This bit indicates whether the counter is enabled or disabled. 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1. This bit is reset to 0 in response to OSTMnTT.OSTMnTT being set to 1.

Note 1. When OSTMnTE = 0, the counter retains its value.
If the counter is restarted, it
• restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
• restarts counting up from the counter value H'0000_0000 if it is in free running comparison mode.

Note 2. For debugging, the GTM counter can be paused by the counter stop request.

5.5.2.2.4 OSTM Count Start Trigger Register (OSTMnTS)

This register starts the counter.

Access Size: This register is writable in 8-bit units. It is always read as H'00.

Address(es): <OSTMn_base>+ H'14

Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTS
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTS	0	W	This bit starts the counter. 0: This setting has no effect. 1: Starts the counter and sets OSTMnTE.OSTMnTE = 1. • In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1. • In free-running comparison mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.

5.5.2.2.5 OSTM Count Stop Trigger Register (OSTMnTT)

This register stops the counter.

Access Size: This register is writable in 8-bit units. It is always read as H'00.

Address(es): <OSTMn_base>+ H'18

Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTT
Initial Value								
R/W	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTT	0	W	Stops the counter. 0: This setting has no effect. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

5.5.2.2.6 OSTM Control Register (OSTMnCTL)

This register specifies the operating mode for the counter and controls enabling/disabling of OSTMnTINT interrupt requests when counting starts.

Access Size: This register is readable/writable in 8-bit units. Writing to this register is only possible if the counter is disabled (OSTMnTOE.OSTMnTOE = 0).

Address(es): <OSTMn_base>+ H'20

Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OSTMnMD1	OSTMnMD0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	OSTMnMD1	0	R/W	Specifies the operating mode for the counter. 0: Interval timer mode 1: Free-running comparison mode
0	OSTMnMD0	0	R/W	Controls enabling/disabling of OSTMnTINT interrupt requests when counting starts. 0: Disables the interrupts when counting starts. 1: Enables the interrupts when counting starts.

5.5.3 Functional Description

Each General timer is a 32-bit timer/counter.

The settings for operating mode specify the direction of counting (up or down) and the generation of interrupt requests.

5.5.3.1 Block Diagram

The following block diagram shows the main components of GTM.

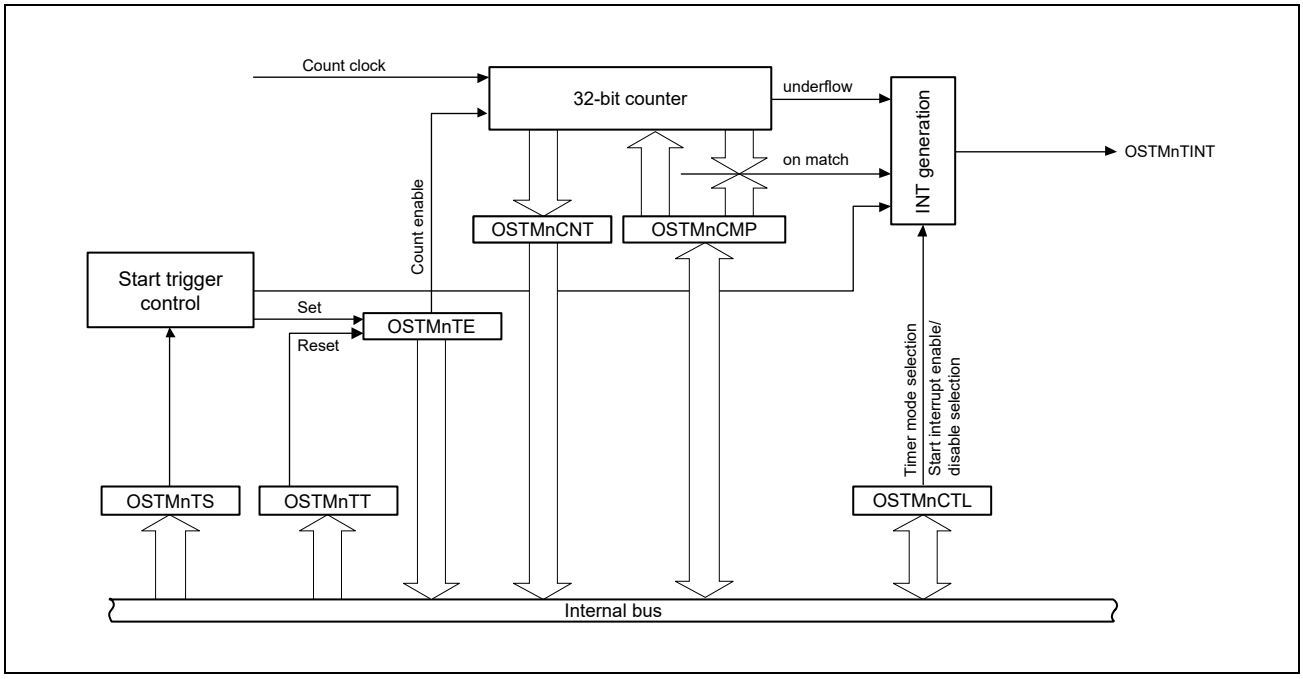


Figure 5.5-1 Block Diagram of GTM

5.5.3.2 Count Clock

The count clock of OSTMn is P0ϕ (OSTMn_PCLK).

5.5.3.3 Generation of Interrupt Request

An OSTMnTINT interrupt request is generated whenever the counter reaches H’0000_0000 (in interval timer mode) or matches the comparison value (in free-running comparison mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This operation is shown in the following figure.

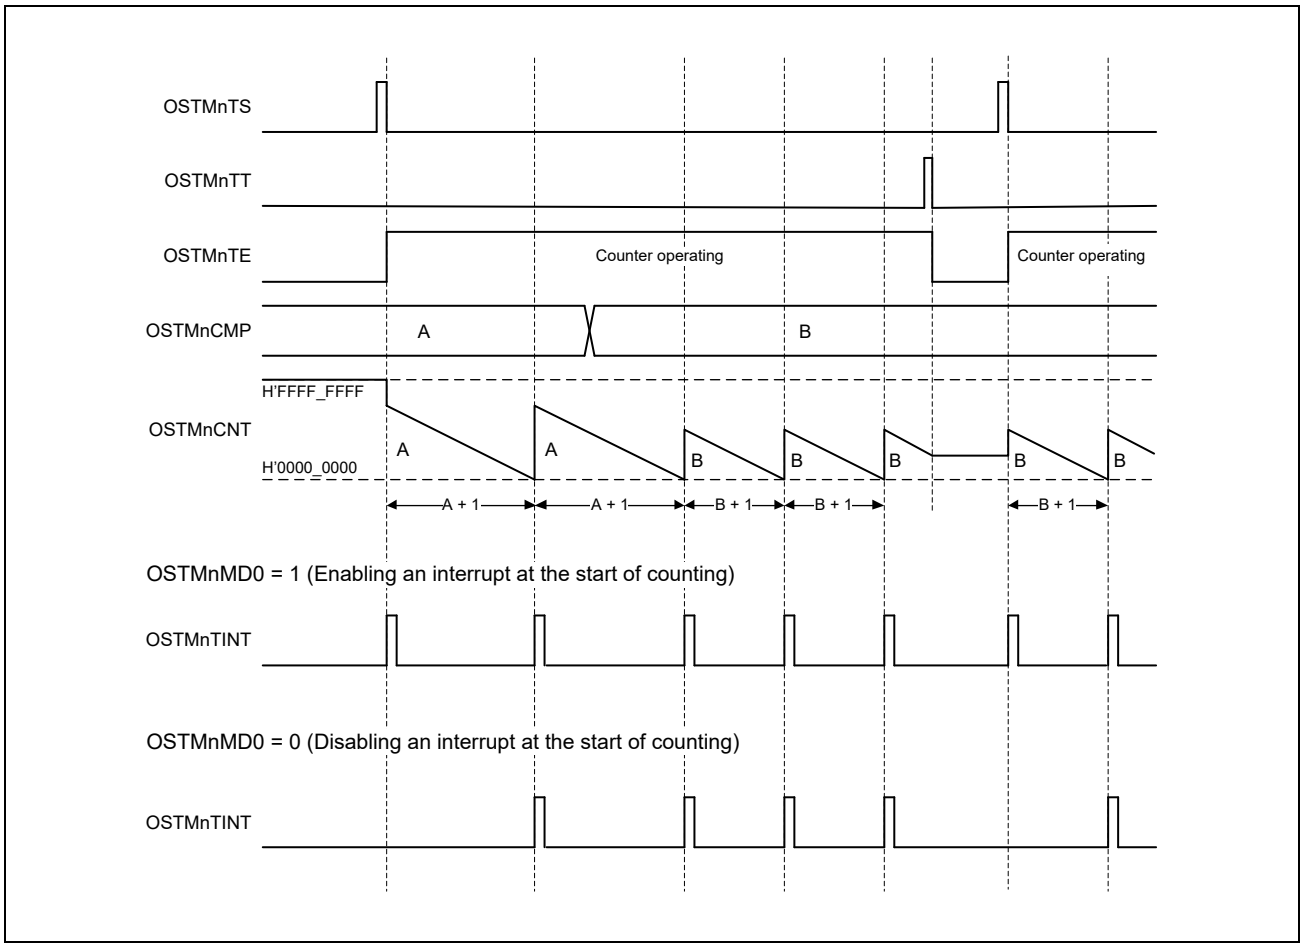

Figure 5.5-2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

5.5.3.4 Starting and Stopping the Timer

The General timer is started and stopped as follows.

Starting the timer

The timer is started in either of the following way:

- setting the OSTMnTS.OSTMnTSF bit to 1

Status bit OSTMnTE.OSTMnTE is set to 1.

The counter starts to count up or down in accord with the settings for operating mode.

Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer.

This also clears the OSTMnTE.OSTMnTE status flag.

5.5.3.5 Interval Timer Mode

Select the interval timer mode when an General timer is to be used as a reference timer for generating interrupt requests at a fixed interval.

5.5.3.5.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMnTINT interrupt request is generated when the counter reaches H'0000_0000.

Select interval timer mode by setting OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next H'0000_0000 is reached.

Cycles of OSTMnTINT output

The cycle of OSTMnTINT output is as follows.

- OSTMnTINT generation cycle = counter-clock cycle × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

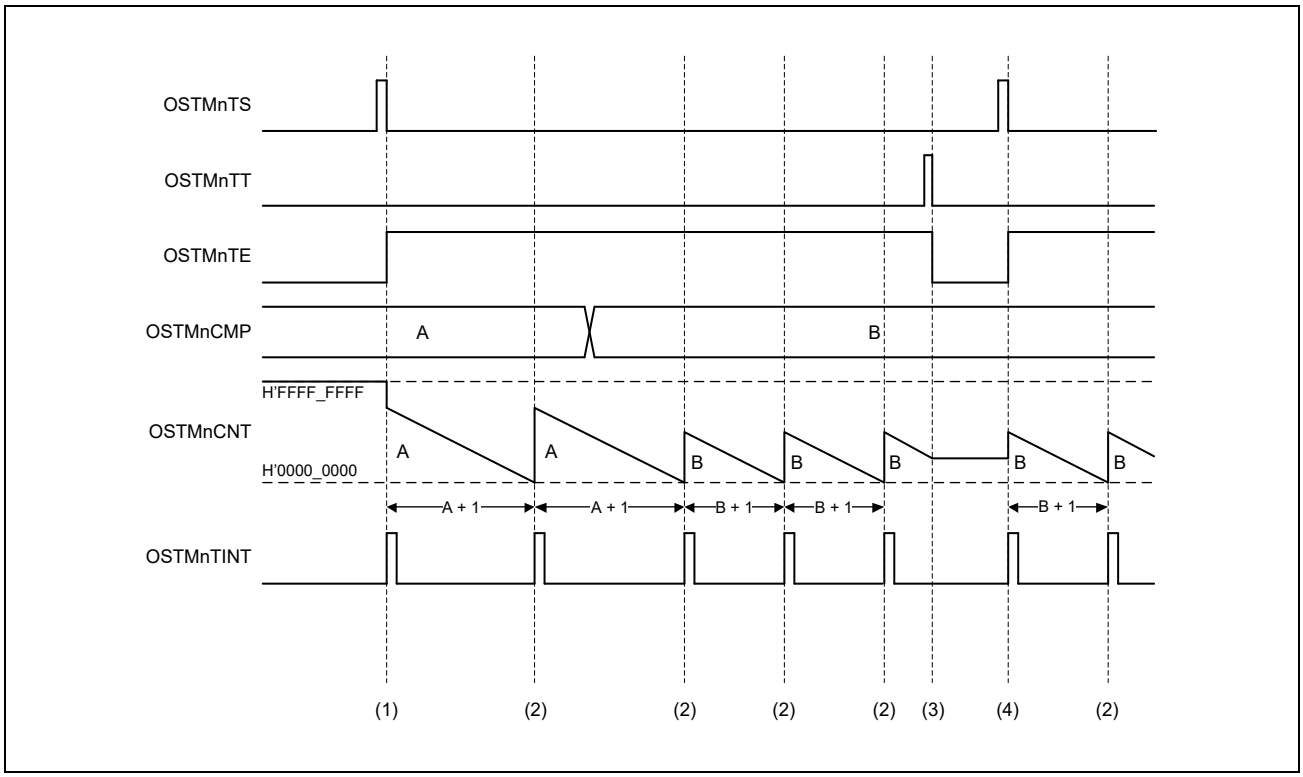

Figure 5.5-3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register contains the current value as the counter.

(2) When the counter reaches H'0000_0000, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the forced restart of the General Timer in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

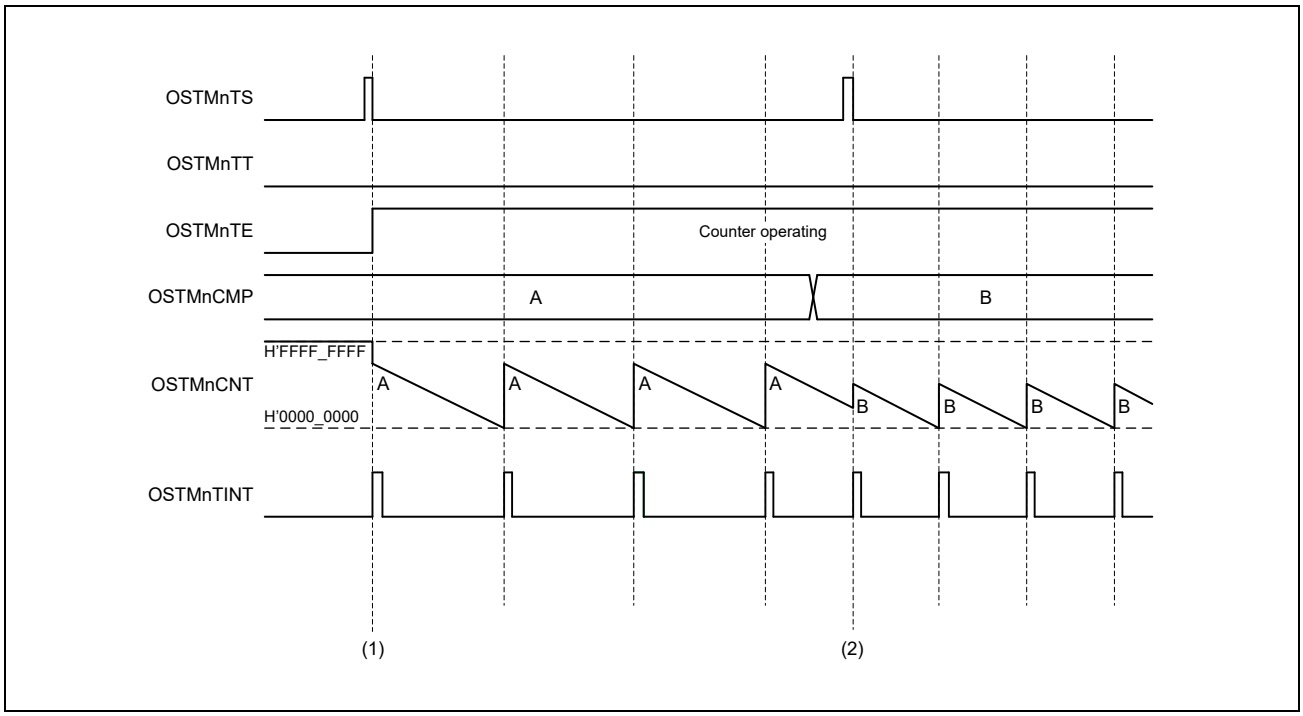

Figure 5.5-4 Timing Diagram of Forced Restart in Interval Timer Mode

Operations shown in the above timing diagram are as follows.

(1) The counter is started and stopped as described under **Figure 5.5-3, Timing Diagram of OSTM in Interval Timer Mode**.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated when counting starts.

5.5.3.5.2 Operation when OSTMnCMP = H’0000_0000

When OSTMnCMP = H’0000_0000, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = H’0000_0000, and counter-start interrupts are enabled.

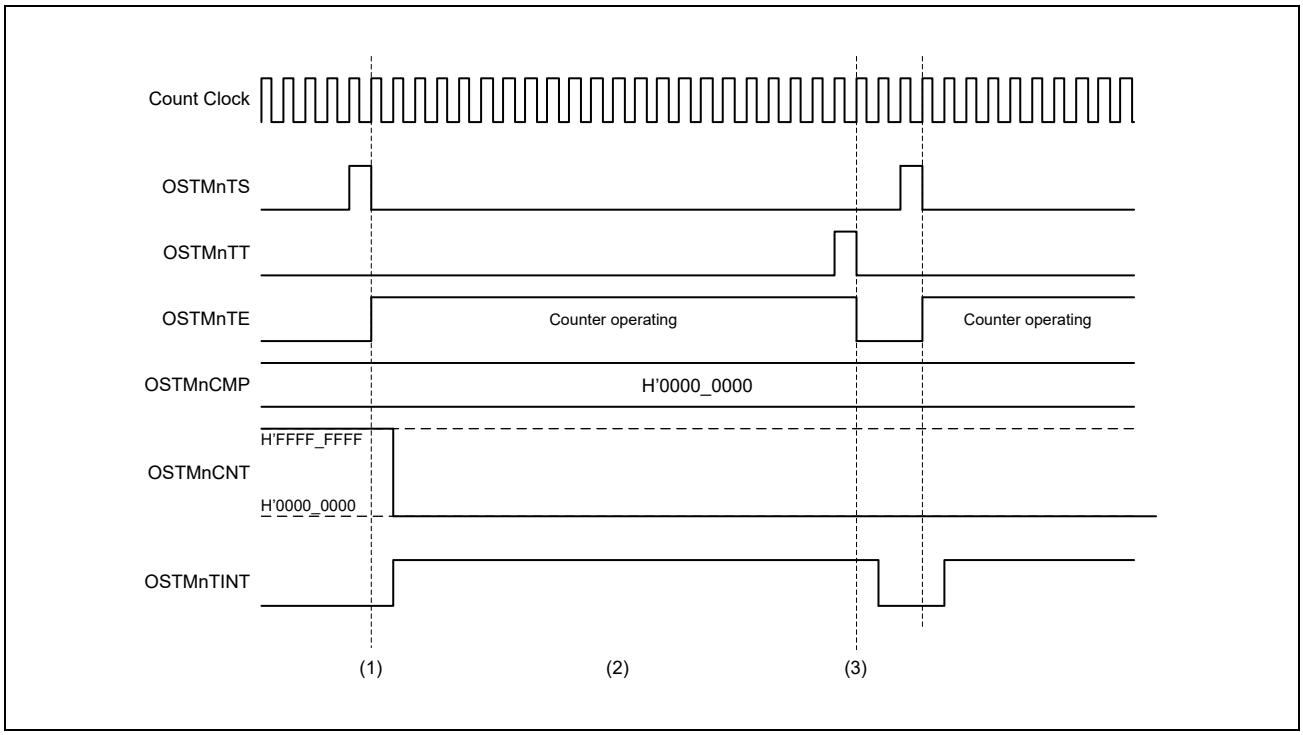

Figure 5.5-5 Timing Diagram when OSTMnCMP = H’0000_0000 in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value H’0000_0000 is retained in OSTMnCMP.

(2) The OSTMTINT interrupt request is continuously asserted.

(3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

(4) When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

5.5.3.6 Free-Running Comparison Mode

5.5.3.6.1 Basic Operation in Free-Running Comparison Mode

In free-running comparison mode, the counter counts up from H'0000_0000 to H'FFFF_FFFF. An OSTMnTINT interrupt request is output when the current value of the counter matches the value of the OSTMnCMP register. The free-running comparison mode is selected by setting the OSTMnCTL.OSTMnMD1 bit to 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

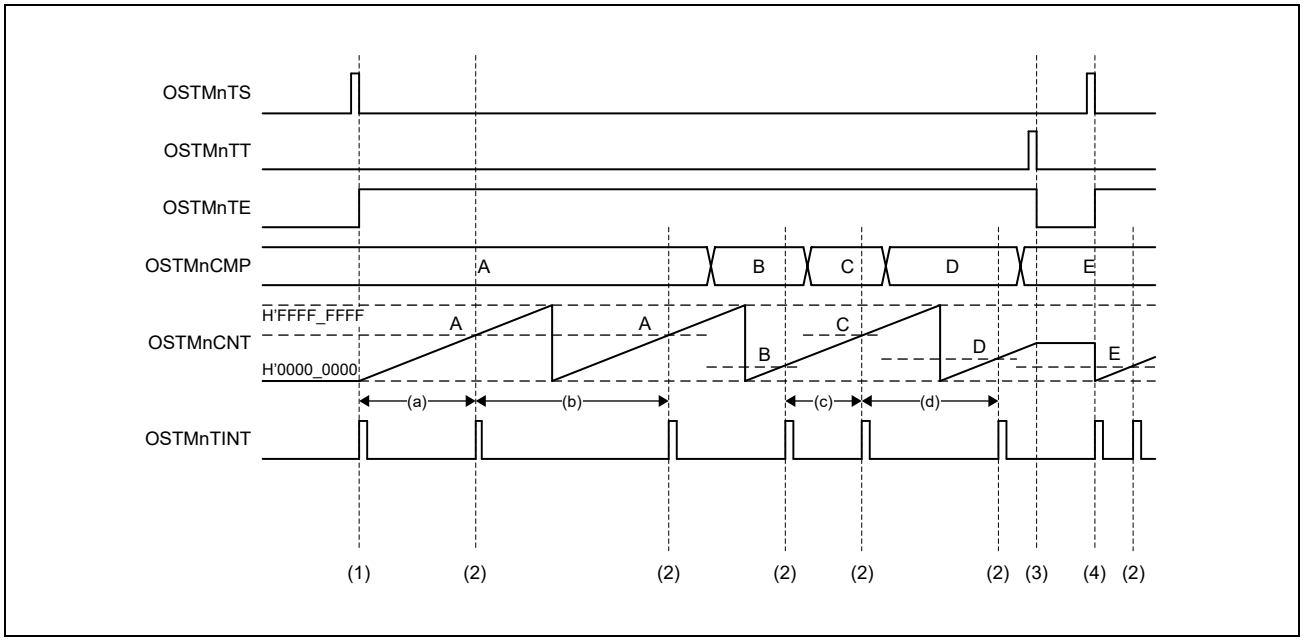

Figure 5.5-6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from H'0000_0000 to H'FFFF_FFFF. The OSTMnCNT register is the counter, so it contains the current value.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from H'0000_0000 when OSTMnTS.OSTMnTS = 1.

OSTMTINT period

The OSTMTINT generation period is different at the start of counting and depends on the old and new compare values if OSTMnCMP is rewritten during operation.

Table 5.5-5 OSTMTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of OSTMTINT Generation	Label in Timing Diagram
Counter starts			(A + 1) × counter clock period	(a)
A	A	No rewriting	(H'FFFF_FFFF + 1) × counter clock period	(b)
B	C > B	B < counter value < C	(C – B) × counter clock period	(c)
C	D < C	Counter value > D,C	(H'FFFF_FFFF – C + D + 1) × counter clock period	(d)

Forced restart

Forced restarting does not proceed during counting even if the OSTMnTS.OSTMnTS bit is set. The counter ignores the attempted setting and continues counting.

5.5.3.6.2 Operation when OSTMnCMP = H’0000_0000

The following figure shows the operation of OSTM when OSTMnCMP = H’0000_0000, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

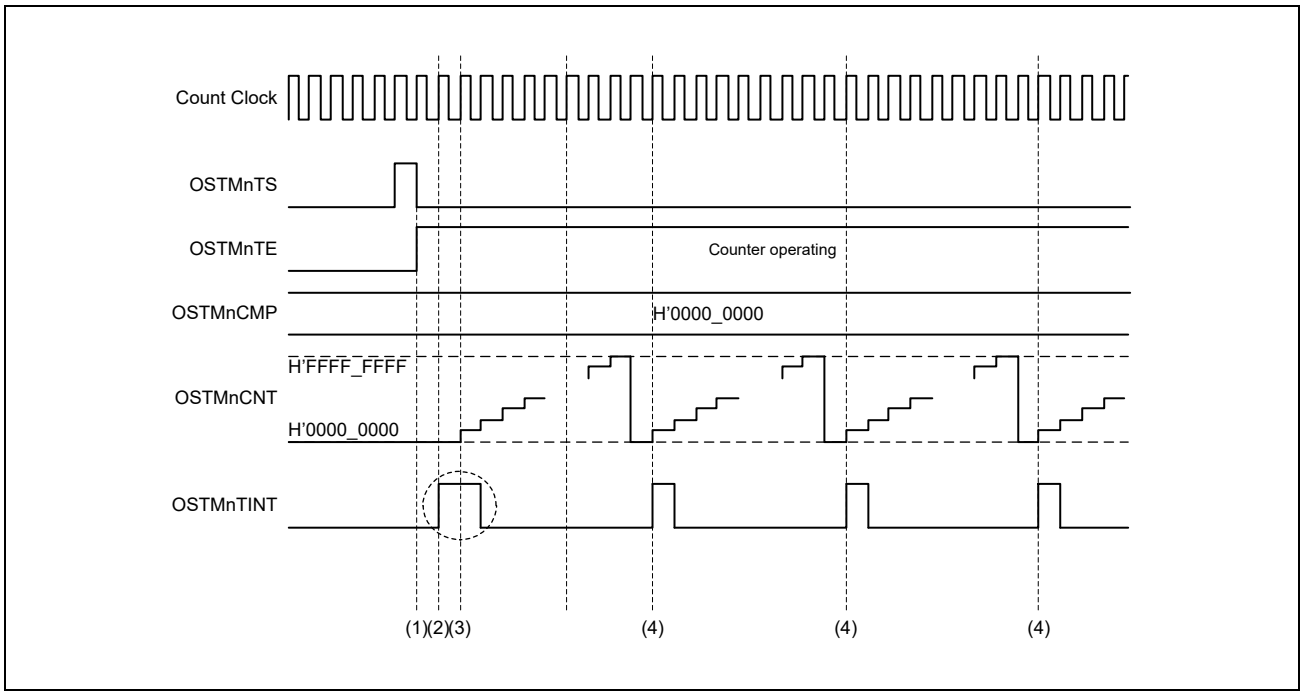

Figure 5.5-7 Timing Diagram when OSTMnCMP = H’0000_0000 in Free-Run Compare Mode

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from H’0000_0000 to H’FFFF_FFFF.

(2) An OSTMTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated. If OSTMnCMP = H’0000_0000 in the above case, OSTMTINT is generated over two clock cycles.

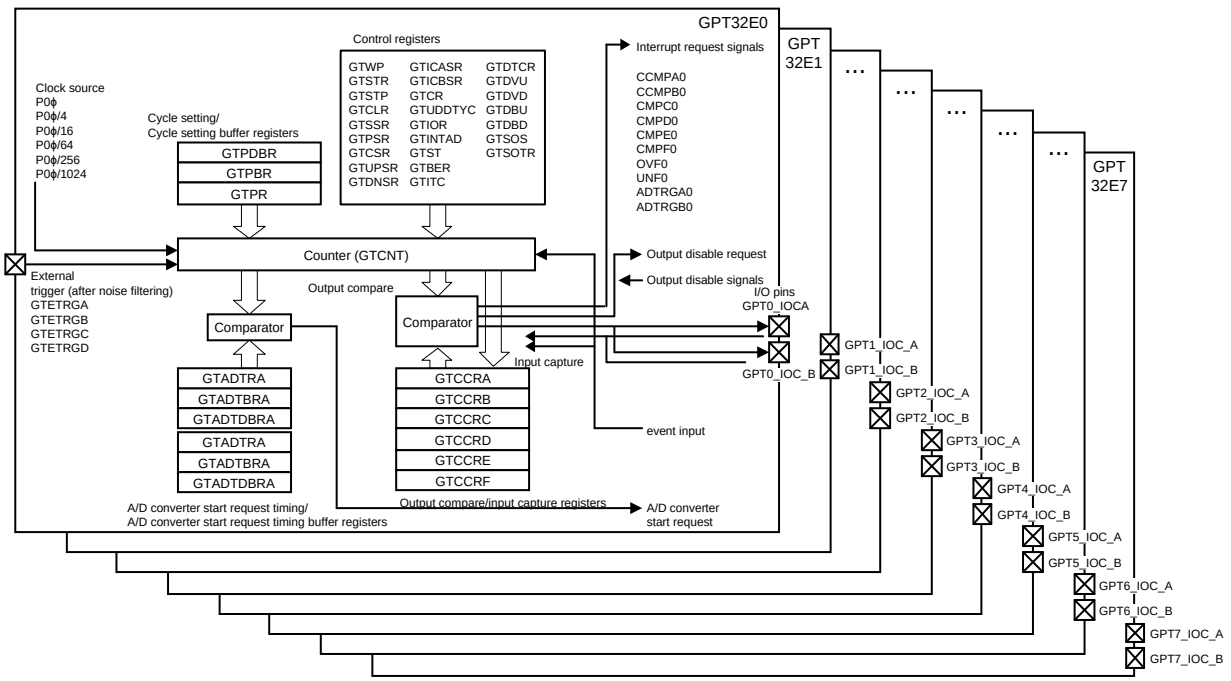
(4) Every (H’FFFF_FFFF + 1) clock cycles the OSTMTINT interrupt request is asserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

SECTION 5 TIMER

5.7 General PWM Timer (GPT)

5.7.1 Overview



This LSI has a general purpose PWM timer (GPT) composed of 8 channels of 32-bit timer (GPT32E). **Table 5.7-1** lists the GPT specifications, **Table 5.7-2** shows the GPT functions, **Figure 5.7-1** shows the block diagram, and **Table 5.7-3** lists the I/O pins.

Table 5.7-1 GPT specifications

Parameter	Specifications
Functions	• 32 bits × 8 channels • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter. • Clock sources independently selectable for each channel • Two I/O pins per channel • Two output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms. • Registers for setting up frame cycles in each channel (with capability for generating interrupts at overflow or underflow) • Generation of dead times in PWM operation • Synchronous starting, stopping and clearing counters for arbitrary channels • Starting, stopping, clearing and up/down counters in response to input level comparison • Starting, clearing, stopping and up/down counters in response to a maximum of four external triggers • Output pin disable function by dead time error and detected short-circuits between output pins • A/D converter start triggers can be generated (GPT32E0 to GPT32E3) • Enables the noise filter for input capture and external trigger operation

Table 5.7-2 GPT functions

Parameter		GPT32E
Count clock		P0ϕ P0ϕ/4 P0ϕ/16 P0ϕ/64 P0ϕ/256 P0ϕ/1024

5.7.2.1 General PWM Timer Write-Protection Register (GTWP)

Address(es): GPT32Em.GTWP H'1004_8000 + H'0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PRKEY[7:0]								—	—	—	—	—	—	—	WP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	WP	0	R/W	Register Write Disable 0: Enable writes to the register 1: Disable writes to the register.
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b15 to b8	PRKEY[7:0]	All 0	R/W	GTWP Key Code When H'A5 is written to these bits, the writes to the WP bit are permitted. These bits are read as 0.
b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

To prevent accidental changes, the GTWP enables or disables writing to following registers:

- GTSSR
- GTPSR
- GTCSR
- GTUPSR
- GTDNSR
- GTICASR
- GTICBSR
- GTCR
- GTUDDTYC
- GTIOR
- GTINTAD
- GTST
- GTBER
- GTITC
- GTCNT
- GTCCRA
- GTCCRB
- GTCCRC
- GTCCRD
- GTCCRE
- GTCCRF
- GTPR
- GTPBR
- GTPDBR
- GTADTRA
- GTADTBRA
- GTADTDBRA
- GTADTRB
- GTADTBRB
- GTADTDBRB
- GTDTCR
- GTDVU
- GTDVD
- GTDBU
- GTDBD
- GTSOS
- GTSOTR.

5.7.2.2 General PWM Timer Software Start Register (GTSTR)

Address(es): GPT32Em.GTSTR H'1004_8004 + H'0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CSTRT7	CSTRT6	CSTRT5	CSTRT4	CSTRT3	CSTRT2	CSTRT1	CSTRT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The GTSTR starts the GTCNT counter operation for each channel x, where x = 0 to 7.

The GTSTR bit number represents the channel number. The GTSTR register is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTR register.

CSTRTx bit (channel x GTCNT Count Start) (x = 0 to 7)

The CSTRTx bit starts channel x of the GTCNT counter operation. Writing to GTSTR.CSTRTx bit has no effect unless GPTx.GTSSR.CSTRT bit is set to 1.

Read data shows the counter status of each channel (GTCR.CST bit). Zero means the counter stops and 1 means the counter is running.

5.7.2.3 General PWM Timer Software Stop Register (GTSTP)

Address(es): GPT32Em.GTSTP H'1004_8008 + H'0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CSTOP 7	CSTOP 6	CSTOP 5	CSTOP 4	CSTOP 3	CSTOP 2	CSTOP 1	CSTOP 0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The GTSTP stops the GTCNT counter operation for each channel x, where x = 0 to 7.

The GTSTP bit number represents the channel number. The GTSTP register is shared by all of the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTP register.

CSTOPx bit (channel x GTCNT Count Stop) (x = 0 to 7)

The CSTOPx bit stops channel x of the GTCNT counter operation. Writing to GTSTP.CSTOPx bit has no effect unless GPTx.GTPSR.CSTOP bit is set to 1. Read data shows the counter status of each channel (invert of GTCR.CST bit). Zero means the counter is running and 1 means the counter stops.

5.7.2.4 General PWM Timer Software Clear Register (GTCLR)

Address(es): GPT32Em.GTCLR H'1004_800C + H'0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CCLR7	CCLR6	CCLR5	CCLR4	CCLR3	CCLR2	CCLR1	CCLR0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

GTCLR is a write-only register that clears the GTCNT counter operation for each channel x, where x = 0 to 7. The GTCLR bit number represents the channel number. The GTCLR register is shared by all of the channels. The

GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter.

CCLRx bit (channel x GTCNT Count Clear) (x = 0 to 7).

Channel x of the GTCNT counter value is cleared on writing 1 to the CCLRx bit. This bit is read as 0.

5.7.2.5 General PWM Timer Start Source Select Register (GTSSR)

Address(es): GPT32Em.GTSSR H'1004_8010 + H'0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b30 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b31	CSTRT	0	R/W	Software Source Counter Start Enable 0: Disable counter start by the GTSTR register 1: Enable counter start by the GTSTR register

GTSSR sets the source to start the GTCNT counter.

SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables GTCNT counter start on the rising edge of GTETRGA pin input.

SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables GTCNT counter start on the falling edge of GTETRGA pin input.

SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables GTCNT counter start on the rising edge of GTETRGB pin input.

SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables GTCNT counter start on the falling edge of GTETRGB pin input.

SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables GTCNT counter start on the rising edge of GTETRGC pin input.

SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables GTCNT counter start on the falling edge of GTETRGC pin input.

SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables GTCNT counter start on the rising edge of GTETRGD pin input.

SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables GTCNT counter start on the falling edge of GTETRGD pin input.

SSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

SSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

SSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

SSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Start Enable)

The SSCAFBH bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

SSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Start Enable)

The SSCBRAL bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

SSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Start Enable)

The SSCBRAH bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

SSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Start Enable)

The SSCBFAL bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

SSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Start Enable)

The SSCBFAH bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables GTCNT counter start by GTSTR register.

5.7.2.6 General PWM Timer Stop Source Select Register (GTPSR)

b12	PSCBRAL	0	R/W	GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Stop Enable 0: Disable counter stop on the rising edge of GTIOCB input when GTIOCA input is 0 1: Enable counter stop on the rising edge of GTIOCB input when GTIOCA input is 0
b13	PSCBRAH	0	R/W	GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Stop Enable 0: Disable counter stop on the rising edge of GTIOCB input when GTIOCA input is 1 1: Enable counter stop on the rising edge of GTIOCB input when GTIOCA input is 1
b14	PSCBFAL	0	R/W	GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Stop Enable 0: Disable counter stop on the falling edge of GTIOCB input when GTIOCA input is 0 1: Enable counter stop on the falling edge of GTIOCB input when GTIOCA input is 0
b15	PSCBFAH	0	R/W	GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Stop Enable 0: Disable counter stop on the falling edge of GTIOCB input when GTIOCA input is 1 1: Enable counter stop on the falling edge of GTIOCB input when GTIOCA input is 1
b30 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b31	CSTOP	0	R/W	Software Source Counter Stop Enable 0: Disable counter stop by the GTSTP register 1: Enable counter stop by the GTSTP register

GTPSR sets the source to stop the GTCNT counter.

PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables GTCNT counter stop on the rising edge of GTETRGA pin input.

PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables GTCNT counter stop on the falling edge of GTETRGA pin input.

PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

The PSGTRGBR bit enables or disables GTCNT counter stop on the rising edge of GTETRGB pin input.

PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables GTCNT counter stop on the falling edge of GTETRGB pin input.

PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

The PSGTRGCR bit enables or disables GTCNT counter stop on the rising edge of GTETRGC pin input.

PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables GTCNT counter stop on the falling edge of GTETRGC pin input.

PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

The PSGTRGDR bit enables or disables GTCNT counter stop on the rising edge of GTETRGD pin input.

PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables GTCNT counter stop on the falling edge of GTETRGD pin input.

PSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

PSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Stop Enable)

The PSCARBH bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

PSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Stop Enable)

The PSCAFBL bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

PSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Stop Enable)

The PSCAFBH bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

PSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Stop Enable)

The PSCBRAL bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

PSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Stop Enable)

The PSCBRAH bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

PSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Stop Enable)

The PSCBFAL bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

PSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Stop Enable)

The PSCBFAH bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables GTCNT counter stop by GTSTP register.

GTCSR sets the source to clear the GTCNT counter.

CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables GTCNT counter clear on the rising edge of GTETRGA pin input.

CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables GTCNT counter clear on the falling edge of GTETRGA pin input.

CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables GTCNT counter clear on the rising edge of GTETRGB pin input.

CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables GTCNT counter clear on the falling edge of GTETRGB pin input.

CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables GTCNT counter clear on the rising edge of GTETRGC pin input.

CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables GTCNT counter clear on the falling edge of GTETRGC pin input.

CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables GTCNT counter clear on the rising edge of GTETRGD pin input.

CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables GTCNT counter clear on the falling edge of GTETRGD pin input.

CSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

CSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

CSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

CSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

CSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

CSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

CSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

CSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables GTCNT counter clear by GTCLR register.

b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTUPSR sets the source to count up the GTCNT counter.

When at least 1 bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In such cases, the setting of GTCR.TPCS has no effect.

USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables GTCNT counter count up on the rising edge of GTETRGA pin input.

USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables GTCNT counter count up on the falling edge of GTETRGA pin input.

USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables GTCNT counter count up on the rising edge of GTETRGB pin input.

USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables GTCNT counter count up on the falling edge of GTETRGB pin input.

USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables GTCNT counter count up on the rising edge of GTETRGC pin input.

USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables GTCNT counter count up on the falling edge of GTETRGC pin input.

USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables GTCNT counter count up on the rising edge of GTETRGD pin input.

USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables GTCNT counter count up on the falling edge of GTETRGD pin input.

USCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

USCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

USCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

USCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Up Enable)

The USCAFBH bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

USCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

USCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

USCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

USCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTDNSR sets the source to count down the GTCNT counter.

When at least 1 bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In such cases, the setting of GTCR.TPCS has no effect.

DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables GTCNT counter count down on the rising edge of GTETRGA pin input.

DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables GTCNT counter count down on the falling edge of GTETRGA pin input.

DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables GTCNT counter count down on the rising edge of GTETRGB pin input.

DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables GTCNT counter count down on the falling edge of GTETRGB pin input.

DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables GTCNT counter count down on the rising edge of GTETRGC pin input.

DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables GTCNT counter count down on the falling edge of GTETRGC pin input.

DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables GTCNT counter count down on the rising edge of GTETRGD pin input.

DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables GTCNT counter count down on the falling edge of GTETRGD pin input.

DSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Down Enable)

The DSCARBL bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

DSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Down Enable)

The DSCARBH bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

DSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Down Enable)

The DSCAFBL bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

DSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Down Enable)

The DSCAFBH bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

DSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Down Enable)

The DSCBRAL bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

DSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Down Enable)

The DSCBRAH bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

DSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Down Enable)

The DSCBFAL bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

DSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Down Enable)

The DSCBFAH bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTICASR sets the source of input capture for GTCCRA.

ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGA pin input.

ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGA pin input.

ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGB pin input.

ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGB pin input.

ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGC pin input.

ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGC pin input.

ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGD pin input.

ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGD pin input.

ASCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

ASCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

ASCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

ASCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

ASCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

ASCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRA Input Capture Enable)

The ASCBRAH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

ASCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

ASCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTICBSR sets the source of input capture for GTCCRB.

BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGA pin input.

BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGA pin input.

BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGB pin input.

BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGB pin input.

BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGC pin input.

BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGC pin input.

BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGD pin input.

BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGD pin input.

BSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

BSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

BSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)

The BSCAFBL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

BSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRB Input Capture Enable)

The BSCAFBH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

BSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)

The BSCBRAL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

BSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRB Input Capture Enable)

The BSCBRAH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

BSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)

The BSCBFAL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

BSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRB Input Capture Enable)

The BSCBFAH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

GTCR controls GTCNT.

CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit being 1.
- among input on the GTIOCA, GTIOCB, or GTETRGA to GTETRGD pins that is enabled in the GTSSR register as a source for the start of counting
- 1 is written by software directly.

[Clearing conditions]

- GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit being 1.
- among input on the GTIOCA, GTIOCB, or GTETRGA to GTETRGD pins that is enabled in the GTPSR register as a source for the stop of counting
- 0 is written by software directly.

MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode. The MD[2:0] bits must be set while the GTCNT operation is stopped.

TPCS[2:0] bits (Timer Prescaler Select)

The TPCS[2:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[2:0] bits must be set while the GTCNT operation is stopped.

5.7.2.13 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC)

Bit	Bit Name	Initial Value	R/W	Description
b31 to b28	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Remarks: x: Don't care

GTUDDTYC sets the direction in which GTCNT counts (up-counting or down-counting) and sets the duty of GTIOCA/GTIOCB pin output.

Count direction:

- In saw-wave mode

  When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down- counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

  When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting is stopped, the counter starts up- counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

  When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.

- In triangle-wave mode

  When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.

  When the UDF bit is set to 1 while counting stops, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction for up-counting or down-counting, for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only write 0 to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty:

- In saw-wave mode

  When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR). When the OADTY/OBDTY value changes during down-counting, the duty is reflected at an underflow (GTCNT = 0). When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting is stopped, the output duty is not reflected at starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0). When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at the starting counter operation.

- In triangle-wave mode

  When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow. When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation, however the output duty is reflected at an underflow.

  When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

OmDTY[1:0] bits (GTIOCm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCm pin.

OmDTYF bit (Forcible GTIOCm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation. When this bit is set to 1 while counting is stopped, return this bit to 0 until the first period ends after the counter starts.

OmDTYR bit (GTIOCm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmDTYR bits select the value that is the object of output retained or toggled at cycle end, when the control changes from 0%/100% duty setting to compare match for GTIOCm pin and GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end).

GPT32 internally continues the compare match operation in performing 0%/100% duty operation. When the OmDTYR bit is set to 1, the GTCIOm pin outputs the value specified in the GTIOR.GTIOm[3:2] bits at the end of compare match cycle.

5.7.2.14 General PWM Timer I/O Control Register (GTIOR)

GTIOR sets the functions of the GTIOCA and GTIOCB pins.

GTIOA[4:0] bits (GTIOCA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCA pin function. For details, see **Table 5.7-5**

OADFLT bit (GTIOCA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCA pin outputs high or low when counting stops.

OAHLD bit (GTIOCA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCA pin output level is retained or the level at the start/stop of counting depends on the register setting.

[When the OAHLD bit is set to 0]

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, it is immediately reflected in the output.

[When the OAHLD bit is set to 1]

- The output is retained when counting starts or stops.

OAE bit (GTIOCA Pin Output Enable)

The OAE bit disables or enables the GTIOCA pin output.

When the GTCCRA register is in use as an input capture register (at least one bit in the GTICASR register is set to 1), signals will not be output from the GTIOCA pin regardless of the setting of this bit.

OADF[1:0] bits (GTIOCA Pin Disable Value Setting)

The OADF bits select a value to be output from the GTIOCA pin in response to the output disable requests.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCA pin. Because changing the value of the bit might lead to internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCA pin. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

GTIOB[4:0] bits (GTIOCB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCB pin function. For details, see **Table 5.7-5**

OBDFLT bit (GTIOCB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCB pin outputs high or low when counting stops.

OBHLD bit (GTIOCB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCB pin output level is retained or the level at the start/stop of counting depends on the register setting.

[When the OBHLD bit is set to 0]

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, it is immediately reflected in the output.

[When the OBHLD bit is set to 1]

- The output is retained when counting starts or stops.

OBE bit (GTIOCB Pin Output Enable)

The OBE bit disables or enables the GTIOCB pin output.

When the GTCCRB register is in use as an input capture register (at least one bit in the GTICBSR register is set to 1), signals will not be output from the GTIOCB pin regardless of the setting of this bit.

OBDF[1:0] bits (GTIOCB Pin Disable Value Setting)

The OBDF bits select a value to be output from the GTIOCB pin in response to the output disable requests.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCB pin. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

Table 5.7-5 Settings of GTIOA[4:0] and GTIOB[4:0] bits

GTIOA/GTIOB[4:0] bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	0	0	0	Set initial output low	Retain output at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	0	0	0	1			Output low at GTCCRA/GTCCRB compare match
0	0	0	1	0			Output high at GTCCRA/GTCCRB compare match
0	0	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	0	1	0	0		Output low at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	0	1	0	1			Output low at GTCCRA/GTCCRB compare match
0	0	1	1	0			Output high at GTCCRA/GTCCRB compare match
0	0	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	1	0	0	0		Output high at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	1	0	0	1			Output low at GTCCRA/GTCCRB compare match
0	1	0	1	0			Output high at GTCCRA/GTCCRB compare match
0	1	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	1	1	0	0		Toggle output at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	1	1	0	1			Output low at GTCCRA/GTCCRB compare match
0	1	1	1	0			Output high at GTCCRA/GTCCRB compare match
0	1	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	0	0	0	0	Set initial output high	Retain output at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	0	0	0	1			Output low at GTCCRA/GTCCRB compare match
1	0	0	1	0			Output high at GTCCRA/GTCCRB compare match
1	0	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	0	1	0	0		Output low at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	0	1	0	1			Output low at GTCCRA/GTCCRB compare match
1	0	1	1	0			Output high at GTCCRA/GTCCRB compare match
1	0	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	1	0	0	0		Output high at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	1	0	0	1			Output low at GTCCRA/GTCCRB compare match
1	1	0	1	0			Output high at GTCCRA/GTCCRB compare match
1	1	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	1	1	0	0		Toggle output at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	1	1	0	1			Output low at GTCCRA/GTCCRB compare match
1	1	1	1	0			Output high at GTCCRA/GTCCRB compare match
1	1	1	1	1			Toggle output at GTCCRA/GTCCRB compare match

Note 1. The cycle end means an overflow (GTCNT is changed from GTPR to 0 in up-counting) or underflow (GTCNT is changed from 0 to GTPR in down-counting). In this case, the GTCNT counter is cleared for saw waves and for the trough (GTCNT is changed from 0 to 1) for triangle waves.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least 1 bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

5.7.2.15 General PWM Timer Interrupt Output Setting Register (GTINTAD)

b31	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

GTINTAD enables or disables interrupt requests, A/D converter start requests and output disable requests.

GTINTA bit (GTCCRA Compare Match/Input Capture Interrupt Enable)

The GTINTA bit enables and disables the interrupt request (CCMPAn) in response to compare matches with or input capture by the GTCCRA register.

GTINTB bit (GTCCRB Compare Match/Input Capture Interrupt Enable)

The GTINTB bit enables and disables the interrupt request (CCMPBn) in response to compare matches with or input capture by the GTCCRB register.

GTINTC bit (GTCCRC Compare Match Interrupt Enable)

The GTINTC bit enables and disables the interrupt request (CMPCn) in response to compare matches with the GTCCRC register.

GTINTD bit (GTCCRD Compare Match Interrupt Enable)

The GTINTD bit enables and disables the interrupt request (CMPDn) in response to compare matches with the GTCCRD register.

GTINTE bit (GTCCRE Compare Match Interrupt Enable)

The GTINTE bit enables and disables the interrupt request (CMPEn) in response to compare matches with the GTCCRE register.

GTINTF bit (GTCCRF Compare Match Interrupt Enable)

The GTINTF bit enables and disables the interrupt request (CMPFn) in response to compare matches with the GTCCRF register.

GTINTPR[1:0] bits (GTPR Compare Match Interrupt Enable)

The GTINTPR[1:0] bits enable and disable the interrupt requests (OVFn and UNFn) in response to compare matches with the GTPR register (and overflows of the GTCNT counter) and underflows of the GTCNT counter.

ADTRAUEN bit (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRAUEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT up-counting.

ADTRADEN bit (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRADEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT down-counting.

ADTRBUEN bit (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRBUEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT up-counting.

ADTRBDEN bit (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRBDEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT down-counting.

GRP[1:0] bits (Output Disable Source Select)

The GRP[1:0] bits select GTIOCA pin and GTIOCB pin output disable source. The output disable requests to the POEG are output to the group selected by the GRP[1:0] bits. Each of the output disable sources, a dead time error, simultaneous output of high-level, and low-level signal, is also output in accord with the setting of its enabling bit. GTST.ODF shows the request of output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when GTIOR.OAE and OBE bits are both 0.

GRPDTE bit (Dead Time Error Output Disable Request Enable)

The GRPDTE bit enables or disables dead time error output disable request.

GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables output disable request when GTIOCA pin and GTIOCB pin output 1 at the same time.

GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables output disable request when GTIOCA pin and GTIOCB pin output 0 at the same time.

5.7.2.16 General PWM Timer Status Register (GTST)

Address(es): GPT32Em.GTST H'1004_803C + H'0100 × m (m = 0 to 7)

b31	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

Note 1. Only 0 can be written to this bit. Do not write 1.

GTST indicates the status of the GPT.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFS flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register function as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC flag (Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

[Setting condition]

- GTCNT = GTCCRC

[Clearing condition]

- 0 is written to this flag. [Not comparing condition]
- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

TCFD flag (Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0 is written to this flag. [Not comparing condition]
- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

TCFE flag (Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0 is written to this flag. [Not comparing condition]
- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag. [Not comparing condition]
- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or a crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR-1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or a trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

ITCNT[2:0] bits (OVFn/UNFn Interrupt Skipping Count Counter)

When the OVFn/UNFn (n=0 to 7) interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter in the ITCNT[2:0] bits increments by 1 every time the OVFn/UNFn interrupt source that is selected in GTITC.IVTC[1:0] is generated.

[Clearing conditions]

- The OVFn/UNFn interrupt skipping function is not used (GTITC.IVTT[2:0] is 000b when GTITC.IVTC[1:0] is 00b)
- The OVFn/UNFn interrupt skipping count matches the specified count (ITCNT[2:0] matches the skipping count specified in GTITC.IVTT[2:0]).

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and is set to 0 in down-counting.

ADTRAUF flag (GTADTRA Compare Match (Counting Up) A/D Converter Start Request Flag)

The ADTRAUF flag indicates whether or not a compare match with the GTADTRA register has occurred during counting up.

[Setting condition]

- GTCNT = GTADTRA during counting up

[Clearing condition]

- 0 is written to this flag.

ADTRADF flag (GTADTRA Compare Match (Counting Down) A/D Converter Start Request Flag)

The ADTRADF flag indicates whether or not a compare match with the GTADTRA register has occurred during counting down.

[Setting condition]

- GTCNT = GTADTRA during counting down

[Clearing condition]

- 0 is written to this flag.

ADTRBUF flag (GTADTRB Compare Match (Counting Up) A/D Converter Start Request Flag)

The ADTRBUF flag indicates whether or not a compare match with the GTADTRB register has occurred during counting up.

[Setting condition]

- GTCNT = GTADTRB during counting up

[Clearing condition]

- 0 is written to this flag.

ADTRBDF flag (GTADTRB Compare Match (Counting Down) A/D Converter Start Request Flag)

The ADTRBDF flag indicates whether or not a compare match with the GTADTRB register has occurred during counting down.

[Setting condition]

- GTCNT = GTADTRB during counting down

[Clearing condition]

- 0 is written to this flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected by GRP[1:0] bits. When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

DTEF flag (Dead Time Error Flag)

The DTEF flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.

This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is returned to the cycle. This flag is read only. Writing 0 to clear the flag is not allowed.

When an interrupt by the DTEF flag is enabled (GTINTAD.GRPDTE = 1), the DTEF flag is output to POEG as an output disable request each time the DTEF flag changes from 0 to 1.

[Setting condition]

- The timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.
  For triangle wave in up-counting: GTCCRA – GTDVU ≤ 0
  For triangle wave in down-counting: GTCCRA – GTDVD < 0
  For saw wave 1 shot pulse mode in up-counting:
  GTCCRA – GTDVU < 0 or GTCCRA + GTDVD > GTPR
  For saw wave 1 shot pulse mode in down-counting:
  GTCCRA + GTDVU > GTPR or GTCCRA - GTDVD < 0

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the timer cycle.

OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that GTIOCA pin and GTIOCB pin output 1 at the same time.

When GTIOCA pin or GTIOCB pin output 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request.

[Setting condition]

- GTIOCA pin and GTIOCB pin output 1 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA pin and GTIOCB pin output 0 at the same time when both the OAE and OBE bits are set to 1
- Either OAE bit or OBE bit is set to 0.

OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that GTIOCA pin and GTIOCB pin output 0 at the same time.

When GTIOCA pin or GTIOCB pin output 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request.

[Setting condition]

- GTIOCA pin and GTIOCB pin output 0 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA pin and GTIOCB pin output 1 at the same time when both the OAE and OBE bits are set to 1
- At least either OAE bit or OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before masked by the output disable function. When the output disable state is performed, a compare match also performs continuously in the GPT and the OABHF/OABLF flag is updated in association with the result of the compared values.

5.7.2.17 General PWM Timer Buffer Enable Register (GTBER)

b31	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

GTBER provides settings for the buffer operation and must be set while the GTCNT operation stops.

BD[0] bit (GTCCR Buffer Operation Disable)

The BD[0] bit disables buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF of the combined GPT.

When GTDTCR.TDE is 1 and when BD[0] is set to 0, GTCCRB does not perform buffer operation and the GTCCRB register is automatically set to a compare match value for a negative-phase waveform with dead time.

BD[1] bit (GTPR Buffer Operation Disable)

The BD[1] bit disables buffer operation using GTPR, GTPBR, and GTPDBR of the combined GPT.

BD[2] bit (GTADTR Buffer Operation Disable)

The BD[2] bit disables buffer operation using GTADTRA, GTADTRB, GTADTBRA, GTADTBRB, GTADTDBRA, and GTADTDBRB of the combined GPT. In event count operation, this bit is not available and the GTADTR buffer operation is not performed.

BD[3] bit (GTDV Buffer Operation Disable)

The BD[3] bit disables buffer operation using GTDVU, GTDVD, GTDBD, and GTDBU of the combined GPT.

When the GTDTCR.TDFER bit is set to 1 and when BD[3] is set to 0, buffer operation is not performed and the GTDVD value is set as a value of GTDVU automatically. In event count operation, this bit is not available and the GTDV buffer operation is not performed.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set buffer operation using GTCCRA, GTCCRC, and GTCCRD of the combined GPT. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.*[1]

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set buffer operation using GTCCRB, GTCCRE, and GTCCRF of the combined GPT. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.* [1]

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set buffer operation using GTPR, GTPBR, and GTPDBR of the combined GPT.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forcibly performs a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after 1 is written. This bit is read as 0 and is only valid when counting is stopped with a specified compare match operation.

ADTTA[1:0] bits (GTADTRA Buffer Transfer Timing Select)

The ADTTA[1:0] bits set the transfer timing for buffer operation of GTADTRA, GTADTBRA, and GTADTDBRA. These bits are not available in event count operation.

ADTDA bit (GTADTRA Double Buffer Operation)

The ADTDA bit sets buffer operation with GTADTRA, GTADTBRA, and GTADTDBRA combined. This bit is not available in event count operation.

ADTTB[1:0] bits (GTADTRB Buffer Transfer Timing Select)

The ADTTB[1:0] bits set the transfer timing for buffer operation of GTADTRB, GTADTBRB, and GTADTDBRB. This bit is not available in event count operation.

ADTDB bit (GTADTRB Double Buffer Operation)

The ADTDB bit sets buffer operation using GTADTRB, GTADTBRB, and GTADTDBRB of the combined GPT. This bit is not available in event count operation.

Note 1. The buffer operation mode is fixed in saw-wave one-shot pulse mode, or triangle-wave PWM mode 3 (64-bit transfer at trough).

5.7.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC)

Address(es): GPT32Em.GTITC H'1004_8044 + H'0100 × m (m = 0 to 7)

b31 to b15	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTITC sets the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (OVFn) and underflow interrupt (UNFn). It also specifies whether to link other interrupts and A/D converter start requests with the OVFn/UNFn interrupt skipping function. An output disable request to the POEG cannot be linked with the OVFn/UNFn interrupt skipping function. This bit is not available in event count operation.

ITLA bit (GTCCRA Compare Match/Input Capture Interrupt Link)

The ITLA bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the OVFn/UNFn interrupt skipping function.

ITLB bit (GTCCRB Compare Match/Input Capture Interrupt Link)

The ITLB bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the OVFn/UNFn interrupt skipping function.

ITLC bit (GTCCRC Compare Match Interrupt Link)

The ITLC bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the OVFn/UNFn interrupt skipping function.

ITLD bit (GTCCRD Compare Match Interrupt Link)

The ITLD bit specifies whether to link the GTCCRD compare match interrupt (GTCID) with the OVFn/UNFn interrupt skipping function.

ITLE bit (GTCCRE Compare Match Interrupt Link)

The ITLE bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the OVFn/UNFn interrupt skipping function.

ITLF bit (GTCCRF Compare Match Interrupt Link)

The ITLF bit specifies whether to link the GTCCRF compare match interrupt (GTCIF) with the OVFn/UNFn interrupt skipping function.

IVTC[1:0] bits (OVFn/UNFn Interrupt Skipping Function Select)

The IVTC[1:0] bits set the skipping function for the GTPR compare match (GTCNT overflow) interrupt (OVFn) and GTCNT counter underflow interrupt (UNFn).

IVTT[2:0] bits (OVFn/UNFn Interrupt Skipping Count Select)

The IVTT[2:0] bits set the skipping count for the GTPR compare match (GTCNT overflow) interrupt (OVFn) and GTCNT counter underflow interrupt (UNFn). When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL bit (GTADTRA A/D Converter Start Request Link)

The ADTAL bit specifies whether to link the GTADTRA A/D converter start request with OVFn/UNFn interrupt skipping function.

ADTBL bit (GTADTRB A/D Converter Start Request Link)

The ADTBL bit specifies whether to link the GTADTRB A/D converter start request with OVFn/UNFn interrupt skipping function.

5.7.2.19 General PWM Timer Counter (GTCNT)

GTCCRn registers are read/write registers.

GTCCRA and GTCCRB are registers used for both output compare and input capture.

GTCCRC and GTCCRE are compare match registers that can also function as buffer registers for GTCCRA and GTCCRB.

GTCCRD and GTCCRF are compare match registers that can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).

5.7.2.21 General PWM Timer Cycle Setting Register (GTPR)

Address(es): GPT32Em.GTPR H'1004_8064 + H'0100 × m (m = 0 to 7)

Bit	Bit Name	Initial Value	R/W	Description
b0	TDE	0	R/W	Negative-Phase Waveform Setting 0: Set GTCCRB without using GTDVU and GTDVD. 1: Use GTDVU and GTDVD to set the compare match value for negative-phase waveform with automatic dead time in GTCCRB.
b3 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b4	TDBUE	0	R/W	GTDVU Buffer Operation Enable 0: Disable GTDVU buffer operation 1: Enable GTDVU buffer operation.
b5	TDBDE	0	R/W	GTDVD Buffer Operation Enable 0: Disable GTDVD buffer operation 1: Enable GTDVD buffer operation.
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	TDFER	0	R/W	GTDVD Setting 0: Set GTDVU and GTDVD separately 1: Automatically set the value written to GTDVU to GTDVD.
b31 to b9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time.

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU and GTDVD. When GTDVU and GTDVD are used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU and GTDVD), is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and automatic setting does not take place.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB and the GTST.DTEF flag is set to 1. However, in triangle waves, when the obtained GTCCRB value exceeds the upper limit value, the GTST.DTEF flag is set to 0.

- Triangle waves
  Upper limit value: GTPR – 1
  Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode
  Upper limit value: GTPR
  Lower limit value: 0

TDBUE bit (GTDVU Buffer Operation Enable)

The TDBUE bit enables buffer operation with GTDVU and GTDBU combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves.

TDBDE bit (GTDVD Buffer Operation Enable)

The TDBDE bit enables buffer operation with GTDVD and GTDBD combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves. When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER bit (GTDVD Setting)

The TDFER bits sets whether or not the value written to GTDVU is also set to GTDVD automatically.

5.7.2.28 General PWM Timer Dead Time Value Register n (GTDVn) (n = U, D)

Address(es): GPT32Em.GTDVU H'1004_808C + H'0100 x m (m = 0 to 7)

GTDVn is a 32-bit read/write register that sets the dead time for generating PWM waveforms with dead time. GTDVU is used for up-counting and GTDVD is used for down-counting.

It is prohibited to set the GTDVn register with a value larger than or equal to that of the GTPR register.

Do not set the change point of waveform beyond the count cycle period, when the automatic dead time setting function is used. By reading the GTCCRB register, can be seen the change point for the reverse-phase waveform after the dead time added, which is set in the automatic dead time setting function.

When GTDVn is used, writing to GTCCRB is not allowed. When this register is set to 0, waveforms without dead time are output. GTDVn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited.

When GTDVn buffer operation is enabled, GTDBn can be written anytime. The value of GTDBn is transferred to GTDVn at the end of the count cycle period. When the GTDVn buffer operation is disabled, set the CST bit in the GTCR register to stop the GPT with before changing GTDVn to a new value. When GTDVn buffer operation is disabled, to change GTDVn to a new value, stop the GPT with the CST bit in the GTCR register.

5.7.2.29 General PWM Timer Dead Time Buffer Register n (GTDBn) (n = U, D)

Address(es): GPT32Em.GTDBU H'1004_8094 + H'0100 × m (m = 0 to 7)

b9, b8	—	All 0	R	Reserved The read value is undefined.
b31 to b10	—	All 0	R	Reserved These bits are read as 0.

GTSOS is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode.

SOS[1:0] bits (Output Protection Function Status)

The SOS[1:0] bits indicate the status of the output protection function in triangle-wave PWM mode.

5.7.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR)

Address(es): GPT32Em.GTSOTR H'1004_80A0 + H'0100 x m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOTR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	SOTR	0	R/W	Output Protection Function Temporary Release 0: Do not release protected state 1: Release protected state.
b31 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTSOTR temporarily releases the protected state of GTIOCB pin output when output protection is set. The protected state can be released only when GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA ≥ GTPR has occurred during transfer at trough). The protected state cannot be released in any other case.

SOTR bit (Output Protection Function Temporary Release)

The SOTR bit specifies whether to temporarily release the protected state of the GTIOCB pin output in an output protected state. When the SOTR bit is set to 1, the output protection function is canceled from the first trough. When the SOTR bit is set to 0, output protection resumes from the first trough.

5.7.3 Operation

5.7.3.1 Basic Operation

Each channel has a 32-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle. When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated pin GTIOCA or GTIOCB can be changed. GTCCRA or GTCCRB can be used as an input capture register with hardware resources. GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

5.7.3.1.1 Counter Operation

(1) Counter start and stop

The counter of each channel starts the count operation by setting GTCR.CST to 1. The GTCR.CST bit value is changed by following sources.

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register.

(2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to H’0000_0000. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1. When GTCNT overflows, up-counting resumes from H’0000_0000.

Figure 5.7-2 shows an example of a periodic count operation in up-counting.

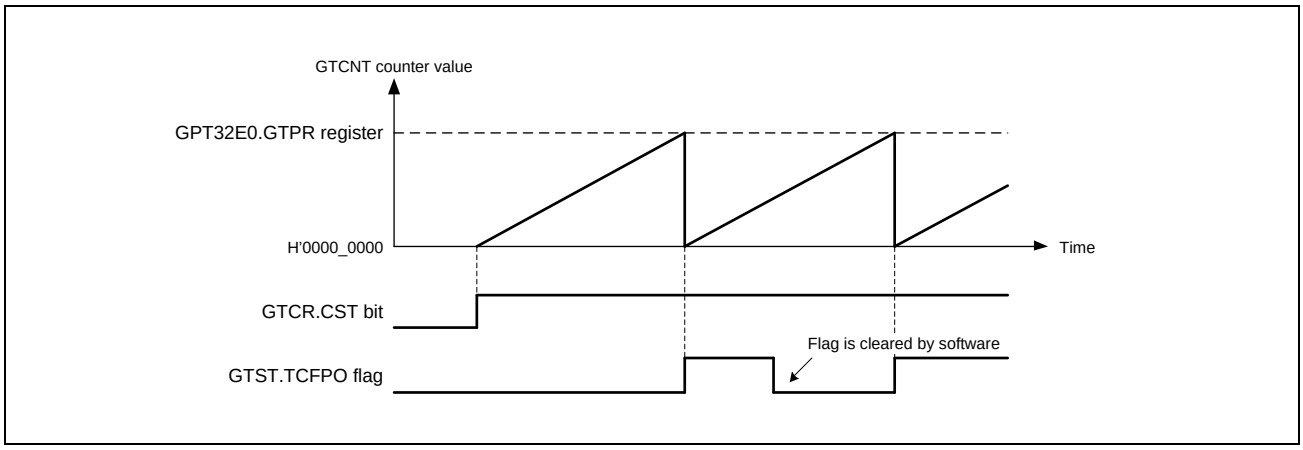

Figure 5.7-2 Example of periodic count operation in up-counting by the count clock

Figure 5.7-3 shows an example setting for periodic count operation in up-counting.

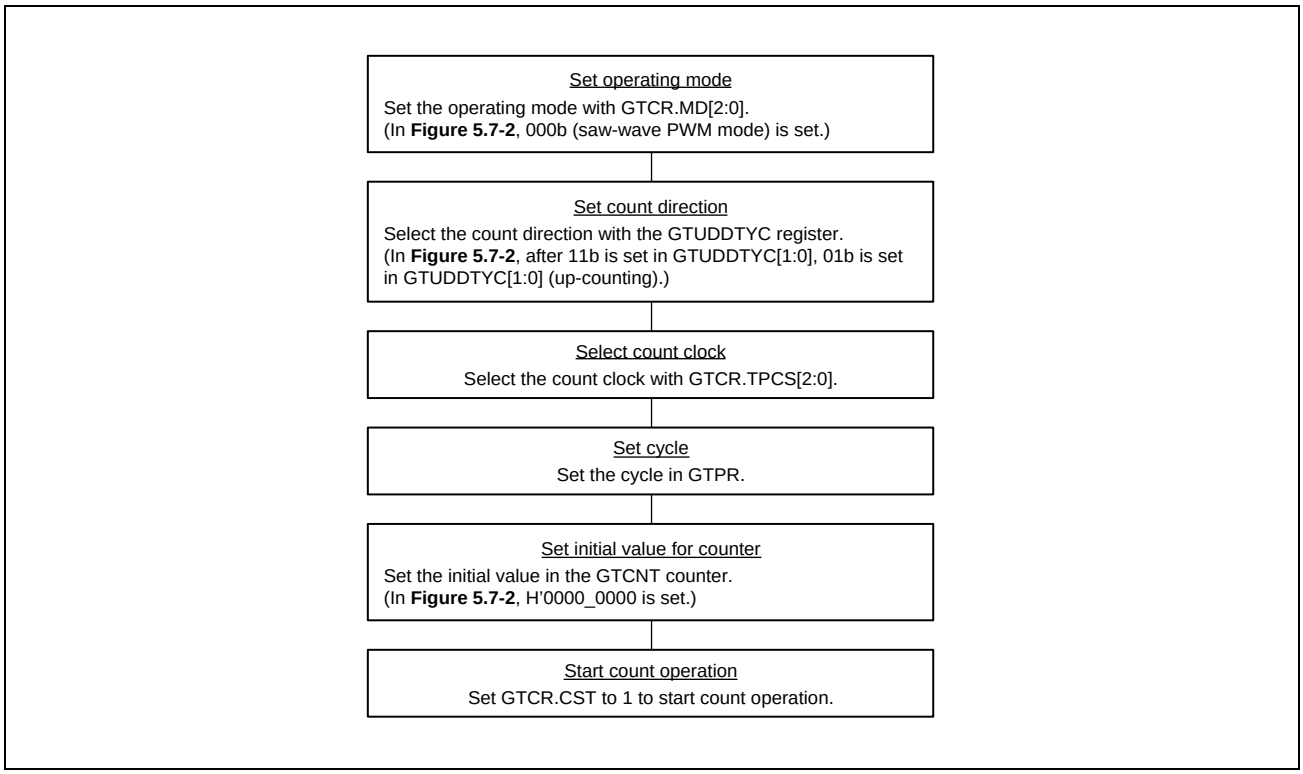

Figure 5.7-3 Example setting for a periodic count operation in up-counting by the count clock

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to H'0000_0000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1. When the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 5.7-4 shows an example of periodic count operation in down-counting by the count clock.

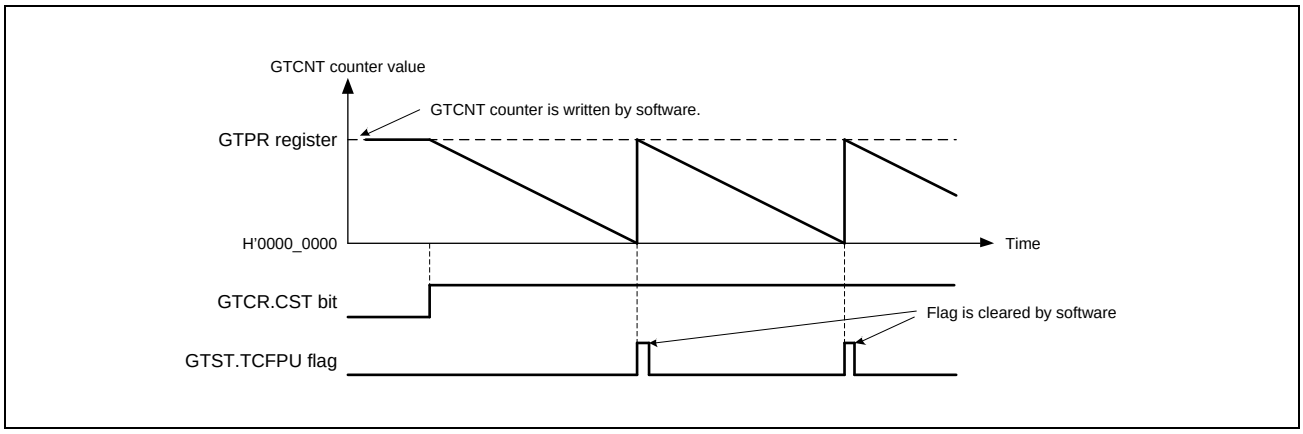

Figure 5.7-4 Example of periodic count operation in down-counting by the count clock

Figure 5.7-5 shows an example setting for periodic count operation in down-counting by the count clock.

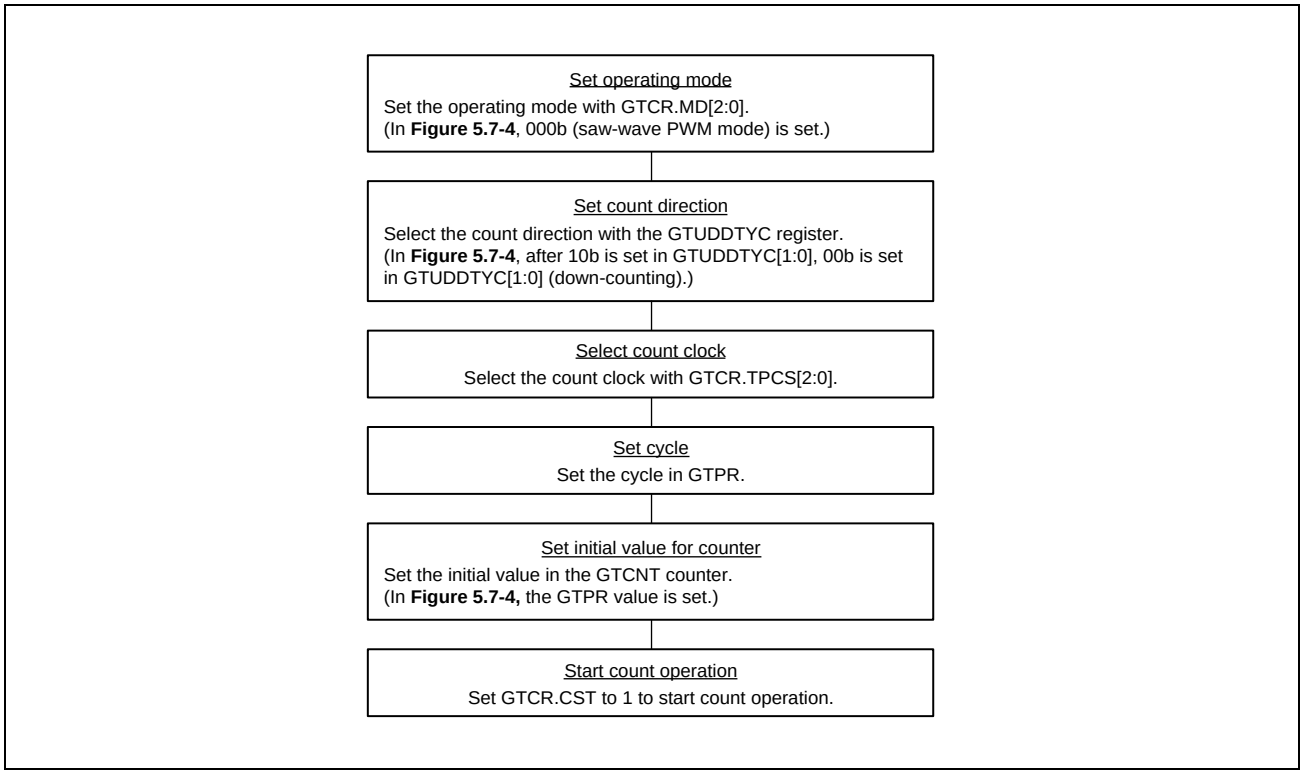

Figure 5.7-5 Example setting for periodic count operation in down-counting by count clock

(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior for up-counting using hardware sources is the same as for up-counting by the count clock.

When GTCR.CST bit is set to 1 to count up using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized by the count clock selected by GTCR.TPCS[2:0]. Set the GTCR.TPCS[2:0] bits to 000b to select counting up of single cycles of the P0ϕ clock with a delay of one clock cycle after the GTCR.CST bit has been set to 1.

Figure 5.7-6 shows an example of a periodic count operation in up-counting by a hardware resource (rising edge of GTETRGA pin).

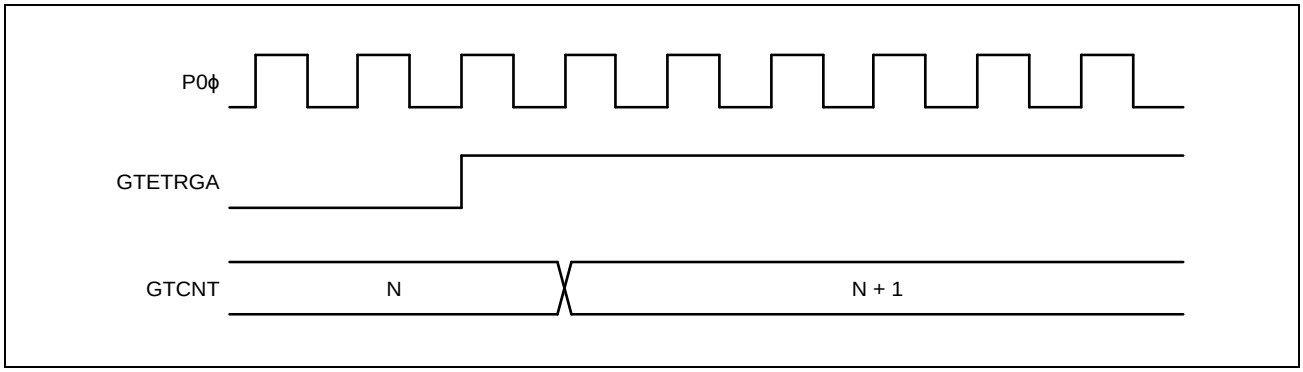

Figure 5.7-6 Example of periodic count operation in up-counting using hardware sources

Figure 5.7-7 shows an example setting for periodic count operation in up-counting by the count clock.

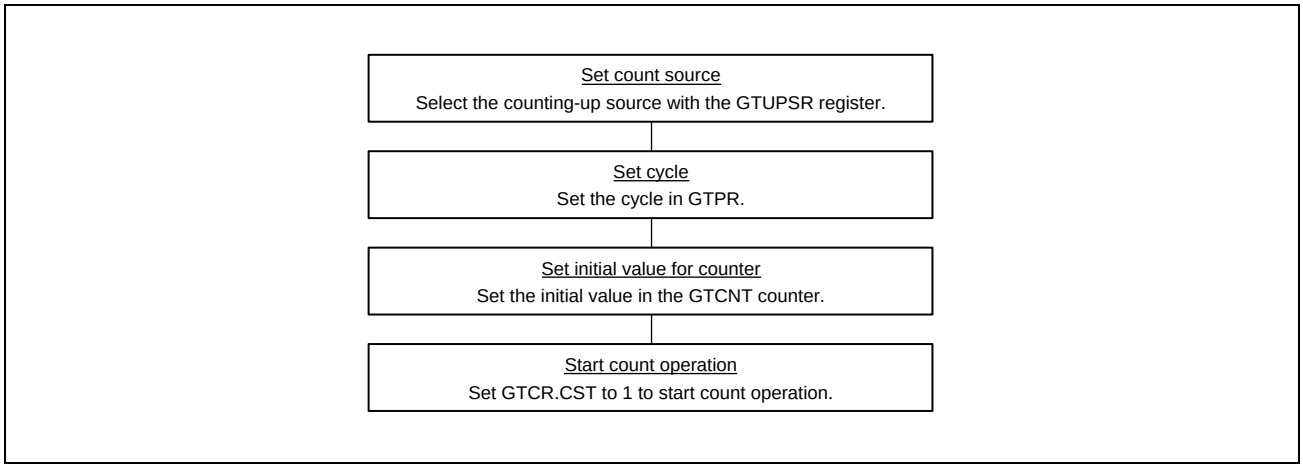

Figure 5.7-7 Example setting for an event count operation in up-counting using hardware sources

(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR. When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time,

GTCNT counter value does not change. The underflow behavior for down-counting using hardware sources is the same as for down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized with the count clock selected by GTCR.TPCS[2:0]. Set the GTCR.TPCS[2:0] bits to 000b to select counting up of single cycles of the P0ϕ clock with a delay of one clock cycle after the GTCR.CST bit has been set to 1.

Figure 5.7-8 shows an example of a periodic count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

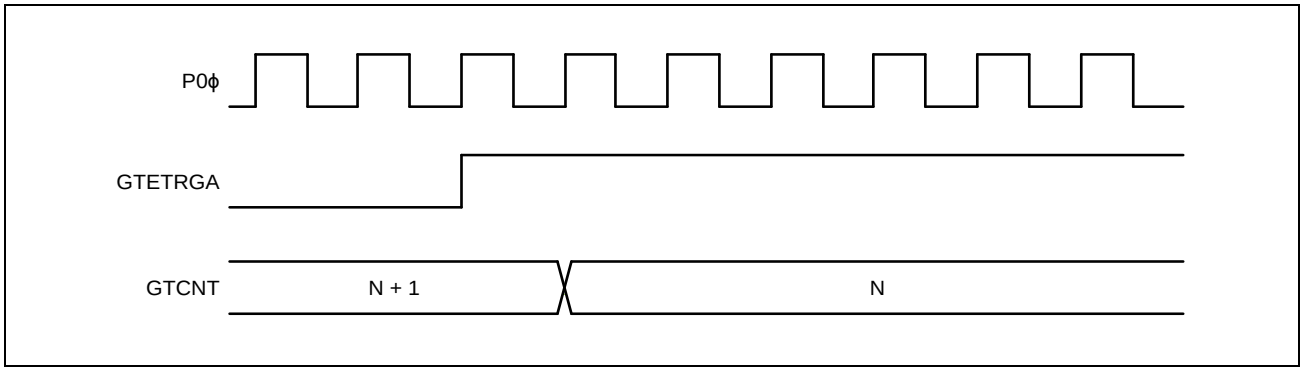

Figure 5.7-8 Example of event count operation in down-counting using hardware sources

Figure 5.7-9 shows an example setting for a periodic count operation in down-counting using a hardware resource.

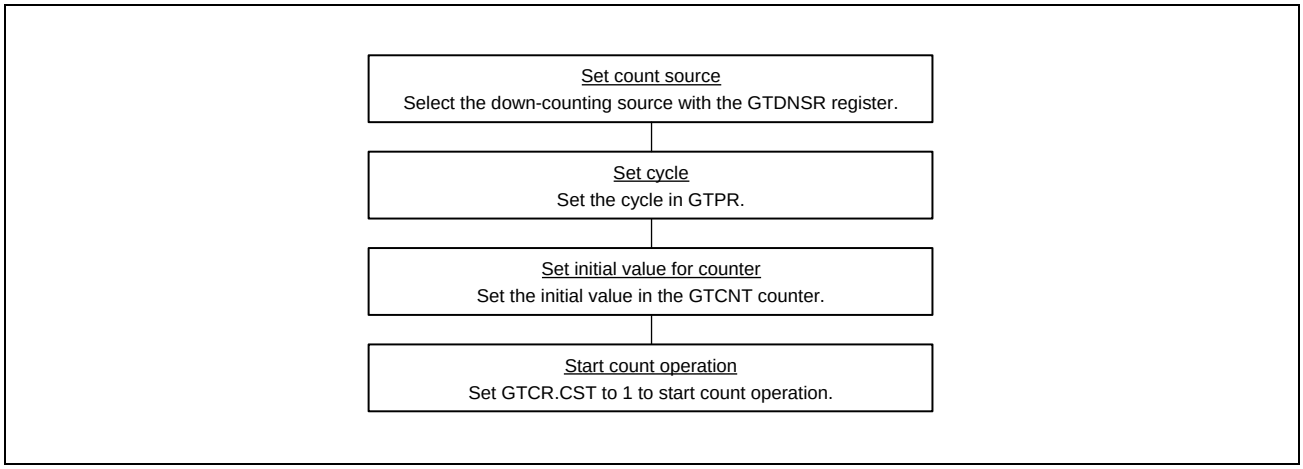

Figure 5.7-9 Example setting for an event count operation in down-counting using hardware sources

(6) Counter clear operation

The counter of each channel is cleared by either of the following sources.

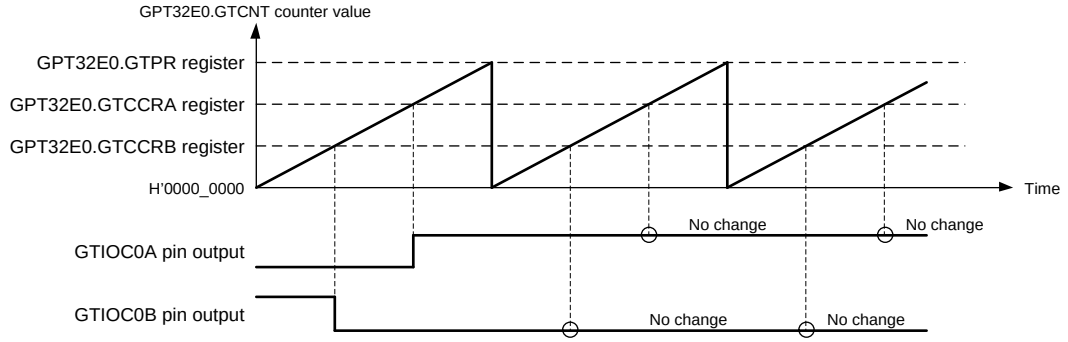
- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST = 1) or not (GTCR.CST = 0).

For saw waves selected by setting GTCR.MD[2:0] and the count direction flag showing down-counting (GTST.TUCF = 0), the GTCNT register is set to the value of the GTPR register when the counter is cleared by writing 1 to the GTCLR register or by the hardware source specified in the GTCSR register. When not in saw waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with P0ϕ. If other settings are used, clear is synchronized with the counter clock selected by GTCR.TPCS[2:0].

5.7.3.1.2 Waveform Output by Compare Match



Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock including the event count. At the same time the GPT can output low, high, or toggle output from the associated GTIOCA or GTIOCB output pin. In addition, the GTIOCA or GTIOCB pin output can be low, high, or toggle at the cycle end which is determined by GTPR. The cycle end is:

- For saw waves in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves – when the GTCNT counter is cleared
- For triangle waves – when the GTCNT changes from 0 to 1 (trough).

(1) Low and high output

Figure 5.7-10 shows an example of low and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOC0A pin by a GPT32E0.GTCCRA compare match, and low is output from the GTOC0B pin by a GPT32E0.GTCCRB compare match. The pin level does not change when the specified level and pin level match.

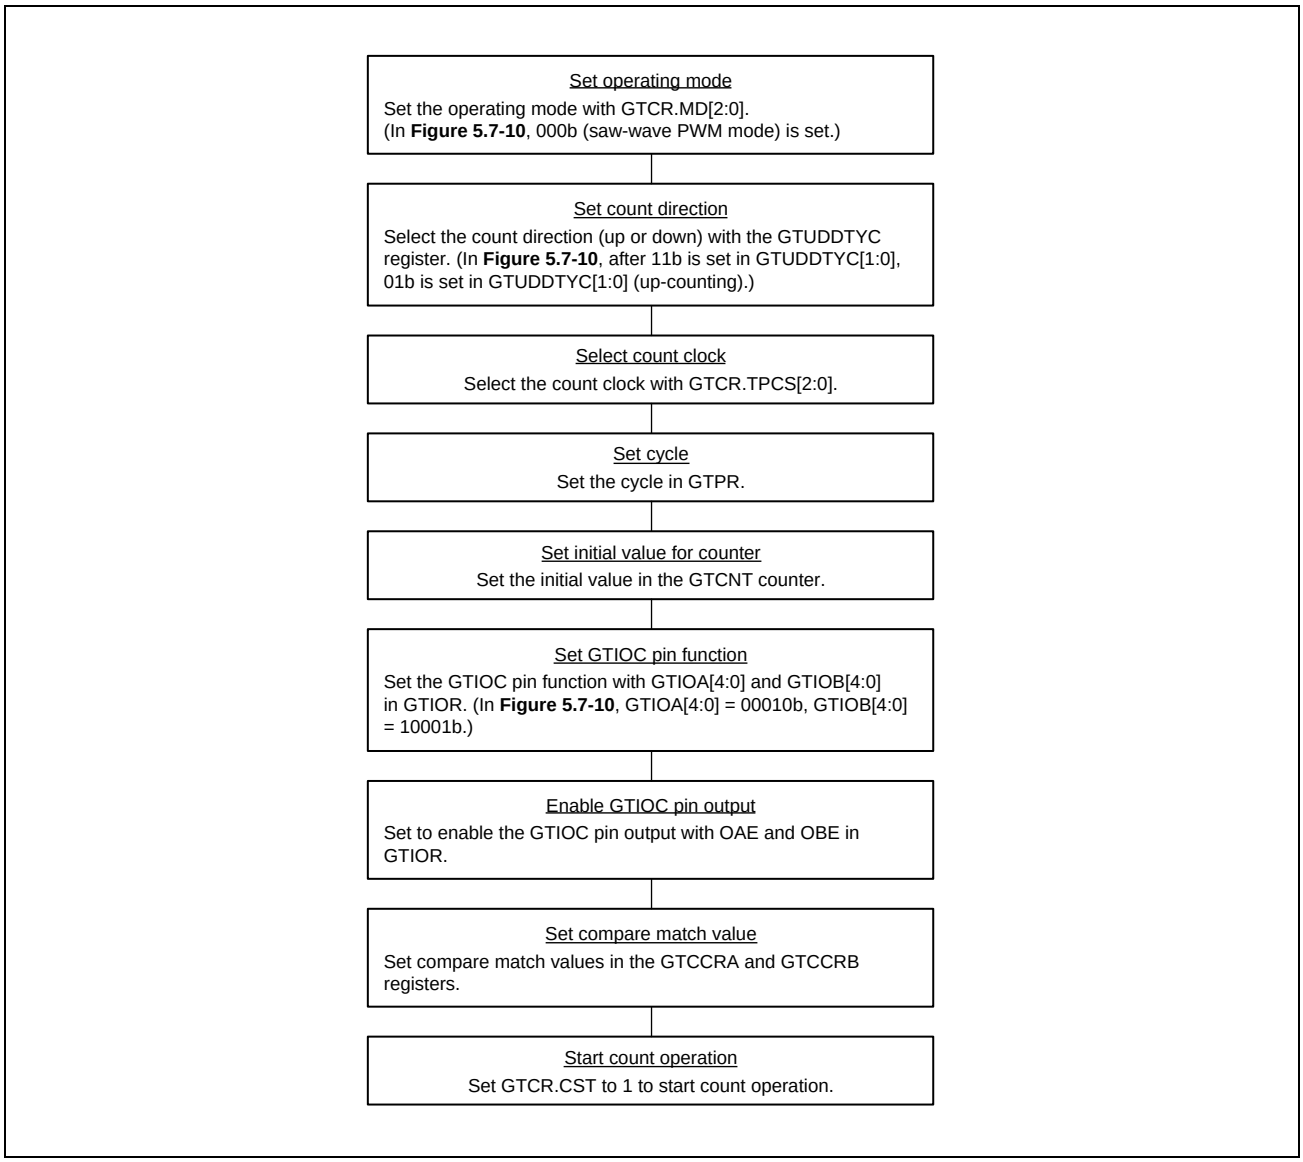
[Setting examples]

GPT32E0.GTIOR.GTIOA[4:0] bits: Initial output is low, high output at compare match, output retained at cycle end

GPT32E0.GTIOR.GTIOB[4:0] bits: Initial output is high, low output at compare match, output retained at cycle end

Figure 5.7-10 Example of low and high output operation

Figure 5.7-11 shows an example setting for low output and high output operation.



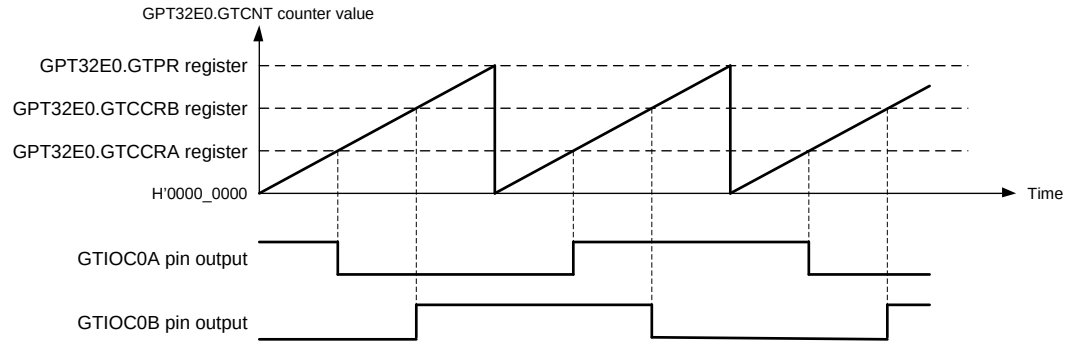


Figure 5.7-11 Example setting for low output and high output operation

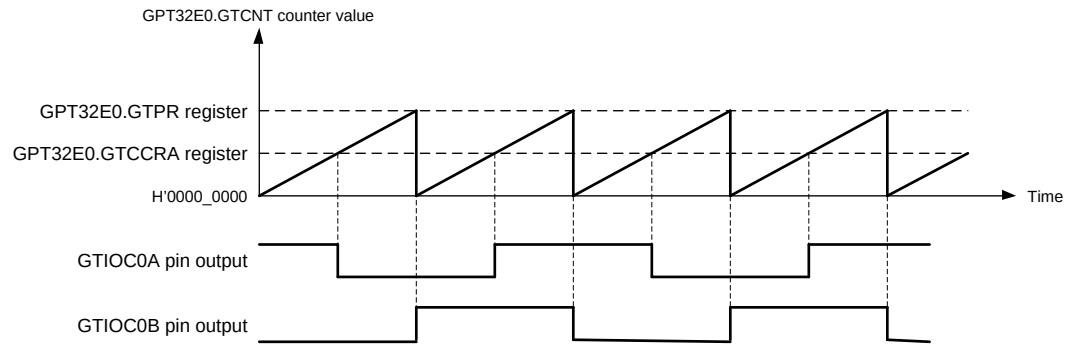
(2) Toggled output

Figure 5.7-12 and **Figure 5.7-13** show examples of toggled output operation by compare matches of GTCCRA and GTCCRB. In **Figure 5.7-12**, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A pin output by a GPT32E0.GTCCRA compare match and GTIOC0B pin output by a GPT32E0.GTCCRB compare match are toggled.

Figure 5.7-13, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A output is toggled by a compare match of GPT32E0.GTCCRA and the GTIOC0B output is toggled at the cycle end.



[Setting examples]

GPT32E0.GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end

GPT32E0.GTIOR.GTIOB[4:0] bits: Initial output is low, output toggled at compare match, output retained at cycle end

Figure 5.7-12 Example of toggled output operation (1)

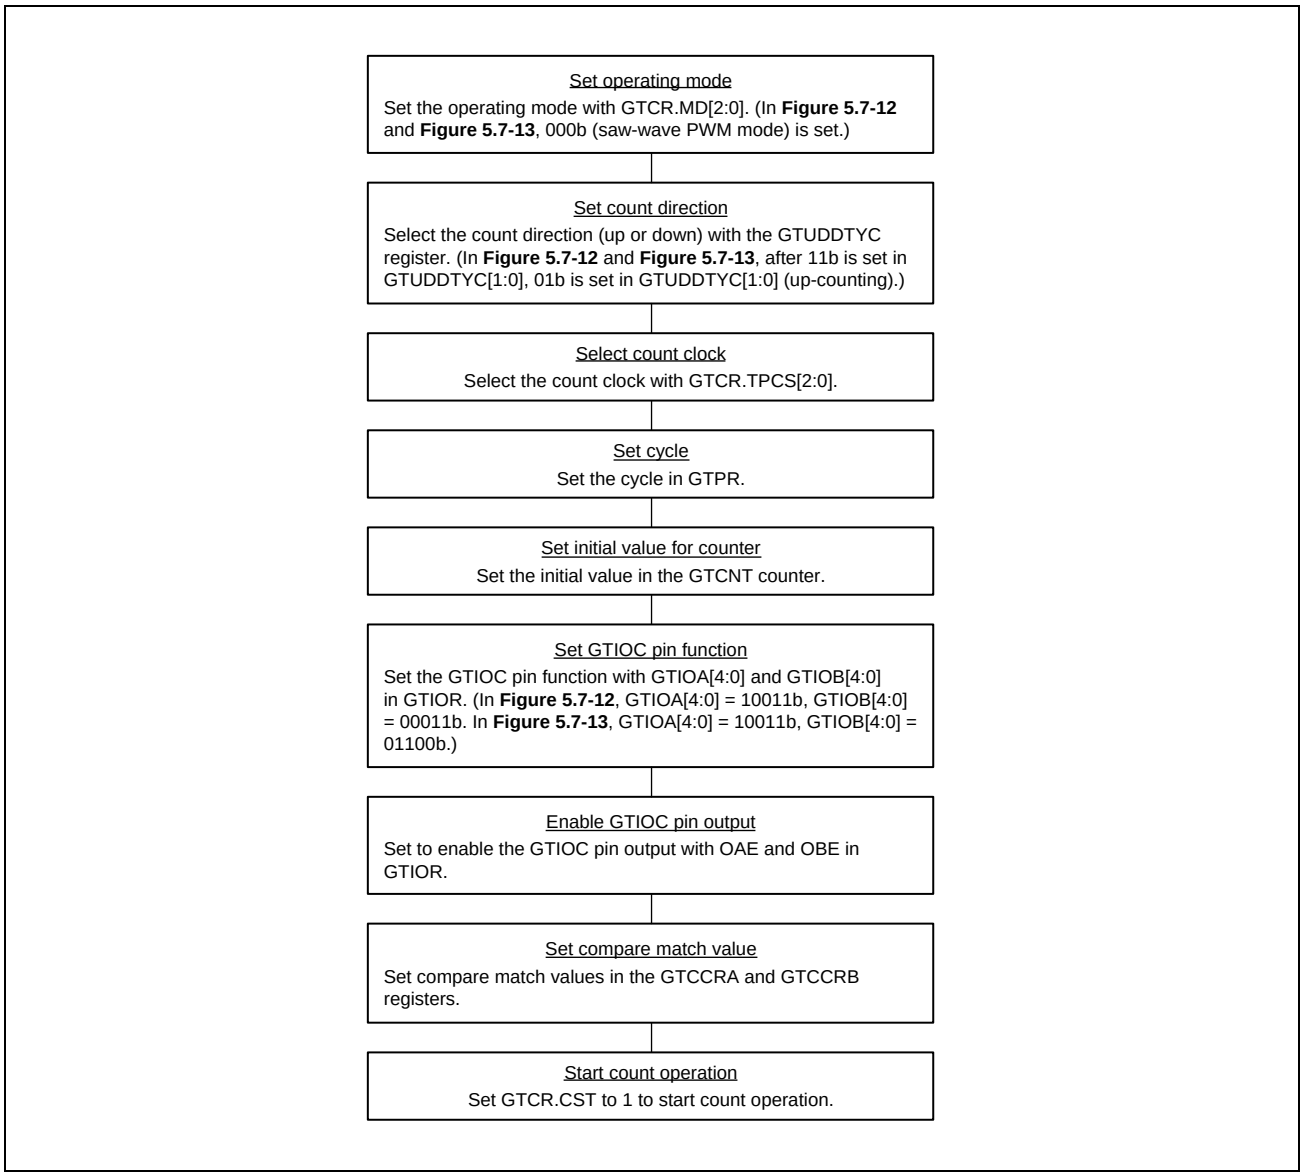
[Setting examples]

GPT32E0.GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end

GPT32E0.GTIOR.GTIOB[4:0] bits: Initial output is low, output retained at compare match, output toggled at cycle end

Figure 5.7-13 Example of toggled output operation (2)

Figure 5.7-14 shows an example setting for toggled output operation.



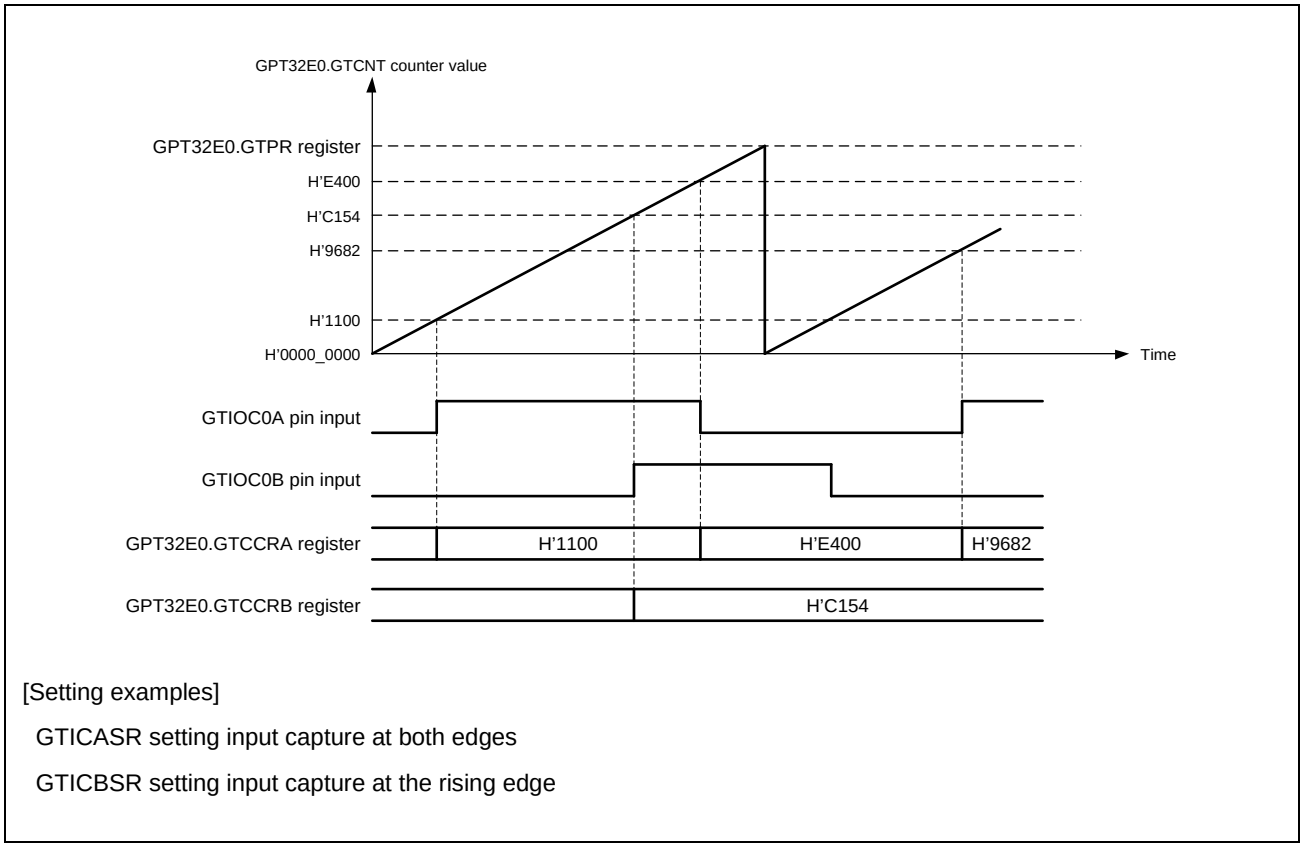


Figure 5.7-14 Example setting for toggled output operation

5.7.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 5.7-15 shows an example of the input capture function.

In this example, the GPT32E0.GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTICCRA at both edges of the GTIOC0A input pin and to GTICCRB on the rising edge of the GTIOC0B input pin.

[Setting examples]

GTICASR setting input capture at both edges

GTICBSR setting input capture at the rising edge

Figure 5.7-15 Example of input capture operation

Figure 5.7-16 shows an example setting for an input capture operation with count operation by the count clock.

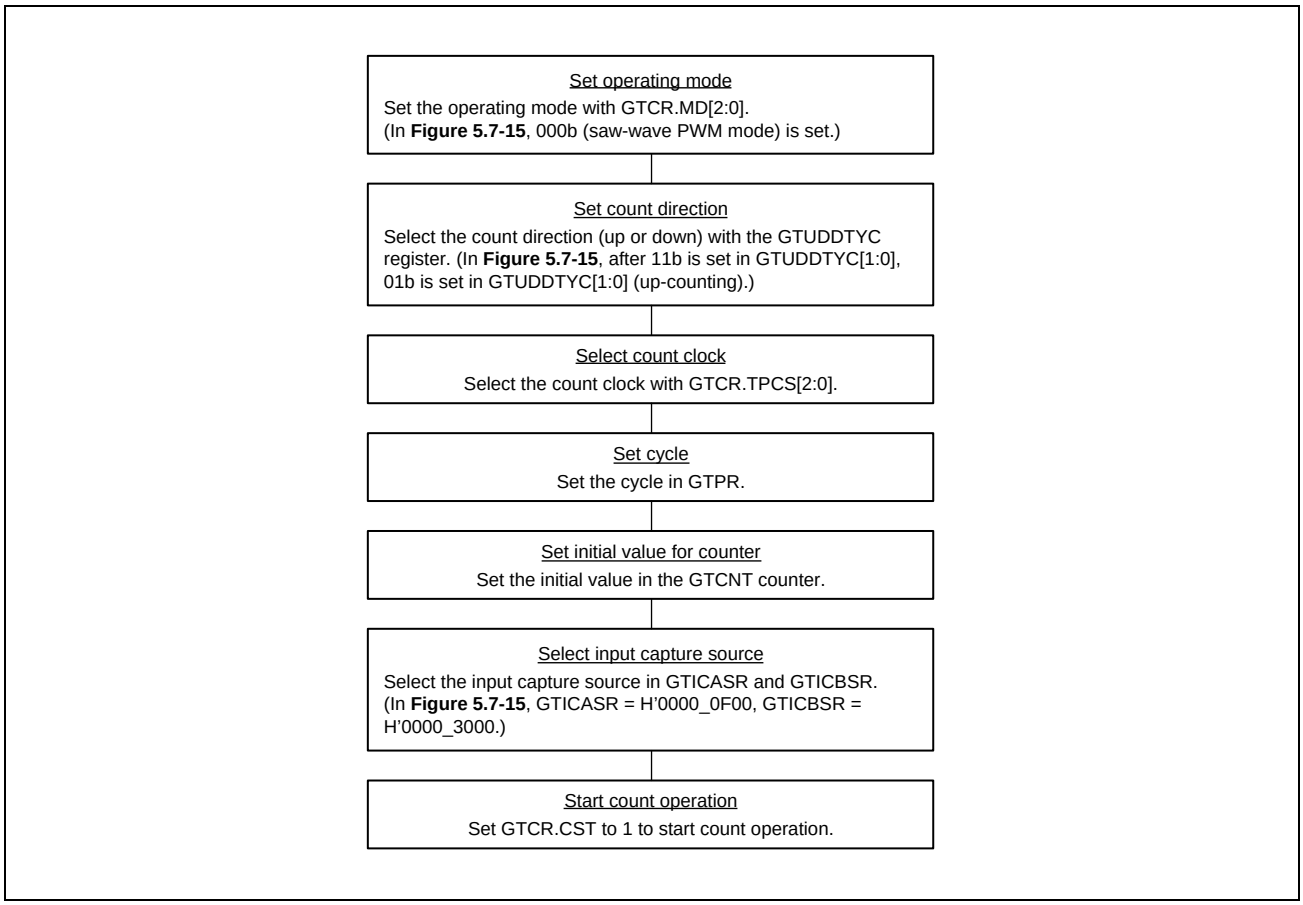

Figure 5.7-16 Example setting for input capture operation

5.7.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR, GTPBR, and GTPDBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB.

The following buffer operations can be set with GTDTCR:

- GTDVU and GTDBU
- GTDVD and GTDBD.

5.7.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR, and GTPDBR can function as a buffer register for GTPBR (double-buffer register for GTPR). The buffer transfer is performed at an overflow during up-counting or an underflow during down-counting in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR[23:0])
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR[n] bit is set to 1, n = channel number).

To set GTPR to function as double buffer, set GTBER.PR[1:0] to 10b or 11b. To set GTPR to not function as a buffer, set GTBER.PR[1:0] to 00b.

Figure 5.7-17 to **Figure 5.7-19** show examples of GTPR buffer operation and **Figure 5.7-20** shows an example setting for GTPR buffer operation.

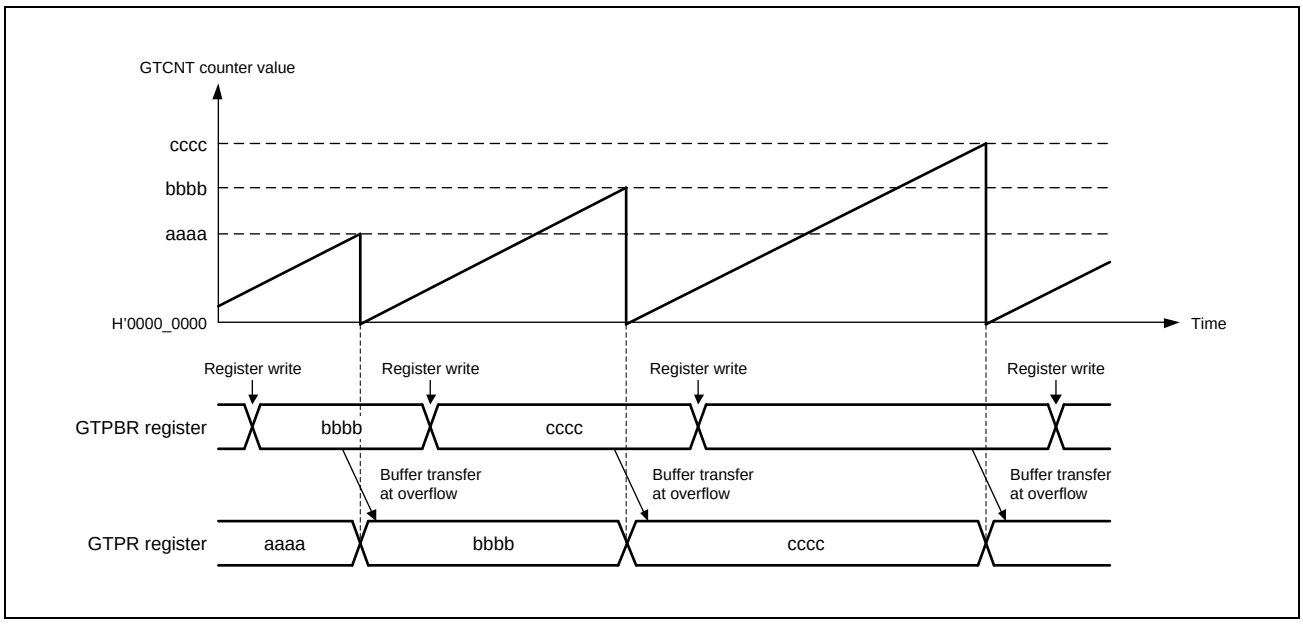

Figure 5.7-17 Example of GTPR buffer operation with saw waves in up-counting

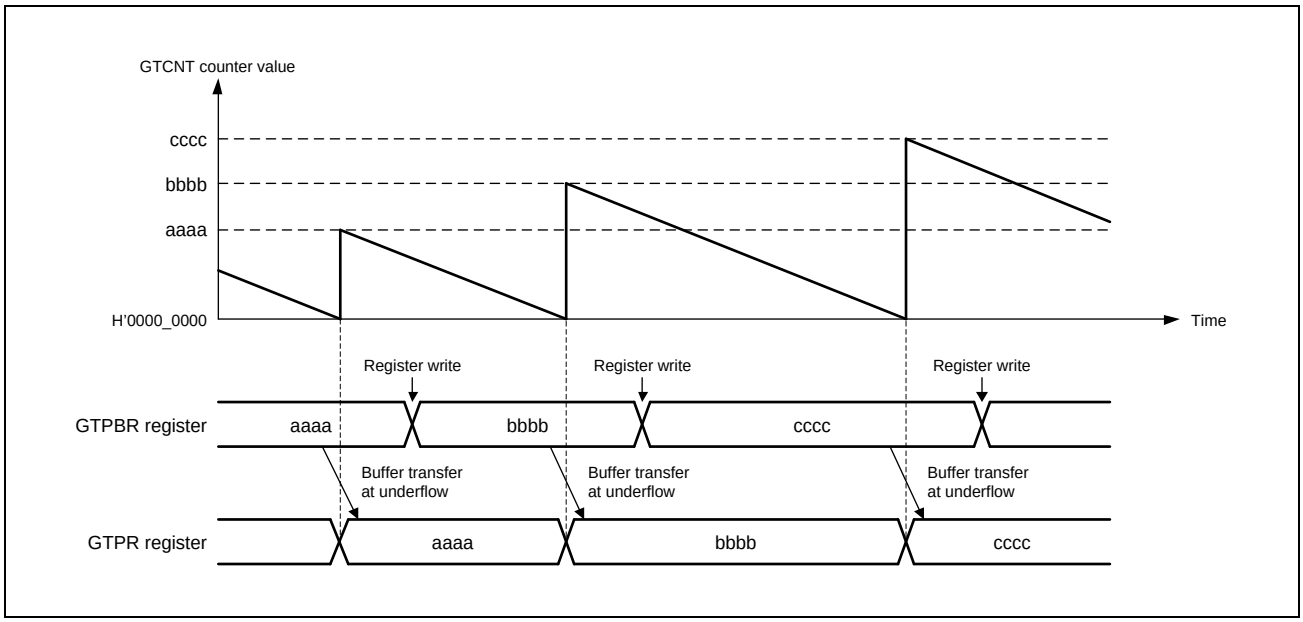

Figure 5.7-18 Example of GTPR buffer operation with saw waves in down-counting

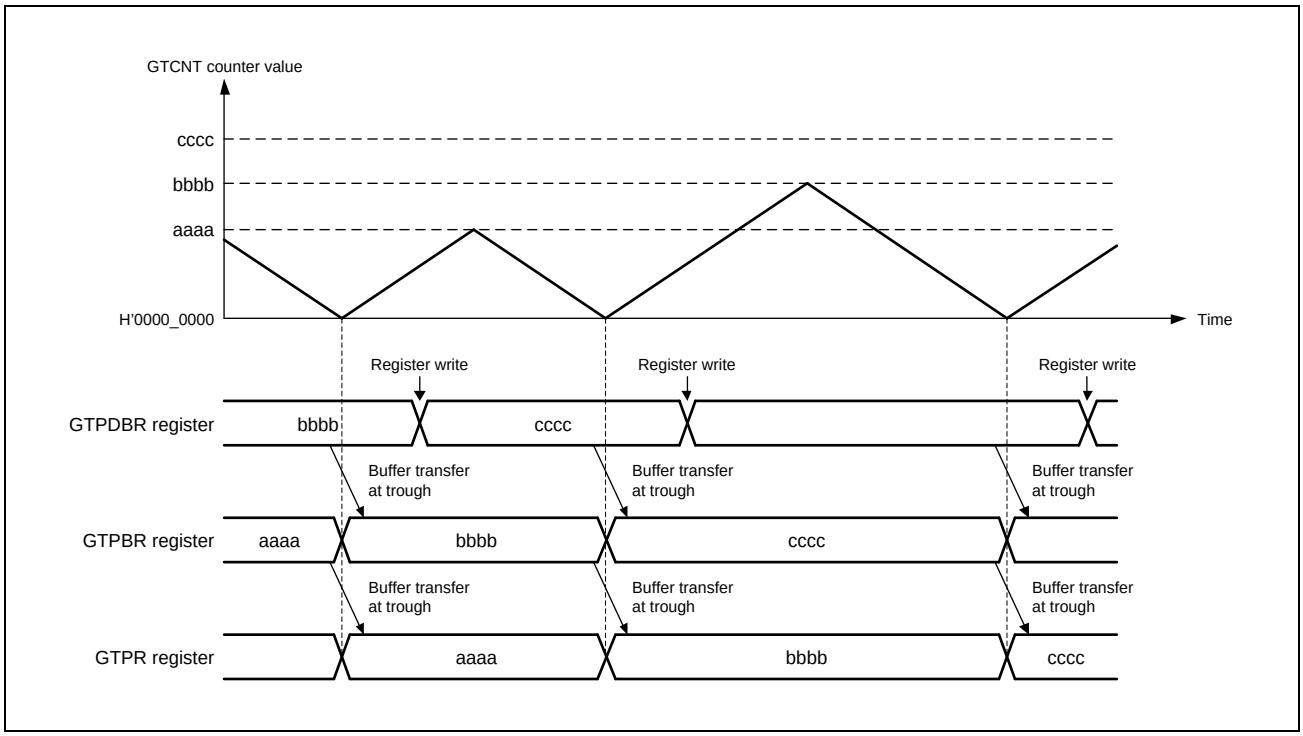

Figure 5.7-19 Example of GTPR double buffer operation with triangle waves

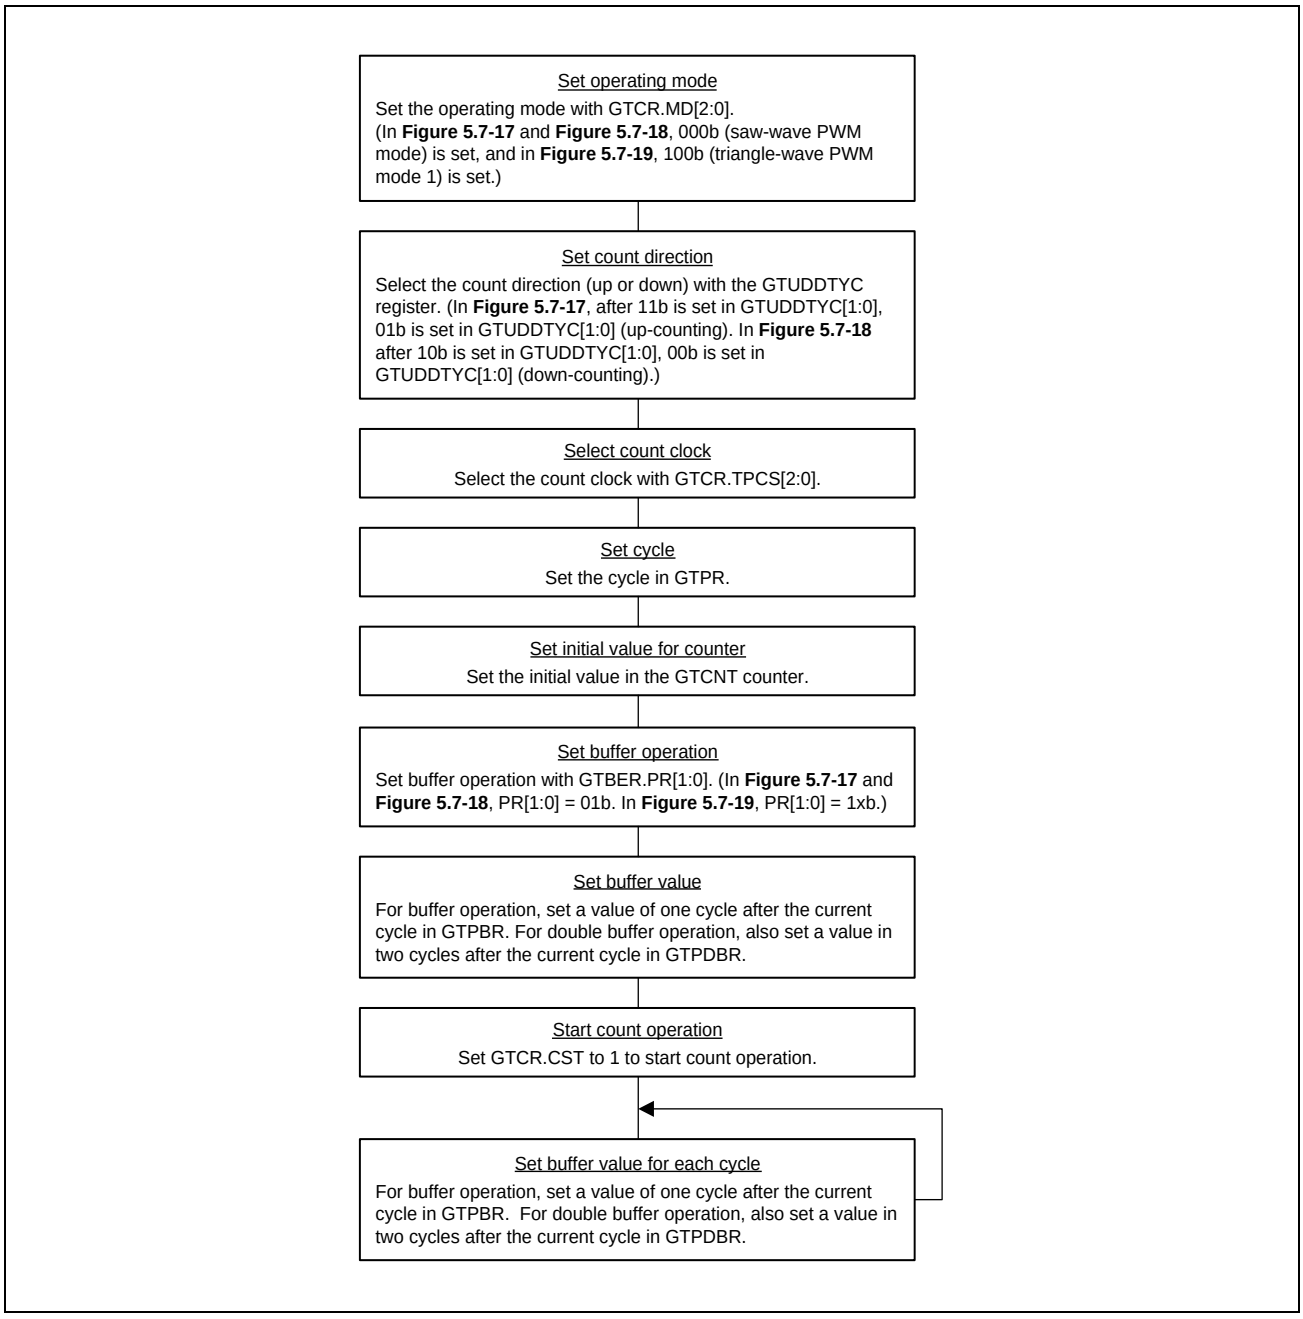

Figure 5.7-20 Example setting for GTPR buffer operation

5.7.3.2.2 Buffer Operation for GTCCRA and GTCCRB

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 01b. To set GTCCRA or GTCCRB to not function as a buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 00b.

(1) When GTCCRA or GTCCRB functions as an output compare register

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow
  Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear
  In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources the same as shown in **5.7.3.2.1 (1) GTPR Register Buffer Operation**. In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer
  When 1 is written to the GTBER.CCRSWT bit while counting is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave 1 shot pulse mode or triangle-wave PWM mode 3.

Figure 5.7-21 to **Figure 5.7-23** show examples of GTCCRA and GTCCRB buffer operation and **Figure 5.7-24** shows an example setting for GTCCRA and GTCCRB buffer operation.

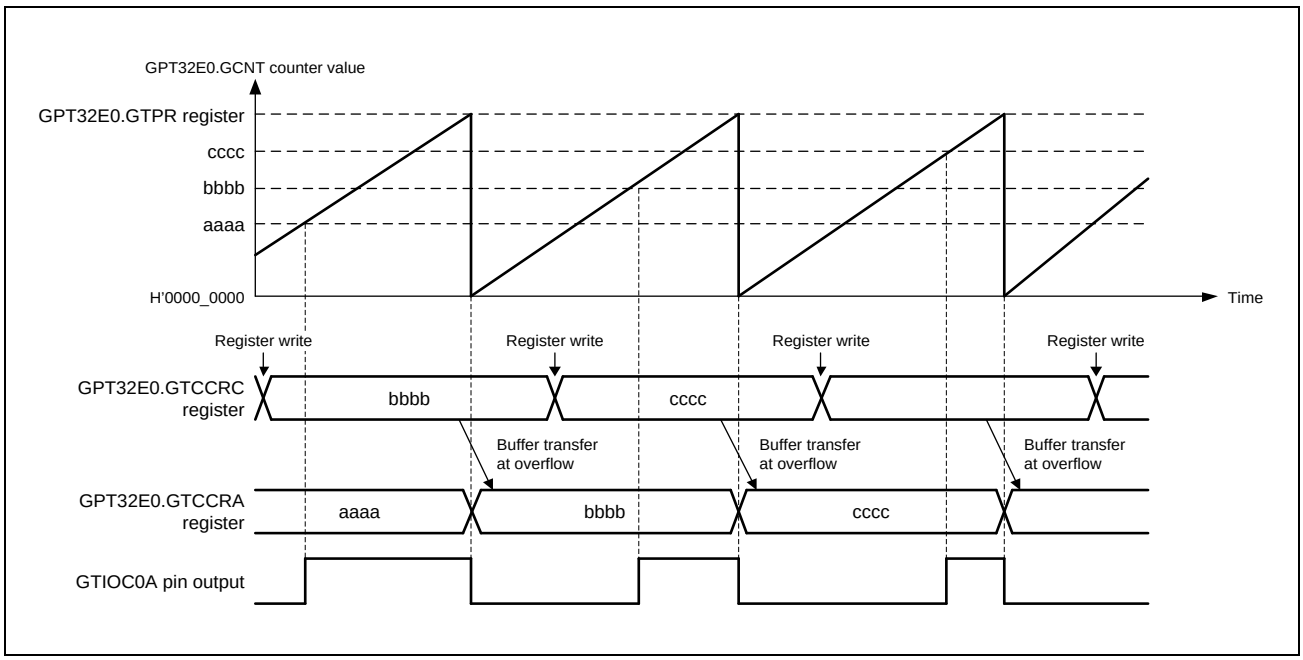

Figure 5.7-21 Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end

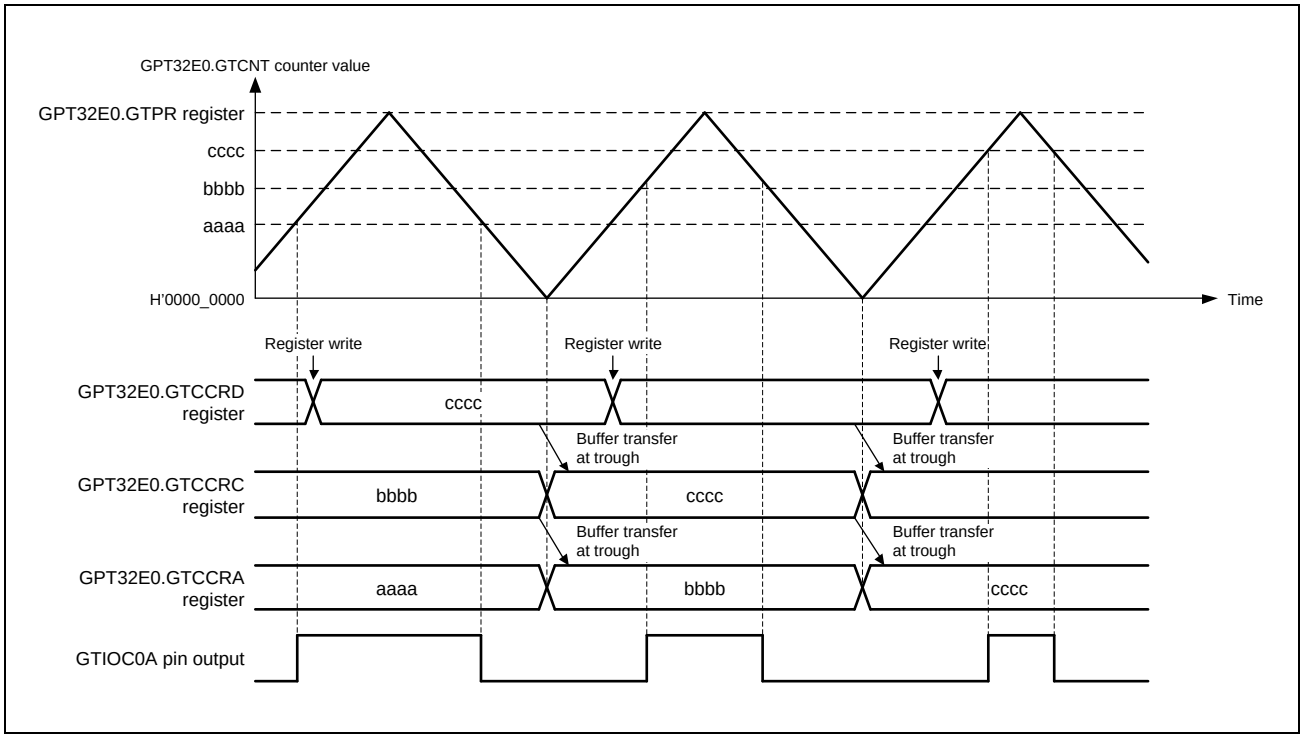

Figure 5.7-22 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end

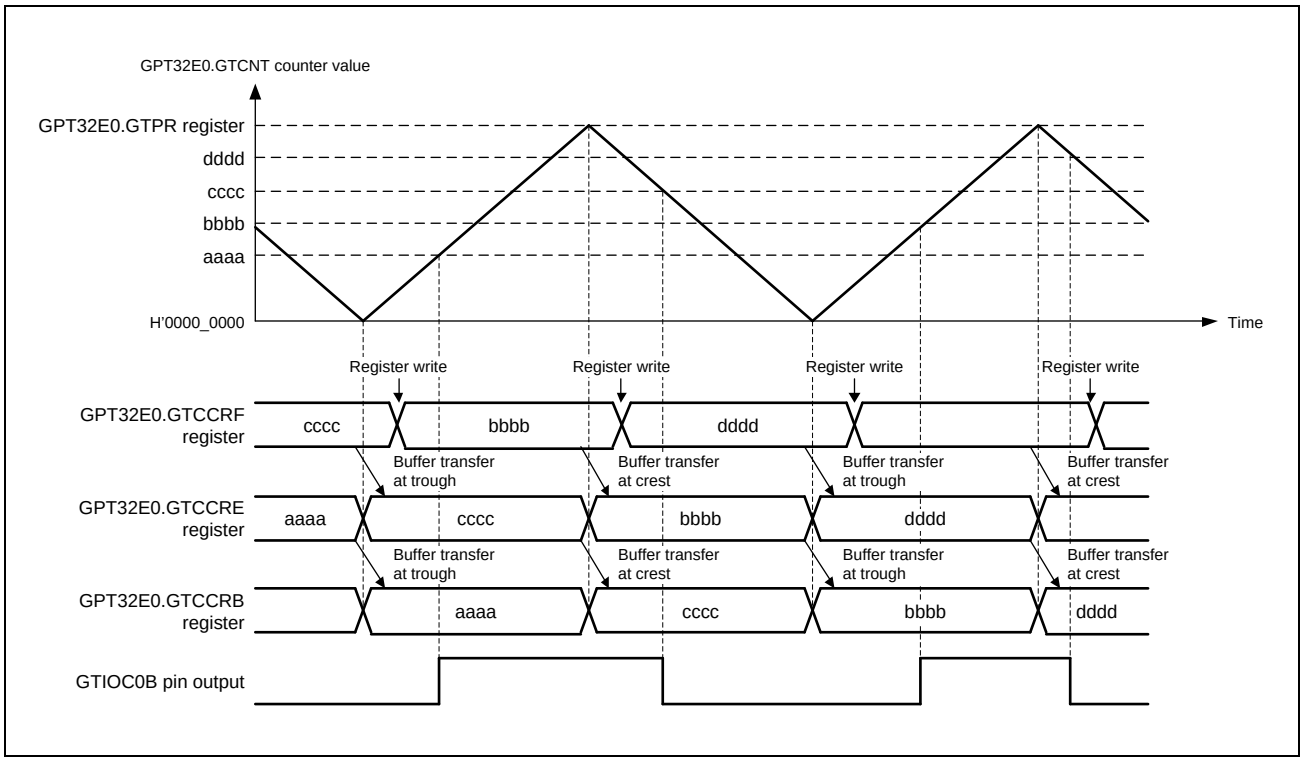

Figure 5.7-23 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

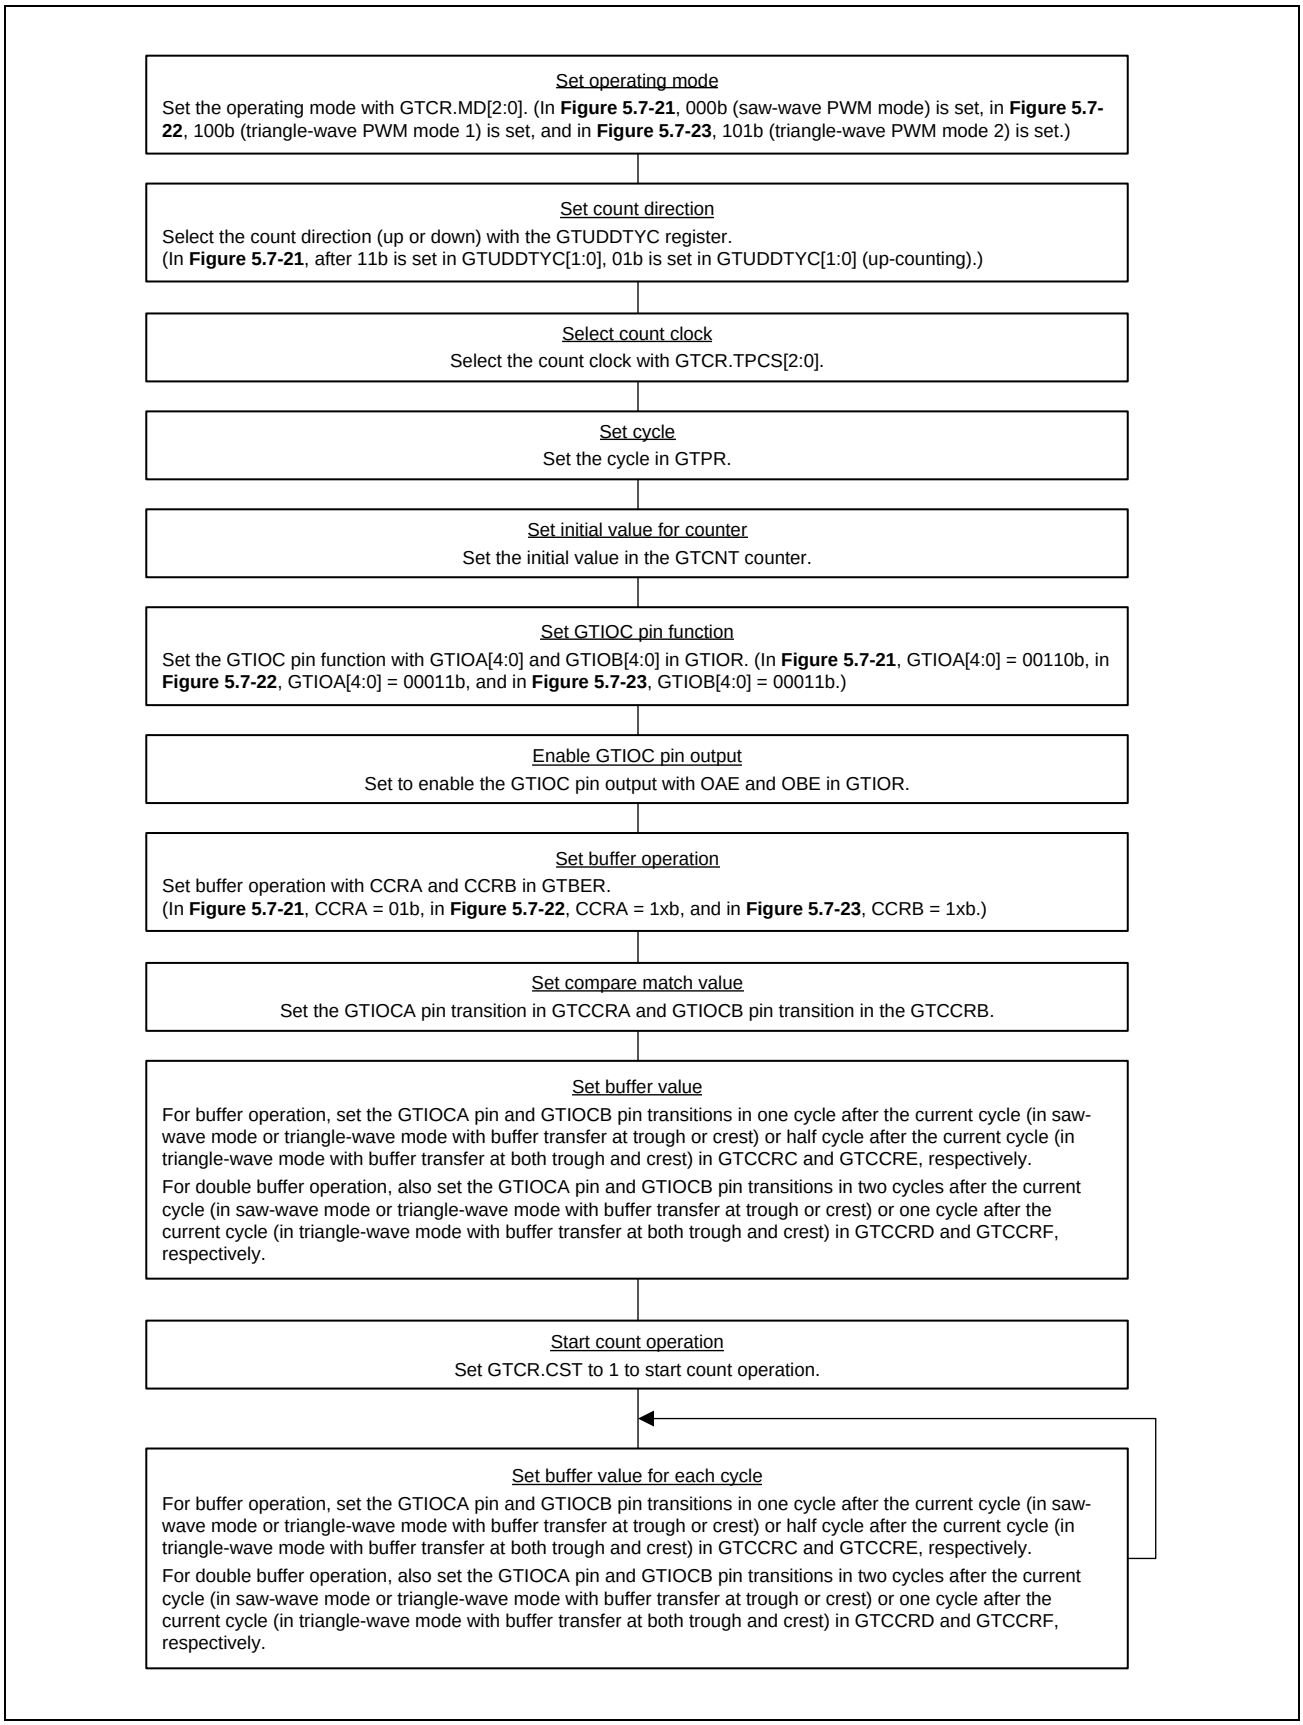

Figure 5.7-24 Example setting for GTCCRA and GTCCRB buffer operation with output compare

(2) When GTCCRA or GTCCRB functions as an input capture register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 5.7-25 and **Figure 5.7-26** show examples of GTCCRA and GTCCRB buffer operation and **Figure 5.7-27** shows an example setting for GTCCRA and GTCCRB buffer operation.

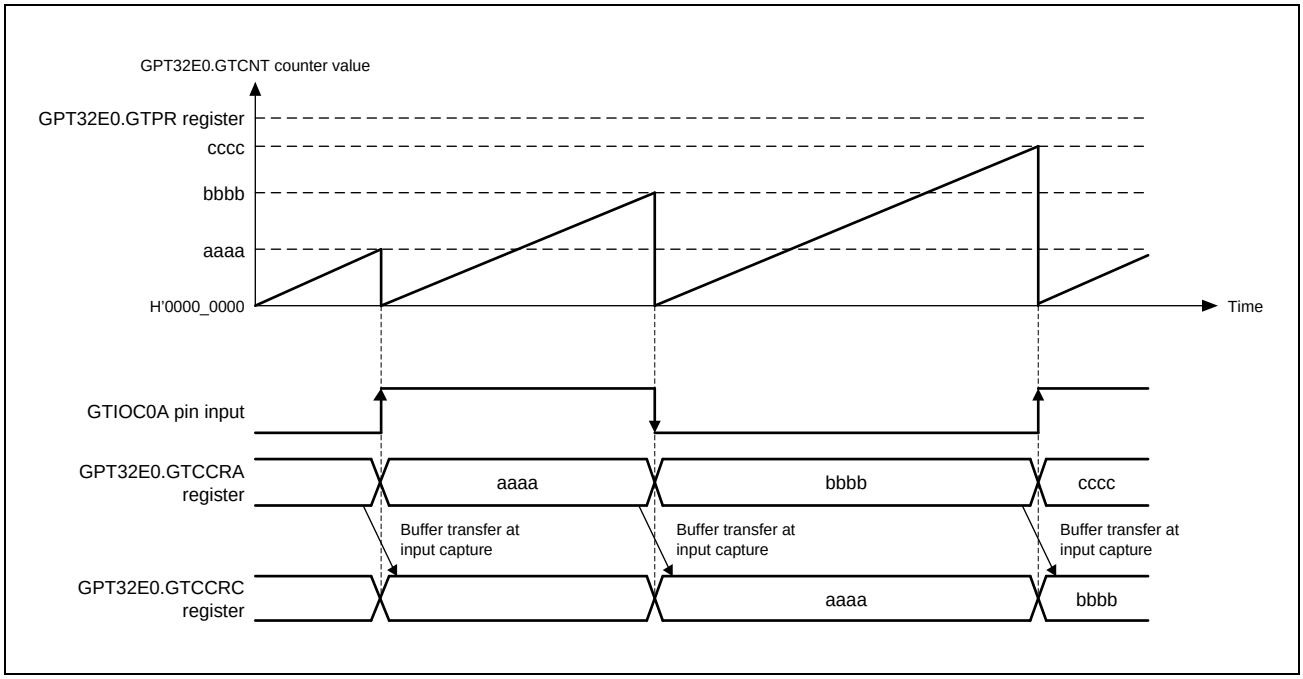

Figure 5.7-25 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOC0A input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0A input

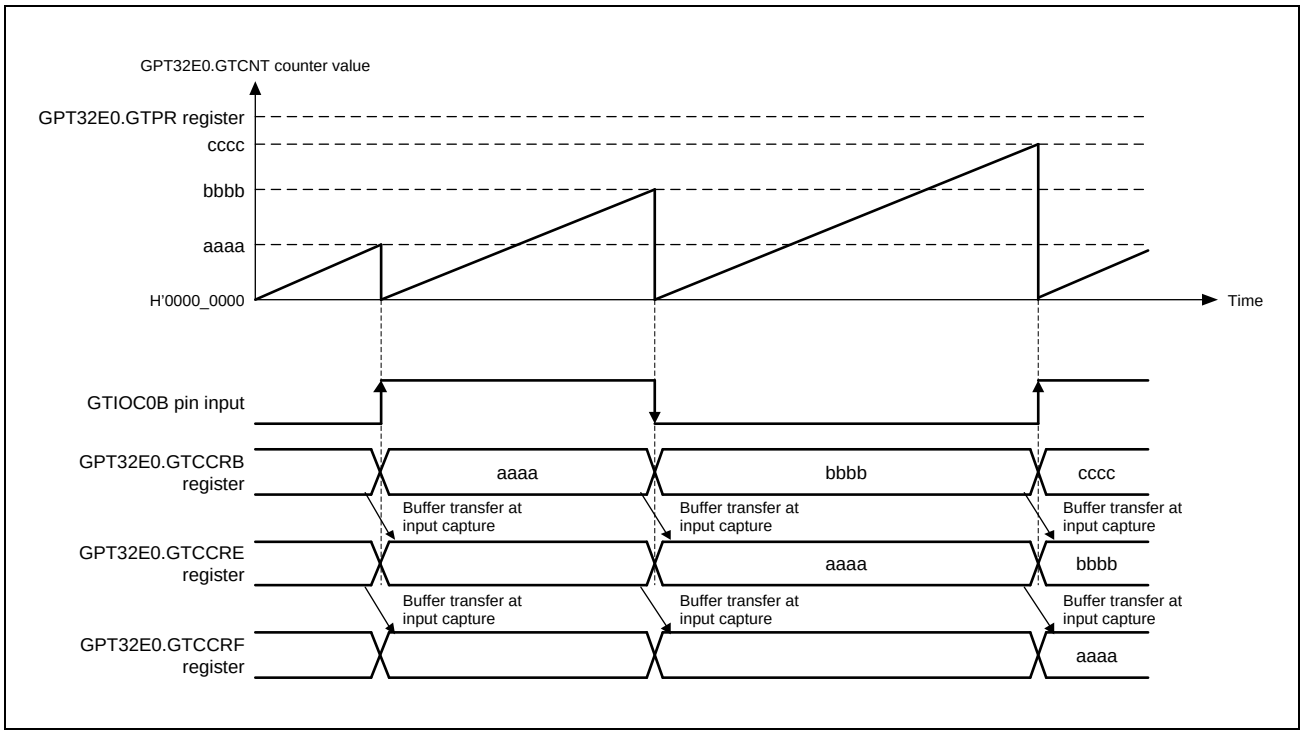

Figure 5.7-26 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOC0B input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0B input

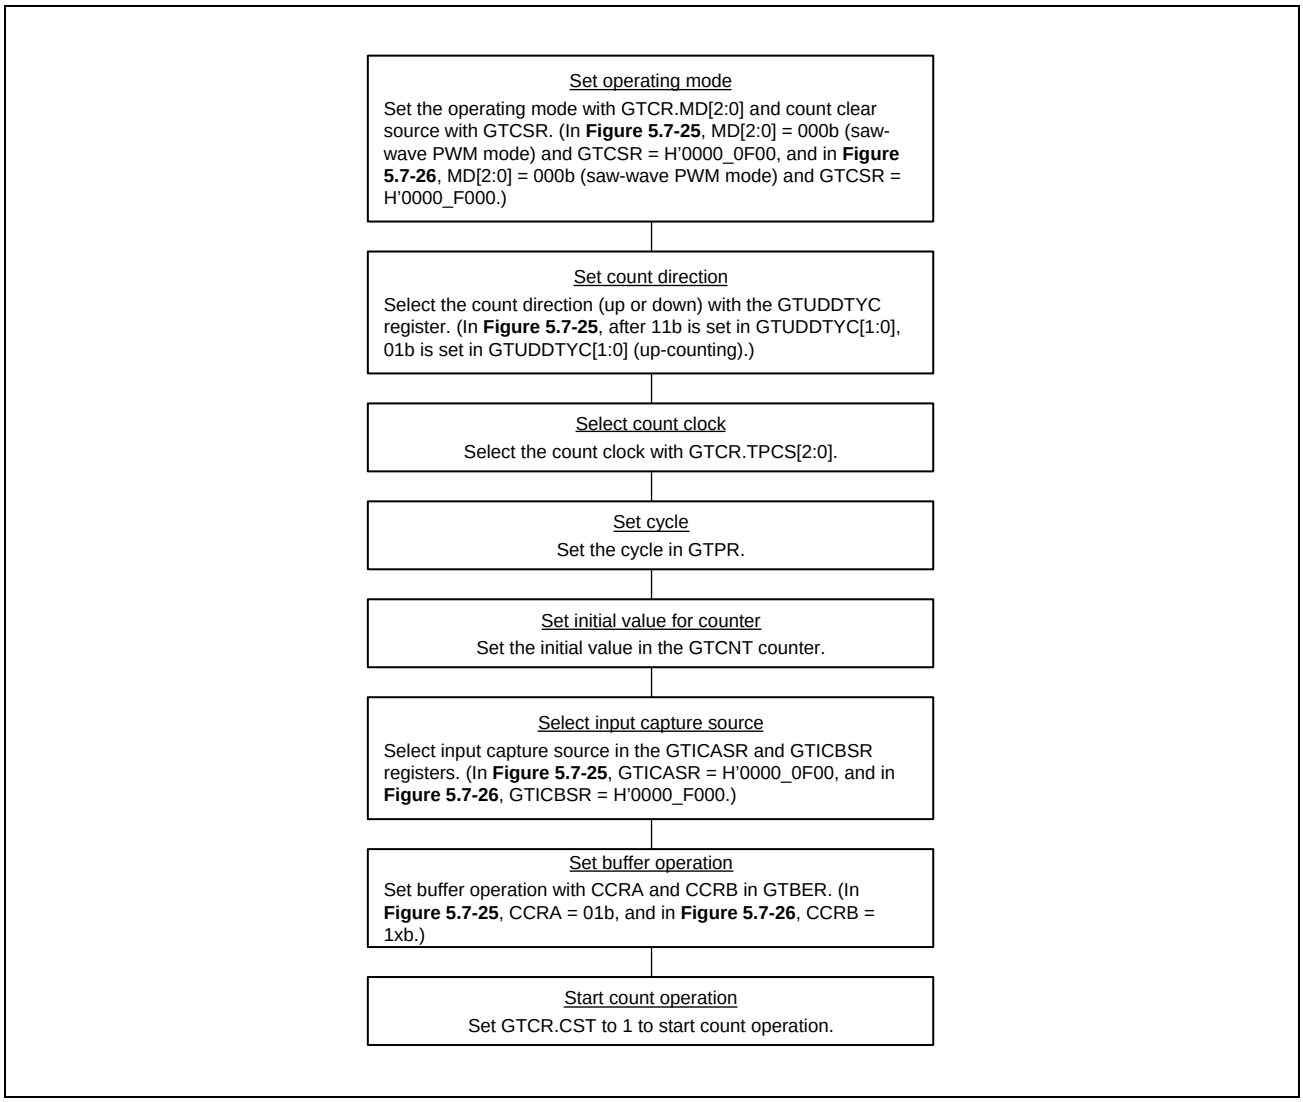

Figure 5.7-27 Example setting for GTCCRA and GTCCRB buffer operation with input capture

5.7.3.2.3 Buffer Operation for GTADTRA and GTADTRB

GTADTBRA can function as the GTADTRA buffer register and GTADTDBRA can function as the GTADTBRA buffer register (double-buffer register for GTADTRA). Similarly, GTADTBRB can function as the GTADTRB buffer register and GTADTDBRB can function as the GTADTBRB buffer register (double-buffer register for GTADTRB).

To set GTADTRA or GTADTRB to function as a double buffer, set GTBER.ADTDA or GTBER.ADTDB to 1. For single buffer operation, set GTBER.ADTDA or GTBER.ADTDB to 0. To set GTADTRA or GTADTRB to not function as a buffer, set GTBER.ADTTA[1:0] or GTBER.ADTTB[1:0] to 00b.

The buffer transfer timing can be set with the GTBER.ADTTA[1:0] bits. For saw waves, overflows (during up-counting) or underflows (during down-counting) can be selected. For triangle waves, crests are selected when GTBER.ADTTA[1:0] = 01b, troughs are selected when GTBER.ADTTA[1:0] = 10b, and both crests and troughs are selected when GTBER.ADTTA[1:0] = 11b.

Figure 5.7-28 to **Figure 5.7-30** show examples of GTADTRA and GTADTRB buffer operation and **Figure 5.7-31** shows an example setting for GTDTRA and GTADTRB buffer operation.

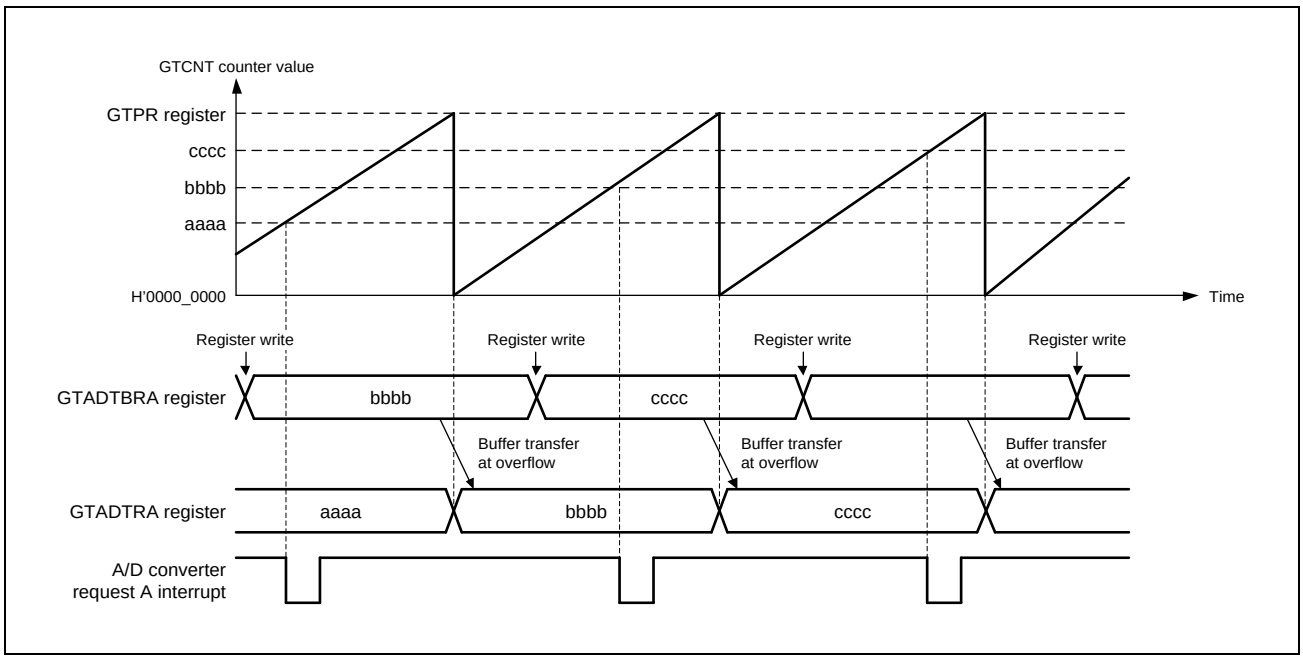

Figure 5.7-28 Example of GTADTRA and GTADTRB buffer operation with saw waves in up-counting and A/D converter start request interrupt generated by up-counting

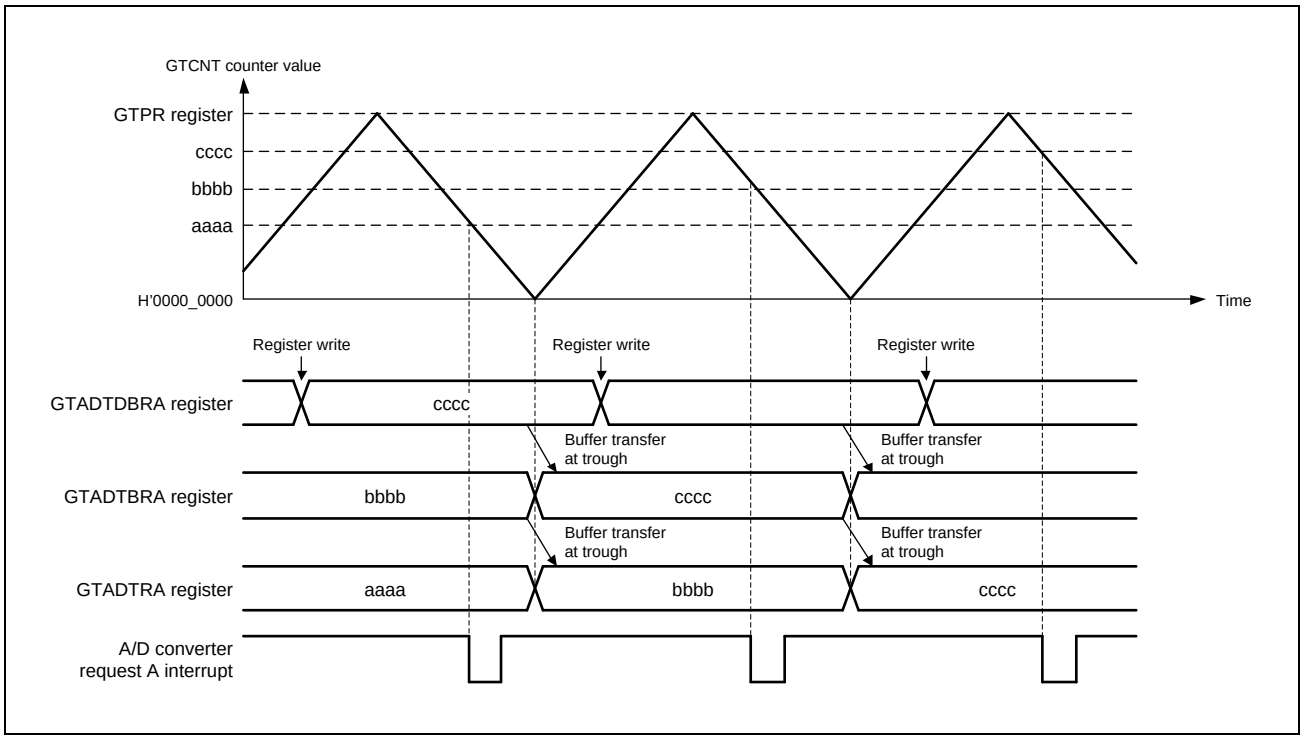

Figure 5.7-29 Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at troughs, and A/D converter start request interrupt generated by down-counting

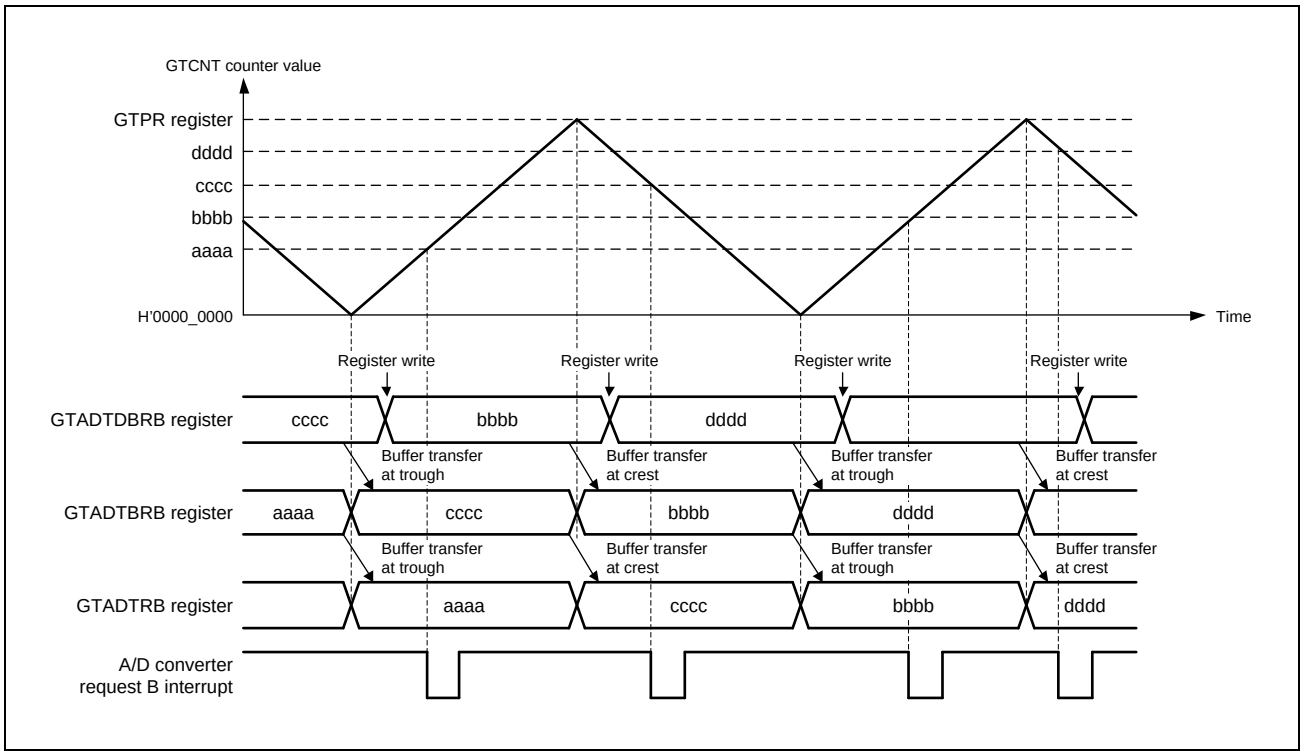

Figure 5.7-30 Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at both troughs and crests, and A/D converter start request interrupt generated by both up- and down- counting

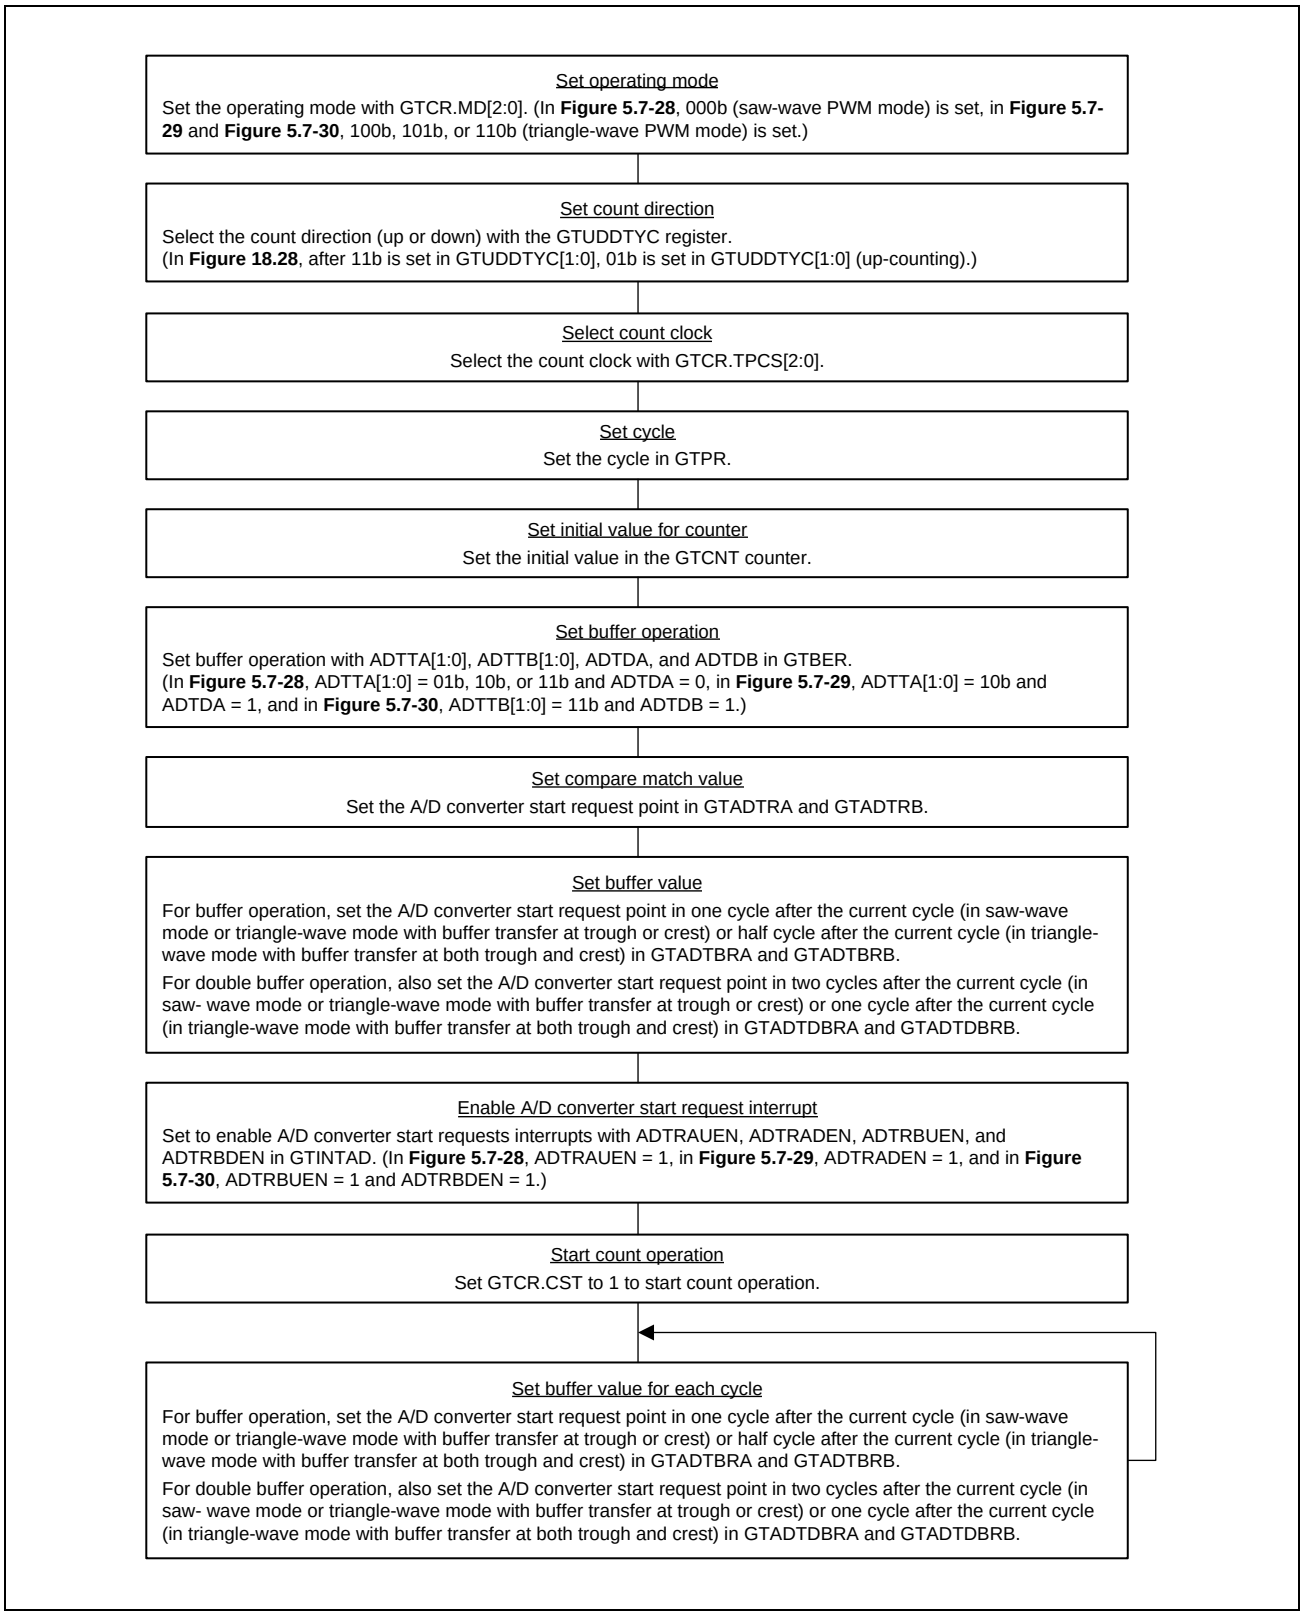

Figure 5.7-31 Example setting for GTADTRA and GTADTRB buffer operation

5.7.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCA or GTIOCB pin by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

5.7.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR.A PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

Figure 5.7-32 shows an example of saw-wave PWM mode operation, and **Figure 5.7-33** shows an example setting for saw-wave PWM mode.

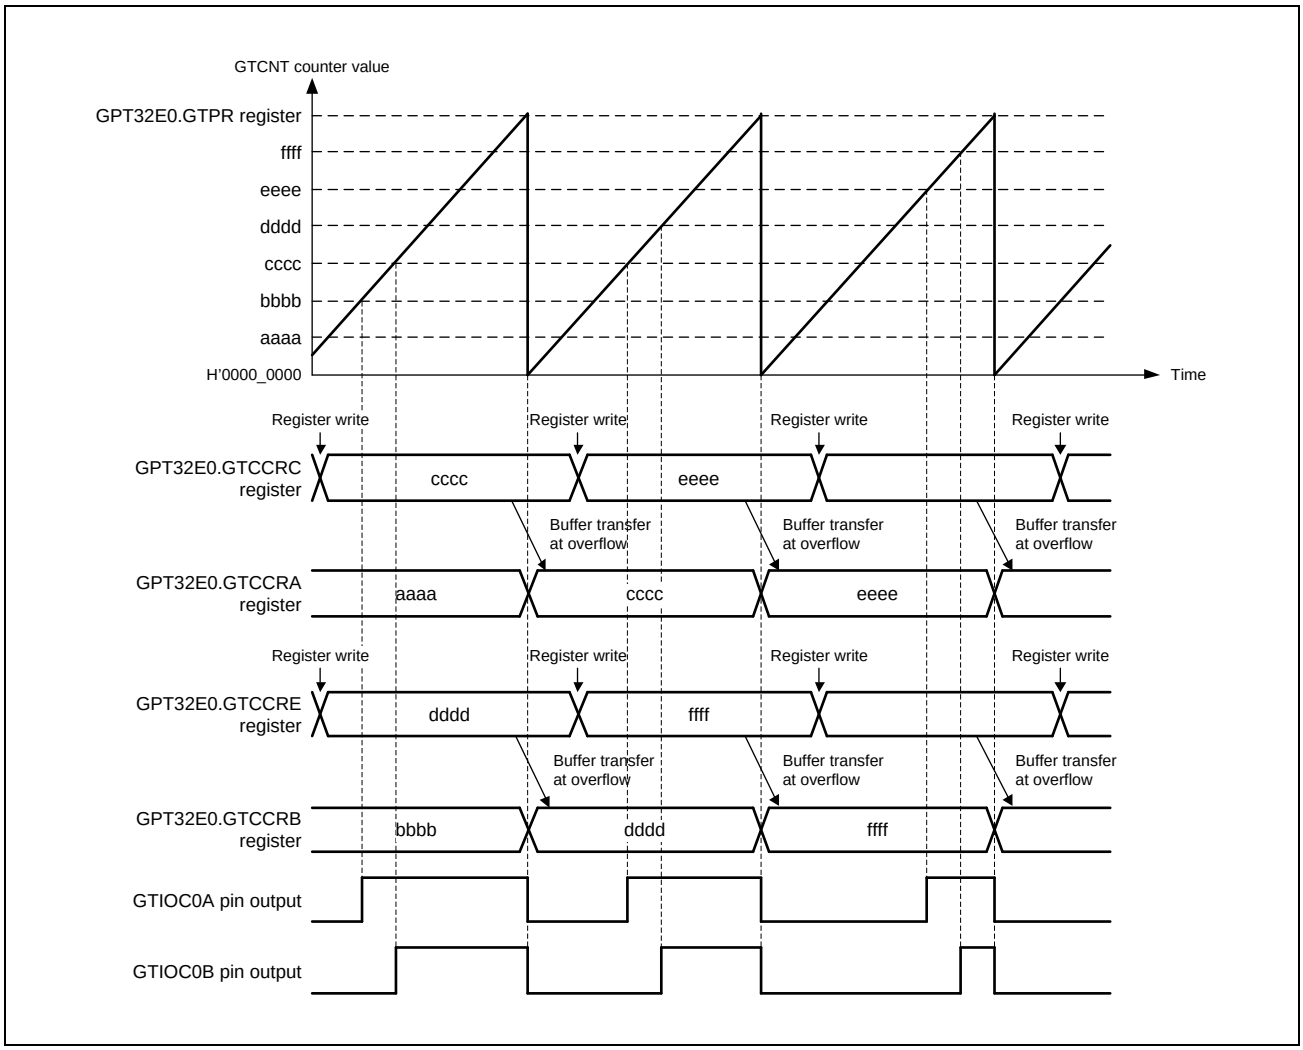

Figure 5.7-32 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

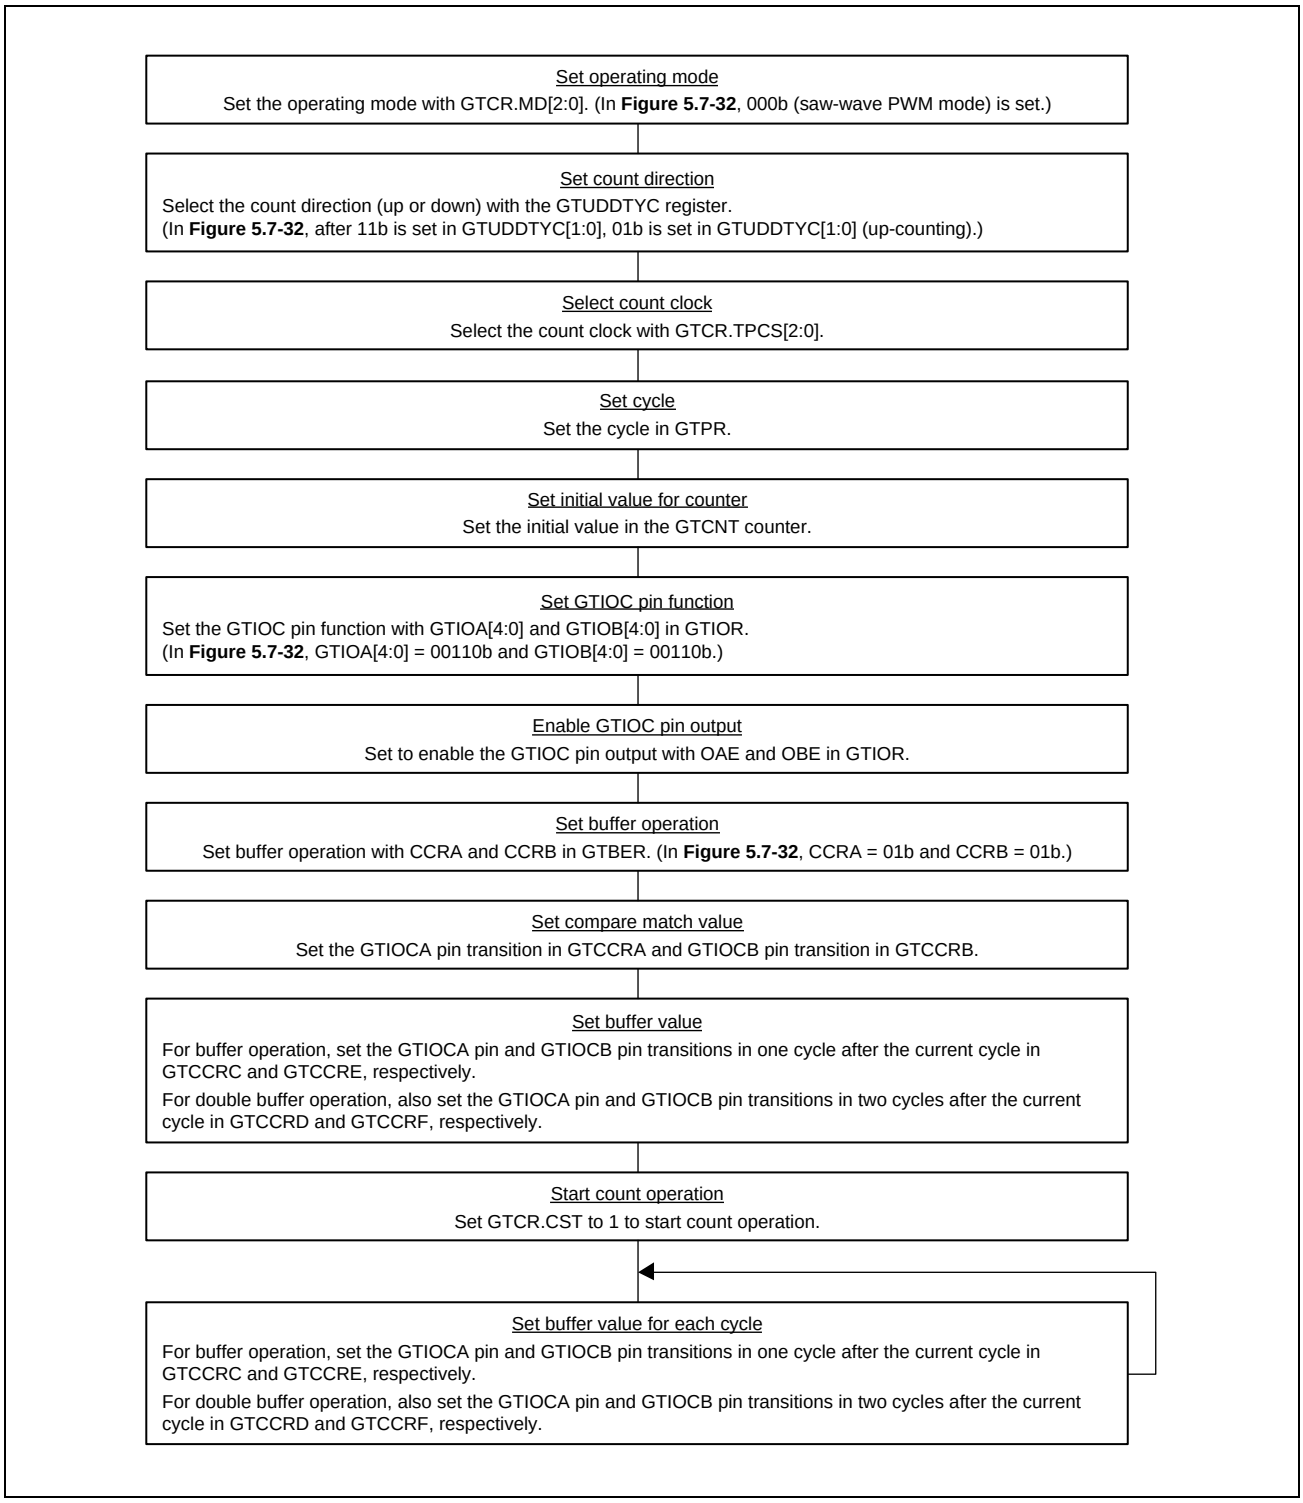

Figure 5.7-33 Example setting for saw-wave PWM mode

5.7.3.3.2 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR. The GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the cycle end based on the GTIOR setting.

When 1 is written to the GTBER.CCRSWT bit while counting is stopped, the values of the GTCCRD and GTCCRF registers are forcibly transferred to the temporary registers A and B, respectively. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 5.7-34 shows an example of saw-wave one-shot pulse mode operation, and **Figure 5.7-35** shows an example setting for saw-wave one-shot pulse mode.

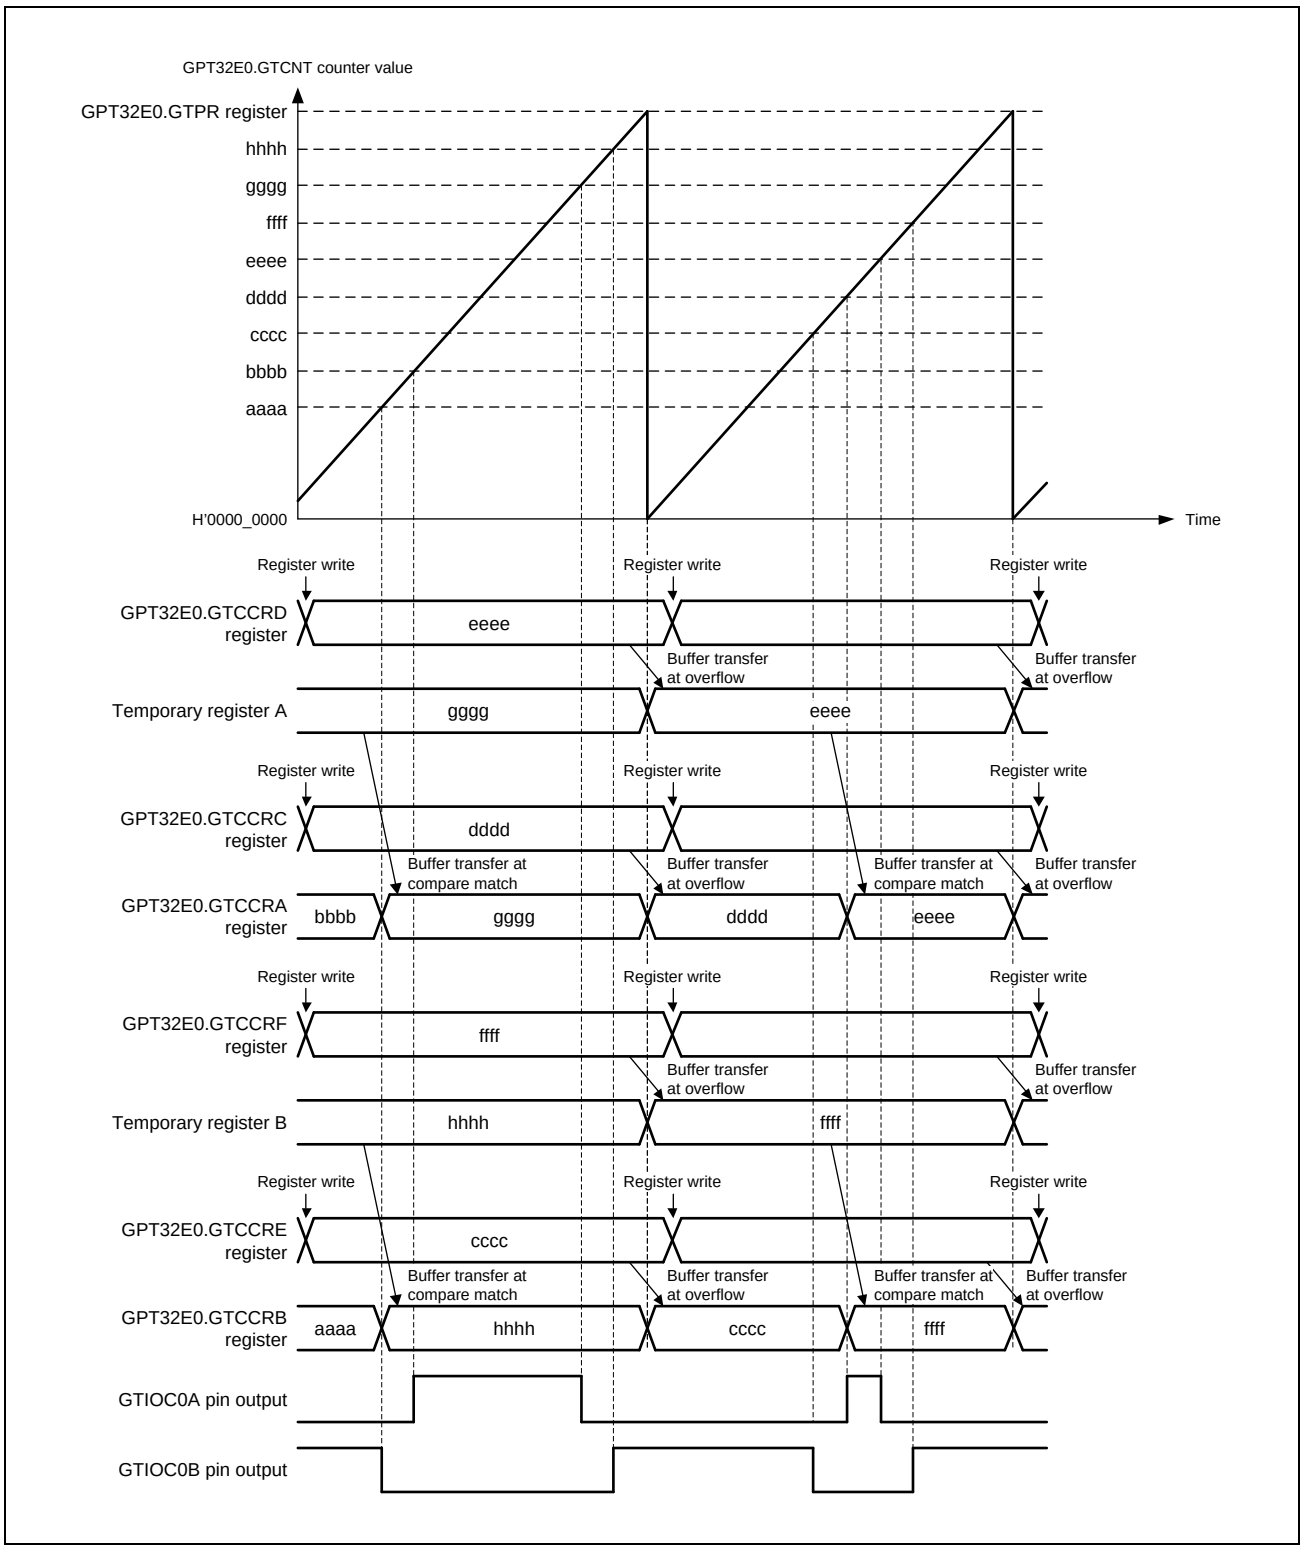

Figure 5.7-34 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

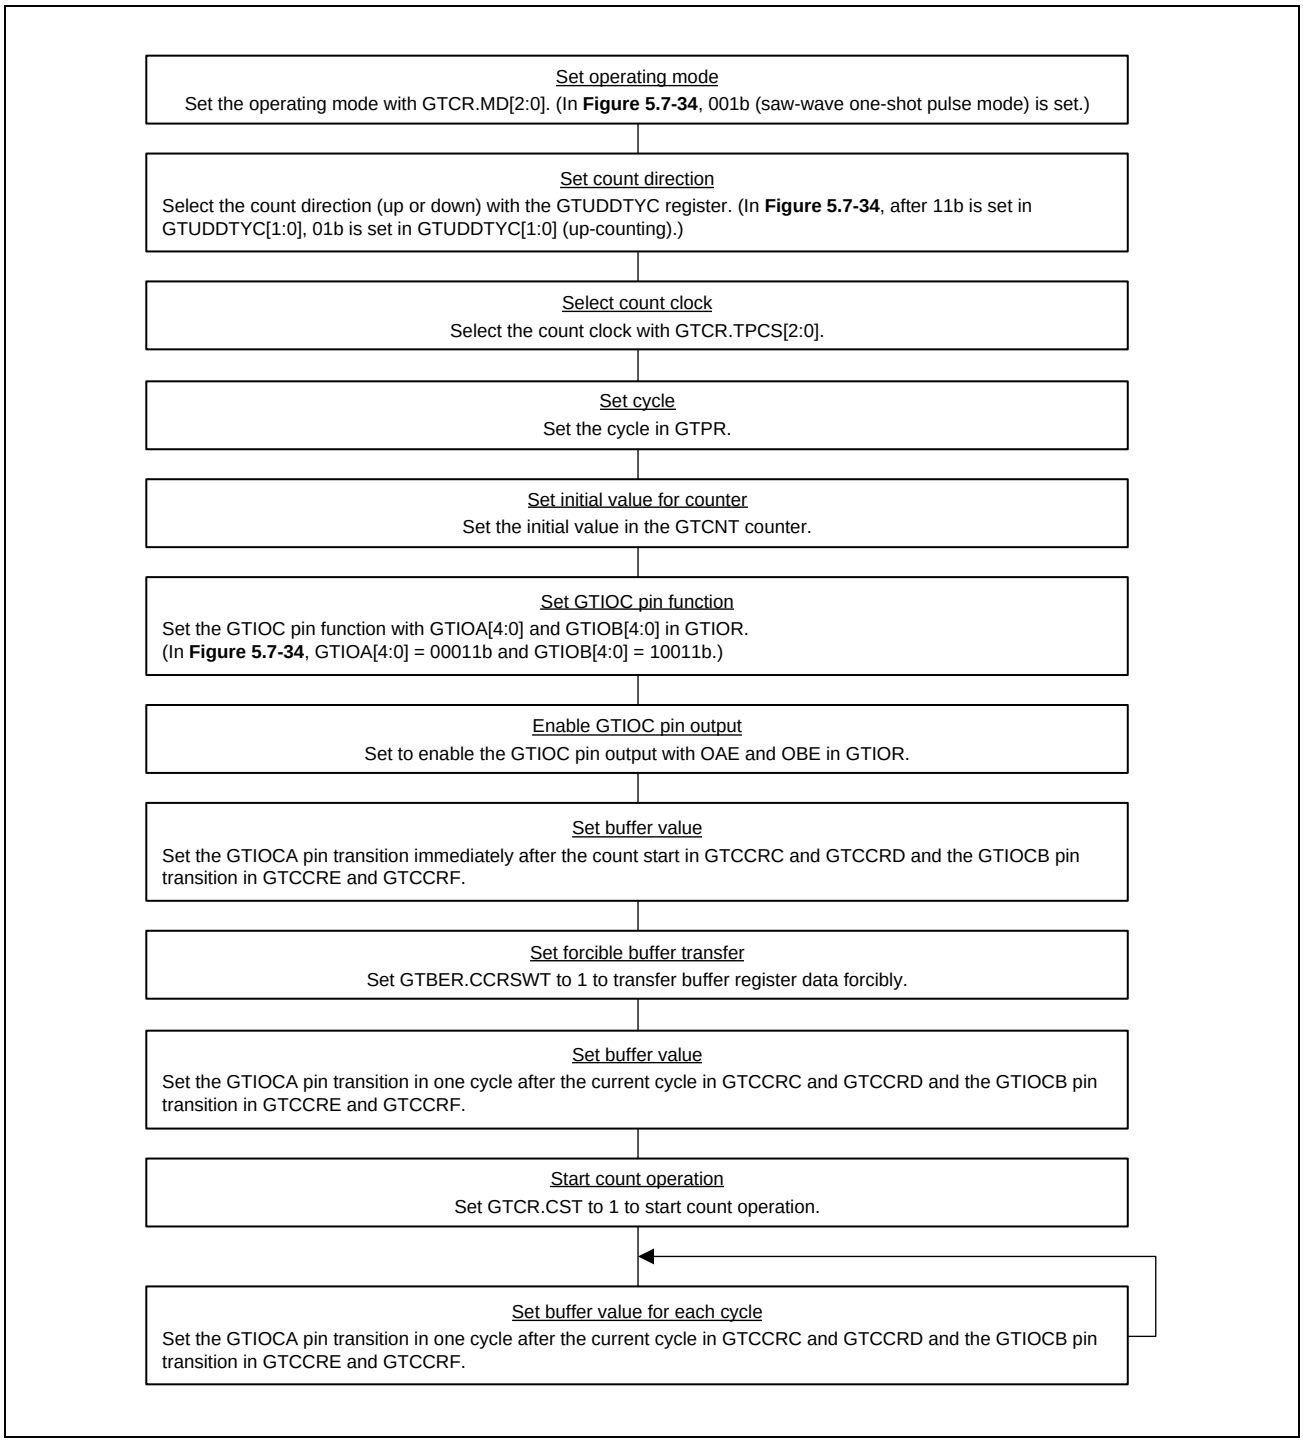

Figure 5.7-35 Example setting for saw-wave one-shot pulse mode

5.7.3.3.3 Triangle-Wave PWM Mode 1 (32-bit transfer at trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 5.7-36 shows an example of a triangle-wave PWM mode 1 operation, and **Figure 5.7-37** shows an example setting for a triangle-wave PWM mode 1.

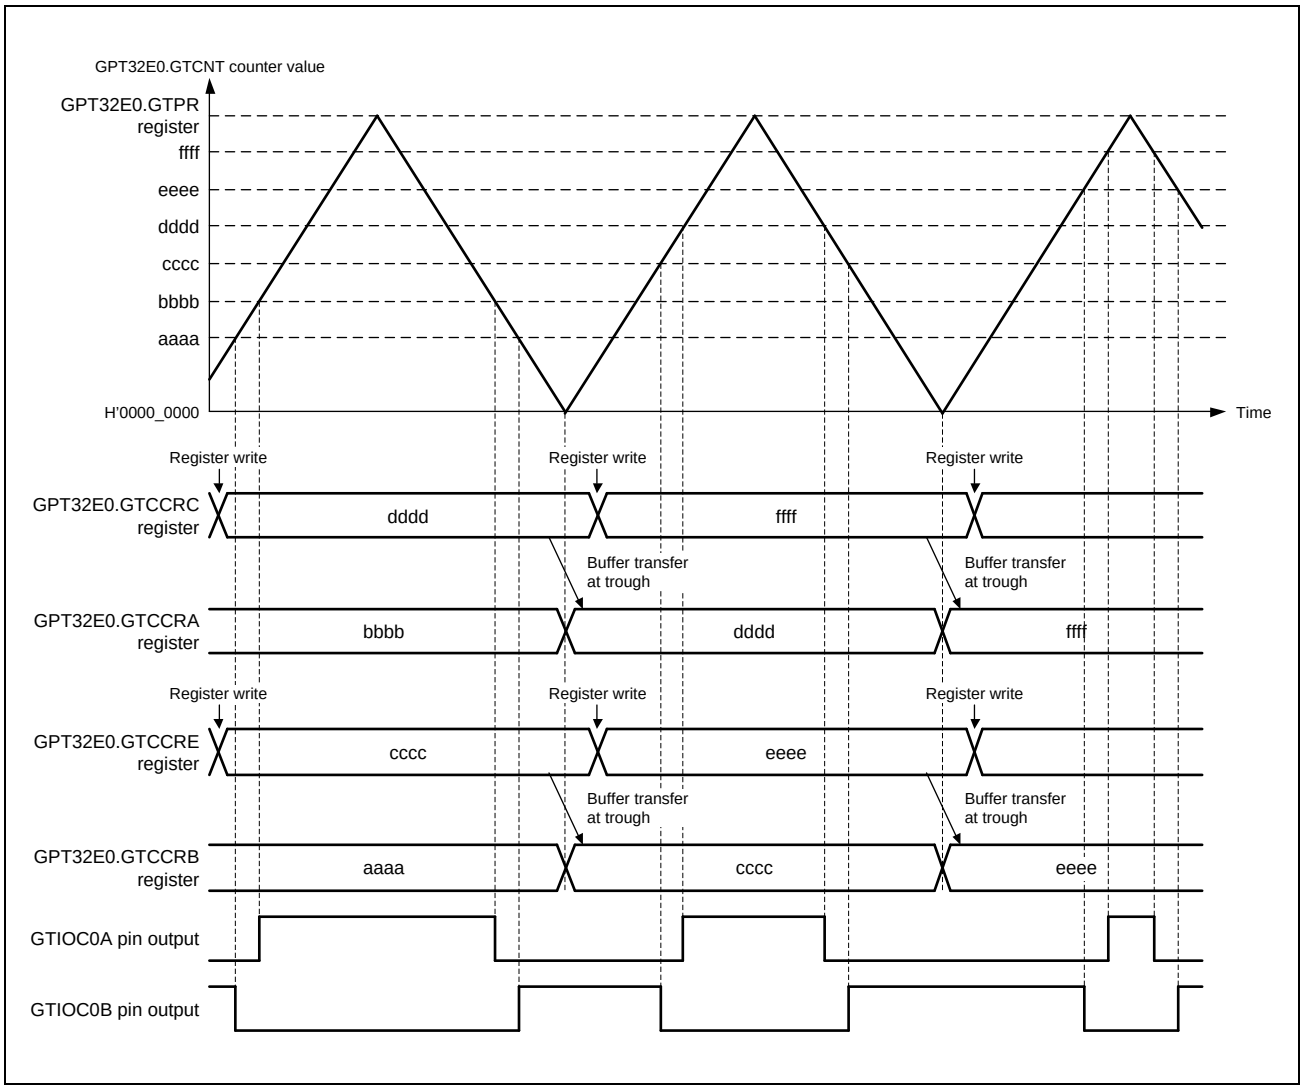

Figure 5.7-36 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB register compare match, and output retained at cycle end

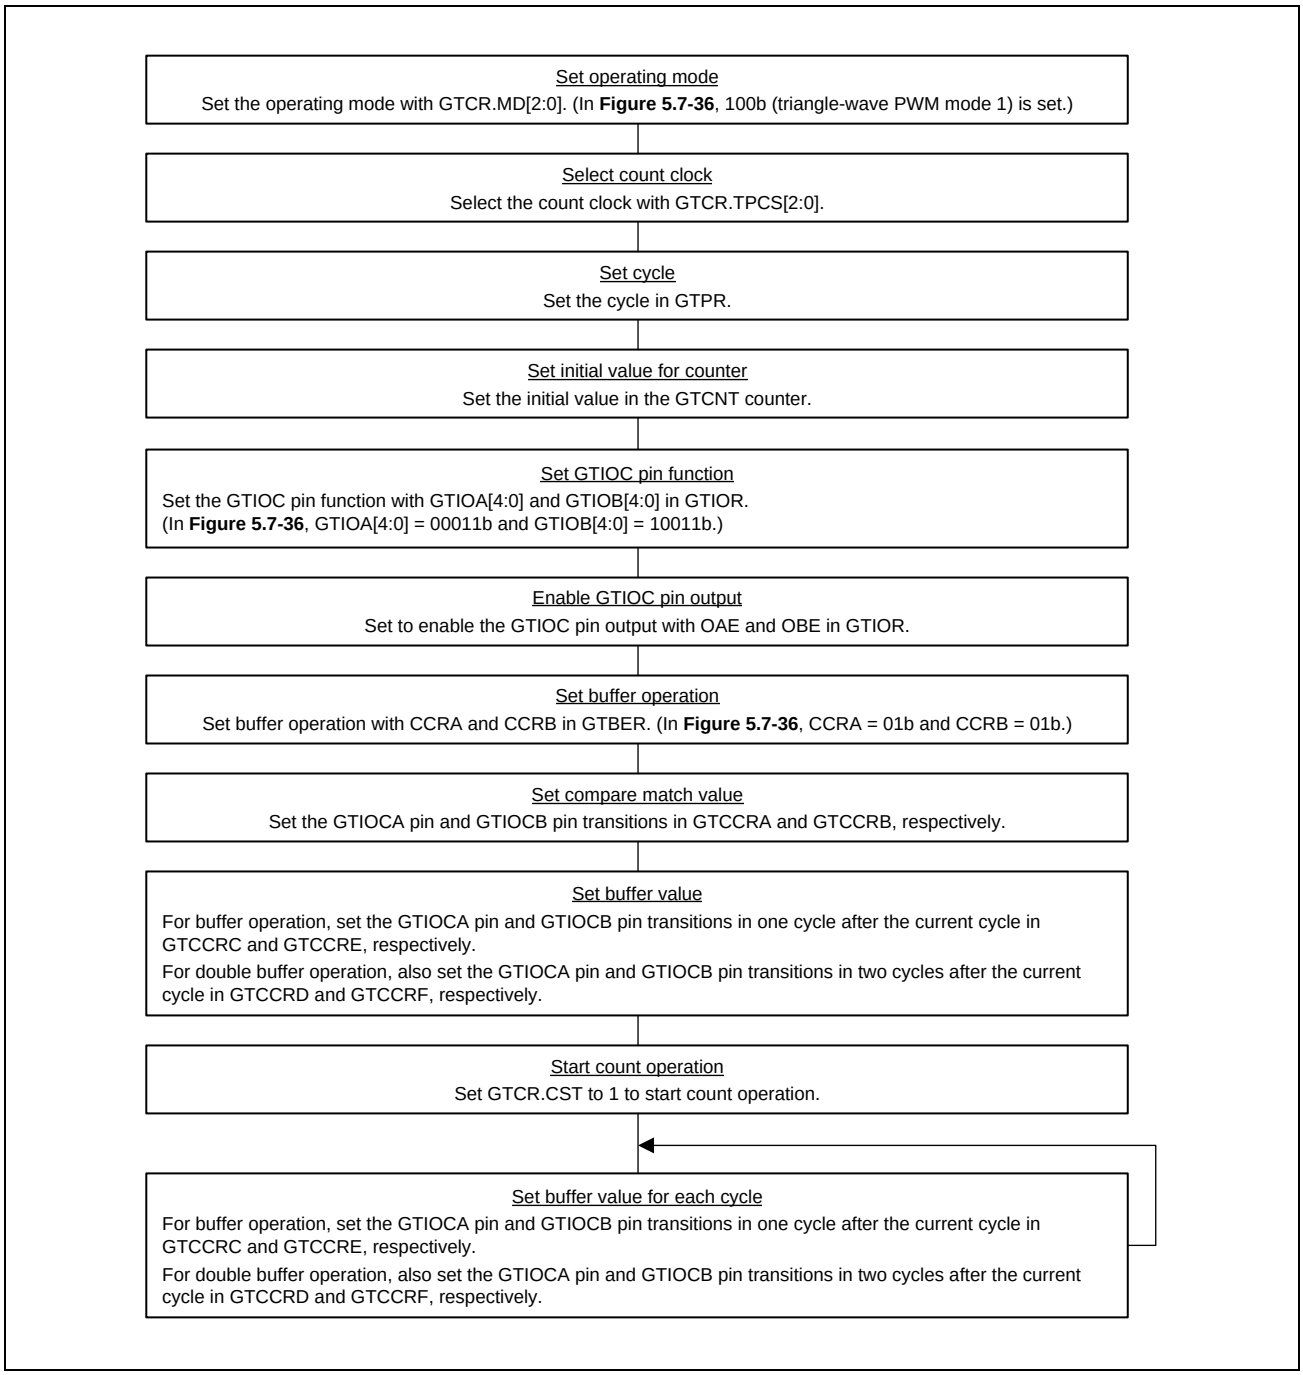

Figure 5.7-37 Example setting for triangle-wave PWM mode 1

5.7.3.3.4 Triangle-Wave PWM Mode 2 (32-bit transfer at crest and trough)
